Preface

This is the primary hardware guide for the Intel® RAID Controller RS25SB008, which can be used to manage SAS and SATA disk drives. It contains installation instructions and specifications.

For details on configuring the storage adapters, and for an overview of the software drivers, see the Intel® RAID Software User’s Guide on the Resource CD.

Audience

This document assumes that you have some familiarity with RAID controllers/modules and related support devices. The people who benefit from this book are:

• Engineers who are planning to use an Intel® RAID Controller RS25SB008 as a part of their RAID system.
• Anyone installing an Intel® RAID Controller RS25SB008 in their RAID system.

Organization

This document includes the following chapters and appendices:

• Chapter 1 provides a general overview of the Intel® RAID Controller RS25SB008.
• Chapter 2 describes the procedures for installing and configuring the RAID controller.
• Chapter 3 provides the characteristics and technical specifications for the Intel® RAID Controller RS25SB008.
• Appendix A explains drive roaming and drive migration.
• Appendix B provides safety instructions to be observed during installation and assembly.
• Appendix C provides regulatory and certification information.

Related Publication

The Intel® RAID Software User’s Guide is included on the Resource CD that shipped with the RAID controller.

The Intel® RAID Controller RS25SB008 is a high-performance intelligent PCI Express® 3.0 compliant SAS/SATA RAID controller that offers reliability, high performance, and fault-tolerant disk subsystem management. This is a RAID solution that meets the external storage needs of workgroup, department, or enterprise systems to use with cost-effective SATA or high performance SAS media.

As a third generation PCI Express* storage controller, the Intel® RAID Controller RS25SB008 addresses the growing demand for increased data throughput and scalability requirements across entry level, midrange, and enterprise server platforms.

The controller controls 8 external 6-Gb/s SAS/SATA ports through two SFF-8088 Mini SAS x4 connectors and allows the use of expanders to connect up to 48 devices. For more information about the use of expanders, see the ANSI SAS Standard, version 2.0 specification.

SATA and SAS are serial, point-to-point, device interfaces that use simplified cabling, smaller connectors, lower pin counts, and lower power requirements than parallel SCSI.

The optional Super Cap 2 module provides cached data protection for the RAID controller, even during system failures.

**Benefits of SAS and SATA**

SAS is a serial, enterprise-level device interface that leverages the proven SCSI protocol set. SAS is a convergence of the advantages of SATA, SCSI, and FC, and is the future mainstay of the enterprise and high-end workstation storage markets. SAS offers a higher bandwidth per pin than parallel SCSI and improves signal and data integrity.

The SAS interface uses the proven SCSI command set to ensure reliable data transfers, while providing the connectivity and flexibility of point-to-point serial data transfers. The serial transmission of SCSI commands eliminates clock skew challenges. The SAS interface provides improved performance, simplified cabling, smaller connectors, lower pin count, and lower power requirements than parallel SCSI.

SAS controllers leverage a common electrical and physical connection interface that is compatible with Serial ATA technology. The SAS and SATA protocols use a thin, 7-wire connector instead of the 68-wire SCSI cable or 40-wire ATA cable. The SAS/SATA connector and cable are easier to manipulate, connect to smaller devices, and do not inhibit airflow. The point-to-point SATA architecture eliminates difficulties created by the legacy ATA master-slave architecture, while maintaining compatibility with existing ATA firmware.
Intel® RAID Controller RS25SB008

The Intel® RAID Controller RS25SB008 is an intelligent, low-profile RAID adapter with an integrated LSI SAS2208 dual-core RAID-On-Chip chipset, providing both a SAS controller and RAID engine. With 1GB RAM built onto a memory board which is connected to the RAID baseboard by default, and eight independent ports supporting 6Gb/s and 3Gb/s SAS data transfers using two SFF-8088 mini multi-lane connectors, this controller supports up to 48 enterprise-class SAS or SATA devices. The PCI Express* connector fits into an x8 or x16 PCI Express* slot capable of performance up to 8GT/s per lane.

The RAID Controller is designed to fit various Intel® Server Boards and systems. For the most up-to-date support list, see the Compatibility section under the link for this Intel® RAID Controller at http://www.intel.com/p/en_US/support/server.

Protocol Support

Each port on the SAS controllers supports SAS devices, SATA II devices, or both using SSP, SMP, STP, and SATA II as follows:

• Serial SCSI Protocol (SSP) to enable communication with other SAS devices.
• SATA II Protocol to enable communication with other SATA II devices.
• Serial Management Protocol (SMP) to share topology management information with expanders.
• Serial Tunneling Protocol (STP) support for SATA II through expander interfaces.

Operating System Support

• Red Hat* Enterprise Linux 4.0, 5.0, and 6.0
• SuSE* Linux Enterprise Server 9, 10, and 11
• VMWare* ESX 4.0
• Solaris* 10
• Citrix* XEN
• FreeBSD* (supports only x86 version)

The operating systems supported may not be supported by your server board. See the Tested operating system list for your server board at http://www.intel.com.

