UNLESS OTHERWISE AGREED IN WRITING BY INTEL, THE INTEL PRODUCTS ARE NOT DESIGNED NOR INTENDED FOR ANY APPLICATION IN WHICH THE FAILURE OF THE INTEL PRODUCT COULD CREATE A SITUATION WHERE PERSONAL INJURY OR DEATH MAY OCCUR.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined." Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Contact your local Intel sales office or your distributor to obtain the latest specifications and before placing your product order.

Copies of documents which have an order number and are referenced in this document, or other Intel literature, may be obtained by calling 1-800-548-4725, or go to: <http://www.intel.com/design/literature.htm>

Software and workloads used in performance tests may have been optimized for performance only on Intel microprocessors. Performance tests, such as SYSmark* and MobileMark*, are measured using specific computer systems, components, software, operations and functions. Any change to any of those factors may cause the results to vary. You should consult other information and performance tests to assist you in fully evaluating your contemplated purchases, including the performance of that product when combined with other products. For more complete information about performance and benchmark results, visit www.intel.com/benchmarks

About this Document

This document is a guide measuring performance of the Intel® Processors on application software. The primary audience for this document includes individuals, publications, OEMs and technical analysts whose goal is to test or evaluate the performance benefits and features of the Intel® Processors. If there are questions that are not answered here on software application performance evaluation of the Intel® Processors, please contact your Intel representative.

Each software application test measures different aspects of processor and/or system performance. While no single numerical measurement can completely describe the performance of a complex device like a microprocessor or a personal computer, application tests can be useful tools for comparing different components and systems. The following results and procedures give a glimpse of the performance of certain software applications, however your own usage of each application may vary from what is shown here. The only totally accurate way to measure the performance of your system, is to test the actual software applications you use, in the way you use them, on your computer system. Test results published by Intel are measured on specific systems or components using specific hardware and software configurations, and any differences between those configurations (including software) and your configuration may make those results inapplicable to your component or system.

Software application tests are, at most, only one kind of information that you may use during the purchasing process. To get a true picture of the performance of a component or system you are considering purchasing, you must consult other sources of information (such as performance information on the exact system you are considering purchasing). If you have any questions about the [performance of any Intel microprocessor](#), please view the detailed performance briefs and reports published by Intel or call Intel at (US) 1-800-628-8686 or 916-356-3104.

Chapter 1

Processor Performance on Adobe* Photoshop* CS5

1.0 Software Description

Adobe* Photoshop* CS5 software is a professional image-editing tool. It helps the user to work more efficiently, explore new creative options, and produce the highest quality images for print, and the web. It creates imagery with easier access to file data, streamlined web design, faster and professional quality photo retouching.

1.1 Test Workflow/Workload Description

Sarah is a student taking a digital photography class. She has taken several photographs using a Canon* PowerShot S50 camera and is beginning to explore the use of filters in Adobe* Photoshop* CS5 on one of the photo lab computers. For her assignment, Sarah has chosen 5 TIFF images, and the photos have a resolution of 2592x1944 and vary in sizes from 11.3MB to 14.4MB. This is Sarah's first experience using Photoshop and the editing session consists of applying a filter to each photo, taking notes of how the filter changes the appearance of each photo, and removing the filter before trying another filter. By the end of the testing, Sarah has experimented with several different filters, and has created a web photo gallery with 5 pictures to share with her social media friends.

Chapter 2

Procedure for Evaluating Processor Performance

The following is a procedure for evaluating performance while applying filters to a digital photograph and creating a web photo gallery using Adobe* Photoshop* CS5.

2.0 **Installing the Software and Test Files:**

1. Obtain Adobe* Photoshop* CS5 Software.
2. Install Photoshop CS5 with default settings.
3. Install Camera_Raw_6_1_updater with default settings
4. Install the patch photoshopcs5 12.01_updated with default settings
5. Launch Adobe Photoshop CS5 _check the box "DON'T SHOW AGAIN" then click NO
6. Reboot the system
7. Launch Adobe Photoshop CS5 when the Adobe Photoshop CS5 Extended window popup click skip
8. Exit Photoshop CS5.
