<table>
<thead>
<tr>
<th>Date</th>
<th>Revision</th>
<th>Description</th>
</tr>
</thead>
</table>
| October 2019 | 15.0     | Document has been updated with the following:  
• Globally removed SHMEM; it is no longer supported.  
• Globally removed references to RHEL* 7.5; it is no longer supported.  
• Updated Preface to include new Best Practices.  
• Combined sections, Setting Up Primarily Independent Subnets and Setting Up Overlapping Subnets, into Setting Up Subnets and included new optional step for multi-rails.  
• Updated information for Setting Up Dual Rails for a Single Subnet and Configuring Dual Rails for Dual Subnets. |
| June 2019   | 14.0     | Document has been updated with the following:  
• Added new section About User Queries Settings.  
• Updated Repositories Included in the IFS Package to change OPA_COMMON to OPA_PKGS and OPA_CUDA to OPA_PKGS_CUDA.  
• Updated Repository Deployment into the Environment to change OPA_COMMON to OPA_PKGS and OPA_CUDA to OPA_PKGS_CUDA and updated Services Node example. |
| March 2019  | 13.0     | Document has been updated with the following:  
• Updated section Install Using Linux* Distribution Software Packages Provided by Intel to provide simplified installation instructions using new opacreaterepo helper script. |
| February 2019 | 12.0    | Document has been updated with the following:  
• Updated Using the INSTALL Command Line Options to remove \(-r\) and \(--prefix\) options. |
| December 2018 | 11.0     | Document has been updated with the following:  
• Global change: For all applicable opafastfabric TUI menus, added \(Q\) (quit) as an additional method to Exit or Return to Previous Menu  
• Removed OS Distribution RPMs from OS RPMs Installation Prerequisites and moved into Intel® Omni-Path Fabric Software Release Notes  
• Updated Install the Intel Omni-Path Software to include new Linux* Distribution Software packages for installation.  
• Updated Using the INSTALL Command Line Options ./INSTALL \(-G\) for GPUDirect-supported OSes and additional non-root user set up for \(--user_queries\).  
• Added new section Install Using Linux* Distribution Software Packages Provided by Intel with RHEL* and SLES* instructions.  
• Renamed section Install Using the Linux* Distribution Software Packages Provided by the OS Vendor.  
• Updated Setting Up PXE Boot for Supported Operating Systems to be more generic by removing specific RHEL and SLES versions for subsections.  
• Updated JRE 1.8 information in Install the Fabric Manager GUI Software on Windows* and Install the Fabric Manager GUI Software on Linux*. |

<th>Description</th>
</tr>
</thead>
</table>
| October 2018 | 10.1     | • Updated Before You Begin and Install the Host Software on the Remaining Hosts Using the FastFabric TUI Menus in Install Host Software on Remaining Servers to include the RHEL 7.x need for pigz compression tool.  
• Added Intel OPA Software Components to Packages Mapping to appendix.                                                                                                                                  |
| September 2018 | 10.0     | Document has been updated with the following:  
• Global change: Removed Verbs only builds for Open MPI and MVAPICH2 (gcc) and builds built with Intel compiler for Open MPI and MVAPICH2. Removed RHEL* 7.3. Added RHEL* 7.5 and SLES* 15.  
• Updated Intel Omni-Path Architecture Overview.  
• Updated OS RPMs Installation Prerequisites to include mci-selector in SLES rpm. Removed unused rpm (related to libelf). Added new RHEL* 7.5 and SLES* 15 RPM tables.  
• Updated Download and Install NVIDIA* Software (Optional).  
• Updated Using the INSTALL Command Line Options  
• Updated Install the Fabric Manager GUI Software on Windows* and Install the Fabric Manager GUI Software on Linux* to include Prerequisites to installation.  
• Updated System Requirements for a Windows* Environment and System Requirements for a Linux* Environment - Support for JRE 1.8  
• Updated Before You Begin and Upgrade the OPA-IFS Software section to include stopping/stating the FM.  
• Added subsections for Starting the Fabric Manager and Stopping the Fabric Manager.                                                                                                                  |
| May 2018     | 9.1      | Document has been updated for OS RPMs Installation Prerequisites: Added papi to RHEL* RPM Matrix. Added RHEL*- and SLES*-specific notes for "additional, required development packages" to respective sections.                                                                                                                  |
| April 2018   | 9.0      | Document has been updated with the following:  
• Removed all instances of GASNET and OpenSHMEM (hfi, gcc) throughout document  
• Removed references to opaxlattopology_cust throughout document  
• Moved Software Installation Checklists to the Appendices  
• Updated Document Organization  
• Updated OS RPMs Installation Prerequisites  
• Updated MPI Compiler Prerequisites  
• Updated Download the Intel Omni-Path Software  
• Updated Using the INSTALL Command Line Options  
• Updated SLES* Distribution Software  
• Added new Chapter Install and Upgrade Standalone Firmware  
• Moved UEFI Secure Boot Support to Part 1, Installing the Software  
• Updated and moved Setting Up PXE Boot for Supported Operating Systems to Part 1, Installing the Software  
• Moved Install Intel® Omni-Path Fabric Suite Fabric Manager GUI to Part 1, Installing the Software  
• Updated Download the Fabric Manager Software  
• Updated Prepare Fabric Manager for Fabric Manager GUI  
• Added new section QSFP-DD Cables  
• Updated table in Setting Up Overlapping Subnets  
• Added subsections for Starting the Fabric Manager and Stopping the Fabric Manager.  
• Updated System Requirements for a Windows* Environment and System Requirements for a Linux* Environment - Support for JRE 1.8  
• Updated Before You Begin and Upgrade the OPA-IFS Software section to include stopping/stating the FM.  
• Added subsections for Starting the Fabric Manager and Stopping the Fabric Manager.  
• Updated Document Organization  
• Updated OS RPMs Installation Prerequisites  
• Updated MPI Compiler Prerequisites  
• Updated Download the Intel Omni-Path Software  
• Updated Using the INSTALL Command Line Options  
• Updated SLES* Distribution Software  
• Added new Chapter Install and Upgrade Standalone Firmware  
• Moved UEFI Secure Boot Support to Part 1, Installing the Software  
• Updated and moved Setting Up PXE Boot for Supported Operating Systems to Part 1, Installing the Software  
• Moved Install Intel® Omni-Path Fabric Suite Fabric Manager GUI to Part 1, Installing the Software  
• Updated Download the Fabric Manager Software  
• Updated Prepare Fabric Manager for Fabric Manager GUI  
• Added new section QSFP-DD Cables  
• Updated table in Setting Up Overlapping Subnets

<tr>
<td>February 2018</td>
<td>8.2</td>
<td>Document has been updated with the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Made corrections in section OS RPMs Installation Prerequisites: was libjson-c, should be libjson-c2.</td>
</tr>
<tr>
<td>November 2017</td>
<td>8.1</td>
<td>Document has been updated with the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Updated OS RPMs Installation Prerequisites</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Updated Setting Up PXE Boot for Supported Operating Systems</td>
</tr>
<tr>
<td>October 2017</td>
<td>8.0</td>
<td>Document has been updated with the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Updated and added information to the Fabric Design Prerequisites section</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added &quot;Sandia-OpenSHMEM (hfi, gcc)&quot; to the OPA-Basic Package section</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Updated OS RPMs Installation Prerequisites to add RHEL* 7.4, SLES* 12.3 and an example of a install command</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added sandiahmem to the &quot;Supported Component (comp) Names&quot; list in Using the INSTALL Command Line Options section</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Updated Upgrade Prerequisites to include link to OS RPMs Installation Prerequisites</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Removed HFI UEFI PXE Installation and Configuration</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added new Appendix, Setting Up PXE Boot for Supported Operating Systems</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Moved Upgrade the HRI UEFI Firmware under Setting Up PXE Boot for Supported Operating Systems and updated the section</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The Intel® Omni-Path Fabric Suite FastFabricCommand Line Interface Reference Guide has been merged into the Intel® Omni-Path Fabric Host Software User Guide and the Intel® Omni-Path Fabric Suite FastFabric User Guide. In this document, all references have been updated appropriately. See the Intel® Omni-Path Documentation Library for details.</td>
</tr>
<tr>
<td>August 2017</td>
<td>7.0</td>

</table>
| Dec 2016  | 5.0      | • Deprecated `opaxlattopology_cust` in Fabric Setup Prerequisites.
|           |          | • Added new section Update the Fabric Manager `opafm` Configuration File.
|           |          | • Added new section Thermal Monitoring Module Verification.
|           |          | • Updated Installation Checklist to include configuration and verification pointers. |
| Aug 2016  | 4.0      | Document has been updated with the following:
|           |          | • Removed all information pertaining to RHEL* 7.1 |
|           |          | • Updated Prepare Fabric Manager for Fabric Manager GUI |
|           |          | • Added new section Multi-Rail Usage to Chapter Additional Installation and Setup Tasks |
|           |          | • Moved Appendix "Multi-Subnet Fabrics" under new Chapter Additional Installation and Setup Tasks |
|           |          | • Updated HFI UEFI PXE Installation and Configuration section |
| May 2016  | 3.0      | Document has been updated with the following:
|           |          | • Added information on UEFI firmware Prerequisites |
|           |          | • Updated Install TUI menus |
|           |          | • Updated `./INSTALL` command information to include `--user-space` |
|           |          | • Updated Fabric Manager GUI Installation information |
|           |          | • Updated “HFI UEFI PXE Installation and Configuration” section |
|           |          | • Updated "hfidiags User Guide" section |
| February 2016 | 2.0    | Document has been updated with the following:
|           |          | • Updated OS RPMs Installation Prerequisites |
|           |          | • Added MPI Compiler Prerequisites |
|           |          | • Added information about minimum disk space requirement for the Fabric Manager GUI installation |
|           |          | • Replaced Client/Server Configuration to Boot Over Fabric section with “HFI UEFI PXE Installation and Configuration” |
| November 2015 | 1.0    | Initial Release |

Preface

This manual is part of the documentation set for the Intel® Omni-Path Fabric (Intel® OP Fabric), which is an end-to-end solution consisting of Intel® Omni-Path Host Fabric Interfaces (HFIs), Intel® Omni-Path switches, and fabric management and development tools.

The Intel® OP Fabric delivers the next generation, High-Performance Computing (HPC) network solution that is designed to cost-effectively meet the growth, density, and reliability requirements of large-scale HPC clusters.

Both the Intel® OP Fabric and standard InfiniBand* (IB) are able to send Internet Protocol (IP) traffic over the fabric, or IPoFabric. In this document, however, it may also be referred to as IP over IB or IPoIB. From a software point of view, IPoFabric behaves the same way as IPoIB, and in fact uses an ib_ipoib driver to send IP traffic over the ib0/ib1 ports.

Intended Audience

The intended audience for the Intel® Omni-Path (Intel® OP) document set is network administrators and other qualified personnel.

Intel® Omni-Path Documentation Library

Intel® Omni-Path publications are available at the following URLs:

- Intel® Omni-Path Switches Installation, User, and Reference Guides
  http://www.intel.com/omnipath/SwitchPublications
- Intel® Omni-Path Software Installation, User, and Reference Guides (includes HFI documents)
  http://www.intel.com/omnipath/FabricSoftwarePublications
- Drivers and Software (including Release Notes)
  http://www.intel.com/omnipath/Downloads

Use the tasks listed in this table to find the corresponding Intel® Omni-Path document.

<tr>
<td>Setting up an Intel® OPA cluster</td>
<td>Intel® Omni-Path Fabric Setup Guide</td>
<td>Provides a high level overview of the steps required to stage a customer-based installation of the Intel® Omni-Path Fabric. Procedures and key reference documents, such as Intel® Omni-Path user guides and installation guides, are provided to clarify the process. Additional commands and best known methods are defined to facilitate the installation process and troubleshooting.</td>
</tr>
<tr>
<td>Installing hardware</td>
<td>Intel® Omni-Path Fabric Switches Hardware Installation Guide</td>
<td>Describes the hardware installation and initial configuration tasks for the Intel® Omni-Path Switches 100 Series. This includes: Intel® Omni-Path Edge Switches 100 Series, 24 and 48-port configurable Edge switches, and Intel® Omni-Path Director Class Switches 100 Series.</td>
</tr>
<tr>
<td>Installing host software</td>
<td>Intel® Omni-Path Host Fabric Interface Installation Guide</td>
<td>Contains instructions for installing the HFI in an Intel® OPA cluster.</td>
</tr>
<tr>
<td>Installing HFI firmware</td>
<td>Intel® Omni-Path Fabric Software Installation Guide</td>
<td>Describes using a Text-based User Interface (TUI) to guide you through the installation process. You have the option of using command line interface (CLI) commands to perform the installation or install using the Linux* distribution software.</td>
</tr>
<tr>
<td>Managing a switch using Chassis Viewer GUI</td>
<td>Intel® Omni-Path Fabric Switches GUI User Guide</td>
<td>Describes the graphical user interface (GUI) of the Intel® Omni-Path Fabric Chassis Viewer GUI. This document provides task-oriented procedures for configuring and managing the Intel® Omni-Path Switch family. Help: GUI embedded help files</td>
</tr>
<tr>
<td>Managing a switch using the CLI</td>
<td>Intel® Omni-Path Fabric Switches Command Line Interface Reference Guide</td>
<td>Describes the command line interface (CLI) task information for the Intel® Omni-Path Switch family. Help: -help for each CLI</td>
</tr>
<tr>
<td>Managing a fabric using FastFabric</td>
<td>Intel® Omni-Path Fabric Suite FastFabric User Guide</td>
<td>Provides instructions for using the set of fabric management tools designed to simplify and optimize common fabric management tasks. The management tools consist of Text-based User Interface (TUI) menus and command line interface (CLI) commands. Help: -help and man pages for each CLI. Also, all host CLI commands can be accessed as console help in the Fabric Manager GUI.</td>

**How to Search the Intel® Omni-Path Documentation Set**

Many PDF readers, such as Adobe* Reader and Foxit* Reader, allow you to search across multiple PDFs in a folder.

Follow these steps:

1. Download and unzip all the Intel® Omni-Path PDFs into a single folder.
2. Open your PDF reader and use **CTRL-SHIFT-F** to open the Advanced Search window.
3. Select **All PDF documents in...**
4. Select **Browse for Location** in the dropdown menu and navigate to the folder containing the PDFs.
5. Enter the string you are looking for and click **Search**.

Use advanced features to further refine your search criteria. Refer to your PDF reader Help for details.
Cluster Configurator for Intel® Omni-Path Fabric

This tool generates sample cluster configurations based on key cluster attributes, including a side-by-side comparison of up to four cluster configurations. The tool also generates parts lists and cluster diagrams.

Documentation Conventions

The following conventions are standard for Intel® Omni-Path documentation:

• **Note:** provides additional information.
• **Caution:** indicates the presence of a hazard that has the potential of causing damage to data or equipment.
• **Warning:** indicates the presence of a hazard that has the potential of causing personal injury.
• Text in blue font indicates a hyperlink (jump) to a figure, table, or section in this guide. Links to websites are also shown in blue. For example:
  See License Agreements on page 17 for more information.
  For more information, visit www.intel.com.
• Text in **bold** font indicates user interface elements such as menu items, buttons, check boxes, key names, key strokes, or column headings. For example:
  Click the **Start** button, point to **Programs**, point to **Accessories**, and then click **Command Prompt**.
  Press **CTRL+P** and then press the **UP ARROW** key.
• Text in **Courier** font indicates a file name, directory path, or command line text. For example:
  Enter the following command: sh ./install.bin
• Text in **italics** indicates terms, emphasis, variables, or document titles. For example:
  Refer to *Intel® Omni-Path Fabric Software Installation Guide* for details.
  In this document, the term **chassis** refers to a managed switch.

Procedures and information may be marked with one of the following qualifications:

• **(Linux)** – Tasks are only applicable when Linux* is being used.
• **(Host)** – Tasks are only applicable when Intel® Omni-Path Fabric Host Software or Intel® Omni-Path Fabric Suite is being used on the hosts.
• **(Switch)** – Tasks are applicable only when Intel® Omni-Path Switches or Chassis are being used.
• Tasks that are generally applicable to all environments are not marked.
Best Practices

- Intel recommends that users update to the latest versions of Intel® Omni-Path firmware and software to obtain the most recent functional and security updates.
- To improve security, the administrator should log out users and disable multi-user logins prior to performing provisioning and similar tasks.

Laser Safety Information

This product may use Class 1 laser optical transceivers to communicate over the fiber optic conductors. The U.S. Department of Health and Human Services (DHHS) does not consider Class 1 lasers to be hazardous. The International Electrotechnical Commission (IEC) 825 Laser Safety Standard requires labeling in English, German, Finnish, and French stating that the product uses Class 1 lasers. Because it is impractical to label the transceivers, the following label is provided in this manual.

![Laser Safety Information Label]

Electrostatic Discharge Sensitivity (ESDS) Precautions

The assemblies used in the switch chassis are ESD sensitive. Observe ESD handling procedures when handling any assembly used in the switch chassis.

License Agreements

This software is provided under one or more license agreements. Please refer to the license agreement(s) provided with the software for specific detail. Do not install or use the software until you have carefully read and agree to the terms and conditions of the license agreement(s). By loading or using the software, you agree to the terms of the license agreement(s). If you do not wish to so agree, do not install or use the software.
Technical Support

Technical support for Intel® Omni-Path products is available 24 hours a day, 365 days a year. Please contact Intel Customer Support or visit http://www.intel.com/omnipath/support for additional detail.
1.0 Introduction

This guide provides instructions for installing the Intel® Omni-Path Architecture (Intel® OPA) software and configuring the system for the first time. It also provides instructions for upgrading the software.

For details about the other documents for the Intel® Omni-Path product line, refer to Intel® Omni-Path Documentation Library in this document.

You install the software using one of the following methods:
- Guided installation using Text User Interface (TUI) menus (recommended)
- Command Line Interface (CLI) commands
- Linux* Distribution Software

NOTE
The default Intel® OPA configuration during installation is for a single-subnet fabric.

To set up other fabric configurations, please contact your Intel Support Personnel. For additional information, refer to Multi-Subnet Fabrics on page 133.

1.1 Document Organization

This manual is organized as follows:
- Introduction
- Overview

Part 1: Installing the Software
- Installation Getting Started
- Install Intel® Omni-Path Software
- Install and Upgrade Standalone Firmware
- Install Intel® Omni-Path Fabric Suite Fabric Manager GUI

Part 2: Configuring the Software
- Configuration Getting Started
- Configure the Chassis
- Configure the Externally Managed Switches
- Install Host Software on Remaining Servers
- Set Up Additional Management Nodes
- Perform Initial Health Check
- Perform High Performance Linpack Benchmark
Additional Installation and Setup Tasks
Installation Verification and Additional Settings

Part 3: Upgrading the Software
Upgrade Getting Started
Upgrading the Intel® Omni-Path Software

Appendices
Software Installation Checklists
Intel® OPA Software Components to Packages Mapping
2.0 Overview

This section provides an overview of the Intel® Omni-Path Architecture and software installation process.

2.1 Intel® Omni-Path Architecture Overview

The Intel® Omni-Path Architecture (Intel® OPA) interconnect fabric design enables a broad class of multiple node computational applications requiring scalable, tightly-coupled processing, memory, and storage resources. With open standard APIs developed by the OpenFabrics Alliance* (OFA) Open Fabrics Interface (OFI) workgroup, host fabric interfaces (HFIs) and switches in the Intel® OPA family systems are optimized to provide the low latency, high bandwidth, and high message rate needed by large scale High Performance Computing (HPC) applications.

Intel® OPA provides innovations for a multi-generation, scalable fabric, including link layer reliability, extended fabric addressing, and optimizations for many-core processors. Intel® OPA also focuses on HPC needs, including link level traffic flow optimization to minimize datacenter-wide jitter for high priority packets, robust partitioning support, quality of service support, and a centralized fabric management system.

The following figure shows a sample Intel® OPA-based fabric, consisting of different types of nodes and servers.
To enable the largest scale systems in both HPC and the datacenter, fabric reliability is enhanced by combining the link level retry typically found in HPC fabrics with the conventional end-to-end retry used in traditional networks. Layer 2 network addressing is extended for systems with over ten million endpoints, thereby enabling use on the largest scale datacenters for years to come.

To enable support for a breadth of topologies, Intel® OPA provides mechanisms for packets to change virtual lanes as they progress through the fabric. In addition, higher priority packets are able to preempt lower priority packets to provide more predictable system performance, especially when multiple applications are running simultaneously. Finally, fabric partitioning provides traffic isolation between jobs or between users.

The software ecosystem is built around OFA software and includes four key APIs.

1. The OFA OFI represents a long term direction for high performance user level and kernel level network APIs.
2. The Performance Scaled Messaging 2 (PSM2) API provides HPC-focused transports and an evolutionary software path from the Intel® True Scale Fabric.

3. OFA Verbs provides support for existing remote direct memory access (RDMA) applications and includes extensions to support Intel® OPA fabric management.

4. Sockets is supported via OFA IPoFabric (also called IPoIB) and rSockets interfaces. This permits many existing applications to immediately run on Intel® Omni-Path as well as provide TCP/IP features such as IP routing and network bonding.

Higher level communication libraries, such as the Message Passing Interface (MPI), and Partitioned Global Address Space (PGAS) libraries, are layered on top of these low level OFA APIs. This permits existing HPC applications to immediately take advantage of advanced Intel® Omni-Path features.

Intel® Omni-Path Architecture combines the Intel® Omni-Path Host Fabric Interfaces (HFIs), Intel® Omni-Path switches, and fabric management and development tools into an end-to-end solution. These building blocks are shown in the following figure.

**Figure 2. Intel® OPA Building Blocks**

2.1.1 **Host Fabric Interface**

Each host is connected to the fabric through a Host Fabric Interface (HFI) adapter. The HFI translates instructions between the host processor and the fabric. The HFI includes the logic necessary to implement the physical and link layers of the fabric architecture, so that a node can attach to a fabric and send and receive packets to other servers or devices. HFIs also include specialized logic for executing and accelerating upper layer protocols.

2.1.2 **Intel® OPA Switches**

Intel® OPA switches are OSI Layer 2 (link layer) devices, and act as packet forwarding mechanisms within a single Intel® OPA fabric. Intel® OPA switches are responsible for implementing Quality of Service (QoS) features, such as virtual lanes, congestion management, and adaptive routing. Switches are centrally managed by the Intel® Omni-Path Fabric Suite Fabric Manager software, and each switch includes a management agent to handle management transactions. Central management means...
that switch configurations are programmed by the FM software, including managing the forwarding tables to implement specific fabric topologies, configuring the QoS and security parameters, and providing alternate routes for adaptive routing. As such, all OPA switches must include management agents to communicate with the Intel® OPA Fabric Manager.

### 2.1.3 Intel® OPA Management

The Intel® OPA fabric supports redundant Fabric Managers that centrally manage every device (server and switch) in the fabric through management agents associated with those devices. The Primary Fabric Manager is an Intel® OPA fabric software component selected during the fabric initialization process.

The Primary Fabric Manager is responsible for:

1. Discovering the fabric's topology.
2. Setting up Fabric addressing and other necessary values needed for operating the fabric.
3. Creating and populating the Switch forwarding tables.
4. Maintaining the Fabric Management Database.

The Primary Fabric Manager sends management packets over the fabric. These packets are sent *in-band* over the same wires as regular Intel® Omni-Path packets using dedicated buffers on a specific virtual lane (VL15). End-to-end reliability protocols detect lost packets.

### 2.2 Intel® Omni-Path Software Overview

For software applications, Intel® OPA maintains consistency and compatibility with existing Intel® True Scale Fabric and InfiniBand* APIs through the open source OpenFabrics Alliance* (OFA) software stack on Linux* distribution releases.

**Software Components**

The key software components and their usage models are shown in the following figure and described in the following paragraphs.
Embedded Management Stack
- Runs on an embedded Intel processor included in managed Intel® OP Edge Switch 100 Series and Intel® Omni-Path Director Class Switch 100 Series switches (elements).
- Provides system management capabilities, including signal integrity, thermal monitoring, and voltage monitoring, among others.
- Accessed via Ethernet* port using command line interface (CLI) or graphical user interface (GUI).