To make sure the RAID controller supports your operating system, see also the Tested Hardware and Operating System List for the Intel® RAID Controller RS25SB008.
Usability

- The card ships with both a standard and a low-profile bracket.
- The card ships with a 1GB memory board which is already installed onto the RAID controller baseboard as the RAID cache.
- Small, thin cabling with serial point-to-point 6.0 Gbps data transfer rates.
- Support for non-disk devices and mixed capacity drives.
- Support for intelligent XOR RAID levels 0, 1, 5, 6, 10, 50, and 60.
- Dedicated or global hot spare with auto rebuild if an array drive fails.
- User defined stripe size per drive: 8, 16, 32, 64, 128, 256, 512, or 1024 KB.
- Advanced array configuration and management utilities provide:
  - Online Capacity Expansion (OCE) adds space to existing drive or new drive. See Appendix A: Drive Roaming and Drive Migration Install for limitations on OCE and RAID migration.
  - Online RAID level migration (upgrade of RAID mode may require OCE)
  - Drive migration
  - Drive roaming
  - No reboot necessary after expansion
  - Load Balancing
- Upgradeable Flash ROM interface.
- Allows for staggered spin-up, hot-plug, and lower power consumption.
- User specified rebuild rate (percent of system resources to use from 0-100%).

Caution: Exceeding 50% rate may cause operating system errors due to waiting for controller access.

- Background operating mode can be set for Rebuilds, Consistency Checks, Initialization (auto restarting Consistency Check on redundant volumes), Migration, OCE, and Patrol Read.

Redundancy and Error Handling

- In-band SES2.
- Enclosure management support.
- Drive coercion (auto-resizing to match existing disks).
- Auto-detection of failed drives with transparent rebuild. There must be disk activity (I/O to the drive) for a missing drive to be marked as failed.
- Auto-resume of initialization or rebuild on reboot (the Auto Rebuild feature must be enabled before virtual disk creation).
• Smart initialization automatically checks consistency of virtual disks if there are five or more disks in a RAID 5 array, which optimizes performance by enabling read-modify-write mode. RAID 5 arrays of only three or four drives use Peer Read mode.
• Smart Technology predicts failures of drives and electronic components.
• Patrol Read checks drives and maps bad sectors.
• Commands are retried at least four times.
• Firmware provides best effort to recognize an error and recover if possible.
• Failures are logged from controller and drive firmware, and SMART monitor.
• Failures are logged in NVRAM, viewable from OS Event Log, Intel® RAID Web Console 2, CIM, and LEDs.
• Multiple cache options allow configuration-specific performance optimization:
  — Write-back: Faster because it does not wait for the disk but data will be lost if power is lost.
  — Write-through: Usually slower but ensures data is on the disk.
  — Read Ahead: Predicts next read will be sequential and buffers this data into the cache.
  — Non Read Ahead: Always reads from the drive after determining exact location of each read.
  — Adaptive Read Ahead: Reads ahead and caches data only if doing sequential reads.
  — I/O setting. Determines whether read operations check the cache before reading from disks.
    ✷ Cache I/O: Checks cache first, only reads disk if data is not in the cache.
    ✷ Direct I/O: Reads data directly from disk. (not cache)
• Redundancy through:
  — Configuration stored in non-volatile RAM and on the drives (COD).
  — Hot-swap support.
  — Super Cap 2 backup for cache memory.
SAS/SATA Features

- Provides eight independent phys, each supporting 6Gb/s and 3Gb/s SAS data transfers per PHY.
- Scalable interface that supports up to 128 physical devices through expanders.
- Supports SSP to enable communication with other SAS devices.
- Supports SMP to communicate topology management information.
- Supports single PHY or wide ports consisting of 2, 3, or 4 PHYs within a single quad port.
- Allows addressing of multiple SATA targets through an expander if using SATA 2.0-compliant hard disk drives.
- Single controller multi-pathing (fail-over).

Online Capacity Expansion and RAID Level Migration Rules

- Migration must occur to the same or larger capacity configuration.
- Migration cannot occur if there is more than one virtual disk in a logical array.
- Migration and OCE cannot be done on Spanned Arrays (RAID 10, 50, and 60).
- Migrations supported are RAID 1 to RAID 0, RAID 5 to RAID 0, RAID 6 to RAID 0.
- With OCE, migrations supported are RAID 0 to RAID 1, RAID 0 to RAID 5, RAID 0 to RAID 6, RAID 1 to RAID 5, RAID 1 to RAID 6, RAID 5 to RAID 6.

Beep Codes

- Short beep (1 second on, 1 second off): Array has degraded but no data has been lost.
- Long beep (3 seconds on, 1 second off): Array has failed and data has been lost.
- Short beep (1 second on, 3 seconds off): Using hot spare in rebuild; alarm will continue during rebuild with a different sound at completion.

To disable the alarm, choose Disable Alarm. To enable the alarm, choose Enable Alarm.

To disable the alarm only until the next event or until next power cycle, choose Silence Alarm.
2 Intel® RAID Controller RS25SB008 Hardware Installation

Requirements

- Intel® RAID Controller RS25SB008 (SAS/SATA cables need to be prepared separately)
- A host system with an available x8 or x16 PCI-Express® slot
- Resource CD, which contains drivers and documentation
- SAS or SATA hard drives up to 6Gb/s speed
- Compatible SAS/SATA cables (for cable requirements, see step 4 in “Installing the RAID Controller”)

*Note: Intel Corporation strongly recommends using an uninterruptible power supply (UPS).*

Installing the RAID Controller

To install the RAID Controller, follow these steps:

1. Turn off the power to the system, all drives, enclosures, and system components. Remove the power cord(s).
2. Remove the server cover. For instructions, see your server system documentation.
3. If necessary, change the bracket on the RAID controller to fit the height of the server system (see Figure 1).
Figure 1. Changing the Bracket

4. Install the RAID controller into an available server system x8 or x16 PCI-Express* slot (see Figure 2). To locate an appropriate slot and for instructions on installing an add-in card, see your server system documentation.

Figure 2. Installing the Intel® RAID Controller RS25SB008

5. Configure and install the SAS/SATA Devices in the target external storage case. Refer to the documentation of the devices for any pre-installation configuration requirements.

6. Use SAS cables to connect the RAID controller to the target external storage case.
7. Install the server system cover and connect the power cords. See your server system documentation for instructions.

**Configuring the RAID Controller**

To configure the RAID Controller, follow these steps:

1. Turn on the system power and check to make sure that the SAS/SATA devices power up before or at the same time as the system.

2. During the boot, the following BIOS message appears to state the keys that you need to press to enter the Intel® RAID BIOS Console 2, such as:  
   Press <CTRL><G> to run BIOS Console 2.  
   This message times out after several seconds. If you miss it, you need to restart the system.

   After you press the keys to enter the Intel® RAID BIOS Console 2 software, the firmware takes several seconds to initialize and then display the Intel® RAID Controller number and firmware version. The numbering of the RAID controller follows the PCI slot scanning order used by the server board.

3. See the *Quick Start User’s Guide* and the *Software User’s Guide* for instructions to configure the RAID controller and to install the operating system drivers.

**Replacing a Controller**

To replace the RAID controller, see your server system documentation for instructions to remove and then install an add-in adapter.

**Resolving a Config Mismatch**

If the newly installed RAID controller was previously configured, a message displays during POST, stating that there is a configuration mismatch because the configuration data in the NVRAM differs from that in the hard drives. Use these steps to resolve the mismatch:

1. Press <Ctrl> + <G> when prompted during boot up to access the BIOS Configuration Utility.

2. Select Configure > View/Add Configuration to see the NVRAM and drive configurations.

3. If the drives contain the correct configuration, use configuration from the disks.

4. Press <Esc> and select YES to update the NVRAM.

5. Exit and reboot.
3 Intel® RAID Controller RS25SB008 Characteristics

The Cache Memory Board component is a printed circuit board with RAID controller cache memory chips on it that mounts directly to the base controller through the Memory Board Connector J5B1 and is secured by one screw. It provides a 20-pin connector for remote Super Cap 2 module installation support.

Figure 5. Hardware Block Diagram
Major Components

LSI* SAS2208 ROC

The LSI* SAS2208 dual-core RAID-On-Chip (ROC) is an integrated SAS and I/O controller operating at 800 MHz. For more information, see http://wwwlsi.com/. The LSI* SAS2208 dual-core ROC provides the following functions:

- SAS 6.0 Gbps serial transfer rate
- Spread Spectrum Clocking (SSC)
- SAS/SMP/STP/SATA support
- Supports SAS and SATA devices
- Initiator and Target mode (SSP)
- Wide port support
- T10 End-to-End Data Protection (EEDP)
- Local 72-bit DDR2 SDRAM interface with ECC checking
- Fusion MPT message unit
- PCI Express* interface supports x8, x4, and x1 lane configurations

Flash ROM

An 16-MB CFI-compliant flash ROM is used to accommodate RAID firmware and RAID BIOS Console 2 OpROM.

Boot Strap ROM (SEEPROM)

The serial bootstrap ROM is used to configure the LSI* SAS2208 ROC before the server board configures the PCI Express* registers. The bootstrap ROM sets the Phase Lock Loop (PLL) dividers, bootstrap configuration, and so on.

NVSRAM

A 128-KB NVSRAM is used to store disk and drive setup information.

SDRAM (Cache)

The Intel® RAID Controller RS25SB008 has a 1GB memory board connected to it at factory, which integrated DDR3 1333 MHz ECC SDRAM memory. This DIMM is connected directly to the memory controller interface bus of the ROC and serves as storage for the executable code transferred from the flash. It also serves as cache during
RAID transactions. Cache mode selection takes immediate effect while the server is online and is available on a per virtual drive basis. The ROC memory controller provides single-bit ECC error correction with multi-bit detection support.