User documents:
- Intel® Omni-Path Fabric Switches GUI User Guide
- Intel® Omni-Path Fabric Switches Command Line Interface Reference Guide

Host Software Stack
- Runs on all Intel® OPA-connected host nodes and supports compute, management, and I/O nodes.
- Provides a rich set of APIs including OFI, PSM2, sockets, and OFA verbs.
- Provides high performance, highly scalable MPI implementation via OFA, PSM2, and an extensive set of upper layer protocols.
- Includes Boot over Fabric mechanism for configuring a server to boot over Intel® Omni-Path using the Intel® OP HFI Unified Extensible Firmware Interface (UEFI) firmware.

User documents:
- Intel® Omni-Path Fabric Host Software User Guide

Software Component Descriptions
2.3 Installation Overview

The standard software installation process takes you through installing the Intel® Omni-Path Fabric (OPA-Basic) or Intel® Omni-Path Fabric Suite (OPA-IFS) software package, configuring the system, and verifying the system settings.

Intel recommends that you install the OPA-IFS software on the Management Node using the Install TUI, and then use FastFabric to configure the Management Node.

Once the Management Node has been configured, the Basic software can be installed on all the remaining hosts using either the FastFabric TUI or a provisioning or diskless boot mechanism.

NOTE
If you are using a provisioning system, consult the documentation that comes with the provisioning system.
2.4 **Installation Packages**

The following software installation packages are available for an Intel® Omni-Path Fabric.

2.4.1 **OPA-Basic Package**

The IntelOPABasic.DISTRO.VERSION.tgz installation package (where DISTRO.VERSION is the OS distribution and software version) installs the Intel® Omni-Path Fabric Host Software components needed to set up compute, I/O, and Service nodes with drivers, stacks, and basic tools for local configuration and monitoring.

The installation package includes the following components:

- Intel® Omni-Path Architecture (Intel® OPA) Stack (Deltas relative to the distribution of the OpenFabrics Alliance* (OFA) stack)
- IBACM (Deltas relative to the distribution of the OFA stack)
- Intel HFI Components
- Intel® OPA Tools
- Intel® OPA OFA Development
- IP over IB (Deltas relative to the distribution of the OFA stack)
- MVAPICH2 (hfi, gcc)
- Open MPI (hfi, gcc)
- MPI Source
- Pre-Boot components
- OFA Debug Info

**NOTE**

A separate Intel® Omni-Path Fabric Host Software installation package is available for each of the supported Linux* distributions. Refer to the release notes of the package version being installed for a list of supported Linux* distributions.

2.4.2 **OPA-IFS Package**

The IntelOPA-IFS.DISTRO.VERSION.tgz installation package (where DISTRO.VERSION is the OS distribution and software version) provides the Intel® Omni-Path Fabric Host Software package along with special features including the Intel® Omni-Path Fabric Suite FastFabric toolset and the Intel® Omni-Path Fabric Suite Fabric Manager.

The installation package includes the following components:

- OPA-Basic package
  For the list of components, refer to OPA-Basic Package.
- Intel® Omni-Path Fabric Suite FastFabric
  Refer to the *Intel® Omni-Path Fabric Suite FastFabric User Guide* for more details.
Intel® Omni-Path Fabric Suite Fabric Manager  
Refer to the Intel® Omni-Path Fabric Suite Fabric Manager User Guide for more details.

**NOTE**  
A separate IFS installation package is available for each of the supported Linux* distributions. Refer to the release notes of the version being installed for a list of supported Linux* distributions.

### 2.4.3 Fabric Manager GUI Packages

The following packages are used to install the Intel® Omni-Path Fabric Suite Fabric Manager GUI:

- **Linux* installation package:**
  
  IntelOPA-FMGUI-linux-x.x.x.x.noarch.rpm

- **Windows* installation package:**
  
  IntelOPA-FMGUI.windows-x.x.x.x.exe

The Intel® Omni-Path Fabric Suite Fabric Manager GUI provides a set of features for viewing and monitoring the fabric or multiple fabrics. The application is installed on a computer outside of the fabric.
Part 1: Installing the Software
3.0 Installation Getting Started

This section provides instructions and information for getting started with the Intel® Omni-Path Software installation.

3.1 Pre-Installation Requirements

This section provides the information and procedures needed prior to installing the fabric software. Typically, the Site Implementation Engineer performs the setup tasks described in this section to ensure that the fabric is ready for the software installation.

3.1.1 Fabric Design Prerequisites

Ensure that the following requirements are met prior to installing the software.

It is important that the design and installation of the hardware be planned carefully prior to the installation and setup of the fabric. The design plan must include the following information:

- Identification of servers that will function as the administration or Management Nodes, where the Intel® Omni-Path Fabric Suite (IFS) will be installed.
  - Server memory requirements based on the software being used:
    - IFS, including the Intel® Omni-Path Fabric Suite Fabric Manager, requires at least 2.5 GB of physical memory for each Fabric Manager instance.
      When managing a cluster of 10000 nodes or more, 5 GB of memory per Fabric Manager instance is required.
      For very large fabrics, with more than 16000 nodes, 15 GB of memory per Fabric Manager instance is required.
    - When running multiple Fabric Manager instances on a single management node, the physical memory requirements should be multiplied by the number of Fabric Manager instances.
  - Swap disk space allowance should follow recommendations for the given version of Linux*. Swap space should be twice the size of the physical memory on the server running the Fabric Manager. Minimum swap disk space should be at least 5 GB + 34 GB (for PM short-term history)
  - All servers with HFI installed should have Unified Extensible Firmware Interface (UEFI) firmware installed.
    Refer to the Client Node on page 70 for UEFI BIOSs versus Boot Mode information.

**NOTE**

Intel® Omni-Path Architecture Option ROM support requires UEFI firmware; and, the HFI drivers are based on UEFI instead of Legacy-BIOS.

- Intel recommends, but does not require the following:
• Using Intel® Xeon® Processor dual-socket server.
• Processor SKUs that favor single threaded performance over maximum cores (i.e. higher base frequency).
• 32GB or more of ECC memory (ideally fully populating DIMM channels on processor to insure maximum memory bandwidth)
• 256GB or more of storage (ideally RAIDed for resiliency)

• Plan the cabling of the fabric and create a cable planning spreadsheet using the sample .xlsx files installed into /usr/share/opa/samples/ on the management node. After a plan is established, opaxlattopology or opaxltttopology_cust may be used to convert the spreadsheet into a topology XML file that can be used by FastFabric during fabric verification, as well as being potentially used by the Fabric Manager for topology verification at runtime.

**NOTE**
The use of cable planning spreadsheets and the resulting topology XML files is highly recommended by Intel as an effective and efficient way to ensure the cluster is assembled and installed as intended.

For more information, refer to the opaxlattopology section of the *Intel® Omni-Path Fabric Suite FastFabric User Guide*.

• Plan the naming conventions for hosts and switches in the fabric. Intel recommends all switches and hosts be given unique names. Having unique names simplifies operations that are performed using host and switch names.

Refer to Appendix C "Node Naming Recommendations" of the *Intel® Omni-Path Fabric Suite Fabric Manager User Guide* for more information on naming the switches and hosts.

### 3.1.2 Fabric Setup Prerequisites

Ensure that the following requirements are met prior to installing and setting up the fabric.

**NOTE**
For information about the configuration files used by FastFabric, refer to *Intel® Omni-Path Fabric Suite FastFabric User Guide*.

1. Ensure all hardware is installed:
   • Servers
   • Core and edge switches
   • Fabric cables
NOTE
When installing externally-managed switches such as the Intel® Omni-Path Edge Switch 100 Series without a management module, the Node GUID could be required. The Node GUID is found on a label on the case of the switch and may be needed to configure and manage the switches with the IFS. You can also use the opagenswitches command to request the node GUIDS if there is a topology input file supplied. Intel recommends that you create a topology input file using opaxlattopology, opagentopology, or other tools. In this case, the switch names and locations are figured out from the fabric and the GUIDs for each switch name are then determined automatically by tools such as opagenswitches.

2. Ensure an Intel® Omni-Path Host Fabric Interface (HFI) is installed in each server. Refer to the Intel® Omni-Path Host Fabric Interface Installation Guide for instructions.

3. The hardware configuration should be reviewed to ensure everything has been installed according to the plan. Following the software installation, Intel® Omni-Path Fabric Suite FastFabric tools may be used to help verify the installation.

4. (Linux) Ensure the required Operating System (OS) version (with the same kernel version) is installed on all hosts with the following options:
   - Root user command prompt ends in "#" or "$" with a space after it.
   - Fancy and colored prompts are disabled.
   - TCL and Expect packages are installed on all Fabric Management Nodes.
The Management Node(s) that run FastFabric should have a full installation and must include the TCL and Expect OS RPMs.
For MPI clusters, install the C and Fortran compilers, along with their associated tools, on each Management Node.

NOTE
Refer to the Intel® Omni-Path Fabric Software Release Notes for a list of supported OS versions.

5. (Linux) Enable remote login as root on each host.
In order for FastFabric to manage the hosts, the Management Node must be able to securely log in as root to each host. This can be accomplished using SSH.

NOTE
FastFabric includes the opasetupssh tool, which can help perform the key exchange to establish secure password-less login from the FastFabric node to all other nodes in the fabric. To simplify the use of this tool, Intel recommends initially configuring the same root password on all hosts. After root access through SSH has been set up using FastFabric, the root passwords can be changed.

6. Resolve the TCP/IP Host Names.
FastFabric and TCP/IP must resolve host names to the management network and IPoIB IP addresses. If the management network is not IPoIB, each host must have both a management network name and an IPoIB network name. To do this, use the actual host name as the management network name and `HOSTNAME-opa` as the IPoIB network name, where `HOSTNAME` is the management network name of the given host.

Name resolution is accomplished by configuring a DNS server on the management network, with both management network and IPoIB addresses for each host and each Intel internally-managed chassis.

Alternatively, an `/etc/hosts` file needs to be created on the Management Node; FastFabric can then propagate this `/etc/hosts` file to all the other hosts.

If you are using the `/etc/hosts` file approach and **not** using Domain Name System (DNS):

- On the master node, add all the Ethernet* and IPoIB addresses into the `/etc/hosts` file.
- For the IPoIB convention, use `HOSTNAME-opa`.
- The `localhost` line should not be edited.
- The `/etc/hosts` file should not have any node-specific data.
- Copy the file to every node, as follows:

  ```
  opascpall -p -f hostfile /etc/hosts /etc/hosts
  ```

If you are using Domain Name System (DNS):

- Refer to the documentation for the domain name system (DNS) server being used. Make sure to edit the `/etc/resolv.conf` configuration file on the Management Node to use the proper DNS server.
- Refer to the Linux* OS documentation for more information about configuring the `/etc/resolv.conf` file. This file is typically configured during OS installation.
- If `/etc/resolv.conf` must be manually configured for each host, FastFabric can aid in copying the file to all the hosts.
- The `/etc/resolv.conf` file created on the Management Node must not have any node-specific data and must be appropriate for use on all hosts.
- Copying the `/etc/resolv.conf` file to all the nodes is accomplished during the OS installation.
- If the `/etc/resolv.conf` file was not set up on all the hosts during the OS installation, the **FastFabric Copy a file to all hosts** operation can be used during the Install Host Software on Remaining Servers procedures to copy the `/etc/resolv.conf` file from the Management Node to all the other nodes.

7. **Set up a Network Time Protocol (NTP) server.**

Configure an NTP server for the cluster, and set all Linux* hosts and internally managed chassis to sync to the NTP server.

The setup of the internally-managed chassis is described in Configure the Chassis.

8. **Assign HFI Node Description Names.**
Node Description names can be configured in many ways. For Intel® Omni-Path, Intel recommends the use of the rdma-ndd daemon to keep the Node Description up to date with the hostname of the node. Once set up to assign node descriptions, rdma-ndd automatically assigns node descriptions to RDMA devices whenever a node is restarted, a RDMA device comes online, or the hostname changes.

For details on rdma-ndd, see the man page.

**Related Links**
- Install Host Software on Remaining Servers on page 108
- Configure the Chassis on page 93

### 3.1.3 OS RPMs Installation Prerequisites

If you are using the INSTALL script for installation, OS RPMs must be installed before you can install the Intel® Omni-Path software.

Refer to the Intel® Omni-Path Fabric Software Release Notes for the list of OS RPMs required for each supported OS in this release.

### 3.1.4 MPI Compiler Prerequisites

MVAPICH2 and Open MPI are downloaded with the OPA-Basic Software package are selectable in the Intel OPA Install Menu. These two MPIs were built with Intel compilers. To use either of these MPIs for compiling and running your applications and benchmarks, you need to install the latest version of the Intel® Parallel Studio XE Composer Edition that includes the C++, and/or Fortran compilers according to your needs.

Intel recommends, at a minimum, to have the Intel Composer Runtime libraries installed to be able to run MPI applications. These runtime libraries may be obtained from: https://software.intel.com/en-us/articles/intel-compilers-redistributable-libraries-by-version

### 3.1.5 Performance Tuning Prerequisites

Intel recommends that you pre-configure servers and settings to tune fabric performance to meet the needs of your system. These tasks can be performed before or after the installation. Refer to the Intel® Omni-Path Fabric Performance Tuning User Guide which describes BIOS settings and parameters that have been shown to improve performance, or make performance more consistent, on Intel® Omni-Path Architecture. If you are interested in benchmarking the performance of your system, these tips may help you obtain better performance.

### 3.2 Download the Intel® Omni-Path Software

If the OS you installed did not include the OPA RPMs, download the software package from an Intel web page or other Intel secured location using the following procedures.

NOTES
You can manually navigate to the software using the following steps:

a. Using a web browser, type downloadcenter.intel.com in the address field and press Enter.

b. In the "Search downloads" field, type Omni-Path and press Enter.

2. In the Description list select the "Intel® Omni-Path Fabric Software" for the version you are wanting to install.

NOTE
The latest version of each type of each download type is showing in the list. To show previous versions select "Show more" at the bottom of the list.

3. In the "Available Downloads" list, select the files you need for the OS you have installed on your fabric.
   
   - For OPA-Basic software, select:
     
     IntelOPA-Basic.DISTRO.VERSION.tgz
   
   - For OPA-IFS software, select:
     
     IntelOPA-IFS.DISTRO.VERSION.tgz

NOTE
DISTRO.VERSION refers to the distribution and CPU.

4. Review the Intel Software License Agreement.
5. Click "I accept the terms in the license agreement."
6. Save the download to your hard drive.

3.3 Unpack the Tar File

You unpack the tar file using the following procedure.

1. Open an SSH client session and log into the host where the package is being installed.
2. Copy the tar file to the /root directory.
3. Change directory to /root.

   cd /root

4. Unpack the tar file.
   
   • For OPA-Basic, use:

     tar xvfz IntelOPA-Basic.DISTRO.VERSION.tgz
3.4 Download and Install NVIDIA* Software (Optional)

If you are installing the Intel® Omni-Path Software onto a machine that has a non-standard kernel, the software may need to recompile the Intel® Omni-Path Host Fabric Interface (HFI) driver. If this is required while installing the GPUDirect* components, you will need the NVIDIA* driver source code and symbols available in order to compile the HFI GPUDirect*-enabled driver.

**IMPORTANT**

You must perform step 2 below to avoid issues where the HFI GPUDirect*-enabled driver may not be able to load due to missing symbols. Failure to perform this step will require that you uninstall and then reinstall the driver using the proper instructions.

Use the following instructions to download and build the NVIDIA* driver:

1. Download the NVIDIA* driver source from:
   

   It is also available in the CUDA* Toolkit package that can be downloaded from:
   

   **NOTE**

   Users of CUDA* applications will need the CUDA* runtime as well, which is also part of the CUDA* Toolkit package. Intel recommends the full CUDA* Toolkit, but acknowledges that some administrators may only want the driver itself.

2. Extract the driver source and build the driver module as per the instructions at:
   

3. Install the NVIDIA* driver module if it's not already installed.

4. Run the command `export NVIDIA_GPU_DIRECT=<path to NVIDIA driver src build directory>` so the Intel® Omni-Path Software installer knows where to find the NVIDIA* driver source when re-building the HFI driver.

   **NOTE**

   The `<path to NVIDIA driver src build directory>` is the directory where the Module.symvers file is present after the NVIDIA* driver is built.

Additionally for any runtime applications that need CUDA* runtime support you will need to have CUDA* runtime installed for these applications. Intel recommends downloading the entire CUDA* Toolkit and installing it.

Download and Installation instructions from NVIDIA* can be found here:

http://docs.nvidia.com/cuda/cuda-installation-guide-linux/
4.0 **Install the Intel® Omni-Path Software**

This section provides information and procedures to install the Intel® Omni-Path Software on the Management Node or on a host node in the fabric.

You install the software using one of the following methods:
- TUI menus (recommended)
- CLI commands
- Linux* Distribution Software packages provided by Intel
- Linux* Distribution Software packages provided by the OS vendor

Intel recommends that you install the OPA-IFS software on the Management Node using the Install TUI, and then use FastFabric to configure the Management Node.

Once the Management Node has been configured, the Basic software can be installed on all the remaining hosts using either the FastFabric TUI or a provisioning or diskless boot mechanism.

**NOTE**

If you are using a provisioning system, consult the documentation that comes with the provisioning system.

Use the Checklists in the Appendices to track your installation of the software.

**Related Links**
- Install Using the TUI Menus on page 42
- Install Using CLI Commands on page 44
- Install Using Linux* Distribution Software Packages Provided by Intel on page 45
- Install Using the Linux* Distribution Software Packages Provided by the OS Vendor on page 48

4.1 **Before You Begin**

Before starting the installation, perform the following:
- Refer to the *Intel® Omni-Path Fabric Software Release Notes* for the list of compatible operating systems and required OS RPMs Installation Prerequisites.
- Be sure you have completed all **Pre-Installation Requirements** on page 30.
- You have downloaded and extracted the software package per **Installation Getting Started** on page 30.
- If you are using a customized installation via the Install CLI command, prepare your command line options. Refer to **Using the INSTALL Command Line Options**.
• For IPoIB IPV4, gather your list of the IP addresses and netmasks for each interface you are going to set up.

4.1.1 About User Queries Settings

During installation, the default user queries setting permits non-root users and tools to query the fabric. This setting enables read/write permissions on Userspace MAD Access Devices (UMADs). The UMAD interface allows Subnet Administration (SA) queries, Performance Administration (PA) queries, Subnet Management Agent (SMA) queries, and Performance Management Agent (PMA) queries from user space applications.

NOTE

Allowing non-root users read/write access to issue queries can be a security risk as non-root users can potentially send MADs to change the fabric state. Also, given the nature of the UMAD interface, sending MADs and receiving the corresponding responses require read/write permission, both for queries and state changes. Setting the interface to read-only for non-root users disables the ability to issue queries.

In Intel® OPA, the MgmtAllowed configuration setting in the switches can be used to prevent a compute node from accessing or altering the fabric configuration. A compute node without MgmtAllowed cannot issue SMA and PMA transactions to other nodes, thus protecting the fabric from malicious or buggy application code. Such a node will also be restricted in its access to SA information and will not be permitted to access PA information. However, when umad is enabled for local use, a malicious application could potentially alter its own SMA or PMA settings, for example, taking the node’s port down or observing or clearing PMA counters.

Many of the Intel® OPA basic tools make use of UMAD. Intel® Omni-Path Fabric Suite FastFabric tools are typically run on a management node and frequently issue SA, PA, SMA, and PMA operations; however they are often run as root.

NOTE

The user query setting you choose should depend on whether there are other tools or applications run as non-root that need access to UMAD and whether non-root users are trusted. For example, some non-root applications may use UMAD to issue SA queries for name services style queries.

4.1.2 Using the INSTALL Command Line Options

The ./INSTALL command for the Basic and IFS installations are issued from the following directories:

• Intel Basic directory: IntelOPA-Basic.DISTRO.VERSION
• Intel IFS directory: IntelOPA-IFS.DISTRO.VERSION

Syntax

or

`.INSTALL -C`

or

`.INSTALL -V`

## Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No option selected</td>
<td>Displays the Intel OPA Software TUI.</td>
</tr>
<tr>
<td><code>-v</code></td>
<td>Provides verbose logging. Logs to the <code>/var/log/opa.log</code> file.</td>
</tr>
<tr>
<td><code>-vv</code></td>
<td>Provides very verbose debug logging. Logs to the <code>/var/log/opa.log</code> file.</td>
</tr>
<tr>
<td><code>-R osver</code></td>
<td>Force install for specific OS kernel version, rather than running kernel.</td>
</tr>
<tr>
<td><code>-B osver</code></td>
<td>Run build for all components targetting specific OS kernel version.</td>
</tr>
<tr>
<td><code>-a</code></td>
<td>Installs all Upper Layer Protocols (ULP) and drivers with the default options, including UEFI firmware.</td>
</tr>
<tr>
<td><strong>NOTE</strong></td>
<td>This rebuilds the RPMs except for CUDA* which is not rebuilt unless <code>-G</code> is specified.</td>
</tr>
<tr>
<td><code>-n</code></td>
<td>Installs all ULPs and drivers with the default options, but does not change the autostart options.</td>
</tr>
<tr>
<td><code>-U</code></td>
<td>Upgrades/reinstalls all presently installed ULPs and drivers with the default options, and does not change the autostart options.</td>
</tr>
<tr>
<td><code>-u</code></td>
<td>Uninstalls all ULPs and drivers with the default options.</td>
</tr>
<tr>
<td><code>-s</code></td>
<td>Enables autostart for all installed software.</td>
</tr>
<tr>
<td><code>-O</code></td>
<td>Keeps the current modified rpm configuration file.</td>
</tr>
<tr>
<td><code>-N</code></td>
<td>Uses a new default rpm configuration file.</td>
</tr>
<tr>
<td><code>-i comp</code></td>
<td>Installs the given component with the default options. This option can appear multiple times on a command line.</td>
</tr>
</tbody>
</table>
IMPORTANT
Using this command to upgrade or downgrade an individual component against the existing IFS will update all previously installed components to the version of the individual component being installed.

-e comp
Uninstalls the given component with the default options. This option can appear multiple times on a command line.

-E comp
Enables autostart of given component. This option can appear with -D or multiple times on a command line.

NOTE
To control which installed software is configured for autostart, combine this option with -a, -n, -i, -e, and -U options.

-D comp
Disables autostart of the given component. This option can appear with -E or multiple times on a command line.

NOTE
To control which installed software is configured for autostart, combine this option with -a, -n, -i, -e, and -U options.

--user-space
Skips kernel space components during installation.

--without-depcheck
Disables the check of OS dependencies.

--rebuild
Forces a rebuild of OFA_DELTA srpms.

--force
Forces the installation, even if the distributions do not match. Use of this option can result in undefined behaviors.

--answer
keyword=value
Provides an answer to a question which might occur during the operation. Answers to questions that are not asked are ignored. Invalid answers result in prompting for interactive installations or use of the default for non-interactive installations.

Possible Questions:

UserQueries  Allows non-root users to access the UMAD interface.
NOTE
Allowing access to umadX device files may present a security risk. However, this allows tools such as opasaquery and opaportinfo to be used by non-root users.

Default options retain existing configuration files.

IrqBalance  Set IrqBalance to Exact?

-C  Shows the list of supported component names.

-V  Outputs the version number of the software.

-G  Install GPUDirect* components. Refer to Other Information.

NOTE
Intel® Omni-Path is compatible with GPUDirect* for RHEL* 7.6, SLES* 12 SP3, SLES* 12 SP4, and SLES* 15.

--user_queries  Permits non-root users to query the fabric. This is the default.

NOTE
Under some OS versions (for example, SLES* 12 SP4), non-root users may need to add /usr/sbin to their $PATH in order to execute query commands.

--no_user_queries  Specifies that non-root users cannot query the fabric.