The Intel® RAID Controller RS25SB008 supports Super Cap 2 module.

Super Cap 2 backup unit is an industrial new technology to dramatically enlarge the life time of the backup unit. There is no need to replace the backup unit with a new one every year. (While traditional battery backup unit is required to be replaced after used for one year, or when 500 learn cycles are reached.) In the Intel® RAID Controller RS25SB080 packaging kit, there is also a mounting bracket for holding the Super Cap 2 backup unit. See below figure for reference only. Actual shape of the product may vary from the figure.

![Image of Super Cap 2 Backup Unit with Bracket](AF004848)

*Figure 6. Super Cap 2 Backup Unit with Bracket*

*Note: Intel Corporation strongly recommends using an uninterruptible power supply (UPS).*

**Diagnostic Components**

**Audible Alarm**

The audible alarm beeps when a drive fails and also during a rebuild. The drive failure alarm beeps are:

- Degraded array: Short tone, one second on, one second off.
- Failed array: Long tone, three seconds on, one second off.
- Hot spare commissioned: Short tone, one second on, three seconds off.
The drive failure tones repeat until the problem is corrected, or until the alarm is silenced or disabled. The alarm can be silenced or disabled on the controller’s properties page in the BIOS Console or by using the failed drive options pane in the Intel® RAID Web Console 2.

Silencing the alarm is temporary. If the cause of failure still exists or if an additional failure is detected, then the alarm sounds again when the system is rebooted. Disabling the alarm is persistent across errors and reboots. When the alarm is disabled, a failure does not cause it to sound until it is re-enabled.

The rebuild alarm tone functions differently. It remains ON during the rebuild. After the rebuild completes, an alarm with a different tone sounds to signal that the rebuild is complete. This is a one-time, non-repeating tone.

**LED Placement and Function**

The Intel® RAID Controller RS25SB008 contains the following LEDs:

- One surface-mounted heartbeat LED (Green Color) to indicate SAS2208 activity.
- Another surface-mounted system error LED (Amber Color) to indicate a board error.

**SAS/SATA Connectors**

The Intel® Integrated RAID controller RS25SB008 provides two external SFF-8088 SAS/SATA signal connectors. Each SFF-8088 connector provides support for four SAS/SATA ports. The sideband signals are configured to adhere to the SFF-8485 Specifications for SGPIO support.

![Figure 7. Intel® RAID Controller RS25SB008 SAS/SATA Connectors](image)

**SAS/SATA Connector Pin-out**

Signal names are with respect to the host; the device connected to the host reverses the signal names. Transmit pins connect to receive pins on the other device. The SAS/SATA connector is keyed at pin 1. These pin-outs for the serial ATA connector are not compatible with the legacy PATA connector.

PCI Interface

The Intel® RAID Controller RS25SB008 must be installed into a standard x8 or larger PCI Express* slot that complies with the PCI Express Specification, Revision 3.0. The controller is backward-compatible with PCI Express* 1.0/2.0 and with x8 or larger slots that are wired with x1, x2, and x4 PCI Express* lanes.

LED Headers

There are 3 2-pin right angled headers present on the board and these headers are used for connection to external LED which indicate activity on any of the connected HDDs, indicate fault on any of the connected HDDs and to indicate a pending write command.

Electrical Characteristics

All power is supplied to the adapter via the PCI Express 3.3V and 12V rail. Necessary Voltages are provided by onboard switching regulator circuitry operating off of 12V and 3.3V rails.

The following states determine the typical current consumption of the board:

- State 1. During a hard reset
- State 2. During a disk stress test
- State 3. While sitting idle at the DOS prompt.
  - Supply voltage = 12V +/- 8% (from PCI edge connector only)
  - Supply voltage = 3.3V +/- 9% (from PCI edge connector only)
  - Actual power consumption.

Thermal and Atmospheric Characteristics

The maximum board temperature is limited by the LSI SAS2208 ROC Processor since it uses the most power and will be the hottest component on the board.

- SAS2208 maximum junction temperature: 115°C
- Ambient temperature: maximum 60°C (without Super Cap 2 module)
- Maximum 45°C (with Super Cap 2 module)
- Airflow over SAS2208: 200 ft/min
- Environmental humidity: 20% to 80% non-condensing
- MTBF: greater than 300,000 hours

Safety Characteristics

The bare PC board shall meet or exceed the requirements of UL flammability rating V0. The bare PC board shall also be marked with the supplier's name or trademark, type, and UL flammability rating. The maximum electrical potential on the board will be 12.96V potential difference, referenced from ground to +12V.

Operating Certifications

The RAID controller in this document is qualified to get Microsoft Windows® Winqual certification (WHQL) at product launch.

Supported Device Technology

The various device technologies supported by the Intel® RAID Controller RS25SB008 is described in the subsections that follow.

Support for Hard Disk Drive Devices

The Intel® RAID Controller RS25SB008 integrates eight external high-performance SAS/SATA III ports that support SAS and enterprise-class SATA hard drives. Each port supports both SAS and SATA devices using the SAS Serial SCSI Protocol (SSP), Serial Management Protocol (SMP), and Serial Tunneling Protocol (STP). The SSP protocol enables communication with other SAS devices. STP allows the SAS RAID controller to communicate with SATA devices using the SATA commands.
SAS Expander Support

The Intel®, RAID Controller RS25SB008 supports LSI® expanders, Vitesse SAS expanders, and PMC expanders that are used as a component in Intel and 3rd party enclosures. Other expanders may be supported post launch, based on market conditions and customer requirements.

Support for Non-Hard Disk Drive Devices

Selected non-hard drive devices are supported for use with this controller. For information on support for non-hard drive devices, see this RAID controller’s Tested Hardware and Operating System List.

Enclosure Management Support

The Intel®, RAID Controller RS25SB008 supports SES2 enclosure management in-band to expander-based backplanes.

RAID Functionality and Features

Hierarchy

The fundamental purpose of a RAID system is to present a usable data storage medium (virtual drive) with some level of redundancy to a host operating system. The Intel® RAID firmware is based on the concept of associating physical drives in arrays and then creating a virtual drive from that array that includes a functional RAID level. To create a virtual drive and present it to the host operating system, the RAID firmware typically follows these steps:

1. One or more physical drives are selected and associated as an array.
2. One or more arrays are associated and given a RAID level. This process creates a virtual drive and provides an option to initialize the virtual drive.
3. The RAID firmware presents the virtual drive to the operating system.

RAID Physical Drive Status

<table>
<thead>
<tr>
<th>Drive State</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unconfigured Good</td>
<td>Unconfigured Good</td>
<td>The drive is functioning normally, but is not part of a configured virtual drive and is not a hot spare.</td>
</tr>
<tr>
<td>Online</td>
<td>ONLN</td>
<td>The drive is online, is part of a configured virtual drive, and is functioning normally.</td>
</tr>
</tbody>
</table>
RAID Virtual Drive Status

<table>
<thead>
<tr>
<th>Drive State</th>

<tr>
<td>Missing</td>
<td>Missing</td>
<td>A physical drive that was online, but which has been removed from its location.</td>
</tr>
<tr>
<td>Offline</td>
<td>Offline</td>
<td>A physical drive that is part of a virtual drive but which has invalid data as far as the RAID configuration is concerned.</td>
</tr>
<tr>
<td>None</td>
<td>None</td>
<td>A physical drive with an unsupported flag set. An Unconfigured Good or Offline physical drive that has completed the ‘prepare for removal’ operation.</td>
</tr>
</tbody>
</table>

**RAID Virtual Drive Status**

**Table 12. RAID Virtual Drive Status**

<table>
<thead>
<tr>
<th>Drive State</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optimal</td>
<td>Optimal</td>
<td>The drive operating system is good. All configured drives are online.</td>
</tr>
<tr>
<td>Degraded</td>
<td>Degraded</td>
<td>The drive operating condition is not optimal because one of the configured drives has failed or is offline.</td>
</tr>
<tr>
<td>Offline</td>
<td>Offline</td>
<td>The drive is not available to the operating system and is unusable.</td>
</tr>
</tbody>
</table>

**RAID Controller Drive Limitations**

Only drives that comply with the SAS and SATA specification extensions are supported.

**SAS Bus and ID Mapping**

Devices on the SAS bus are persistently mapped based on a SAS address.
Appendix A: Drive Roaming and Drive Migration Install

Drive Roaming

Drive roaming occurs when the hard drives are changed to different ports on the same controller. When the drives are placed on different ports, the controller detects the RAID configuration from the configuration data on the drives.

**Note:** If you move a drive that is currently being rebuilt, the rebuild operation will restart, not resume.

To use drive roaming, follow these steps:

1. Turn off the power to the system, all drives, enclosures, and system components. Remove the power cord(s).
2. Remove the server cover. For instructions, see your server system documentation.
3. Move the drives to different positions on the backplane to change the targets. See your server documentation for instructions to install and remove drives.
4. Determine the target requirements.
5. Make sure the drives are inserted properly.
6. Install the server cover. For instructions, see your server system documentation.
7. Plug in and power on the system.

The controller detects the RAID configuration from the configuration data on the drives (COD).
Drive Migration

Drive migration moves a configured set of hard drives from one controller to another. The drives must remain on the same port and be reinstalled in the same order as in the original configuration. The controller to which you migrate the drives cannot have an existing configuration.

Note: Only complete configurations can be migrated; individual virtual disks cannot be migrated. Drive roaming and drive migration cannot be supported at the same time.