Examples

./INSTALL
./INSTALL -n
./INSTALL -C
./INSTALL -V
./INSTALL -a -G
Other Information

Supported Component (comp) Names:

- opa_stack
- ibacm
- mpi_selector
- intel_hfi
- oftools
- opa_stack_dev
- fastfabric
- rdma_ndd
- delta_ipoib
- delta_srp
- delta_srpt
- opafm
- opamgt_sdk
- mvapich2_gcc_hfi
- openmpi_gcc_hfi
- openmpi_gcc_cuda_hfi
- mpisrc
- hfi1_uefi
- delta_debug

Supported Component (comp) Name Aliases:

- opa
- ipoib
- mpi
- psm_mpi
- pgas
- opadev

Components for -G (CUDA-based) Installations:

For RHEL*:

- ifs-kernel-updates-devel
- kmod-ifs-kernel-updates
- ifs-kernel-updates-debuginfo
- libpsm2
- libpsm2-debuginfo
- libpsm2-compat
- libpsm2-devel

For SLES*:

- ifs-kernel-updates-devel
- ifs-kernel-updates-kmp-default
- libpsm2
- libpsm2-compat
- libpsm2-devel

**NOTE**

While the openmpi_gcc_cuda_hfi is CUDA-enabled, it co-exists with the non-CUDA openmpi_gcc_hfi version and thus is always installed by default.

### 4.2 Install Using the TUI Menus

You can install both the Intel® Omni-Path Software Basic and IFS software packages using the Intel OPA Software menu.

**Assumptions**

- You are logged in.
- You have your IPV4 list of IP addresses and netmasks for each interface you are going to set up.

**Procedures**

Perform the following steps to install the Intel® OP Software:

**CAUTION**

Do not interrupt an operation mid-process. Some operations may take a few minutes to complete.
<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1.   | At the command prompt, change directory to the location of the installation software package: | • For Basic, type the following and press Enter: `cd IntelOPA-Basic.DISTRO.VERSION`
• For IFS, type the following and press Enter: `cd IntelOPA-IFS.DISTRO.VERSION`
where `DISTRO.VERSION` is the distribution and CPU. |
| 2.   | At the command prompt, start the install script. | Type `./INSTALL` and press Enter.  
Notes: • To install IFS with different root directory, use `chroot`.  
• When the kernel version in the `chroot` environment is different from the host's kernel version, use `./INSTALL -R` to force the IFS installation with the target OS kernel version. |
| 3.   | Select 1) Install/Uninstall Software. | Type 1. |
| 4.   | Review the items to be installed. | Accept the defaults (No action required).  
Type N to go to the next page.  
NOTE: If you need to change any item, enter the alphanumeric character associated with the item to toggle between Install or Don't Install. |
| 5.   | Start the installation. | Type P to perform the actions.  
Note: This may take a few minutes. |
| 6.   | Preparing OFA VERSION release for Install... Rebuild OFA SRPMs (a=all, p=prompt per SRPM, n=only as needed?) [n]: | Press Enter to accept the default.  
NOTE: The system will display prompts that require your response throughout the installation. |
| 7.   | For each system prompt... | Accept the defaults by pressing Enter to continue.  
Note: Some of the default processes may take a few minutes to complete. |
| 8.   | When the Intel OPA Autostart Menu displays, review the items. | Intel recommends leaving all of the Autostart selections set to the default values. However, on the Fabric Management Nodes where you plan to run the Intel® Omni-Path Fabric Suite Fabric Manager, make sure to set the OPA FM to enable autostart.  
NOTE: If you need to change any item, enter the alphanumeric character associated with the item to toggle between Enable or Disable. |
| 9.   | Run the OPA Autostart operations. | Type P. |
| 10.  | For each system prompt, "Hit any key to continue..." | Press any key.  
NOTE: When the installation completes, you are returned to the main menu. |

**Set up IPoIB IPV4 Configuration**

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.</td>
<td>Select 2) Reconfigure OFA IP over IB.</td>
<td>Type 2.</td>
</tr>
<tr>
<td>12.</td>
<td>Configure OFA IP over IB IPV4 addresses now? [n]:</td>
<td>Type y.</td>
</tr>
<tr>
<td>13.</td>
<td>How many OFA IP over IB interfaces would you like to configure? [1]:</td>
<td>Type the number of interfaces and press Enter.</td>
</tr>
</tbody>
</table>
| 14.  | For each interface, provide the following information:  
• OFA IP over IB interface name  
• IPV4 address in dot notation (or dhcp)  
• IPV4 netmask in dot notation | Provide the required information and press Enter.  
NOTE: After setup is complete, you are returned to the main menu. |

**continued...**
Step | Task/Prompt | Action
---|---|---
15. | Exit out of the TUI to the command prompt. | Type X.
16. | Reboot the server. | Type reboot and press Enter.  
**Caution:** Please do not interrupt the reboot process. Depending on your operating system, the reboot may take a few minutes.
17. | Verify the installation was successful. | Type opaconfig -V and press Enter.

**End Task**

Configure IPoIB IPV6 on page 52  
Upgrade the HFI UEFI Firmware on page 55  
Configuring the Software on page 88

### 4.3 Install Using CLI Commands

You can install both the Intel® Omni-Path Software Basic and IFS software packages using the `.INSTALL` command.

The `.INSTALL` command has many options including installing single components, and enabling and disabling autostart of components. This section provides instructions for the default installation, but you can append the install command with specific options for a more customized installation.

**Assumptions**
- You are logged in.
- You have your IPV4 list of IP addresses and netmasks for each interface you are going to set up.

**Procedures**

Perform the following steps to install the default Intel® OP Software configuration:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1. | At the command prompt, change directory to the location of the installation software package:  
• For Basic, type the following and press Enter:  
  ```bash  
  cd IntelOPA-Basic.DISTRO.VERSION  
  ```  
• For IFS, type the following and press Enter:  
  ```bash  
  cd IntelOPA-IFS.DISTRO.VERSION  
  ```  
  where `DISTRO.VERSION` is the distribution and CPU. |  |
| 2. | At the command prompt, start the install script.  
**Note:**  
• To install IFS with different root directory, use `chroot`.  
• When the kernel version in the `chroot` environment is different from the host's kernel version, use `.INSTALL -R` to force the IFS installation with the target OS kernel version. | Type `.INSTALL -n` and press Enter. |
| 3. | At the command prompt, reboot the server. | Type reboot and press Enter. |

Set up IPoIB IPV4 Configuration...
### Step 4
Manually edit or create the `/etc/sysconfig/network-scripts/ifcfg-ibX` file.

**Note:** Use the OS distribution-supplied instructions for setting up network interfaces. For example (RHEL*):

```
DEVICE=ib0
BOOTPROTO=static
IPADDR=1.1.1.1
BROADCAST=1.255.255.255
NETWORK=1.0.0.1
NETMASK=255.0.0.1
ONBOOT=yes
CONNECTED_MODE=yes
MTU=65520
```

### Step 5
Create the `ifcfg-ibx` configuration file for each host using the host IP addresses from the `/etc/hosts` file.

Type `opahostadmin -f /etc/opa/hosts configipoib` and press Enter.

---

- Upgrade the HFI UEFI Firmware on page 55
- Configuring the Software on page 88

## 4.4 Install Using Linux* Distribution Software Packages Provided by Intel

The Intel® Omni-Path Software IFS package contains the OS-specific repository for installing the Intel® OPA software.

This section provides the instructions for installing using the IFS package repository.

### 4.4.1 Repositories Included in the IFS Package

The IFS package contains two repositories:

- **OPA_PKGS** – Contains all software needed to be installed on the compute node, management node, or service node, such as storage node.
- **OPA_PKGS_CUDA** – Contains all software needed to be installed on the node that includes NVIDIA* cards.

**NOTE**

These two repositories cannot coexist on a node. Ensure that only one exists or is enabled.

### 4.4.2 Repository Deployment into the Environment

The `IntelOPA-IFS.<OS_VERSION>-x86_64.<VERSION>.tgz` tar package contains the repository used to install the Intel® OPA software. It also includes a helper script called `opacreatererepo` that checks and rebuilds kernel rpms, creates the local repository, and generates the recommended packages to install on each compute.
management, and service nodes. Intel recommends using this script to create the local repository ensuring that the correct version kernel rpms and the proper repository is created for the GPUDirect® (CUDA) support requirement.

For example, if an OPA_PKGS_CUDA repository already exists and you want to replace it with a repository for OPA_PKGS, the script will back up and remove the OPA_PKGS_CUDA to prevent the CUDA version packages from installing unintentionally.

Once a local repository has been successfully created, you can transfer it to an enterprise repository, based on organization needs, to allow sharing it among nodes.

The following shows the usage information for opacreaterepo.

Usage: opacreaterepo [-G]  
opacreaterepo -i  
opacreaterepo --help

Create a local repo for Intel OPA IFS packages.

Options:
- G create a repo with GPU Direct support (to install it must have NVidia driver installed)
- i display information about the repo it will create
--help produce full help text

Examples:
opacreaterepo
opacreaterepo -G
opacreaterepo -i

Once the script executes successfully, it will recommend the installation commands. To use these commands, you copy and paste them into a command prompt, or save them to be edited prior to executing.

The example below shows the output for RHEL:

Repo IntelOPA-IFS was successfully created.

Please use the following recommended commands to install Intel OPA software

Management Node:
  yum install opa-scripts opa-mpi-apps libfabric ifs-kernel-updates-devel
  opaconfig mtstests_mwapich2_gcc_hfi mtstests_openmpi_gcc_hfi opa-fm hfi1-
  firmware_debug libfabric-verbs libpsm2-devel opa-debuginfo openmpi_gcc_cuda_hfi
  opa-libopamgt opa-fastfabric hfi1-firmware opa-fm-debuginfo libpsm2-compat hfi1-
  diagtools-sw opa-basic-tools hfi1-firmware libfabric-psm2 libpsm2 opa-address-
  resolution ifs-kernel-updates-debuginfo kmod-ifs-kernel-updates libfabric-devel
  libfabric-psm mtstests_openmpi_gcc_cuda_hfi hfi1-diagtools-sw-debuginfo libpsm2-
  debuginfo openmpi_gcc_hfi mwapich2_gcc_hfi mpi-selector opa-libopamgt-devel

Compute Node:
  yum install opa-scripts libfabric ifs-kernel-updates-devel opaconfig
  mtstests_mwapich2_gcc_hfi mtstests_openmpi_gcc_hfi hfi1-firmware_debug libfabric-
  verbs libpsm2-devel openmpi_gcc_cuda_hfi opa-libopamgt hfi1-firmware libpsm2-

  devel

Services Node:
  yum install opa-scripts libfabric ifs-kernel-updates-devel opaconfig hfi1-
Using IFS Repository on Linux* OS

You can install the Intel® Omni-Path Software packages on Red Hat* Enterprise Linux* (RHEL*) or SUSE* Linux* Enterprise Server (SLES*) using the OS distribution included in the IFS package repository and its dependencies.

Assumptions

- You are logged in.
- You have your IPV4 list of IP addresses and netmasks for each interface you are going to set up.
- You have your software packages ready for installation.

Refer to Intel® Omni-Path Fabric Software Release Notes for supported OS packages.

Procedure

Perform the following steps to install the default Intel® Omni-Path Software configuration:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Set Up the IFS Repository</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1.</td>
<td>Create the local repository.</td>
<td>At the command prompt, type: opacreaterepo.</td>
</tr>
</tbody>
</table>
| 2. | Create the local repository on nodes that need CUDA* support.  
*Note:* If you install CUDA*-supported packages on nodes without NVIDIA* cards, you may see performance degradation. | At the command prompt, type: opacreaterepo -G.  
*Note:* After execution, the recommended install commands are provided. |
| 3. | On each node, install the Intel® OPA Software.  
For a list of packages in specific Intel® OPA components, refer to Intel® OPA Software Components to Packages Mapping. | Copy the recommended install command (based on node type), paste it in the command prompt, and press Enter.  
*Note:* Alternatively, you can insert the recommended install command (based on node type) in a provision script. |
| **Set up IPoIB IPV4 Configuration** | | |
| 4. | At the command prompt, start opaconfig. | Type opaconfig. |
| 5. | Select 2) Reconfigure OFA IP over IB. | Type 2. |
| 6. | Configure OFA IP over IB IPV4 addresses now? [n]: | Type y. |

continued...
7. How many OFA IP over IB interfaces would you like to configure? [1]: Type the number of interfaces and press Enter.

8. For each interface, provide the following information:
   • OFA IP over IB interface name
   • IPv4 address in dot notation (or dhcp)
   • IPv4 netmask in dot notation
   **NOTE:** To configure datagram mode for Accelerated IP (AIP), refer to Using RHEL* Distribution Software on page 48, Set up IPoIB IPV4 Configuration instructions. Provide the required information and press Enter. **NOTE:** After setup is complete, you are returned to the main menu.

9. Exit out of the TUI to the command prompt. Type X.

10. Reboot the server. Type reboot and press Enter. **Caution:** Please do not interrupt the reboot process. Depending on your operating system, the reboot may take a few minutes.

11. Verify the installation was successful. Type opaconfig -V and press Enter.

---

**Next Steps**
- If you need to set up IPoIB IPV6, go to Configure IPoIB IPV6.
- If you are ready to configure your IFS software, go to Configuring the Software.

---

**4.5 Install Using the Linux* Distribution Software Packages Provided by the OS Vendor**

The Intel® Omni-Path Software package is included with the Red Hat* Enterprise Linux* (RHEL*) and SUSE* Linux* Enterprise Server (SLES*) OS distributions.

This section provides the installation instructions for each OS.

**4.5.1 Using RHEL* Distribution Software**

You can install the Intel® Omni-Path Software package that is included with the Red Hat* Enterprise Linux* (RHEL*) OS distribution.

**Assumptions**
- You are logged in.
- You have your IPV4 list of IP addresses and netmasks for each interface you are going to set up.

**Procedures**

Perform the following steps to install the default Intel® Omni-Path Software configuration using RHEL* OS:
### Install OPA-Basic Software

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>At the command prompt, enter the installation command for opa-basic-tools.</td>
<td>Type <code>yum install -y opa-basic-tools</code> and press Enter.</td>
</tr>
<tr>
<td>2.</td>
<td>At the command prompt, reboot the server.</td>
<td>Type <code>reboot</code> and press Enter.</td>
</tr>
</tbody>
</table>
| 3.   | Check your link using `opainfo`. | Type `opainfo` and press Enter. **Example output:**

```
hf1 @i1  PortGID: 0xfe80000000000000:001175010163f931
PortState:  Active
LinkSpeed:  Act: 25Gb  En: 25Gb
LinkWidth:  Act: 4  Rx: 4  En: 3,4
LinkWidthInGrd:  Act: 4
LCRC:  Act: 14-bit  En: 14-bit,16-bit, 48-bit
Mgmt:  True
LID:  0x00000000-0x00000000  SM LID: 0x00000000c
SL:  0
QUIC:  ACC  Pm FINISAR CORP  P/N FCBN425QI010  Rev A
Xmit Data: 251 0 MB
Recvd Data: 251 0 MB
Pkt: 251
Link Quality: 5 (Excellent) |
| 4.   | Install the rdma-core rpm. | Type `yum install -y rdma-core` and press Enter. |
| 5.   | On all compute nodes: install the PSM2 library. | Type `yum install -y libpsm2` and press Enter. |

### Install Intel® Omni-Path Fabric Suite Components on the Management Node

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.</td>
<td>Install the opa-address-resolution rpm on all nodes.</td>
<td>Type <code>yum install -y opa-address-resolution</code> and press Enter.</td>
</tr>
<tr>
<td>8.</td>
<td>Install Fabric Manager.</td>
<td>Type <code>yum install -y opa-fm</code> and press Enter.</td>
</tr>
<tr>
<td>9.</td>
<td>Start the Fabric Manager.</td>
<td>Type <code>systemctl start opafm</code> and press Enter.</td>
</tr>
</tbody>
</table>

### Set up IPoIB IPV4 Configuration

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
</table>
| 10.  | Manually edit or create the ifcfg-ibX file. | **Note:** Use the OS distribution-supplied instructions for setting up network interfaces. Type `cat /etc/network-scripts/ifcfg-ib0` and press Enter. **Example output:**

```
DEVICE=ib0
TYPE=infinband
BOOTPROTO=static
IPADDR=10.228.200.173
BROADCAST=10.228.203.255
NETWORK=10.228.200.0
NETMASK=255.255.252.0
ONBOOT=yes
CONNECTED_MODE=yes
MTU=4520
```

Step | Task/Prompt | Action
---|---|---
11. | Bring up the ib0 interface. | Type `ifup ib0` and press Enter.
12. | Perform a test ping. | Type `ping <remote IPoIB address>` and press Enter.

For example:
```
ping 10.228.200.161
PONG 10.228.200.161 (10.228.200.161) 56(84) bytes of data.
64 bytes from 10.228.200.161: icmp_seq=1 ttl=64 time=0.863 ms
```

End Task

**Next Steps**
- If you need to set up IPoIB IPV6, go to Configure IPoIB IPV6.
- If you are ready to configure your IFS software, go to Configuring the Software.

**4.5.2 Using SLES* Distribution Software**

You can install the Intel® Omni-Path Software package that is included with the SUSE* Linux* Enterprise Server (SLES*) OS distribution.

**Assumptions**
- You are logged in.
- You have your IPV4 list of IP addresses and netmasks for each interface you are going to set up.

**Procedures**

Perform the following steps to install the default Intel® Omni-Path Software configuration using SLES* OS:

**Install OPA-Basic Software**

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>At the command prompt, enter the installation command for <code>opa-basic-tools</code>.</td>
<td>Type <code>zypper install -y opa-basic-tools</code> and press Enter.</td>
</tr>
<tr>
<td>2.</td>

</table>

### Set up IPOIB IPV4 Configuration

10. | Manually edit or create the ifcfg-ibX file. | **Note:** Use the OS distribution-supplied instructions for setting up network interfaces. Type `cat /etc/network/ifcfg-ib0` and press Enter.
Example output:
```
BOOTPROTO=static
IPADDR=192.168.0.1
BROADCAST=192.168.0.255
NETWORK=192.168.0.0
NETMASK=255.255.255.0
STARTMODE=auto
IPOIB_MODE="connected"
MTU=65520
```
**NOTE:** To configure datagram mode for AIP, change `IPOIB_MODE=datagram` and remove (comment out) `MTU=` of the ifcfg-ib0 file. Further details can be found in the Intel® Omni-Path Fabric Performance Tuning User Guide.

11. | Bring up the ib0 interface. | Type `ifup ib0` and press Enter. |

12. | Perform a test ping. | Type `ping <remote IPOIB address>` and press Enter.
For example:
```
ping 10.228.200.161
64 bytes from 10.228.200.161: icmp_seq=1 ttl=64
time=0.863 ms
```

### (Optional) Install the Fabric Manager GUI

13. | On one node in the fabric: install the Fabric Manager GUI. | **Note:** Intel recommends not to install the Fabric Manager GUI on the Management Node where the Fabric Manager is being used.
Type `zypper install -y opa-fmgui` and press Enter. |

### Next Steps
- If you need to set up IPOIB IPV6, go to Configure IPOIB IPV6.
If you are ready to configure your IFS software, go to Configuring the Software.

4.6 Configure IPoIB IPV6

You configure IPoIB for IPV6 on the management node. Instructions are dependent on the particular OS installed on the node.

Using Red Hat* Enterprise Linux*

To configure IPoIB for IPV6, perform the following:
1. Edit file `/etc/sysconfig/network` to add the following line:

   NETWORKING_IPV6=yes

2. Edit file `ifcfg-ifname` to add the following lines:

   IPV6INIT=yes
   IPV6ADDR="ipv6addr/prefix-length"

   IPV6 address should look like the following example:

   3ffe::6/64

3. Restart the network.

Using SUSE* Linux* Enterprise Server

To configure IPoIB for IPV6, perform the following:
1. Edit `ifcfg-ifname` to add the following line:

   IPADDR="ipv6addr/prefix-length"

   IPV6 address should look like the following example:

   3ffe::6/64

2. Restart the IPoIB network interfaces.

Next Steps

- At this time, you should tune Verb and IPoFabric performance. Refer to the Intel® Omni-Path Fabric Performance Tuning User Guide for instructions.
- Configure your IFS software.

Configuring the Software on page 88
5.0 Install and Upgrade Standalone Firmware

This section provides information and procedures to install and upgrade the Intel® Omni-Path standalone firmware.

The standalone firmware consist of the following rpms:

- **hfi1-uefi-<version>.rpm**: Contains HFI1 UEFI Option ROM and the Intel® Omni-Path Boot EFI application
- **hfi1-tmm-<version>.rpm**: Contains the Thermal Management Microchip (TMM) firmware
- **hfi1-firmware-tools-<version>.rpm**: Contains tools required to manage the HFI UEFI and TMM firmware:
  - **hfi1_eprom**: Update/query images on the Intel® Omni-Path HFI Adapter EPROM
  - **opatmmtool**: Manages and updates the firmware on the Thermal Management Microchip (TMM).

5.1 Before You Begin

Before installation or upgrading the standalone firmware, perform the following:

- Refer to the Release Notes for the list of compatible operating systems.
- You have installed the Intel® Omni-Path Software.

5.2 Download the Firmware

Download the firmware rpms from an Intel web page or other Intel secured location using the following procedures.

   **NOTES**
   You can manually navigate to the software using the following steps:
   a. Using a web browser, type downloadcenter.intel.com in the address field and press Enter.
   b. In the "Search downloads" field, type Omni-Path and press Enter.

2. In the Description list, select the Intel® Omni-Path Host Fabric Interface Platform Firmware file (i.e., UEFI, TMM or FW Tools) for the version you want to install.

   **NOTE**
   The latest version of each type of each download type is showing in the list. To show previous versions, select "Show more" at the bottom of the list.
3. In the “Available Downloads” list, select the files you need.
4. Review the Intel Software License Agreement.
5. Click "I accept the terms in the license agreement."
6. Save the download to your hard drive.

5.3 Installing and Upgrading rpms

This section provides information for installing or upgrading firmware rpms.

- To install the rpms, use `rpm -ivh <rpm name>`.
- To upgrade the rpms, use `rpm -Uvh <rpm name>`.

### Important Information for Firmware Tools

- When trying to install `hfil-firmware-tools.rpm` on OPA-IFS prior to V10.7, the installation fails due to an existing version of these firmware tools owned by other rpms.

  To resolve this issue, you can safely force the installation of the rpm using the following command:

  ```
  rpm -ivh --force hfil-firmware-tools-<version>.rpm
  ```

- When trying to install a pre-10.7 version of OPA-IFS on systems where the `hfil-firmware-tools.rpm` is already installed, the `hfil-diagtools-sw` and `opa-basic-tools` will fail to install due to existing versions owned by the `hfil-firmware-tools`.

  To resolve this issue, you can
  - Uninstall the existing `hfil-firmware-tools.rpm` prior to the OPA-IFS installation.
  - If desired, you can safely force the installation of the rpm using the following command:

  ```
  rpm -ivh --force hfil-firmware-tools-<version>.rpm
  ```

### Important Information for TMM Tools

- When trying to install `hfil-tmm.rpm` on OPA-IFS prior to V10.4, the installation fails due to an existing version of TMM firmware owned by other rpm i.e., `hfil-firmware rpm`.

  To resolve this issue, you can safely force the installation of the rpm using the following command:

  ```
  rpm -ivh --force hfil-tmm-<version>.rpm
  ```

- When trying to install a pre-10.4 version of OPA-IFS on systems where the `hfil-tmm.rpm` is already installed, the `hfil-firmware` will fail to install due to existing versions owned by the `hfil-tmm`.

  To resolve this issue, you can
  - Uninstall the existing `hfil-tmm.rpm` prior to the OPA-IFS installation.
— If desired, you can safely force the installation of the rpm using the following command:

```bash
rpm -ivh --force hfi1-tmm-<version>.rpm
```

- When trying to install `hfi1-tmm` rpm on OPA-IFS versions between V10.4 and the current release (or vice versa), installation will succeed and the user can see that the TMM firmware is owned by two rpms (`hfi1-tmm` and `hfi1-firmware`). This is an expected behavior as TMM firmware in both the rpms are identical.

```bash
rpm -qf /lib/firmware/updates/hfi1_smbus.fw
```

```
hfi-tmm-<version>.noarch
```

```
hfi-firmware-<version>.noarch
```

Upgrade the HFI UEFI Firmware on page 55

## 5.3.1 Upgrade the HFI UEFI Firmware

The HFI UEFI firmware for the Intel® Omni-Path Host Fabric Interface (HFI) discrete adapters is available as a separate rpm. For integrated HFIs, UEFI firmware is integrated with a BIOS image and can only be changed by updating the BIOS.

**Pre-Requisites**

You must download the standalone firmware rpms below prior to performing the steps.

- `hfi1-uefi-<version>.rpm`
- `hfi1-firmware-tools-<version>.rpm`

**Steps**

To upgrade the HFI UEFI firmware, perform the following steps:

1. Install the HFI UEFI rpm.