To migrate drives, follow these steps:

1. Clear the configuration on the system to which you migrate the drives.
   This prevents a configuration data mismatch between the hard drives and the NVRAM.
2. Turn off the power to the system, all drives, enclosures, and system components.
   Remove the power cord(s).
3. Remove the server cover. For instructions, see your server system documentation.
4. Disconnect the cables from the drives to be migrated.
5. Remove the hard drives from the first system and install them into the second system. For instructions to install and remove drives, see your server documentation.
6. Connect the data cables to the hard drives in the second system in the same order as they were connected in the first system. Make sure all the cables meet specifications.
7. Determine the drive target requirements.
8. Make sure all cables are properly attached and the RAID controller is properly installed.
9. Install the server cover. For instructions, see your server system documentation.
10. Plug in and power on the system.

When you start the system, the controller detects the RAID configuration from the configuration data on the drives.
Appendix B: Installation/Assembly

Safety Instructions

As you use your computer system, observe these safety guidelines:

- Do not operate your computer system with any cover(s) (such as computer covers, bezels, filler brackets, and front-panel inserts) removed.
- To help avoid damaging your computer, be sure the voltage selection switch on the power supply is set to match the alternating current (AC) power available at your location.
- To help avoid possible damage to the server board, wait five seconds after turning off the system before removing a component from the server board or disconnecting a peripheral device from the computer.
- To help prevent electric shock, plug the computer and peripheral power cables into properly grounded power sources. These cables are equipped with 3-prong plugs to ensure proper grounding. Do not use adapter plugs or remove the grounding prong from a cable. If you must use an extension cable, use a 3-wire cable with properly grounded plugs.
- To help protect your computer system from sudden, transient increases and decreases in electrical power, use a surge suppressor, line conditioner, or uninterruptible power supply.
- Be sure nothing rests on your computer system's cables and that the cables are not located where they can be stepped on or tripped over.
- Do not spill food or liquids on your computer. If the computer gets wet, consult the documentation that came with it.
- Do not push any objects into the openings of your computer. Doing so can cause fire or electric shock by shorting out interior components.
- Keep your computer away from radiators and heat sources. Also, do not block cooling vents. Avoid placing loose papers underneath your computer; do not place your computer in a closed-in wall unit or on a rug.

When working inside your computer:

- Do not attempt to service the computer system yourself, except as explained in this guide and elsewhere in Intel documentation. Always follow installation and service instructions closely.
- Turn off your computer and any peripherals.
- Disconnect your computer and peripherals from their power sources. Also disconnect any telephone or telecommunications lines from the computer.

Doing so reduces the potential for personal injury or shock.
Additional safety guidelines:

- When you disconnect a cable, pull on its connector or on its strain-relief loop, not on the cable itself. Some cables have a connector with locking tabs; if you are disconnecting this type of cable, press in on the locking tabs before disconnect the cable. As you pull connectors apart, keep them evenly aligned to avoid bending any connector pins. Also, before you connect a cable, make sure both connectors are correctly oriented and aligned.

- Handle components and cards with care. Do not touch the components or contacts on a card. Hold a card by its edges or by its metal mounting bracket. Hold a component such as a microprocessor chip by its edges, not by its pins.

Protecting against electrostatic discharge

- Static electricity can harm delicate components inside your computer. To prevent static damage, discharge static electricity from your body before you touch any of your computer's electronic components, such as the microprocessor. You can do so by touching an unpainted metal surface, such as the metal around the card-slot openings at the back of the computer.

- As you continue to work inside the computer, periodically touch an unpainted metal surface to remove any static charge your body may have accumulated. In addition to the preceding precautions, you can also take the following steps to prevent damage from electrostatic discharge (ESD).

- When unpacking a static-sensitive component from its shipping carton, do not remove the component from the antistatic packing material until you are ready to install the component in your computer. Just before unwrapping the antistatic packaging, be sure to discharge static electricity from your body.

- When transporting a sensitive component, first place it in an antistatic container or packaging.

- Handle all sensitive components in a static-safe area. If possible, use antistatic floor pads and workbench pads.
English

Read all caution and safety statements in this document before performing any of the instructions. See also Intel® Server Boards and Server Chassis Safety Information on the Resource CD and/or at http://www.intel.com/support/motherboards/server/sb/cs-010770.htm.

<table>
<thead>
<tr>
<th>The power button on the system does not turn off system AC power. To remove AC power from the system, you must unplug each AC power cord from the wall outlet or power supply. The power cord(s) is considered the disconnect device to the main (AC) power. The socket outlet that the system plugs into shall be installed near the equipment and shall be easily accessible.</th>
</tr>
</thead>
</table>

**SAFETY STEPS:** Whenever you remove the chassis covers to access the inside of the system, follow these steps:

1. Turn off all peripheral devices connected to the system.
2. Turn off the system by pressing the power button.
3. Unplug all AC power cords from the system or from wall outlets.
4. Label and disconnect all cables connected to I/O connectors or ports on the back of the system.
5. Provide some electrostatic discharge (ESD) protection by wearing an antistatic wrist strap attached to chassis ground of the system-any unpainted metal surface-when handling components.
6. Do not operate the system with the chassis covers removed.

<table>
<thead>
<tr>
<th>After you have completed the six SAFETY steps above, you can remove the system covers. To do this:</th>
</tr>
</thead>
</table>

1. Unlock and remove the padlock from the back of the system if a padlock has been installed.
2. Remove and save all screws from the covers.
3. Remove the cover(s).

<table>
<thead>
<tr>
<th>For proper cooling and airflow, always reinstall the chassis covers before turning on the system. Operating the system without the covers in place can damage system parts. To install the covers:</th>
</tr>
</thead>
</table>

1. Check first to make sure you have not left loose tools or parts inside the system.
2. Check that cables, add-in cards, and other components are properly installed.
3. Attach the covers to the chassis with the screws removed earlier, and tighten them firmly.
4. Insert and lock the padlock to the system to prevent unauthorized access inside the system.
5. Connect all external cables and the AC power cord(s) to the system.
A microprocessor and heat sink may be hot if the system has been running. Also, there may be sharp pins and edges on some board and chassis parts. Contact should be made with care. Consider wearing protective gloves.

<table>
<thead>
<tr>
<th>Deutsch</th>
</tr>
</thead>
</table>

Die Stromkabel sind das "Unterbrechungsgerät" zur Hauptstromquelle. Die Steckdose, in die das System gesteckt wird, sollte sich in der Nähe des Gerätes befinden und leicht zugänglich sein.

**SICHERHEITSMASSNAHMEN:** Immer wenn Sie die Gehäuseabdeckung abnehmen um an das Systeminnere zu gelangen, sollten Sie folgende Schritte beachten:

1. Schalten Sie alle an Ihr System angeschlossenen Peripheriegeräte aus.
2. Schalten Sie das System mit dem Hauptschalter aus.
5. Tragen Sie ein geerdetes Antistatik Gelenkband, um elektrostatische Ladungen (ESD) über blanke Metallstellen bei der Handhabung der Komponenten zu vermeiden.
Français

Notez que le commutateur CC de mise sous tension /hors tension du panneau avant n'éteint pas l'alimentation CA du système. Pour mettre le système hors tension, vous devez débrancher chaque câble d'alimentation de sa prise.

C'est le câble d'alimentation qui est considéré comme le moyen de se déconnecter du CA. La prise à laquelle le système est branché doit se situer à proximité de l'équipement et être facilement accessible.

CONSIGNES DE SÉCURITÉ -Lorsque vous ouvrez le boîtier pour accéder à l'intérieur du système, suivez les consignes suivantes:

1. Mettez hors tension tous les périphériques connectés au système.
2. Mettez le système hors tension en mettant l'interrupteur général en position OFF (bouton-poussoir).
3. Débranchez tous les cordons d'alimentation c.a. du système et des prises murales.
4. Identifiez et débranchez tous les câbles reliés aux connecteurs d'E-S ou aux accès derrière le système.
5. Pour prévenir les décharges électrostatiques lorsque vous touchez aux composants, portez une bande antistatique pour poignet et reliez-la à la masse du système (toute surface métallique non peinte du boîtier).
6. Ne faites pas fonctionner le système tandis que le boîtier est ouvert.

Une fois TOUTES les étapes précédentes accomplies, vous pouvez retirer les panneaux du système. Procédez comme suit:

1. Si un cadenas a été installé sur à l'arrière du système, déverrouillez-le et retirez-le.
2. Retirez toutes les vis des panneaux et mettez-les dans un endroit sûr.
3. Retirez les panneaux.

Afin de permettre le refroidissement et l'aération du système, réinstallez toujours les panneaux du boîtier avant de mettre le système sous tension. Le fonctionnement du système en l'absence des panneaux risque d'endommager ses pièces. Pour installer les panneaux, procédez comme suit:

1. Assurez-vous de ne pas avoir oublié d'outils ou de pièces démontées dans le système.
2. Assurez-vous que les câbles, les cartes d'extension et les autres composants sont bien installés.
3. Revissez solidement les panneaux du boîtier avec les vis retirées plus tôt.
4. Remettez le cadenas en place et verrouillez-le afin de prévenir tout accès non autorisé à l'intérieur du système.
5. Rebranchez tous les cordons d'alimentation c. a. et câbles externes au système.
Le microprocesseur et le dissipateur de chaleur peuvent être chauds si le système a été sous tension. Faites également attention aux broches aiguës des cartes et aux bords tranchants du capot. Nous vous recommandons l’usage de gants de protection.