```bash
# rpm -i hfi1-uefi-version.rpm
```

2. Install the HFI Firmware Tools rpm.

```bash
# rpm -i hfi1-firmware-tools-version.rpm
```

3. Change directory to `/usr/share/opa/bios_images/`

```bash
# cd /usr/share/opa/bios_images/
```

4. Update the HFI UEFI firmware. The basic command is:

```bash
# hfi1_eprom [See Additional Options] -u ./HfiPcieGen3Loader_X.X.X.X.rom ./HfiPcieGen3_X.X.X.X.efi
```
Alternatively you can use a wildcard to update the HFI UEFI firmware using the file from specific directory:

```
# cd /usr/share/opa/bios_images/
# hfi1_eprom [See Additional Options] -u ./*
```

**Example output of update:**

```
Updating driver file with "/HfiPcieGen3_1.7.0.0.0.0.efi"
Updating loader file with "/HfiPcieGen3Loader_1.7.0.0.0.0.rom"
Using device: /sys/bus/pci/devices/0000:05:00.0/resource0
Erasing loader file... done
Writing loader file... done
Erasing driver file... done
Writing driver file... done
```

**Additional Options:**

The following information provides guidance for various firmware update options.

- **To update all of the HFIs, add the -d all option before the -u option.**

  ```
  # hfi1_eprom -d all -u HfiPcieGen3Loader_XX.X.X.X.X.rom
  HfiPcieGen3_XX.X.X.X.X.efi
  ```

- **To update each HFI separately (using -d only), perform the following steps:**
  a. List all available HFI discrete cards in the system:

  ```
  # hfi1_eprom -d
  0: /sys/bus/pci/devices/0000:05:00.0/resource0
  1: /sys/bus/pci/devices/0000:81:00.0/resource0
  ```

  b. Update specific card using card index:

  ```
  # hfi1_eprom -d 1 -u HfiPcieGen3Loader_XX.X.X.X.X.rom
  HfiPcieGen3_XX.X.X.X.X.efi
  Updating loader file with "HfiPcieGen3Loader_XX.X.X.X.X.rom"
  Updating driver file with "HfiPcieGen3_XX.X.X.X.X.efi"
  Using device: /sys/bus/pci/devices/0000:81:00.0/resource0
  Erasing loader file... done
  Writing loader file... done
  Erasing driver file... done
  Writing driver file... done
  ```

5. **Read UEFI firmware version of all HFIs in the system.**

   ```
   # hfi1_eprom -d all -V
   ```

   **Example output:**

   ```
   Using device: /sys/bus/pci/devices/0000:05:00.0/resource0
   loader file version: XX.X.X.X
   driver file version: XX.X.X.X
   config file version: HFI_TYPE1 vX.X.X.X
   ```

6. **Reboot the server.**

   ```
   # reboot
   ```

Download the Firmware on page 53

5.4 **UEFI Secure Boot Support**

Intel® Omni-Path software includes support for Unified Extensible Firmware Interface (UEFI) Secure Boot, both in the UEFI firmware environment and in Linux*.

5.4.1 **UEFI Firmware Support**

All UEFI drivers shipped as part of the Intel® Omni-Path Fabric Host Software are signed to support UEFI Secure Boot using the Microsoft* UEFI CA signing process.

**Limitations**

PXE Booting over the Intel® Omni-Path fabric is not supported when UEFI Secure Boot mode is enabled.

5.4.2 **Linux* Support**

Kernel modules shipped with major Linux* distributions RHEL* 7.3 and SLES* 12.2 are signed using the keys for those distributions.

Kernel modules shipped as part of the Intel® Omni-Path IFS installation suite are signed using an Intel key. The Intel public key is automatically added to the Machine Owner Key (MOK) list in the UEFI firmware environment with no action required by the user. Refer to the Client Node section in the Setting Up PXE Boot for Supported Operating Systems appendix for UEFI firmware requirements.

The following MOK utility can be used to list the currently enrolled keys in the MOK list keyring:

```
mokutil --list-enrolled
```

**Limitations**

When UEFI Secure Boot mode is enabled, the following Intel® Omni-Path Linux* utilities are not available:

- `hfil_eprom`
- `hfidiags`
5.5 Setting Up PXE Boot for Supported Operating Systems

Different operating systems require specific instructions for setting up PXE Boot on the Intel® Omni-Path Fabric.

The basic requirement for the preferred environment consists of a cluster with at least two nodes connected to a switch. One of the nodes is the Client node, where the OS will be installed over HFI. The other node will be a Preboot Execution Environment (PXE) Server to which the Client will connect to initialize and perform the OS installation.

The communication over Intel® Omni-Path (IP over InfiniBand*) proceeds as follows:

1. Client requests to DHCP Server and receives the IP address of TFTP Server and boot image (the name of bootloader).
2. Client contacts the TFTP Server and receives the boot image.
3. Client executes the boot image and downloads from PXE Server all other needed files like kernel and initial root file system (initramfs) image and loads them.

**NOTE**

The initramfs image does not contain all the modules and firmware required to use IPoIB with HFI. Therefore it needs to be updated before booting over HFI.

4. The installation of the target OS starts on the Client machine using the ISO image of the target OS downloaded from the HTTP Server.

The following procedures describe how to configure and boot a server over Intel® Omni-Path using the HFI UEFI firmware. Note that it does not cover all possible PXE configurations. The examples given are targeted for servers running the latest, supported Red Hat* Enterprise Linux* (RHEL*) and SUSE* Linux* Enterprise Server (SLES*) operating systems.

- For information on other PXE server configurations, please refer to your OS vendor documentation.
- For PXE boot information on earlier supported RHEL* and SLES* OS versions, contact your Intel Support Personnel.
5.5.1 PXE Server

You use the Intel® Omni-Path Host Fabric Interface (HFI) Unified Extensible Firmware Interface (UEFI) firmware to configure a server to boot over Intel® Omni-Path.

This section describes the procedures for different, supported operating systems.

5.5.1.1 Configure PXE Server with RHEL*

5.5.1.1.1 Before You Begin

The OPA-IFS package contains the HFI driver and the required IP over IB software stack. The package also installs the Fabric Manager. Note that the Fabric Manager must be installed for the Intel® Omni-Path Boot client to be fully initialized.

In order to boot over Intel® Omni-Path, the following requirements must be met:

1. The Intel® Omni-Path Fabric Suite Fabric Manager software must be running. Usually Fabric Manager is running on the Switch, but in a simple Back-to-Back configuration, Fabric Manager will be started on a head node (PXE server).

   NOTE

   If you need to install and start the Fabric Manager, perform the following steps:

   a. Install Intel® Omni-Path Fabric Suite Fabric Manager using the command:

      ```
      yum install opa-fm
      ```

   b. Start up Fabric Manager using the following command:

      ```
      service opafm start
      ```

2. The HFI driver (hfi1) and IP over InfiniBand* modules must be running. Use the commands:

   ```
   modprobe hfi1
   modprobe ib_ipoib
   ```

5.5.1.1.2 Configure Network Interface

Before IP packets can be sent to and from the PXE server, an Intel® Omni-Path network interface must be configured. To configure an Intel® Omni-Path network interface, perform the following steps:

1. Add ib0 network interface configuration file: /etc/sysconfig/network-scripts/ifcfg-ib0

   ```
   DEVICE=ib0
   TYPE=ib0
   BOOTPROTO=static
   IPADDR=192.168.100.1
   NETMASK=255.255.255.0
   NETWORK=192.168.100.0
   ```
3. Run the following command, where \( \text{ib0} \) is the name of the network interface configured in step 2:

```bash
ifup ib0
```

### 5.5.1.1.3 Configure DHCP Server

The following procedure describes how to configure DHCP for dynamic IP or fixed IP addressing.

#### For Dynamic IP Addressing

To install a DHCP server for dynamic IP addressing, follow the steps below:

1. Install DHCP package using the command:

```bash
yum install dhcp
```

2. Add DHCP configuration file.

The following is an example of `/etc/dhcp/dhcpd.conf`

```conf
# DHCP Server Configuration file.
option space pxelinux;
option pxelinux.magic code 208 = string;
option pxelinux.configfile code 209 = text;
option pxelinux.pathprefix code 210 = text;
option pxelinux.reboottime code 211 = unsigned integer 32;
option architecture-type code 93 = unsigned integer 16;
allow booting;
allow bootp;
subnet 192.168.100.0 netmask 255.255.255.0 {
    range 192.168.100.2 192.168.100.230;
    option subnet-mask 255.255.255.0;
    option broadcast-address 192.168.100.255;
    option routers 192.168.100.1;
    class "pxeclients" {
        match if substring (option vendor-class-identifier, 0, 9) = "PXECClient";
        next-server 192.168.100.1;
        if option architecture-type = 00:07 {
            filename "uefi/shim.efi";
        } else {
            filename "pxelinux/pxelinux.0";
        }
    }
}
```

3. Start DHCP server using the command:

```bash
service dhcd start
```

4. Enable DHCP service to be run always with OS start:

```bash
systemctl enable dhcd.service
```
For Fixed IP Addressing

To install a DHCP server for fixed IP addressing, follow the steps below:

1. Use the GUID from the client HFI in this example:
   
   001175010165abb2

2. Configure the `dhcpd.conf` file as the following, using the standard ff:

   00:00:00:00:00:02:00:00:01:57:

   ```
   [root@phs1fnivd14u25 dhcp]# cat /etc/dhcp/dhcpd.conf
   option space pxelinux;
   option pxelinux.magic code 208 = string;
   option pxelinux.configfile code 209 = text;
   option pxelinux.pathprefix code 210 = text;
   option pxelinux.reboottime code 211 = unsigned integer 32;
   option architecture-type code 93 = unsigned integer 16;
   allow booting;
   allow bootp;
   subnet 192.168.100.0 netmask 255.255.255.0 {
       range 192.168.100.20 192.168.100.230;
       option subnet-mask 255.255.255.0;
       option broadcast-address 192.168.100.255;
       option routers 192.168.100.1;
   }
   host phs1fnivd14u23 {
       #dynamic;
       uid ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2;
       fixed-address 192.168.100.15;
       supersede dhcp-client-identifier =
       ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2;
   }
   class "pxeclients" {
       match if substring (option vendor-class-identifier, 0, 9) = "PXEClient";
       next-server 192.168.100.1; 
       if option architecture-type = 00:07 {
           filename "uefi/shim.efi";
       } else {
           filename "pxelinux/pxelinux.0";
       }
   }
   ```

   3. Start DHCP server using the command:

   ```
   service dhcp start
   ```

   4. The output from `/var/log/messages` for the DHCP server will look something like the following example:

   ```
   Jun 30 03:16:13 phs1fnivd14u25 systemd: Started DHCPv4 Server Daemon.
   Jun 30 03:16:26 phs1fnivd14u25 dhcpcd: DHCPCD DISCOVER from
   ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2 via ib0
   Jun 30 03:16:26 phs1fnivd14u25 dhcpcd: DHCPOFFER on 192.168.100.15 to
   ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2 via ib0
   Jun 30 03:16:29 phs1fnivd14u25 dhcpcd: DHCPPACK from 192.168.100.15
   (192.168.100.1) to ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2
   ```
Install a TFTP Server

**Prerequisite:** XINETD may have been installed with OS. If not, use the following command:

```
yum install xinetd
```

To install a TFTP server, perform the following steps:

1. Install TFTP package using the command:

```
yum install tftp-server
```

2. Add or modify TFTP configuration file. An example is shown below:

```
/etc/xinetd.d/tftp

service tftp {
    socket_type = dgram
    protocol = udp
    wait = yes
    user = root
    server = /usr/sbin/in.tftpd
    server_args = -s /var/lib/tftpboot
    disable = no
    per_source = 11
    cps = 100 2
    flags = IPv4
}
```

**NOTE**

The `disable` field defaults to `yes` and should be changed to `no` before starting the XINETD server.

3. Start XINETD server using the command:

```
service xinetd start
```

4. Enable XINETD service to be run always with OS start:

```
systemctl enable xinetd.service
```

Create Directory Structure for PXE Server

The PXE Server is contained within a directory structure indicated by the `server_args` argument of the TFTP configuration file.
1. Create the base directory structure using the command:

   ```
   mkdir -p /var/lib/tftpboot/uefi
   ```

5.5.1.6 Configure the HTTP Server

To configure the HTTP Server, perform the following steps:

1. Install the TFTP package using the command:

   ```
   yum install httpd
   ```

2. Add the configuration file `/etc/httpd/conf.d/netinstall.conf` with the following content:

   ```
   Alias /netinstall /var/www/netinstall
   <Directory /var/www/netinstall>
   Options Indexes FollowSymLinks
   Order Deny,Allow
   Allow from all
   </Directory>
   ```

3. Create a new directory for iso image of the system that will be installed over the Intel® Omni-Path Host Fabric Interface. Use the following command:

   ```
   mkdir -p /var/www/netinstall/ISO/
   ```

4. Start the HTTP server using the command:

   ```
   service httpd start
   ```

5. Enable the HTTP service to be run always with OS start:

   ```
   systemctl enable httpd.service
   ```

6. Whenever the content of `/var/www/netinstall` is modified use the command:

   ```
   service httpd reload
   ```

Post-requisite

To see if the HTTP server was started successfully, open a web browser and enter `<IP address of the PXE server>/netinstall`. For example, if IP address of the PXE server is 100.100.200.200, use `http://100.100.200.200/netinstall/`.

5.5.1.7 Configure the Boot Loader

To configure a PXE server to use the `Grub2` boot loader, perform the following steps.
NOTE
For configuration details of other boot loaders, please refer to your OS vendor documentation.

1. Copy the shim.efi file from the shim package and the grubx64.efi file from the grub2-efi package in the ISO image file. Enter the following commands as root:

```
# mount -t iso9660 /path_to_image/name_of_image.iso /mount_point -o loop,ro
# cp -pr /mount_point/Packages/shim-version-architecture.rpm /
publicly_available_directory
# cp -pr /mount_point/Packages/grub2-efi-version-architecture.rpm /
publicly_available_directory
# umount /mount_point
```

2. Extract the packages.

```
# rpm2cpio shim-version-architecture.rpm | cpio -dimv
# rpm2cpio grub2-efi-version-architecture.rpm | cpio -dimv
```

3. Copy the EFI boot images from your boot directory.

```
# cp publicly_available_directory/boot/efi/EFI/redhat/shim.efi /var/lib/
tftpboot/uefi
# cp publicly_available_directory/boot/efi/EFI/redhat/grubx64.efi /var/lib/
tftpboot/uefi
```

   The following is an example for RHEL* 7.x using vmlinuz kernel file and initrd.img as a minimal file system image.

   ```
   set timeout=60
   menuentry 'RHEL 7' {
     linuxefi uefi/vmlinuz
     initrd.efi uefi/initrd.img
   }
   ```

5.5.1.2 Configure PXE Server with SLES*

5.5.1.2.1 Before You Begin

The OPA-IFS package contains the HFI driver and the required IP over IB software stack. The package also installs the Fabric Manager. Note that the Fabric Manager must be installed for the Intel® Omni-Path Boot client to be fully initialized.

In order to boot over Intel® Omni-Path, the following requirements must be met:

1. The Intel® Omni-Path Fabric Suite Fabric Manager software must be running.

   Usually Fabric Manager is running on the Switch, but in a simple Back-to-Back configuration, Fabric Manager will be started on a head node (PXE server).
NOTE
If you need to install and start the Fabric Manager, perform the following steps:

a. Install Intel® Omni-Path Fabric Suite Fabric Manager using the command:

```
zypper install opa-fm
```

b. Start up Fabric Manager using the following command:

```
service opafm start
```

2. The HFI driver (hfil) and IP over InfiniBand* modules must be running. Use the commands:

```
modprobe hfil
modprobe ib_ipoib
```

5.5.1.2.2 Configure Network Interface

Before IP packets can be sent to and from the PXE server, an Intel® Omni-Path network interface must be configured. To configure an Intel® Omni-Path network interface, perform the following steps:

1. Add ib0 network interface configuration file: `/etc/sysconfig/network-scripts/ifcfg-ib0`

2. Add the following content related to DHCP configuration to the configuration file:

```
DEVICE=ib0
TYPE=infiniband
BOOTPROTO=static
IPADDR=192.168.100.1
NETMASK=255.255.255.0
NETWORK=192.168.100.0
BROADCAST=192.168.100.255
ONBOOT=yes
USERCTL=no
```

3. Run the following command, where `ib0` is the name of the network interface configured in step 2:

```
ifup ib0
```

5.5.1.2.3 Configure DHCP Server

The following procedure describe how to configure DHCP for dynamic or fixed IP addressing.

For Dynamic IP Addressing

To install a DHCP server for dynamic IP addressing, follow the steps below:

1. Install DHCP package using the command:

```
zypper install dhcp-server
```
2. Add DHCP configuration file.
   The following is an example: /etc/dhcpd.conf

```
# DHCP Server Configuration file.
 option space pxelinux;
 option pxelinux.magic code 208 = string;
 option pxelinux.configfile code 209 = text;
 option pxelinux.pathprefix code 210 = text;
 option pxelinux.reboottime code 211 = unsigned integer 32;
 option architecture-type code 93 = unsigned integer 16;
 allow booting;
 allow bootp;
 subnet 192.168.100.0 netmask 255.255.255.0 {
   range 192.168.100.2 192.168.100.230;
   option subnet-mask 255.255.255.0;
   option broadcast-address 192.168.100.255;
   option routers 192.168.100.1;
   class "pxeclients" {
     match if substring (option vendor-class-identifier, 0, 9) = "PXEClient";
     next-server 192.168.100.1;
     if option architecture-type = 00:07 {
       filename "uefi/shim.efi";
     } else {
       filename "pxelinux/pxelinux.0";
     }
   }
   }
```

3. Modify /etc/sysconfig/dhcpd by adding at the end of file line:

```
DHCPD_INTERFACE="ib0"
```

4. Start DHCP server using the command:

```
service dhcpd start
```

5. Enable DHCP service to be run always with OS start:

```
systemctl enable dhcpd.service
```

### For Fixed IP Addressing

To install a DHCP server for fixed IP addressing, follow the steps below:

1. Use the GUID from the client HFI in this example:

```
001175010165abb2
```

2. Configure the dhcpd.conf file as the following, using the standard ff:

```
00:00:00:00:00:02:00:00:01:57:
```

```
[root@phs1fnivd14u25 dhcp]# cat /etc/dhcp/dhcpd.conf
option space pxelinux;
option pxelinux.magic code 208 = string;
option pxelinux.configfile code 209 = text;
option pxelinux.pathprefix code 210 = text;
option pxelinux.reboottime code 211 = unsigned integer 32;
option architecture-type code 93 = unsigned integer 16;
```
allow booting;
allow bootp;

subnet 192.168.100.0 netmask 255.255.255.0 {
  range 192.168.100.20 192.168.100.230;
  option subnet-mask 255.255.255.0;
  option broadcast-address 192.168.100.255;
  option routers 192.168.100.1;

host phs1fnivd14u23 {
  #dynamic;
  uid ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2;
  fixed-address 192.168.100.15;
  supersede dhcp-client-identifier = ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2;
}

class "pxeclients" {
  match if substring (option vendor-class-identifier, 0, 9) = "PXEClient";
  next-server 192.168.100.1;
  if option architecture-type = 00:07 {
    filename "uefi/shim.efi";
  } else {
    filename "pxelinux/pxelinux.0";
  }
}

3. Start DHCP server using the command:

    service dhcp start

4. The output from /var/log/messages for the DHCP server will look something like the following example:

    Jun 30 03:16:13 phs1fnivd14u25 systemd: Started DHCPv4 Server Daemon.
    Jun 30 03:16:26 phs1fnivd14u25 dhcpd: DHCPDISCOVER from
    ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2 via ib0
    Jun 30 03:16:26 phs1fnivd14u25 dhcpd: DHCPOFFER on 192.168.100.15 to
    ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2 via ib0
    Jun 30 03:16:29 phs1fnivd14u25 dhcpd: DHCPREQUEST for 192.168.100.15
    (192.168.100.1) from ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2
    via ib0
    Jun 30 03:16:29 phs1fnivd14u25 dhcpd: DHCPACK on 192.168.100.15 to
    ff:00:00:00:00:00:02:00:00:01:57:00:11:75:01:01:65:ab:b2 via ib0

5.5.1.2.4 Install a TFTP Server

**Prerequisite:** XINETD may have been installed with OS. If not, use the following command:

    zypper install xinetd

To install a TFTP server, perform the following steps:

1. Install TFTP package using the command:

    zypper install tftp
2. Add or modify TFTP configuration file. An example is shown below:

```plaintext
/etc/xinetd.d/tftp

service tftp {
    socket_type             = dgram
    protocol                = udp
    wait                    = yes
    flags                   = IPv6 IPv4
    user                    = root
    server                  = /usr/sbin/in.tftpd
    server_args             = -u tftp -s /srv/tftpboot
    disable                 = no
}
```

**NOTE**
The `disable` field defaults to `yes` and should be changed to `no` before starting the XINETD server.

3. Start XINETD server using the command:

```plaintext
service xinetd start
```

4. Enable XINETD service to be run always with OS start:

```plaintext
systemctl enable xinetd.service
```

5.5.1.2.5 **Create Directory Structure for PXE Server**

The PXE Server is contained within a directory structure indicated by the `server_args` argument of the TFTP configuration file.

1. Create the base directory structure using the command:

```plaintext
mkdir -p /srv/tftpboot/uefi
```

2. Change the SUSE default access permission of the TFTP Server directory.

```plaintext
chmod 755 /srv/tftpboot/
```

5.5.1.2.6 **Configure the HTTP Server**

To configure the HTTP Server, perform the following steps:

1. Install the TFTP package using the command:

```plaintext
zypper install apache2
```
2. Add the configuration file `/etc/apache2/conf.d/netinstall.conf` with the following content:

```
Alias /netinstall /var/www/netinstall
<Directory /var/www/netinstall>
Options Indexes FollowSymLinks
Require all granted
</Directory>
```

**NOTE**
The configuration file above is valid for Apache* version 2.4 or higher.

3. Create a new directory for iso image of the system that will be installed over Intel® Omni-Path Host Fabric Interface. Use the following command:

```
mkdir -p /srv/www/netinstall/ISO/
```

4. Start the HTTP server using the command:

```
service apache2 start
```

5. Enable the HTTP service to be run always with OS start:

```
systemctl enable apache2.service
```

6. Whenever the content of `/srv/www/netinstall` is modified use the command:

```
service apache2 reload
```

**Post-requisite**
To see if the HTTP server was started successfully, open a web browser and enter `<IP address of the PXE server>/netinstall`. For example, if IP address of the PXE server is 100.100.200.200, use `http://100.100.200.200/netinstall/`.

5.5.1.2.7 **Configure the Boot Loader**
To configure a PXE server to use the **Elilo** boot loader, perform the following steps.

**NOTE**
For configuration details of other boot loaders, please refer to your OS vendor documentation.

1. Copy the EFI boot files from the ISO image file. Enter the following commands as root.

```
# mount -t iso9660 /path_to_image/name_of_image.iso /mount_point -o loop,ro
# cd /mount_point/EFI/BOOT
# umount /mount_point
```
2. Copy the EFI boot images from your boot directory.

```bash
# cp -a bootx64.efi grub.efi MokManager.efi /var/lib/tftpboot/uefi
```

3. Create the Grub2 configuration file: /var/lib/tftpboot/uefi/grub.cfg

The following is an example for SUSE* Linux 12.x using vmlinux kernel file and initrd.img as a minimal file system image:

```bash
set timeout=60
menuentry 'SUSE Linux 12' {
    linuxefi uefi/linux
    initrddefi uefi/initrd.img
}
```

5.5.2 Client Node

You install the operating system over Intel® OP HFI for the Client node.

The following table shows the BIOS versus Boot Mode information.

<table>
<thead>
<tr>
<th>BIOS</th>
<th>Boot Mode</th>
<th>UEFI Driver Is Run By BIOS?</th>
<th>PCIe BGT/s (Gen3) Transition</th>
<th>Platform Configuration Data for AOC support</th>
<th>Boot Options</th>
<th>Board Description</th>
<th>Subsystem/SubVendor ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>UEFI</td>
<td>UEFI BIOS</td>
<td>Yes</td>
<td>Achieved pre boot</td>
<td>Provided by UEFI driver</td>
<td>Boot over fabric Boot local Boot from Ethernet</td>
<td>Customized by UEFI driver</td>
<td>Customized by UEFI driver</td>
</tr>
<tr>
<td>UEFI</td>
<td>Legacy BIOS</td>
<td>Yes (BIOS that runs UEFI driver in this mode)</td>
<td>Achieved pre boot</td>
<td>Provided by UEFI driver</td>
<td>Boot local Boot from Ethernet</td>
<td>Default board description</td>
<td>Customized by UEFI driver</td>
</tr>
<tr>
<td>UEFI</td>
<td>Legacy BIOS</td>
<td>No (BIOS does not run UEFI driver in this mode – e.g., Intel UEFI BIOS)</td>
<td>Achieved by host driver post boot</td>
<td>Provided by driver post boot (with limitations)</td>
<td>Boot local Boot from Ethernet</td>
<td>Default board description</td>
<td>Default subsystem values</td>
</tr>
<tr>
<td>Legacy</td>
<td>Legacy</td>
<td>No</td>
<td>Achieved by host driver post boot</td>
<td>Provided by driver post boot (with limitations)</td>
<td>Boot local Boot from Ethernet</td>
<td>Default board description</td>
<td>Default subsystem values</td>
</tr>
</tbody>
</table>

5.5.2.1 Before You Begin

Before installing the operating system over Intel® OP HFI, perform the following:

- Perform the steps in Upgrade the HFI UEFI Firmware if needed.
- Be sure to build the initrd.img image file on a machine that uses the same OS distribution that it targets. For instance, you build RHEL* 7.7 initrd.img on a machine that has Linux* RHEL* 7.7 running on it.
5.5.2.2 Install RHEL* over Intel® OP HFI

To edit the initrd.img, perform the following steps:

1. Log in as root.
2. Decompress the .iso archive with RHEL* distribution. The initrd.img is located in the /images/pxeboot folder.
3. Create /home/images/initrd folder.
   ```bash
   mkdir -p /home/images/initrd
   ```
4. Copy initrd.img to home/images/initrd.
   ```bash
   cp <.iso decompressed archive path>/images/pxeboot/initrd.img /home/images/initrd
   ```
5. Change directories to /home/images/initrd.
   ```bash
   cd /home/images/initrd
   ```
6. Check archive type. For example:
   ```bash
   file initrd.img
   initrd.img: XZ compressed data
   ```
7. Extract initrd.img according to archive type:
   - For XZ archive
     ```bash
     xzcat ./initrd.img | cpio -d -i -m
     ```
   - For GZ archive
     ```bash
     gunzip < initrd.img | cpio -i --make-directories
     ```
8. Move initrd.img out of the folder.
   ```bash
   mv ./initrd.img ../initrd.img
   ```

**NOTE**
From this point on in the instructions, all commands assume that the present working directory (pwd) is /home/images/initrd and all commands are relative to this path.

9. Copy firmware files.
   ```bash
   cp --recursive /lib/firmware/updates/ usr/lib/firmware/updates/
   ```
The list of required firmware files are:

/lib/firmware/updates/hfi1_dc8051_d.fw
/lib/firmware/updates/hfi1_dc8051.fw
/lib/firmware/updates/hfi1_fabric_d.fw
/lib/firmware/updates/hfi1_fabric.fw
/lib/firmware/updates/hfi1_pcie_d.fw
/lib/firmware/updates/hfi1_pcie.fw
/lib/firmware/updates/hfi1_sbus_d.fw
/lib/firmware/updates/hfi1_smbus.fw
/lib/firmware/updates/hfi_dc8051.bin

10. Add ib_ipoib.conf file.

```bash
mkdir etc/modules-load.d/
touch etc/modules-load.d/ib_ipoib.conf
echo "# Load ib_ipoib.ko at boot" >> etc/modules-load.d/ib_ipoib.conf
echo "ib_ipoib" >> etc/modules-load.d/ib_ipoib.conf
```

```bash
cd /home/images/initrd
find . -print | cpio -o -H newc | xz --format=lzma > ../initrd-new.img
chmod 777 ../initrd-new.img
```

**NOTE**
Remember to use appropriate Linux kernel file (vmlinuz) along with initrd.img.

12. Sample elilo.conf where xx is the version number.

```bash
prompt
chooser=textmenu
message=textmenu-message.msg
delay=20

default=rhel
image=vmlinuz
  label=rhel
  description = "RHEL"
  initrd=initrd-new.img
  read-only
  append="ip=ib0:dhcp rd.driver.post=ib_ipoib rd.net.timeout.carrier=50 inst.repo=http://192.168.100.1/netinstall/RHELxx"
```

### 5.5.2.3 Install SLES* over Intel® OP HFI

To edit the initrd.img, perform the following steps:

1. Log in as root.
2. Mount the SLES* .iso file (where xx-SPx is the SLES* version number).

```bash
sudo mkdir /mnt/iso
sudo mount -o loop SLE-xx-SPx-Server-DVD-x86_64-GM-DVD1.iso /mnt/iso
```
3. Create a working directory `/home/new_initrd`.

   ```bash
   mkdir /home/new_initrd
   ```

4. Copy `linux` file to `/home/new_initrd`.

   ```bash
   cp /mnt/iso/boot/x86_64/loader/linux /home/new_initrd
   ```

   **NOTE**
   
   `linux` (Linux kernel – corresponds to "vmlinuz" in RHEL) will not be modified. Please remember to use this file as the kernel file provided for PXE Boot (in `elilo.conf`).

5. Copy `initrd.img` to `/home/new_initrd`.

   ```bash
   cp /mnt/iso/boot/x86_64/loader/initrd /home/new_initrd/initrd.img
   ```

   **NOTE**
   
   `initrd` (initial root filesystem image) will be modified in this procedure.

6. Change directories to `/home/new_initrd`.

   ```bash
   cd /home/new_initrd
   ```

7. Create a new `initrd` folder and move `initrd.img` into it.

   ```bash
   mkdir initrd
   mv initrd.img ./initrd
   ```

   ```bash
   cd initrd
   xzcat ./initrd.img | cpio -d -i -m
   ```

9. Move `initrd.img` out of the folder.

   ```bash
   mv initrd.img ../
   cd..
   ```

10. Go to `initrd/parts` directory.

    ```bash
    cd initrd/parts
    ```

11. Copy `00_lib` file into `new_initrd` directory (outside of `initrd`).

    ```bash
    cp 00_lib ../..
    cd ../..
    ```
12. Extract 00_lib file.

```bash
unsquashfs 00_lib
```

**NOTE**

00_lib will be extracted to a newly created ./squashfs-root directory.

After this step, the present working directory (/home/new_initrd) should look like this:

```bash
# ls
00_lib
initrd
initrd.img
linux
squashfs-root
```

13. Copy five firmware drivers to squashfs-root/lib/firmware directory.

```bash
cp --recursive /lib/firmware/updates/ ./squashfs-root/lib/firmware/
```

14. Copy the following additional drivers from system that are not present in the default initrd.img.

```bash
cp --recursive /lib/modules/$(uname -r)/updates/ifs-kernel-updates/
squashfsroot/ lib/modules/$(uname -r)/initrd/
```

15. In order to keep the existing module dependencies, temporarily copy some modules from <initrd-root>/lib/modules/$(uname -r)/initrd into squashfsroot/lib/modules/$(uname -r)/initrd.

```bash
cp initrd/lib/modules/$(uname -r)/initrd/lz4_decompress.ko squashfsroot/
cp initrd/lib/modules/$(uname -r)/initrd/squashfs.ko squashfsroot/
cp initrd/lib/modules/$(uname -r)/initrd/loop.ko squashfs-root/lib/modules/$(uname -r)/initrd/
```

16. Create a backup copy of an existing <initrd-root>/lib/modules directory.

```bash
cp -R initrd/lib/modules modules_backup
```

17. Temporarily remove the modules directory from initrd.

```bash
rm -rf initrd/lib/modules
```

18. Copy modules directory from squashfs to initrd.

```bash
cp -R squashfs-root/lib/modules initrd/lib
```
19. Change root to initrd root directory and rebuild module dependencies.

```bash
    cd initrd
    chroot $(pwd)
    depmod -a -v
    exit
    cd ..
```

20. Go to `<initrd-root>/lib/modules/$(uname -r)/initrd` and remove all files added in 15.

```bash
    rm initrd/lib/modules/$(uname -r)/initrd/iz4_decompress.ko
    rm initrd/lib/modules/$(uname -r)/initrd/loop.ko
    rm initrd/lib/modules/$(uname -r)/initrd/squashfs.ko
```

21. Remove modules directory from squashfs.

```bash
    rm -rf squashfs-root/lib/modules
```

22. Copy a modified modules directory back to the squashfs.

```bash
    cp -R initrd/lib/modules squashfs-root/lib
```

23. Remove modules directory from initrd.

```bash
    rm -rf initrd/lib/modules
```

24. Restore (from the backup done in 16) the previous content of modules directory.

```bash
    cp -R modules_backup initrd/lib/modules
```

25. Pack squashfs-root contents again to 00_lib.

```bash
    mksquashfs squashfs-root 00_lib_new
```

26. Overwrite the existing 00_lib in the initrd directory.

```bash
    cp 00_lib_new initrd/parts/00_lib
```

27. Compress again initrd contents (from initrd-root).

```bash
    cd initrd
    find . -print | cpio -ov -H newc | xz --format=lzma > ../initrd-sles.img
```

```bash
    chmod 777 ../initrd-sles.img
```

29. Update grub.cfg to include the line

```bash
    insmod=ib_ipoib netdevice=ib0
    netsetup=dhcp
```

   Update grub.cfg to include the line `insmod=ib_ipoib netdevice=ib0 netsetup=dhcp`. 
This forces an automatic `ib_ipoib` module start, uses `ib0` as a default network device, and configures IP address via DHCP.

```
set timeout=60
menuentry 'SUSE Linux xx' {
    linuxefi uefi/linux insmod=ib_ipoib netdevice=ib0 netsetup=dhcp
    install=http://192.168.100.1/netinstall/SLES_xxx
    initrd.efi uefi/initrd-new.img
}
```
6.0 Install Intel® Omni-Path Fabric Suite Fabric Manager GUI

Intel® Omni-Path Fabric Suite Fabric Manager GUI can be run on a Linux® or Windows® desktop/laptop system with TCP/IP connectivity to the Intel® Omni-Path Fabric Suite Fabric Manager. Network connectivity to the Fabric Executive (FE) component of the Fabric Manager allows continuous, remote, “out of band” monitoring. If configured with alternate FE connection information, the Fabric Manager GUI automatically fails over to an alternative FE if the connection to the original is lost.

This section provides information and procedures to install and set up the Fabric Manager GUI on your desktop or laptop.

6.1 Before You Begin

The following sub-sections provide information and instructions that are necessary before you start the Intel® Omni-Path Fabric Suite Fabric Manager GUI installation.

6.1.1 System Requirements for a Windows® Environment

The minimum system requirements are as follows:

- Windows® operating system
  - Windows Vista® Service Pack 2 or higher
  - Windows® 7 Service Pack 1 or higher
  - Windows® 8.x
  - Windows® 10.x
  - Windows Server® 2008 Service Pack 2 or higher
  - Windows Server® 2012
- x86 or x64 processor architecture
- Oracle® Java Runtime Environment (JRE) 1.8
- Ethernet card/local network access
- Minimum disk space requirement is 100 MB. This amount includes the disk space needed for the application binaries and the application cache for topology information.
- 2 GB or greater of RAM
- 1280 x 800 resolution (65 K color depth)

6.1.2 System Requirements for a Linux® Environment

The minimum system requirements for the Linux® installation are as follows:

- Linux® operating system
— Red Hat* Enterprise Linux* 5.5 or higher
— SUSE* Linux* Enterprise Server 10 or higher
- x86 or x64 processor architecture
- Oracle* Java* Runtime Environment (JRE) 1.8
- libgnome
- X Window System
- Ethernet card/local network access
- Minimum disk space requirement is 100 MB. This amount includes the disk space needed for the application binaries and the application cache for topology information.
- 2 GB or greater of RAM
- 1280 x 800 resolution (65 K color depth)

6.1.3 **Download the Fabric Manager Software**

1. Using a web browser, go to https://downloadcenter.intel.com/search?keyword=Fabric+Manager+GUI.

**NOTES**
You can manually navigate to the software using the following steps:
   a. Using a web browser, type downloadcenter.intel.com in the address field and press Enter.
   b. In the "Search downloads" field, type Fabric Manager GUI and press Enter.

2. In the Description list select the "Intel® Omni-Path Fabric Suite Fabric Manager GUI" for the version you are wanting to install.

**NOTE**
The latest version of each download type is showing in the list. To show previous versions select "Show more" at the bottom of the list.

3. In the Available Downloads list, select the file(s) you need for the OS you have installed on your fabric.

**NOTE**
You can download either the executable file to install or the source files to build your Intel OPA Fabric Manager GUI jar file. This document only addresses installing through the executable.

4. Review the Intel Software License Agreement.
5. Click "I accept the terms in the license agreement.
6. Save the download to your hard drive.
6.2 Install the Fabric Manager GUI Software on Windows*

You install the Fabric Manager GUI (FM GUI) software on your Windows* desktop using the installation wizard.

Assumption
- You have downloaded the installation executable for Windows* to your desktop.
- You have installed JRE version 1.8.

Pre-requisites
The Java Runtime Environment (JRE) version 1.8 must be installed for Fabric Manager GUI to execute. If JRE1.8 is not installed, the Fabric Manager GUI installer will do it for you. If this happens, you will need to update the environment variable JAVA_HOME to the path where the JRE is installed; for example, C:\Program Files\Java\jre1.8.0_181. This section is intended to guide you through the configuration steps to ensure the software functions properly.

**IMPORTANT**
Use of any JRE version other than 1.8 may result in unexpected behavior.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open the Windows* Control Panel and set up the environment.</td>
<td>For versions pre-Win10: 1. Click the Windows Start icon. 2. Select Control Panel. 3. Click the System icon. 4. Select &quot;Advanced system settings&quot;. For Win10: 1. Click the Windows Search icon. 2. Type Advanced system settings and press Enter.</td>
</tr>
<tr>
<td>3.</td>
<td>Under System variables, create or edit the JAVA_HOME variable.</td>
<td>1. Click New to create a new variable named &quot;JAVA_HOME&quot;, or select &quot;JAVA_HOME&quot; and click Edit to modify. 2. Set the variable value to the path where the JRE can be found, for example, C:\Program Files\Java\jre1.8.0_181. 3. Click OK.</td>
</tr>
<tr>
<td>4.</td>
<td>Under System variables, edit the Path variable.</td>
<td>1. Select &quot;Path&quot; and click Edit. 2. Click New. 3. Type %JAVA_HOME%\bin and click Enter. 4. Move the entry to the top of the list, by selecting it and clicking Move Up until it is at the top. 5. Click OK.</td>
</tr>
<tr>
<td>5.</td>
<td>To accept the changes to the Environment Variables.</td>
<td>Click OK.</td>

</table>

End Task

Procedure
To install the software, perform the following:
<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Start the wizard.</td>
<td>Using File Explorer, navigate to the target folder and double-click the IntelOPA-FMGUI.windows-x.x.x.x.exe file on the desktop where x.x.x.x is the version number of the Fabric Manager GUI application being installed.</td>
</tr>
<tr>
<td></td>
<td>a) At the prompt: Do you want to allow the following program to make changes to this computer?</td>
<td>Click Yes.</td>
</tr>
<tr>
<td></td>
<td>b) Installer Language...</td>
<td>Select the language to be used for the installation screens and then click OK.</td>
</tr>
</tbody>
</table>
|     | c) Fabric Manager GUI Setup dialog... | • If this is a first-time installation... Click Next.  
       • If Fabric Manager GUI is already installed on your system and you are re-installing... Click Yes to overwrite the existing software and then click Next. |
|     | d) After reviewing the Licence Agreement... | Select the checkbox "I accept the terms of the License Agreement" and click Next. |
|     | e) Choose Install Location... | Intel recommends that you use the default file location. Click Install. |
|     | f) Completing Fabric Manager GUI Setup... | Click Finish. |
| 2. | (Optional) Change the database location. | Navigate to \<app_data_path>\Intel\FabricManagerGUI where \<app_data_path> is a user's application data folder. Under Windows 7/8, it's \C:\Users\<user_name>\AppData\Roaming |
       2. Name the file settings.xml.  
       3. Click Yes to change the extension. |
       2. Name the file settings.xml.  
       3. Click Yes to change the extension. |
|     | c) Open the file in a text editor and add the contents... | Change c:|temp\db\mydbname to the location for the database file.  
       **NOTE:** Only change the database file path. Omitting the other options will cause database performance issues in HSQLDB. |
|     | | Save and close the file. |

**Next Steps**
- To prepare the Fabric Manager for Fabric Manager GUI, refer to Prepare Fabric Manager for Fabric Manager GUI.
6.3 Install the Fabric Manager GUI Software on Linux*

You install the Fabric Manager GUI software on your Linux* desktop using the rpm file.

Assumption
• You have downloaded the installation rpm for Linux* to your desktop.

Pre-requisites
The Java Runtime Environment (JRE) version 1.8 must be installed for Fabric Manager GUI to execute. If JRE1.8 is not installed, the Fabric Manager GUI installer will do it for you. If this happens, you will need to update the environment variable JAVA_HOME to the path where the JRE is installed; for example, /usr/lib/jvm/java-1.8<build-id>/jre. This section is intended to guide you through the configuration steps to ensure the software functions properly.

IMPORTANT
Use of any JRE version other than 1.8 may result in unexpected behavior.

NOTE
These instructions assume a Bash shell environment is being used

### Table

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Set up the environment using one of two methods:</td>
<td>During runtime the ‘fmgui’ script checks the environment variable JAVA_HOME. If it is not set, it checks the system path for ‘java’. This is the order of precedence that can be used to permit two versions of the JRE to run simultaneously on a given system. Note: If it is necessary for the JRE on the system path to be greater than 1.8, then JAVA_HOME MUST be set to point to JRE1.8.</td>
</tr>
<tr>
<td></td>
<td>Locally - Edit the .bashrc file in your account.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Globally - Create a shell script in /etc/profile.d</td>
<td></td>
</tr>
</tbody>
</table>
| 2.   | Update the script with the following entries:                              | • If there is no JRE on the system path, the Fabric Manager GUI installer will install it for you and it will be available on the system path. No action is required.  
• If the version of JRE on the system path is greater than 1.8, then enter:  
  ```
  export JAVA_HOME=<path-to-jre-8>
  ```
  Example: export JAVA_HOME=/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.161-2.b14.e17.x86_64/jre
• If the version of JRE on the system path is 1.8, then no action is required |
| 3.   | Save the file and exit.                                                     |                                                                                                                                         |

End Task

Procedure
To install the software, perform the following:
**Step** | **Task/Prompt** | **Action**
--- | --- | ---
1. | Log into the system where the Fabric Manager GUI will be installed. | Or become root by typing `su` and entering the super-user password.
2. | Open a Terminal window in X Windows. | 
3. | Change directories to the directory where you downloaded the rpm file. | Type `cd directory_path_name`.
4. | Install the package.  
*Note:* Wait for the successful completion of the command before continuing. | 
• Using RHEL | Type `yum install IntelOPA-FMGUI-linux-\*\*\*\*\*.noarch.rpm` where \*\*\*\*\* is the version number of the Fabric Manager GUI application being installed. | 
• Using SLES | Type `zypper install IntelOPA-FMGUI-linux-\*\*\*\*\*.noarch.rpm` where \*\*\*\*\* is the version number of the Fabric Manager GUI application being installed. |
5. | (Optional) Change the database location. | 
   a) Change directory. | Type `cd ~/.Intel/FabricManagerGUI`. |
   b) Create file `settings.xml`. | Type `touch settings.xml` |
   c) Using a text editor, add the following contents... |
   ```xml
   <?xml version="1.0" encoding="UTF-8" standalone="no"?>
   <!DOCTYPE properties SYSTEM "http://java.sun.com/dtd/properties.dtd">
   <properties>
   <comment>FM GUI Application configuration settings</comment>
   <entry key="db.connection.url">jdbc:hsqldb:file:/var/temp/db/mydbname;hsqldb.result_max_memory_rows=1000;hsqldb.default_table_type=cached;hsqldb.log_size=50;</entry>
   </properties>
   ``` |
   d) Change `/var/temp/db/mydbname` to the location for the database file.  
*Note:* Only change the database file path. Omitting the other options will cause database performance issues in HSQLDB. | |
   e) Save and close the file. |

**Next Steps**
- To prepare the Fabric Manager for Fabric Manager GUI, refer to [Prepare Fabric Manager for Fabric Manager GUI](#).

### 6.4 Prepare Fabric Manager for Fabric Manager GUI

Fabric Manager GUI requires a running fabric with FE available. This task shows you how to prepare the Fabric Manager to work with the Fabric Manager GUI.

**Assumptions**
- You have completed the installation of the Fabric Manager GUI on your system.
Before running Fabric Manager GUI, ensure that Fabric Manager has the proper configuration and is running normally.

**Procedure**

To install the software, perform the following:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>On the management node, edit the /etc/opafm/opafm.xml file.</td>
<td>NOTE: The following steps contain the necessary edits to opafm.xml.</td>
</tr>
<tr>
<td>2.</td>
<td>Ensure that the FE is enabled.</td>
<td>In the &lt;FE&gt; section, &quot;Start&quot; is 1.</td>
</tr>
<tr>
<td></td>
<td>In the &lt;FE&gt; section, &quot;Start&quot; is 1.</td>
<td><img src="http://example.com/xml_snippet" alt="Example XML snippet" /></td>
</tr>
<tr>
<td>3.</td>
<td>Ensure that FE has proper security setup.</td>
<td><img src="http://example.com/xml_snippet" alt="Example XML snippet" /></td>
</tr>
<tr>
<td></td>
<td>If you want to run FE without SSL, ensure that the SslSecurityEnable is 0. Also, when you run Fabric Manager GUI, set up FE host as unsecured (clear the &quot;Secure&quot; checkbox).</td>
<td><img src="http://example.com/xml_snippet" alt="Example XML snippet" /></td>
</tr>
<tr>
<td></td>
<td>If you want to run FE with SSL, ensure that you set SslSecurityEnable to 1. To set up keys and opafm.xml properly, refer to additional steps in sections and appendices found in the Intel® Omni-Path Fabric Suite Fabric Manager User Guide: — &quot;Out-of-Band Security&quot; — &quot;Core-Level Public Key Infrastructure (PKI) Best Practices Guidelines&quot; — &quot;Advanced-Level Public Key Infrastructure Best Practices Guidelines&quot; — &quot;SSL Key Creation for Fabric Manager GUI&quot; And, when you run Fabric Manager GUI, set up FE host as &quot;Secure&quot; with the key files (select the &quot;Secure&quot; checkbox).</td>
<td><img src="http://example.com/xml_snippet" alt="Example XML snippet" /></td>
</tr>
<tr>
<td>4.</td>
<td>Ensure that PM is enabled.</td>
<td>In the &lt;Pm&gt; section, &quot;Start&quot; is 1.</td>
</tr>
<tr>
<td></td>
<td>In the &lt;Pm&gt; section, &quot;Start&quot; is 1.</td>
<td><img src="http://example.com/xml_snippet" alt="Example XML snippet" /></td>
</tr>
<tr>
<td>5.</td>
<td>If you made any changes...</td>
<td>Save and close the file.</td>
</tr>
<tr>
<td>6.</td>
<td>Restart the Fabric Manager so that your changes take effect.</td>
<td>Type <code>systemctl restart opafm</code>.</td>
</tr>
</tbody>
</table>

**Next Steps**

- To start the Fabric Manager GUI on Windows*, go to [Start the Fabric Manager GUI on Windows*](#).
- To start the Fabric Manager GUI on Linux*, go to [Start the Fabric Manager GUI on Linux*](#).
6.5 Start the Fabric Manager GUI on Windows*

You start the Intel® Omni-Path Fabric Suite Fabric Manager GUI on Windows* through the Start menu.

**NOTE**
Intel recommends that you accept the default startup options (settings). Refer to the Intel® Omni-Path Fabric Suite Fabric Manager GUI Online Help for procedures to set user preferences.

**Using Windows Vista and Windows 7**
To start the application:
1. From the **Start** menu, select **All Programs**.
2. Select **Intel ➤ Omni-Path ➤ Fabric Manager GUI**
   The Fabric Manager GUI application starts.

**NOTES**
It is recommended that you create a shortcut to put an icon on your desktop.
- For Windows Vista, right-click the application name in step 2 and select **Send To ➤ Desktop (Create Shortcut)**.
- For Windows 7, right-click the application name in step 2 and select **Pin to Start**.

**Using Windows 8.x**
To start the application:
1. From the **Start** menu, select the Search (magnifying glass) icon.
2. In the search box, begin typing **Fabric Manager GUI**.
   The application will appear for selection.
3. Select the application.
   The Fabric Manager GUI application starts.

**NOTE**
It is recommended that you pin the application to your Start menu. Right-click the application name in step 2 and select **Pin to Start**.

6.6 Start the Fabric Manager GUI on Linux*

You can start the Fabric Manager GUI on Linux* from either a terminal window on X Windows or the K Desktop Environment (KDE).
NOTE
Intel recommends that you accept the default startup options (settings). Refer to the Intel® Omni-Path Fabric Suite Fabric Manager GUI Online Help for procedures to set user preferences.

Using X Windows
To start the application from a terminal window on X Windows:
1. Open a terminal window in X Windows.
2. Type `fmgui` and press Enter.
   The Fabric Manager GUI starts.

Using K Desktop Environment (KDE)
To start the application from the K Desktop Environment (KDE):
1. From the K Menu, select Applications.
2. Select the Fabric folder.
3. Select Fabric Manager GUI.
   The Fabric Manager GUI starts.

6.7 Uninstall Fabric Manager GUI
This section provides instructions and information for uninstalling the Fabric Manager GUI from your desktop. These instructions are provided for reference only.

NOTE
The Fabric Manager GUI must be closed for the uninstall to be successful. The uninstall program does not warn you if the application is open. Warnings may be received at the end of the uninstall process stating that certain files have not been removed or it might just fail.

6.7.1 Uninstall Fabric Manager GUI Software on Windows*

Using Windows* Vista and Windows* 7
To uninstall the software, perform the following:
1. From the Start menu, select Control Panel.
2. Under the Programs category, select Uninstall a program.
3. In the program list, select Intel Fabric Manager GUI.
4. Click the Uninstall button at the top of the list.
5. Follow the instructions on the uninstall window.
   The Fabric Manager GUI is uninstalled.

Using Windows* 8.x
To uninstall the software, perform the following:
1. Right-click the **Start** menu and select **Programs and Features**.
2. In the program list, select **Intel Fabric Manager GUI**.
3. Click the **Uninstall** button at the top of the list.
4. Follow the instructions on the uninstall window.
   The Fabric Manager GUI is uninstalled.

### 6.7.1 Clear the Fabric Manager GUI Cache on Windows*

The Fabric Manager GUI uses local disk storage to keep a cache of fabric information.
The size of this cache depends on the size of the fabric(s) configured in the Fabric Manager GUI and the refresh rate used for performance monitoring. You can reclaim this disk storage by using the Clear FM GUI Cache. Be aware that clearing the cache also clears subnet configurations. Also, this option is only available to those users who have used the Fabric Manager GUI.

**Using Windows* Vista and Windows* 7**
To clear the cache, perform the following:
1. Select **Start** menu.
2. Select **All Programs**.
3. Select **Intel**.
4. Select **Omni-Path**.
5. Select **Clear FM GUI Cache**.
   A command window is displayed.
6. Type `y` and press **Enter**.
7. Press any key to complete the process.

**Using Windows* 8.x**
To clear the cache, perform the following:
1. Select the Start button (window icon).
2. Click the Search (magnifying glass) icon.
3. Begin typing **Clear FM GUI Cache**.
   The application will display in the results pane.
4. Select **Clear FM GUI Cache**.
   A command window is displayed.
5. Type `y` and press **Enter**.
6. Press any key to complete the process.

### 6.7.2 Uninstall Fabric Manager GUI Software on Linux*
To uninstall the software, perform the following:
1. Log in to the server where Fabric Manager GUI is installed as a user with root access.
2. Open a Terminal window in X Windows.
3. Type 
   `rpm -e IntelOPA-FMGUI-linux-x.x.x.x.x.noarch.rpm`
   where `x.x.x.x.x` is the version number of the Fabric Manager GUI application
   being uninstalled.

4. Wait for the successful completion of the command.
   The Fabric Manager GUI is uninstalled.

### 6.7.2.1 Clear the Fabric Manager GUI Cache on Linux*

The Fabric Manager GUI uses local disk storage to keep a cache of fabric information. The size of this cache depends on the size of the fabric(s) configured in the Fabric Manager GUI and the refresh rate used for performance monitoring. You can reclaim this disk storage by using the Clear FM GUI Cache. Be aware that clearing the cache also clears subnet configurations. Also, this option is only available to those users who have used the Fabric Manager GUI.

**Using X Windows**

To clear the cache, perform the following:

1. Open a Terminal window in X Windows.
2. Enter the following commands:

   ```
   cd ~/.Intel/FabricManagerGUI
   fmguiclear.sh
   ```

   The Fabric Manager GUI cache is cleared.

**Using K Desktop Environment (KDE)**

To clear the cache, perform the following:

1. In KDE or GNOME, select **Applications**.
2. Select **Fabric**; if not available, try the **System** category.
3. Select **Clear FM GUI Cache**.

   The Fabric Manager GUI cache is cleared.
Part 2: Configuring the Software
7.0 Configuration Getting Started

This section provides instructions and information for getting started with the Intel® Omni-Path Fabric Suite configuration.

You configure the fabric components using one of the following methods:
- Using the FastFabric TUI menus (recommended).
- Using the CLI commands.

Use the Software Installation Checklists on page 158 to track your configuration and verification of the software.

7.1 Pre-Configuration Requirements

This section provides the information and procedures needed prior to configuring and verifying the fabric software.

7.1.1 Chassis Configuration Prerequisites

Ensure that the following requirements are met prior to configuring the chassis.

NOTE
The Intel® Omni-Path Fabric Switches Hardware Installation Guide contains additional details about steps that must be performed before completing this procedure.

1. **Switch** Connect each chassis to the management network through its Ethernet management port. For chassis with redundant management, connect both Ethernet management ports.

2. **Switch** Set up the netmask and gateway addresses on each Intel chassis, following the procedures in the Intel® Omni-Path Fabric Switches GUI User Guide.

3. **Switch** Assign each Intel chassis a unique IP address, and appropriately configure the Ethernet management port network settings.

4. **Switch** For a chassis with redundant management, assign a unique IP address for each Intel Management Module or Intel Management Spine, and configure their Ethernet management port network settings.

5. **Switch** Select a unique name for each Intel chassis, Management Module, and Spine. This name should be configured in DNS or /etc/hosts as the TCP/IP name for the Ethernet management port.

NOTE
The chassis node description is set later in this process.

6. **Switch** Configure the administrator password on each Intel chassis.
NOTE
All versions of Intel® Omni-Path Chassis 100 Series firmware permit SSH keys to be configured within the chassis for secure password-less login. Intel® Omni-Path Fabric Suite FastFabric includes a tool (opasetupssh) that can help perform the key exchange to establish secure password-less login from the Management Node to all the internally managed switches in the fabric. For simplicity, Intel recommends you initially configure the same administrator password on all switches. (Another method is to leave the default "adminpass" until FastFabric has set up SSH keys.) After SSH has been set up using FastFabric, Intel recommends you change the admin password.

7. (Switch) Copy the relevant chassis firmware files onto the Management Node. When performing the Chassis Configuration procedures, the *.spkg files are used to upgrade the firmware on each chassis.

NOTE
Place all files at a given firmware level into a single directory. Intel recommends that you include the firmware revision number in the directory name.

7.1.2 Switch Configuration Prerequisites

Ensure that the following requirements are met prior to configuring the externally-managed switch.

1. (Switch) Select a unique name to be used for each switch. This name is configured as the Switch Description for the switch.

NOTE
Externally-managed switches do not have an Ethernet port and therefore do not have a TCP/IP name.

2. (Switch) Copy the relevant switch firmware files onto the Intel® Omni-Path Fabric Suite FastFabric management node. The *.emfw files are used to upgrade the firmware on each switch.

NOTE
Place all files at a given firmware level into a single directory. Intel recommends that you include the firmware revision number in the directory name.

7.2 How to Use the FastFabric TUI

The FastFabric TUI menus are set up for ease of use. The submenus are designed to present operations in the order they would typically be used during an installation.

NOTE
All FastFabric TUI menu alpha-based options are case-insensitive.
Selecting Menu Items and Performing Operations

1. From the Intel FastFabric OPA Tools main menu, select the target menu item (0-4).

   Intel FastFabric OPA Tools
   Version: X.X.X.X
   1) Chassis Setup/Admin
   2) Externally Managed Switch Setup/Admin
   3) Host Setup
   4) Host Verification/Admin
   5) Fabric Monitoring
   X) Exit (or Q)

   NOTE
   Menu item 5 provides access to the Fabric Performance Monitor (opatop).

   The target menu is displayed as shown in the example below:

   FastFabric OPA Chassis Setup/Admin Menu
   Chassis File: /etc/opa/chassis
   Setup:
   0) Edit Config and Select/Edit Chassis File [ Skip ]
   1) Verify Chassis via Ethernet Ping [ Skip ]
   2) Update Chassis Firmware [ Skip ]
   3) Set Up Chassis Basic Configuration [ Skip ]
   4) Set Up Password-Less SSH/SCP [ Skip ]
   5) Reboot Chassis [ Skip ]
   6) Get Basic Chassis Configuration [ Skip ]
   7) Configure Chassis Fabric Manager (FM) [ Skip ]
   8) Update Chassis FM Security Files [ Skip ]
   9) Get Chassis FM Security Files [ Skip ]
   Admin:
   a) Check OPA Fabric Status [ Skip ]
   b) Control Chassis Fabric Manager (FM) [ Skip ]
   c) Generate All Chassis Problem Report Info [ Skip ]
   d) Run a Command on All Chassis [ Skip ]
   Review:
   e) View opachassisadmin Result Files [ Skip ]
   P) Perform the Selected Actions N) Select None
   X) Return to Previous Menu (or ESC or Q)

2. Type the key corresponding to the target menu item (0-9, a-d) to toggle the Skip/Perform selection.

   More than one item may be selected.

3. Type P to perform the operations that were selected.

   NOTES
   • If more than one menu item is selected, the operations are performed in the order shown in the menu. This is the typical order desired during fabric setup.
   • If you want to perform operations in a different order, you must select the first target menu item, type P to perform the operation, then repeat this process for the next menu item operation to be performed, and so on.

4. Type N to clear all selected items.
5. Type X or press Esc or Q to exit this menu and return to the Main Menu.

Aborting Operations

While multiple menu items are performing, you have an opportunity to abort individual operations as they come up. After each operation completes and before the next operation begins, you are prompted as shown below:

Hit any key to continue...

- Press Esc or Q to stop the sequence of operations return to the previous menu.
  Any unperformed operations are still highlighted in the menu. To complete the selected operations, type P.
- Press any other key to perform the next selected menu item being performed.
  This prompt is also shown after the last selected item completes, providing an opportunity to review the results before the screen is cleared to display the menu.

Submenu Configuration Files

On each FastFabric submenu, item 0 permits a different file to be selected and edited (using the editor selected by the EDITOR environment variable). It also permits reviewing and editing of the opafastfabric.conf file. The opafastfabric.conf file guides the overall configuration of FastFabric and describes cluster-specific attributes of how FastFabric operates.

At the top of each FastFabric submenu screen beneath the title, the directory and configuration file containing the components on which to operate are shown.

In the example below, the configuration file is noted in bold.

<table>
<thead>
<tr>
<th>FastFabric OPA Host Setup Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host File: /etc/opa/hosts</td>
</tr>
<tr>
<td>Setup:</td>
</tr>
<tr>
<td>0) Edit Config and Select/Edit Host File [ Skip ]</td>
</tr>
<tr>
<td>1) Verify Hosts Pingable            [ Skip ]</td>
</tr>
<tr>
<td>2) Set Up Password-Less SSH/SCP     [ Skip ]</td>
</tr>
</tbody>
</table>

NOTE

During the execution of each menu selection, the actual FastFabric command line tool being used is shown. This can be used as an educational aid to learn the command line tools.

The example snippet below shows how the CLI is displayed in the TUI execution.

Performing Chassis Admin: Verify Chassis via Ethernet Ping
Executing: /usr/sbin/opapingall -C -p -F /etc/opa/chassis
8.0 Configure the Chassis

This section provides information and procedures to configure the internally-managed switches, such as the Intel® Omni-Path Director Class Switch 100 Series, using the Intel® Omni-Path Fabric Suite FastFabric toolset.

---

**NOTE**

For information about configuring switches made by other manufacturers, refer to the vendor's switch documentation.

---

8.1 Before You Begin

Before starting the chassis configuration, perform the following:

- Be sure you have completed all Chassis Configuration Prerequisites on page 89.
- Be sure you have the latest Intel® Omni-Path Fabric Switches Release Notes for reference.
- Gather your information for the configuration files, as needed.

Note that you can edit the files before you configure the chassis. Configuration files are located under the /etc/opa directory. Sample files are installed into /usr/share/opa/samples with the suffix -sample.

The following files are used to configure the chassis:

- **opafastfabric.conf**: Lists the default settings for most of the FastFabric command line options.
- **ports**: Lists the local HFI ports to use to access the fabrics.
  
  For typical single-subnet clusters, the default of "0:0" may be used. This uses the first active port on the Management Node to access the fabric.

- **chassis**: Lists the TCP/IP names of the internally-managed switches in the cluster.

  Intel recommends you use chassis names (the TCP/IP Ethernet management port names assigned). Enter one chassis name or IP address per line. **Note**: Do not list externally-managed switches in this file.

  For example:

  ```
  Chassis1
  Chassis2
  ```

  For more details about configuration files, refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide.

  For more details about the file format of the configuration files, refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide.
8.2 Configure the Chassis Using the FastFabric TUI Menu

You can configure the chassis using the FastFabric OPA Chassis Setup/Admin Menu.

Assumptions

• You are logged into the management node.
• You have the latest Intel® Omni-Path Fabric Switches Release Notes for reference.

Pre-Work

For the following menu items, prepare to answer questions or provide input as follows:

• **Updating the Chassis FM Security Files**
  — Choose options:
    • push – Ensures given security files are pushed to each chassis.
    • restart – After push, restart FM on master, stop on slave.
    • restartall – After push, restart FM on all MM.
  — Select security files or directory containing pem files
  — Choose parallel versus serial update
  — Set chassis password (default is to have password in fastfabric.conf or to use password-less SSH)

• **Checking the OPA Fabric Status**
  — Would you like to perform fabric error analysis? [y]:
    Allows you to start the analysis.
  — Clear error counters after generating report? [n]:
    Allows you to clear the error counters after generating the report.
  — Would you like to perform fabric link speed error analysis? [y]:
    Allows you to analyze fabric link speed errors.
  — Check for links configured to run slower than supported? [n]:
    Allows you to check for Links running slower than expected.
  — Check for links connected with mismatched speed potential? [n]:
    Allows you to check for links connected with mismatched speed.
  — Enter filename for results [/root/linkanalysis.res]:
    Allows you to enter a filename for the results or use the default file.

• **Control Chassis Fabric Manager**
Would you like to make sure the FM is not running? [n]:
Allows you to ensure that the FM is not running.

Would you like to make sure the FM is running? [n]:
Allows you to ensure that the FM is running.

Would you like to run FM on slave MMs? [n]:
Allows you to run FM on slave management modules.

Would you like to do the operation in parallel? [y]:
Allows you to perform operations in parallel (on multiple chassis). Doing the operation in parallel will finish the fastest.

Would you like to change FM boot state to enable FM start at boot? [n]:
Allows you to enable FM start on slave management modules at boot.

Would you like to change FM boot state to disable FM start at boot? [n]:
Allows you to disable FM start on slave management modules at boot.

Would you like to be prompted for chassis' password? [n]:
Allows you to be prompted for the chassis password.

### Procedures

The following steps provide simplified instructions for first-time configuration of the chassis. For additional details, refer to the *Intel® Omni-Path Fabric Suite FastFabric User Guide*.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>

</table>

**End Task**

**Next Steps**
- To configure the externally-managed switches, go to **Configure the Externally-Managed Switches**.
# Configure the Chassis Using the FastFabric CLI Commands

You can configure the chassis using the CLI commands.

## Assumptions
- You are logged into the management node.
- You have the latest Intel® Omni-Path Fabric Switches Release Notes for reference.

## Procedures

The following steps provide simplified instructions for first-time configuration of the chassis. For additional details, refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1. (Optional) Edit or review the configuration files. | **a)** Edit the `/etc/opa/opafastfabric.conf` file. Review the file with a focus on the following:  
  - `FF_CHASSIS_LOGIN_METHOD`
  - `FF_CHASSIS_ADMIN_PASSWORD`
  - Select the location for the result files from FastFabric with the `FF_RESULT_DIR` parameter. If you made any changes, save and close the file. |  
| | **b)** Edit the `/etc/opa/ports` file. Review the file. If you made any changes, save and close the file. |  
| | **c)** Edit the `/etc/opa/chassis` file. Create the file with a list of the chassis names (the TCP/IP Ethernet management port names assigned) or IP addresses. *Note:* Do not list externally-managed switches in this file. If you made any changes, save and close the file. |  
| 2. | Verify the chassis is accessible over the management network. Type `opapingall -C -p -f /etc/opa/chassis`. |  
| | • If all chassis were found... Continue to the next step. |  
| | • If some chassis were not found... Review the following list for those chassis that were not found:  
  - Is chassis powered on and booted?  
  - Is chassis connected to management network?  
  - Are chassis IP address and network settings consistent with DNS or `/etc/hosts`?  
  - Is Management node connected to the management network?  
  - Are Management node IP address and network settings correct?  
  - Is management network itself up (including switches, routers, and others)?  
  - Is correct set of chassis listed in the chassis file? You may need to repeat the previous step to review and edit the file. |  
| 3. | Update the chassis firmware using either the parallel or serial method. **NOTE:** Before continuing, refer to the Intel® Omni-Path Fabric Switches Release Notes for any prerequisites. |  
| | **a)** For the parallel method... Type `opachassisadmin -S -F chassisfile -P package -a run upgrade`. |  
| | **b)** For the serial method... Type `FF_MAX_PARALLEL=0 opachassisadmin -S -F chassisfile -P package -a run upgrade`. |  

continued...
**NOTES:**
During the firmware update, the following files are produced:
- `test.res` - Appended with summary results of run
- `test.log` - Appended with detailed results of run
- `save_tmp/` - Contains a directory per failed operation with detailed logs
- `test_tmp/*` - Intermediate result files while operation is running

If any chassis fails to be updated, refer to the `View opachassisadmin result files` section to review the result files from the update. Refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide for more details.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.</td>
<td>Set up the chassis with the basic configuration settings using the command.</td>
<td>Type <code>opachassisadmin -S -F chassisfile configure</code>.</td>
</tr>
</tbody>
</table>
|      | a) Follow the system prompts to select and configure the items required. | This wizard gives you the option of setting up the following items on the chassis:  
• Syslog server  
• NTP server  
• Timezone and DST information  
• Chassis link width  
• Configure Node Desc to match Ethernet* chassis name  
• Configure the Link CRC Mode |
| 5.   | Set up secure password-less SSH, such that the Management Node can securely log into all the chassis as admin through the management network, without requiring a password. | Type `opasetupssh -p -S -C -F chassisfile`. |
| 6.   | Reboot all the selected chassis and ensure they reboot fully, as verified through ping over the management network. | Type `opachassisadmin -S -F chassisfile reboot`. |
| 7.   | Retrieve basic information from chassis such as syslog, NTP configuration, time zone, node description, and other information. | Type `opachassisadmin -F chassisfile getconfig`. |
| 8.   | Configure the Chassis Fabric Manager for any Intel® Omni-Path Chassis 100 Series chassis using either parallel or serial method. | NOTE: For configuring multi-subnets: At least one subnet manager is required per subnet. Refer to the Intel® Omni-Path Fabric Suite Fabric Manager User Guide for more information on how to configure a host SM node to manage more than one subnet.  
 a) For the parallel method...  
 b) For the serial method... |
|      | a) For the parallel method... | Type `opachassisadmin -S -F chassisfile -P package -a run fmconfig`. |
|      | b) For the serial method... | Type `FF_MAX_PARALLEL=0 opachassisadmin -S -F chassisfile -P package -a run fmconfig`. |
| 9.   | Update Chassis Fabric Manager Security Files to permit the chassis security files to be verified and updated using either parallel or serial method, as needed. | Note: The FM security files are the private key, public key, and certificate files required by the FM, to support secure socket connection via OpenSSL. Refer to the Intel® Omni-Path Fabric Suite Fabric Manager User Guide for instructions on the administration tasks required to support these files.  
 a) For the parallel method...  
 b) For the serial method... |
<p>|      | a) For the parallel method... | Type <code>opachassisadmin -S -F chassisfile -s securityFiles -a push fmsecurityfiles</code>. |
|      | b) For the serial method... | Type <code>FF_MAX_PARALLEL=0 opachassisadmin -S -F chassisfile -s securityFiles -a push fmsecurityfiles</code>. |</p>
<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.</td>
<td>Retrieve the Chassis Fabric Manager Security Files from the chassis.</td>
<td>Type <code>opachassisadmin -F chassisfile fmgetsecurityfiles</code>.</td>
</tr>
<tr>
<td></td>
<td>Verifying the Chassis Configuration</td>
<td></td>
</tr>
</tbody>
</table>
| 11.  | Check the OPA fabric status. | Type `opalinkanalysis -U -x snapshot_suffix reports verifyall > results_file 2>&1`. **NOTE:** This step performs the following operations:  
• Perform a fabric error analysis.  
• Clear the error counters after generating a report.  
• Perform a fabric link speed error analysis.  
• Check for links configured to run slower than supported.  
• Check for links connected with mismatched speed potential.  
• Enter a filename for the results or save the results to the default location which is: `/root/ffres/linkanalysis.res`. |
|      | To control the Chassis Fabric Manager, you can perform any or all of the following optional steps: |        |
|      | a) Restart all the Chassis Fabric Managers and run the Fabric Manager on the slave Management Module using either parallel or serial methods. **NOTE:** There is a disruption as FMs are restarted. Using the serial method may reduce the disruption. |        |
|      | • For parallel method... | Type `opachassisadmin -S -F chassisfile -a restartall fmcontrol`. |
|      | • For serial method... | Type `FF_MAX_PARALLEL=0 opachassisadmin -S -F chassisfile -a restartall fmcontrol`. |
|      | b) Restart the Master Chassis Fabric Managers and stop the Fabric Manager on the slave Management Modules using either parallel or serial methods. **NOTE:** There is a disruption as FMs are restarted. Using the serial method may reduce the disruption. |        |
|      | • For parallel method... | Type `opachassisadmin -S -F chassisfile -a restart fmcontrol`. |
|      | • For serial method... | Type `FF_MAX_PARALLEL=0 opachassisadmin -S -F chassisfile -a start fmcontrol`. |
|      | c) Stop the Master Chassis Fabric Managers from running using either parallel or serial methods. |        |
|      | • For parallel method... | Type `opachassisadmin -S -F chassisfile -a stop fmcontrol`. |
|      | • For serial method... | Type `FF_MAX_PARALLEL=0 opachassisadmin -S -F chassisfile -a stop fmcontrol`. |
|      | d) Ensure all of the Chassis Fabric Managers are running, including the slaves using either parallel or serial methods. |        |
|      | • For parallel method... | Type `opachassisadmin -S -F chassisfile -a runall fmcontrol`. |
|      | • For serial method... | Type `FF_MAX_PARALLEL=0 opachassisadmin -S -F chassisfile -a runall fmcontrol`. |
|      | e) Ensure the Master Chassis Fabric Manager is running and the slaves are stopped using either parallel or serial methods. |        |

</tbody>
</table>

**NOTE:** In the line above, "editor" indicates the command line editor; for example, `vi`. The following default files are created:
- punchlist.csv
- test.res
- test.log

Next Steps
- To configure the externally-managed switches, go to [Configure the Externally-Managed Switches](#).
9.0 Configure the Externally-Managed Switches

This section provides information and procedures to configure the externally-managed switches, such as Intel® Omni-Path Switch 100 Series using the Intel® Omni-Path Fabric Suite FastFabric toolset.

9.1 Before You Begin

Before starting the switch configuration, perform the following:

- Be sure you have completed all Switch Configuration Prerequisites on page 90.
- Be sure you have the latest Intel® Omni-Path Fabric Switches Release Notes for reference.
- Gather your information for the configuration files, as needed.

Note that you can edit the files before you configure the switch. Configuration files are located under the /etc/opa directory. Sample files are installed into /usr/share/opa/samples with the suffix -sample.

The following files are used to configure the switch:

- opafastfabric.conf: Lists the default settings for most of the FastFabric command line options.
- ports: Lists the local HFI ports to use to access the fabric.
- switches: Lists the GUID, Node Description, and optional Distance of each externally-managed switch in the cluster.

Create the file with a list of the switch node GUID and required switch names. Enter one switch node GUID and required switch name per line. Do not use any spaces before or after the comma separating the switch node GUID and the name. Note: Do not list internally-managed chassis in this file.

For example:

```
0x00117500d9000138,edge1
0x00117500d9000139,edge2
```

For more details about configuration files, refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide.

For more details about the file format of the configuration files, refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide.

NOTE

If you are configuring multiple subnets, refer to Multi-Subnet Fabrics on page 133 for additional instructions.
## 9.2 Configure the Externally-Managed Switches Using FastFabric TUI Menu

You configure the externally-managed switches using the FastFabric OPA Switch Setup/Admin menu.

### Assumptions
- You are logged into the management node.
- You have the latest *Intel® Omni-Path Fabric Switches Release Notes* for reference.

### Procedures

The following steps provide simplified instructions for first-time configuration of the switch. For additional details, refer to the *Intel® Omni-Path Fabric Suite FastFabric User Guide*.

**Verifying the Switch Configuration**

12. View opaswitchadmin Result Files (menu item a)
### Next Steps

- To install the host software on the remaining servers, go to [Install Host Software on Remaining Servers](#).

---

### 9.3 Configure the Externally-Managed Switches Using FastFabric CLI Commands

You configure the externally-managed switches using the FastFabric OPA Switch Setup/Admin menu.

#### Assumptions

- You are logged into the management node.
- You have the latest [Intel® Omni-Path Fabric Switches Release Notes](#) for reference.

#### Procedures

The following steps provide simplified instructions for first-time configuration of the switch. For additional details, refer to the *Intel® Omni-Path Fabric Suite FastFabric User Guide*.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>(Optional) Edit or review the configuration files.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>a) Edit the <code>/etc/opa/opafastfabric.conf</code> file.</td>
<td>Review the file. If you made any changes, save and close the file.</td>
</tr>
<tr>
<td></td>
<td>b) Edit the <code>/etc/opa/ports</code> file.</td>
<td>Review the file. If you made any changes, save and close the file.</td>
</tr>
<tr>
<td></td>
<td>c) Edit the <code>/etc/opa/switches</code> file.</td>
<td>Create the file with a list of the switch node GUID and required switch names. If you made any changes, save and close the file.</td>
</tr>
<tr>
<td>2.</td>
<td>(Optional) Generate or update the <code>switches</code> file. <strong>NOTE:</strong> You can also update switch names in the <code>switches</code> file by comparing the actual fabric to topology xml data.</td>
<td>Type <code>opagenswitches -s -o switches</code>.</td>
</tr>
<tr>
<td>3.</td>
<td>Test to see if each externally-managed switch is present.</td>
<td>Type <code>opaswitchadmin -L switchfile ping</code>.</td>
</tr>
<tr>
<td></td>
<td>a) If all switches were found...</td>
<td>Continue to the next step.</td>
</tr>
</tbody>
</table>
|      | b) If some switches were not found... | Review the following list for those switches that were not found:  
  - Is switch powered on and booted?  
  - Is switch connected to Intel® Omni-Path Fabric?  
  - Is Subnet Manager running?  
  - Is Management Node’s Port active? |

<tr>
<td>4.</td>
<td>Verify the switch firmware to check that each externally managed switch is operational and that its firmware is valid and accessible.</td>
<td>Type <code>opaswitchadmin -L switchfile fwverify</code>.</td>
</tr>
</tbody>
</table>
| 5.   | Update the switch firmware version and the switch node name set. | **NOTE:** Be aware that non-parallel operation for a fabric with many externally-managed switches can take a significant amount of time.  
  * For the parallel method... Type `opaswitchadmin -O -L switchfile -P packages -a run upgrade`.  
  * For the serial method... Type `FF_MAX_PARALLEL=0 opaswitchadmin -O -L switchfile -P packages -a run upgrade`. |
| 6.   | Reboot the externally managed switches. | Type `opaswitchadmin -L switchfile reboot`. |
| 7.   | Set up the switch basic configuration for all externally managed switches. | Type `opaswitchadmin -L switchfile configure`. **NOTE:** This command runs a wizard to set up the externally-managed switch configuration. |
| 8.   | Run a report for the firmware and hardware versions for each switch, along with the part number and data rate capability of all of the externally managed switches. | Type `opaswitchadmin -L switchfile info`. |
| 9.   | Run the command to get the externally managed switch configuration report for all of the ports. | Type `opaswitchadmin -L switchfile getconfig`. |
| 10.  | Run the report that returns externally managed switch hardware vital product data (VPD) for all of the nodes listed in the `/etc/opa/switches` file. | Type `opaswitchadmin -L switchfile hwvpd`. |

### Verifying the Switch Configuration

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
</table>
| 11.  | View the `opaswitchadmin` results files. | Type `editor result_dir/result_file`.  
  **NOTE:** In the line above, "editor" indicates the command line editor; for example, vi.  
The following default files are created:  
  * punchlist.csv  
  * test.res  
  * test.log |

**Next Steps**

- To install the host software on the remaining servers, go to Install Host Software on Remaining Servers.
10.0 Install Host Software on Remaining Servers

This section provides information and procedures to install, configure, and verify the Intel® Omni-Path Fabric Host Software on the remaining hosts.

NOTE
Intel® Omni-Path Fabric Suite FastFabric is also used to install the Intel® Omni-Path Fabric Stack Tools on the remaining hosts when using other variations of OFA. In this case, OFA software must be installed on each host prior to installing the Intel® OPA software.

10.1 Before You Begin

Before starting the host installation and configuration, perform the following:

- On RHEL 7.x systems, install parallel gzip (pigz) and make it the default compression tool prior to upgrading the software to avoid false installation failures being reported.

- Gather your information for the configuration files, as needed.

Note that you can edit the files before you configure the hosts. Configuration files are located under the /etc/opa directory. Sample files are installed into /usr/share/opa/samples with the suffix -sample.

The following files are used to configure the hosts:

- opafastfabric.conf: Lists the default settings for most of the FastFabric command line options.

  NOTE
  During setup of password-less SSH, FastFabric provides the opportunity to enter the host root password interactively when needed. Therefore, Intel recommends that you do not place it within the opafastfabric.conf file.

  If you are required to keep the root password for the hosts in the opafastfabric.conf file, Intel recommends that you change the opafastfabric.conf permissions to be 0x600 (root-only access).

- Intel recommends that a FastFabric topology file is created as /etc/opa/topology.0:0.xml to describe the intended topology of the fabric. The file can also augment assorted fabric reports with customer-specific information, such as cable labels and additional details about nodes, SMs, links, ports, and cables. Refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide for more information about topology verification files.

- ports: Lists the local HFI ports to use to access the fabric.
For typical single-subnet clusters, the default of "0:0" may be used. This uses the first active port on the Management Node to access all externally managed switches.

- **hosts**: List of the hosts names (the TCP/IP management network names), except the Management Node from which FastFabric is presently being run. Enter one host's name per line.

  For example:

  ```
  host1
  host2
  ```

**NOTE**

Do not list the Management Node itself (that is, the node where FastFabric is currently running).

If additional Management Nodes are to be used, they may be listed at this time, and FastFabric can aid in their initial installation and verification.

- **allhosts**: Lists the Management Node's hosts name (the TCP/IP management network name, for example `mgmthost`) and includes the `hosts` file.

  For example:

  ```
  mgmthost
  include /etc/opa/hosts
  ```

- **hostverify.sh**: Script to verify the configuration and performance of an individual node. This should be run using `opaverifyhosts`. It can also be run on an individual node directly.

  For more details about configuration files, refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide.

  For more details about the file format of the configuration files, refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide.

**NOTE**

If you are configuring multiple subnets, refer to Multi-Subnet Fabrics on page 133 for additional instructions.

- For the following Host Setup menu item, prepare to answer questions or provide input as follows:

  - **Building Test Apps and Copying to Hosts**

    Choose MPI Directory Selection:

    ```
    Host Setup: Build Test Apps and Copy to Hosts
    MPI Directory Selection
    Please Select MPI Directory:
    0) /usr/mpi/gcc/mvapich2-2.3b-hfi
    1) /usr/mpi/gcc/openmpi-2.1.2-cuda-hfi
    2) /usr/mpi/gcc/openmpi-2.1.2-hfi
    ```
3) Enter Other Directory  
X) Return to Previous Menu (or ESC or Q)

NOTE
Refer to the Intel® Omni-Path Fabric Software Release Notes for the latest supported MPI Library versions.

• For the following Host Verify menu item, prepare to answer questions or provide input as follows:
  — Perform Single Host Verification
    • Prior to using this operation, you must have a copy of the hostverify.sh in the directory pointed to by FF_HOSTVERIFY_DIR. If the file does not exist in that directory, copy the sample file /usr/share/opa/samples/hostverify.sh to the directory pointed to by FF_HOSTVERIFY_DIR.
    • Determine the tests to be run and time limit (in minutes) for the tests.

10.2 Install the Host Software on the Remaining Hosts Using the FastFabric TUI Menu

You can configure the host software using the FastFabric OPA Host Setup menu.

Assumption
• You are logged into the management node.
• On RHEL 7.x systems, you have installed parallel gzip (pigz) and made it the default compression tool.

Procedures

The following steps provide simplified instructions for first-time configuration of the hosts. For additional details, refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Access the FastFabric OPA Host Setup menu.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>a) If you are not already logged into Intel FastFabric OPA Tools, at the command prompt...</td>
<td>Type opafastfabric and press Enter.</td>
</tr>
</tbody>
</table>
|      | c) Select menu items. | • Select items 0 – 2 and 4 – 8.  
• Select item 3 if you are using /etc/hosts for name resolution (as opposed to using DNS). |
|      | d) Start the operations. | Press P.  
NOTE: Each selected item is preformed in the order of the menu list. |
### Step 2: Edit Configuration and Select/Edit Host File (menu item 0)

<table>
<thead>
<tr>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
</table>
| a) Edit the `opafastfabric.conf` file. | Review the file with a focus on the following:  
- FF_IPOIB_SUFFIX  
- FF_IPOIB_NETMASK  
- FF_IPOIB_CONFIG  
- FF_PRODUCT  
- FF_PACKAGES  
- FF_INSTALL_OPTIONS  
- FF_UPGRADE_OPTIONS  
If you made any changes, save and close the file. Press any key to continue. |
| b) Edit the `hosts` configuration file. | Create the file with a list of the hosts names (the TCP/IP management network names), except the Management Node from which FastFabric is presently being run. If you made any changes, save and close the file. |
| c) Do you want to edit/review/change the files? [y]: | Type **n** and Press Enter. |
| e) Continue to next step. | Press any key to continue. |

### Step 3: Verify Hosts Pingable (menu item 1)

- If all hosts were found...
- If some hosts were not found...

Press **ESC** to exit the menu and review the following list for those hosts that were not found:  
- Host powered on and booted?  
- Host connected to management network?  
- Host management network IP address and network settings consistent with DNS or `/etc/hosts`?  
- Management node connected to the management network?  
- Management node IP address and network settings correct?  
- Management network itself up (including switches, routers, and others)?  
- Correct set of hosts listed in the hosts file? You may need to repeat the previous step to review and edit the file.

### Step 4: Set Up Password-Less SSH/SCP (menu item 2)

<table>
<thead>
<tr>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Password for root on all hosts:</td>
<td>Type the password for root on all hosts and press Enter.</td>
</tr>
<tr>
<td>b) Continue to next step.</td>
<td>Press any key to continue.</td>
</tr>
</tbody>
</table>

### Step 5: Copy `/etc/hosts` to All Hosts (menu item 3)

<table>
<thead>
<tr>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Continue to next step.</td>
<td>Press any key to continue.</td>
</tr>
</tbody>
</table>

### Step 6: Show `uname -a` for All Hosts (menu item 4)

**Note:** Refer to the Intel® Omni-Path Fabric Switches Release Notes to ensure that any prerequisites for the upgrade to the new firmware level have been met prior to performing the upgrade through FastFabric.

<table>
<thead>
<tr>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Continue to next step.</td>
<td>Press any key to continue.</td>
</tr>
</tbody>
</table>

*continued...*
<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
</table>
| 7.   | Install/Upgrade OPA Software (menu item 5) | Note: An initial installation uninstalls any existing OFA Delta or IFS software. Initial installs must be performed when installing on a clean system or on a system that has stock OFA installed. To upgrade the fabric, refer to Upgrade the Software on the Remaining Servers on page 154.  

| a) Do you want to use ./IntelOPA-[Basic|IFS].DISTRO.VERSION.tgz? [y]: | Press Enter to accept the default. |
| b) Would you like to do a fresh [i]install, an [u]grade or [s]kip this step? [u]: | Type i and press Enter. |
| c) Are you sure you want to proceed? [n]: | Type y and press Enter. |
| d) Complete the installation. | Press any key to continue.  
Note: This step may take several minutes to complete. |
| • If all hosts install... | Press any key to continue.  
| • If any hosts fails to install... | Use the View opahostadmin Results Files menu item to review the result files from the update. |
| 8.   | Configure IPoIB IP Address (menu item 6) |  
| a) Continue to next step. | Press any key to continue. |
| 9.   | Build Test Apps and Copy to Hosts (menu item 7) |  
| a) For each prompt... | Provide your selections and press Enter.  
| b) Continue to next step. | Press any key to continue. |
| 10.  | Reboot Hosts (menu item 8) |  
| a) Continue to next step. | Press any key to continue. |
| 11.  | Ensure the hosts fully reboot, as verified through ping over the management network. | Perform Step 3. |

Optional Tasks  

| 11.   | Refresh SSH Known Hosts (menu item 9) | This menu item refreshes the SSH known hosts list on this server for the Management Network. This may be used to update security for this host if hosts are replaced, reinstalled, renamed, or repaired. |
| 12.   | Rebuild MPI Library and Tools (menu item a) | This menu item prompts you for selection of which MPI to rebuild, and provides choices as to which available compiler to use. |
| 13.   | Run a Command on All Hosts (menu item b) | Intel recommends that you run the date command on all hosts to verify that the date and time are consistent. If needed, use the Copy a File to All Hosts menu item to copy the appropriate files to all hosts to enable and configure NTP. |
| 14.   | Copy a File to All Hosts (menu item c) | A file on the local host may be specified to be copied to all selected hosts. |

Verifying the Host Configuration  

| 15.   | View opahostadmin Result Files (menu item d) | continued... |
### 10.3 Verify the Host Software on the Remaining Servers Using the FastFabric TUI Menu

You can verify the host software using the FastFabric OPA Host Verification/Admin menu.

**NOTE**
As a result of running this sequence, a `punchlist.csv` file is produced. This file provides a cumulative summary of tests that failed and may be provided to technicians for corrective action. The file can easily be imported into spreadsheets or other tools.

**Assumption**
- You are logged into the management node.

**Procedures**

The following steps provide simplified instructions for first-time verification of the hosts. For additional details, refer to the *Intel® Omni-Path Fabric Suite FastFabric User Guide*.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Access the FastFabric OPA Host Verification/Admin Menu.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>a) If you are not already logged into Intel FastFabric OPA Tools, at the command prompt...</td>
<td>Type <code>opafastfabric</code> and press Enter.</td>
</tr>
<tr>
<td></td>
<td>b) Access the OPA Host Verification/Admin Menu.</td>
<td>Press 4.</td>
</tr>
<tr>
<td></td>
<td>c) Select menu items.</td>
<td>Select items 0 – 8.</td>
</tr>
</tbody>
</table>
|      | d) Start the operations.                       | Press P. 
**NOTE:** Each selected item is performed in the order of the menu list. |
| 2.   | Edit Configuration and Select/Edit Host File (menu item 0) | Review the file with focus on the following:                           |
|      | a) Edit the `opafastfabric.conf` file.          |   - `FF_TOPOLOGY_FILE`                                                  |
|      |                                               |   - `FF_IPOIB_SUFFIX`                                                   |
|      |                                               |   - `FF_DEVIATION_ARGS`                                                 |

```
Step | Task/Prompt                                      | Action                                                                 |
1.   | Access the FastFabric OPA Host Verification/Admin Menu. |                                                                 |
|      | a) If you are not already logged into Intel FastFabric OPA Tools, at the command prompt... | Type `opafastfabric` and press Enter.                                   |
|      | b) Access the OPA Host Verification/Admin Menu. | Press 4.                                                                |
|      | c) Select menu items.                           | Select items 0 – 8.                                                    |
|      | d) Start the operations.                       | Press P. 
**NOTE:** Each selected item is performed in the order of the menu list. |
| 2.   | Edit Configuration and Select/Edit Host File (menu item 0) | Review the file with focus on the following:                           |
|      | a) Edit the `opafastfabric.conf` file.          |   - `FF_TOPOLOGY_FILE`                                                  |
|      |                                               |   - `FF_IPOIB_SUFFIX`                                                   |
|      |                                               |   - `FF_DEVIATION_ARGS`                                                 |
```
<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>

      | Create the file with the Management Node’s hosts name  
      | (the TCP/IP management network name, for example  
      | mgmthost) and include the hosts file.  
      | Note: If you have a cluster with mixed servers or HFI  
      | configurations, create a /etc/opa/*hosts file  
      | for each type of server configuration.  
      | If you made any changes, save and close the file.  
      | Press any key to continue. |
|      | c) Do you want to edit/review/change the files? [y]:  
      | Type n and Press Enter. |
|      | e) Continue to next step.  
      | Press any key to continue. |
| 3.  | 3. Summary of Fabric Components (menu item 1)  
      | a) After the operation completes...  
      | Review the results against the expected configuration of  
      | the cluster.  
      | NOTE: If components are missing, or degraded or  
      | omitted links are found, they should be corrected.  
      | Subsequent steps aid in locating any such links.  
      | b) Continue to next step.  
      | Press any key to continue. |
| 4.  | 4. Verify Hosts Pingable, SSHable and Active (menu  
      | item 2)  
      | a) For each prompt...  
      | Provide the required information and press Enter.  
      | b) After completion of the tests, you are prompted:  
      | Would you like to now use /etc/opa/good as  
      | Host File? [y]:  
      | Press Enter to use the file or n to discard the file. |
| 5.  | 5. Perform Single Host Verification (menu item 3)  
      | a) Would you like to edit /root/hostverify.sh  
      | and copy to hosts? [y]:  
      | Review the settings near the top and the list of TESTS  
      | selected.  
      | Note: If you have a cluster with mixed servers or HFI  
      | configurations, ensure you add the proper  
      | settings for the server configuration (HFI PCIe  
      | bus, server memory size, expected single node  
      | HPL performance for server, etc) to the /root/  
      | hostverify.sh file  
<pre><code>  | If you made any changes, save and close the file. |
</code></pre>

<td>Type <code>opascpall -p -f hostfile /etc/hosts /etc/hosts</code>.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> If DNS is being used, skip this step.</td>
<td></td>
</tr>
<tr>
<td>5.</td>
<td>(Optional) Copy the <code>/etc/resolv.conf</code> file on this host to all the other selected hosts.</td>
<td>Type <code>opascpall -p -f hostfile /etc/resolv.conf /etc/resolv.conf</code>.</td>
</tr>
<tr>
<td>6.</td>
<td>Show <code>uname -a</code> (OS version) on all the hosts.</td>
<td>Type <code>opacmdall -T 60 -f hostfile 'uname -a'</code>.</td>
</tr>
<tr>
<td>7.</td>
<td>Install the Intel® Omni-Path Fabric Host Software on all the hosts.</td>
<td>Type <code>opahostadmin -f hostfile -d dir load</code>. By default, it looks in the current directory for the IntelOFA-Basic.DISTRO.VERSION.tgz file.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> An initial installation uninstalls any existing OFA Delta or IFS software. Initial installs must be performed when installing on a clean system or on a system that has stock OFA installed. To upgrade the fabric, refer to Upgrade the Software on the Remaining Servers on page 154.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• If all hosts install...</td>
<td>Continue to the next step.</td>
</tr>
<tr>
<td></td>
<td>• If any hosts fails to install...</td>
<td>Use the View opahostadmin result files option to review the result files from the update.</td>
</tr>
<tr>
<td>8.</td>
<td>Configure IPoIB IP Address.</td>
<td>Type <code>opahostadmin -f hostfile configipoib</code>. <strong>NOTE:</strong> The file is created with a statically assigned IPv4 address. The IPoIB IP address for each host is determined by the resolver (Linux* host command). If not found through the resolver, <code>/etc/hosts</code> on the given host is checked.</td>
</tr>
</tbody>
</table>
## 9. Build the MPI sample applications on the Management Node and copy the resulting object files to all the hosts.

**Note:** This is in preparation for execution of MPI performance tests and benchmarks in a later step.

**Note:** This option is only available when using the Intel® Omni-Path Fabric Host Software packaging of OFA (OFA Delta).

**Type**

```
MPICH_PREFIX=path_to_mpi
cd /usr/src/opa/mpi_apps; make clobber quick
opascpall -t -p -f hostfile source_dir dest_dir.
```

## 10. Reboot all the selected hosts.

**Type**

```
opahostadmin -f hostfile reboot.
```

## 11. Ensure the hosts fully reboot, as verified through ping over the management network.

Perform Step 2.

### Verifying the Host Configuration

#### 15. View opahostadmin result files.

**Type**