### Español

<table>
<thead>
<tr>
<th>INSTRUCCIONES DE SEGURIDAD: Cuando extraiga la tapa del chasis para acceder al interior del sistema, siga las siguientes instrucciones:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Apague todos los dispositivos periféricos conectados al sistema.</td>
</tr>
<tr>
<td>2. Apague el sistema presionando el interruptor encendido/apagado.</td>
</tr>
<tr>
<td>3. Desconecte todos los cables de alimentación CA del sistema o de las tomas de corriente alterna.</td>
</tr>
<tr>
<td>4. Identifique y desconecte todos los cables enchufados a los conectores E/S o a los puertos situados en la parte posterior del sistema.</td>
</tr>
<tr>
<td>5. Cuando manipule los componentes, es importante protegerse contra la descarga electrostática (ESD). Puede hacerlo si utiliza una muñequera antiestática sujetada a la toma de tierra del chasis - o a cualquier tipo de superficie de metal sin pintar.</td>
</tr>
<tr>
<td>6. No ponga en marcha el sistema si se han extraído las tapas del chasis.</td>
</tr>
</tbody>
</table>

Después de completar las seis instrucciones de SEGURIDAD mencionadas, ya puede extraer las tapas del sistema. Para ello:

1. Desbloquee y extraiga el bloqueo de seguridad de la parte posterior del sistema, si se ha instalado uno. |
2. Extraiga y guarde todos los tornillos de las tapas. Extraiga las tapas.
Para obtener un enfriamiento y un flujo de aire adecuados, reinstale siempre las tapas del chasis antes de poner en marcha el sistema. Si pone en funcionamiento el sistema sin las tapas bien colocadas puede dañar los componentes del sistema. Para instalar las tapas:

1. Asegúrese primero de no haber dejado herramientas o componentes sueltos dentro del sistema.
2. Compruebe que los cables, las placas adicionales y otros componentes se hayan instalado correctamente.
3. Incorpore las tapas al chasis mediante los tornillos extraídos anteriormente, tensándolos firmemente.
4. Inserte el bloqueo de seguridad en el sistema y bloquéelo para impedir que pueda accederse al mismo sin autorización.
5. Conecte todos los cables externos y los cables de alimentación CA al sistema.

Si el sistema ha estado en funcionamiento, el microprocesador y el disipador de calor pueden estar aún calientes. También conviene tener en cuenta que en el chasis o en el tablero puede haber piezas cortantes o punzantes. Por ello, se recomienda precaución y el uso de guantes protectores.

Italiano

L'interruttore attivato/disattivato nel pannello anteriore non interrompe l'alimentazione in c.a. del sistema. Per interromperla, è necessario scollegare tutti i cavi di alimentazione in c.a. dalle prese a muro o dall'alimentazione di corrente.

Il cavo è considerato il dispositivo d'interruzione dell'alimentazione principale (in c.a.). La presa alla quale si collega il sistema deve essere installata vicino all'unità e deve essere facilmente accessibile.
PASSI DI SICUREZZA: Qualora si rimuovano le coperture del telaio per accedere all'interno del sistema, seguire i seguenti passi:

1. Spegnere tutti i dispositivi periferici collegati al sistema.
2. Spegnere il sistema, usando il pulsante spento/acceso dell'interruttore del sistema.
3. Togliere tutte le spine dei cavi del sistema dalle prese elettriche.
4. Identificare e scollegare tutti i cavi attaccati ai collegamenti I/O od alle prese installate sul retro del sistema.
5. Qualora si tocchino i componenti, proteggersi dallo scarico elettrostatico (SES), portando un cinghia anti-statica da polso che è attaccata alla presa a terra del telaio del sistema - qualsiasi superficie non dipinta - .
6. Non far operare il sistema quando il telaio è senza le coperture.

Dopo aver seguito i sei passi di SICUREZZA sopracitati, togliere le coperture del telaio del sistema come segue:

1. Aprire e rimuovere il lucchetto dal retro del sistema qualora ve ne fosse uno installato.
2. Togliere e mettere in un posto sicuro tutte le viti delle coperture.
3. Togliere le coperture.

Per il giusto flusso dell'aria e raffreddamento del sistema, rimettere sempre le coperture del telaio prima di riaccendere il sistema. Operare il sistema senza le coperture al loro proprio posto potrebbe danneggiare i componenti del sistema. Per rimettere le coperture del telaio:

1. Controllare prima che non si siano lasciati degli attrezzi o dei componenti dentro il sistema.
2. Controllare che i cavi, dei supporti aggiuntivi ed altri componenti siano stati installati appropriatamente.
3. Attaccare le coperture al telaio con le viti tolte in precedenza e avitarle strettamente.
4. Inserire e chiudere a chiave il lucchetto sul retro del sistema per impedire l'accesso non autorizzato al sistema.
5. Ricollegare tutti i cavi esterni e le prolunghe AC del sistema.

Se il sistema è stato a lungo in funzione, il microprocessore e il dissipatore di calore potrebbero essere serraraldati. Fare attenzione alla presenza di piedini appuntiti e parti taglienti sulle schede e sul telaio. È consigliabile l'uso di guanti di protezione.
Appendix C: Regulatory and Certification Information

Product Safety and EMC Compliance

This Intel® RAID Controller has been evaluated for regulatory compliance as an Intel end system, and is included as part of the end system certification. For information on end system certification, refer to the product regulatory certification for the end system level product.