```
editor result_dir/ result_file.
```

**NOTE:** In the line above, "editor" indicates the command line editor; for example, vi. The following default files are created:

- test.res
- test.log

### Next Steps

- To verify the host software is installed and running on the remaining servers, go to **Verify the Host Software on the Remaining Servers Using CLI Commands**.

### 10.5 Verify the Host Software on the Remaining Servers Using CLI Commands

You can verify the host software using the FastFabric OPA Host Verification/Admin menu.

**NOTE**

As a result of running this sequence, a punchlist.csv file is produced. This file provides a cumulative summary of tests that failed and may be provided to technicians for corrective action. The file can easily be imported into spreadsheets or other tools.

### Assumption

- You are logged into the management node.

### Procedures

The following steps provide simplified instructions for first-time verification of the hosts. For additional details, refer to the **Intel® Omni-Path Fabric Suite FastFabric User Guide**.

| • If any hosts fail... | • Carefully examine the failing hosts to verify the HFI models, PCIe slot used, BIOS settings, and any motherboard or BIOS settings related to devices on PCIe buses or slot speeds.  
• Also verify that the HFI and any riser cards are properly seated.  

**Optional Tasks**

*NOTE:* This should be performed after configuring any additional Management Nodes.  
Type `opaallanalysis -b`.  

12. Perform host and/or ISL cable testing.  
*NOTE:* The test allows for starting and stopping an extended Bit Error Rate test. The system prompts to clear hardware counters.  
*NOTE:* Intel recommends that you run this test for 20-60 minutes for a thorough test. While the test is running, monitor the fabric for signal integrity or stability errors using `opatop`, `opareport`, and/or the Fabric Manager GUI. Once the desired test time has elapsed, stop the test using the command:  
Type `opacabletest -C -f hostfile start`.  

| a) To stop the test... | Type `opacabletest -f hostfile stop`. |

**Review the Host Verification**

13. View `opahostadmin` result files.  
Type `editor result_dir/result_file`.  
*NOTE:* In the line above, "editor" indicates the command line editor; for example, vi. The following default files are created:  
• `test.res`  
• `test.log`  

**End Task**

**Next Steps**

• To set up and configure the management software for additional management nodes, go to Set Up Additional Management Nodes.
11.0 Set Up Additional Management Nodes

If the fabric has more than one Management Node, you need to set up additional management nodes. Previous sections in this installation guide described how to perform basic software installation, setup, and verification on the nodes in a fabric. This section describes how to install and configure the management software itself.

NOTE

The following procedures assume a symmetrical configuration where all Management Nodes have the same connectivity and capabilities.

In asymmetrical configurations where the Management Nodes are not all connected to the same set of management networks and subnets, the files copied to each management node may need to be slightly different. For example, configuration files for fabric analysis may indicate different port numbers, or host files used for FastFabric, and MPI may need to list different hosts.

For multiple-subnet configurations, refer to Multi-Subnet Fabrics on page 133.

11.1 Before You Begin

Before starting the set up of the additional management nodes, perform the following:

- If required, upgrade the software to add additional IFS components using the procedure documented in Upgrade from OPA-Basic to OPA-IFS Software Package on page 156.
  - The Management Node must have at least Intel® Omni-Path Fabric Suite FastFabric, the Intel® Omni-Path Fabric Stack, and should have IPoIB installed and configured.
  - If this node is intended to also run a redundant fabric manager, install the Intel® Omni-Path Fabric Suite Fabric Manager.
  - For MPI clusters, the Management Node should also include at least OFA openmpi or OFA mvapich2. If you plan to rebuild MPI, the Intel® Omni-Path Fabric Host Software Fabric Development package and MPI Source packages are also required.

NOTE

Do not uninstall or replace existing configuration files that were previously created, especially IPoIB-related configuration files.

11.2 Configure Additional Management Nodes Using FastFabric TUI Menus

You can configure additional management nodes using the FastFabric TUI menus.
Assumption
• You are logged into the target Management Node.

Procedures
Repeat the following steps on each additional Management Node.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1.   | Copy the FastFabric configuration files from the initial Management Node to each new management node. | At a minimum, the following files should be copied:  
/etc/opa/opafastfabric.conf  
/etc/opa/ports  
/etc/opa/topology*.xml  
/etc/opa/hosts  
/etc/opa/allhosts  
/etc/opa/switches  
/etc/opa/chassis |
| 2.   | Log into the FastFabric TUI. At the prompt... | Type opafastfabric. |
| 3.   | From the main menu, access the FastFabric OPA Host Setup menu. | Press 3. |
|      | a) Edit Configuration and Select/Edit Host File | Select 0 and press P to start the operation. |
|      | b) Edit the hosts file. | Edit the hosts file such that the file on each Management Node omits itself. |
|      | c) Complete the task. | Press X to return to the main menu. |
|      | a) Edit Configuration and Select/Edit Host File | Select 0 and press P to start the operation. |
|      | b) Edit the allhosts file. | Edit the allhosts file such that the file on each Management Node specifies itself. |
|      | c) Complete the task. | Press X to return to the main menu. |
| 5.   | If Fabric Manager is to be run on the new management nodes, copy the Fabric Manager configuration file (/etc/opa-fm/opafm.xml) from the initial Management Node to each new management node. | Refer to the Intel® Omni-Path Fabric Suite Fabric Manager User Guide for more information on how to configure the Fabric Manager. |
|      | a) Edit the opafm.xml file on each Management Node as needed. |
|      | a) (Linux) Set Up Password-Less SSH/SCP | Select 2 and press P to start the operation. |
|      | b) Password for root on all hosts: | Type the password for root on all hosts and press Enter. |
|      | c) Upon completing the task, you are returned to the FastFabric OPA Host Setup menu. |
|      | d) Refresh SSH Known Hosts | Select 9 and press P to start the operation. |
|      | e) Complete the operation. | Press any key to end the operation. |

End Task

Next Steps
• To configure and run the health check tool, go to Perform Initial Health Check.
11.3 Configure Additional Management Nodes Using FastFabric CLI Commands

You can configure additional management nodes using the FastFabric CLI commands.

Assumption
• You are logged into the target Management Node.

Procedures
Repeat the following steps on each additional Management Node.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Copy the FastFabric configuration files from the initial Management Node to each new management node.</td>
<td>At a minimum, the following files should be copied:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>/etc/opa/opafastfabric.conf</td>
</tr>
<tr>
<td></td>
<td></td>
<td>/etc/opa/ports</td>
</tr>
<tr>
<td></td>
<td></td>
<td>/etc/opa/topology*.xml</td>
</tr>
<tr>
<td></td>
<td></td>
<td>/etc/opa/hosts</td>
</tr>
<tr>
<td></td>
<td></td>
<td>/etc/opa/allhosts</td>
</tr>
<tr>
<td></td>
<td></td>
<td>/etc/opa/switches</td>
</tr>
<tr>
<td></td>
<td></td>
<td>/etc/opa/chassis</td>
</tr>
<tr>
<td>2.</td>
<td>Edit the /etc/opa/hosts configuration file.</td>
<td>Edit the hosts file such that the file on each Management Node omits itself.</td>
</tr>
<tr>
<td>3.</td>
<td>Edit the /etc/opa/allhosts configuration file.</td>
<td>Edit the allhosts file such that the file on each Management Node specifies itself.</td>
</tr>
<tr>
<td>4.</td>
<td>If Fabric Manager is to be run on the new management nodes, copy the Fabric Manager configuration file (/etc/opa-fm/opafm.xml) from the initial Management Node to each new management node.</td>
<td></td>
</tr>
<tr>
<td>5.</td>
<td>Edit the opafm.xml file on each Management Node as needed.</td>
<td>Refer to the Intel® Omni-Path Fabric Suite Fabric Manager User Guide for more information on how to configure the Fabric Manager.</td>
</tr>
<tr>
<td>6.</td>
<td>Set up secure password-less SSH, such that the Management Node can securely log into all the hosts as root through the management network, without requiring a password.</td>
<td>Type opasetupssh -S -p -i &quot;&quot; -f hostfile.</td>
</tr>
<tr>
<td>7.</td>
<td>Refresh the SSH known_hosts file on the Management Node to include the IPoIB hostnames of all the hosts.</td>
<td>Type opasetupssh -p -u -f hostfile.</td>
</tr>
</tbody>
</table>

End Task

Next Steps
• To configure and run the health check tool, go to Perform Initial Health Check.
12.0 **Perform Initial Health Check**

The Health Check tool performs the initial fabric verification and creates a baseline of the hardware and software configuration. Once a good baseline has been established, you use the tools to compare the present fabric against the baseline and check its health. Baselines are rerun when changes occur such as fabric upgrades, hardware replacements or changes and software configuration changes.

12.1 **Before You Begin**

Before starting the health check configuration, perform the following:

- Be sure you have the latest *Intel® Omni-Path Fabric Switches Release Notes* for reference.
- Gather your information for the configuration files, as needed.
  
  Note that you can edit the files before you configure the health check. Configuration files are located under the `/etc/opaf` directory. Sample files are installed into `/usr/share/opaf/samples` with the suffix `-sample`.

The following files are used to configure the health check:

- `opafastfabric.conf`: Lists the default settings for most of the FastFabric command line options.
  
  Review and update the following parameters as needed:
  
  - `FF_ANALYSIS_DIR`
    
    This parameter should be updated to reflect the type of SM (esm or hsm).
  
  - `FF_ALL_ANALYSIS`
    
    **NOTE:** If you are running in a back-to-back configuration, this parameter should not contain `chassis`.

  - `FF_FABRIC_HEALTH`
  
  - `FF_CHASSIS_CMDS`
  
  - `FF_CHASSIS_HEALTH`
  
  - `FF_ESM_CMDS`

- `esm_chassis`: Lists the chassis names, using the assigned TCP/IP Ethernet management port names or IP addresses, that are running SMs if using Embedded SM(s) in the Intel® Omni-Path Fabric Chassis.

  Intel recommends you use chassis names (the TCP/IP Ethernet management port names assigned). Enter one chassis name or IP address per line.

  For example:

  ```
  Chassis1
  Chassis2
  ```

## 12.2 Configure and Initialize Health Check Tools Using FastFabric TUI Menu

The health check tools may be run on one or more Management Nodes within the cluster. You set up and use the Intel® Omni-Path Fabric Suite FastFabric health check tools using the FastFabric TUI Menu.

For more information about health check tools, see the detailed discussion in the *Intel® Omni-Path Fabric Suite FastFabric User Guide*.

### Assumption
- You are logged into the target management node.

### Procedures

Repeat the following steps on each Management Node that will use the health check tools.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Create the <code>/etc/opa/esm_chassis</code> file.</td>
<td>Create the file with a list of the chassis names using the assigned TCP/IP Ethernet management port names.</td>
</tr>
<tr>
<td>2.</td>
<td>Access the FastFabric OPA Host Verification/Admin Menu.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>a) If you are not already logged into Intel FastFabric OPA Tools, at the command prompt...</td>
<td>Type <code>opafastfabric</code> and press Enter.</td>
</tr>
<tr>
<td></td>
<td>b) Access the OPA Host Verification/Admin Menu.</td>
<td>Press 4.</td>
</tr>
<tr>
<td>2.</td>
<td>Edit Configuration and Select/Edit Host File (menu item 0)</td>
<td></td>
</tr>
</tbody>
</table>
|      | a) Edit `opafastfabric.conf` file. | Review the following parameters:  
  - `FF_ANALYSIS_DIR`  
    This parameter should be updated to reflect the type of SM (esm or hsm).  
  - `FF_ALL_ANALYSIS`  
    **NOTE:** If you are running in a back-to-back configuration, this parameter should not contain `chassis`.  
  - `FF_FABRIC_HEALTH`  
  - `FF_CHASSIS_CMDS`  
  - `FF_CHASSIS_HEALTH`  
  - `FF_ESM_CMDS` |
| 3.   | Check Overall Fabric Health (menu item 9) | Select item 9 and press P. |
|      | a) Performing Host Admin: Check Overall Fabric Health Baseline present configuration? [n]: | Press Enter. |
| 4.   | Check the results. | a) If no errors were encountered... Continue to next step. |

*continued...*
Step | Task/Prompt | Action
--- | --- | ---
b) If any errors are encountered... | Perform the following:
1. Resolve the errors.
2. Rerun 3. and 4. until a clean run occurs.

5. Create a cluster configuration baseline.

a) Check Overall Fabric Health (menu item 9) | Select item 9 and press P.

b) Performing Host Admin: Check Overall Fabric Health Baseline present configuration? [n]: | Press y and press Enter.

6. If required, schedule regular runs of opaallanalysis through cron or other mechanisms. | Refer to the Linux* OS documentation for more information on cron.
Also refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide for more information about opaallanalysis and its automated use.

End Task

Next Steps
- Before you run top500 HPL (High Performance Linpack) runs or customer acceptance tests, Intel recommends that you follow all steps outlined in the Intel® Omni-Path Fabric Setup Guide.
- To run top500 HPL2, go to Run a Sample High Performance Linpack 2 Configuration.

12.3 Configure and Initialize Health Check Tools Using FastFabric CLI Commands

The health check tools may be run on one or more Management Nodes within the cluster. You set up and use the Intel® Omni-Path Fabric Suite FastFabric health check tools using CLI commands.

For more information, see the detailed discussion in the Intel® Omni-Path Fabric Suite FastFabric User Guide.

Assumption
- You are logged into the target management node.

Procedures
Repeat the following steps on each Management Node that will use the health check tools.

Step | Task/Prompt | Action
--- | --- | ---
1. | Edit /etc/opa/opafastfabric.conf file. | Review the following parameters:
- FF_ANALYSIS_DIR
  This parameter should be updated to reflect the type of SM (esm or hsm).
- FF_ALL_ANALYSIS
  NOTE: If you are running in a back-to-back configuration, this parameter should not contain chassis.
- FF_FABRIC_HEALTH

continued...
## Step 2

### Task/Prompt
Create the `/etc/opa/esm_chassis` file.

### Action
Create the file with a list of the chassis names using the assigned TCP/IP Ethernet management port names.

## Step 3

### Task/Prompt
Perform a health check.

### Action
Type `opaallanalysis -e`.

## Step 4

### Task/Prompt
Check the results.

#### a) If no errors were encountered...
Continue to next step.

#### b) If any errors are encountered...
Perform the following:
1. Resolve the errors.
2. Rerun steps 3 and 4 until a clean run occurs.

## Step 5

### Task/Prompt
Create a cluster configuration baseline.

*Note:* This may also be done using the FastFabric TUI menu by selecting Check Overall Fabric Health and answering y to the question: Baseline present configuration? [n]:

### Action
Type `opaallanalysis -b`.

## Step 6

### Task/Prompt
If required, schedule regular runs of `opaallanalysis` through cron or other mechanisms.

### Action
Refer to the Linux* OS documentation for more information on cron. Also refer to the Intel® Omni-Path Fabric Suite FastFabric User Guide for more information about `opaallanalysis` and its automated use.

## Next Steps

- Before you run top500 HPL (High Performance Linpack) runs or customer acceptance tests, Intel recommends that you follow all steps outlined in the Intel® Omni-Path Fabric Setup Guide.

- To run top500 HPL2, go to Run a Sample High Performance Linpack 2 Configuration.
13.0 Perform High Performance Linpack Benchmark

This section describes how to gather MPI benchmark data. A set of common MPI benchmarks are installed as part of the installation process. A popular measure of overall performance is High Performance Linpack 2 (HPL2), which is used to rate systems on the Top 500 list.

You run the initial HPL2 benchmark to gather preliminary baseline numbers. The sample configurations provided in the /usr/src/opa/mpi_apps/hpl-config folder should perform within 10 – 20% of optimal HPL2 results for the cluster. For further performance tuning, refer to the Intel® Omni-Path Fabric Performance Tuning User Guide.

The basic HPL2 process is:

1. **Perform the initial run.**
   
   This should be a very small problem size to determine if the run is successful. Performance of this run is expected to be low.
   
   If the initial run is successful, you are ready to move onto full scale HPL2 runs.

2. **Perform full scale runs based on your cluster size using sample or customized configurations.**
   
   Assorted sample HPL.dat files are provided in the /usr/src/opa/mpi_apps/hpl-config folder. These files are a good starting point for most clusters and should get within 10 – 20% of the optimal performance for the cluster. The problem sizes used assume a cluster with 1GB of physical memory per processor. For example, for a two-processor node, 2 GB of node memory is assumed. For each cluster size, four files are provided:
   
   - **t** – A very small test run (5000 problem size)
   - **s** – A small problem size on the low end of optimal problem sizes
   - **m** – A medium problem size
   - **l** – A large problem size

   The sample files can be selected using config_hpl2.
   
   Customized files can be generated using hpl_dat_gen.

3. **Review the results.**
   
   Use the top command on a node to monitor memory and CPU usage.
   
   The xhpl should use 98 – 99% of the CPU. If any other processes are taking more than 1 – 2%, review the host configuration and stop these extra processes if possible. HPL is very sensitive to swapping. If a lot of swapping is seen, and xhpl is dropping below 97% for long durations, this may indicate a problem size that is too large for the memory and OS configuration.
   
   You can continue to tune HPL2 to refine performance. Parameters in HPL.dat can all affect HPL performance. In addition, the selection of compiler and BLAS Math library may also significantly affect performance. The new HPL.dat files may be
placed in /usr/src/opa/mpi_apps/hpl-config. Use config_hpl to select them and copy them to all nodes in the run. Alternately, scpall may be used to copy the file to all nodes. Refer to Intel® Omni-Path Fabric Suite FastFabric User Guide for more information on scpall.

13.1 Before You Begin

Before starting the High Performance Linpack benchmark, perform the following:

- Ensure that you have followed all steps outlined in the Intel® Omni-Path Fabric Setup Guide.
- Create the file /usr/src/opa/mpi_apps/mpi_hosts listing the host names of all the hosts.

**NOTE**

Use mpi_hosts.sample as a starting point for creating the mpi_hosts file.

- Determine the HPL2 runs in advance, as needed.
  - Select an initial, small configuration to verify HPL has been properly compiled.
  - Select one or more full scale configurations based on the cluster size and problem size.

**NOTES**

You will need to the following commands to perform the funs:
- Select configuration command usage:
  ```bash
  ./config_hpl2 config_name[problem_size]
  ```
- Run command usage:
  ```bash
  run_hpl number_processes
  ```

For example, ./config_hpl2 256s selects the configuration and, subsequently, ./run_hpl2 256 runs the configuration.

13.2 Run a Sample High Performance Linpack 2 Configuration

You can run sample HPL2 configurations to gather baseline numbers based on pre-configured HPL.dat files found in the /usr/src/opa/mpi_apps/hpl-config folder.

**Assumptions**

- You are logged into the host.
- You have determined the configurations you will run.
**Procedure**

**NOTE**
It is best to start with a small configuration to verify HPL has been properly compiled, then move on to full scale HPL2 runs.

*(Host)* To run a sample HPL2 configuration, perform the following:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Change directories to the mpi_apps folder.</td>
<td>Type cd /usr/src/opa/mpi_apps</td>
</tr>
<tr>
<td>2.</td>
<td>If you do not know which configuration file you will use, view the sample configuration files.</td>
<td>Type ./config_hpl2.</td>
</tr>
<tr>
<td>3.</td>
<td>Select an initial run with a very small problem size to determine if the run is successful.</td>
<td>Type ./config_hpl2 &lt;number of processes&gt;&lt;problem size&gt;. For example, ./config_hpl2 32a</td>
</tr>
<tr>
<td>4.</td>
<td>Run the configuration.</td>
<td>Type ./run_hpl2 &lt;number of processes&gt;&lt;problem size&gt; For example, ./run_hpl2 32</td>
</tr>
<tr>
<td>5.</td>
<td>Review the results. <strong>NOTE:</strong> Performance of this run is expected to be low.</td>
<td>Continue to the next step.</td>
</tr>
<tr>
<td></td>
<td>• If the run is successful...</td>
<td>Troubleshoot.</td>
</tr>
<tr>
<td></td>
<td>• If it is not successful...</td>
<td></td>
</tr>
<tr>
<td>6.</td>
<td>View the sample configuration files to find a configuration that simulates your cluster.</td>
<td>Type ./config_hpl2.</td>
</tr>
<tr>
<td>7.</td>
<td>Select a full scale run to that simulates your cluster.</td>
<td>Type ./config_hpl2 &lt;number of processes&gt;&lt;problem size&gt;. For example, ./config_hpl2 9216m</td>
</tr>
<tr>
<td>8.</td>
<td>Run the configuration.</td>
<td>Type ./run_hpl2 &lt;number of processes&gt;&lt;problem size&gt; For example, ./run_hpl2 9216</td>
</tr>
<tr>
<td>9.</td>
<td>Review the results.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>End Task</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Next Steps**
- To install and start up the Fabric Manager GUI software, refer to Install Intel® Omni-Path Fabric Suite Fabric Manager GUI.

**13.3 Generate and Run a Custom High Performance Linpack Configuration**

To generate a custom HPL2 configuration, you use hpl_dat_gen to probe the current node for information on the number of cores and the amount of memory and prompts you for the desired characteristics of the run.

**Assumptions**
- You are logged into the host.
- You have determined the configurations you will run.
Procedures

(Host) To generate and run a custom HPL2 configuration, perform the following:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Change directories to the mpi_apps folder.</td>
<td>Type cd /usr/src/opa/mpi_apps</td>
</tr>
<tr>
<td>2.</td>
<td>Start the dat generator tool.</td>
<td>Type ./hpl_dat_gen.</td>
</tr>
<tr>
<td>3.</td>
<td>Provide the following information:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>a) Number of compute nodes [1]?</td>
<td>Type a number and press Enter.</td>
</tr>
<tr>
<td></td>
<td>b) Number of cores per node [72]?</td>
<td>Type a number and press Enter.</td>
</tr>
<tr>
<td></td>
<td>c) Number of RAM per node (in MB) [64156]?</td>
<td>Type a number and press Enter.</td>
</tr>
<tr>
<td></td>
<td>d) Memory pressure (range between 0.1 and 0.9) [0.3]?</td>
<td>Type a decimal number and press Enter.</td>
</tr>
<tr>
<td></td>
<td>e) From the results, note the number of processes. This will be added to the run command: ./run_hpl2 &lt;number of processes&gt;.</td>
<td>Continue to the next step.</td>
</tr>
</tbody>
</table>

```
HPLinpack benchmark input file - 9216 processes, 0.5 memory size
Generated by hpl_dat_gen.sh.
HPL.out        file name (if any)
6        device out (6=stdout,7=stderr,file)

0        U in [0=transposed,1=no-transposed] form
1        Equilibration (0=no,1=yes)
8        memory alignment in double (> 0)
```

3. Run the configuration. Type ./run_hpl2 <number of processes>. For example: ./run_hpl2 9216
4. Review the results.

End Task

Next Steps
- To install and start up the Fabric Manager GUI software, refer to Install Intel® Omni-Path Fabric Suite Fabric Manager GUI.
14.0 Additional Installation and Setup Tasks

This chapter describes additional installation and setup tasks that, depending on your configuration, you may need to perform during or after software installation.

14.1 QSFP-DD Cables

If your hardware configuration uses QSFP-DD cables, you will need to perform the following steps to be able to query the cable information using command line tools.

1. On the Host, open the `/etc/opa-fm/opafm.xml` file for editing.
2. Search on "<CableInfoPolicy>".
3. Uncomment the line and change the value to `ByPort` as shown below.
   ```xml
   <CableInfoPolicy>ByPort</CableInfoPolicy>
   ```
4. Save the `opafm.xml` file.
5. Restart the Fabric Manager using `systemctl restart opafm`.
6. Copy the `opafm.xml` file to other hosts.
7. Restart the Fabric Manager on the other hosts using `systemctl restart opafm`.

14.2 Multi-Subnet Fabrics

Intel® Omni-Path Fabric Suite FastFabric supports management of both single-subnet fabric and multi-subnet fabrics. This section describes differences in the installation procedure that are relevant for multi-subnet fabrics.

When operating a multi-subnet fabric, a subnet manager (SM) is required for each subnet. An SM may be run within switches within each subnet, or a host-based SM may be run. A host-based SM can manage multiple subnets (assuming the host server is connected to more than one subnet).

A number of combinations are possible for multi-subnet fabrics:

- **All subnets are completely independent (except for any interconnecting routers).**

  If a separate FastFabric node is being used per subnet, and servers are not installed in more than one subnet, the individual subnets can be treated separately. This single-subnet scenario is created using the default FastFabric instructions previously described in this document. No further instructions are required from this section.

- **The subnets are primarily independent.**

  The only components common to more than one subnet are the FastFabric nodes (and possibly SM nodes) and no servers are installed in more than one subnet. To configure independent subnets, follow the instructions described in this section.
The subnets are overlapping.
Multiple components are common to more than one subnet, such as FastFabric nodes, servers, and others. This includes dual rail fabrics with dual subnets. To configure overlapping subnets, follow the instructions described in this section.

14.2.1 Setting Up Subnets
This section provides additional instructions performed for specific steps during the installation and configuration process. Use the table below as both instructions and a checklist for setting up your subnets.

Procedures
Perform the installation and configuration as described in this guide. Append the following actions during the process.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Installation Prerequisites</td>
<td></td>
</tr>
<tr>
<td>a)</td>
<td>Fabric Design Prerequisites</td>
<td>Design the cabling such that the FastFabric node is connected to each subnet it manages. The FastFabric node must also have a management network path to all the nodes in all the subnets that it manages. As part of the design, consider where routes between subnets are required, between routers, IPoIB routers, and other devices.</td>
</tr>
<tr>
<td>b)</td>
<td>Fabric Setup Prerequisites</td>
<td>When installing the IFS software on the Fabric Management Node, IPoIB must be configured such that each subnet is an independent IPoIB network interface, typically with different IP subnets. Refer to the Intel® Omni-Path Fabric Host Software User Guide for more information on configuring IPoIB.</td>
</tr>
<tr>
<td>2.</td>
<td>Install the Intel® Omni-Path Software</td>
<td>As stated.</td>
</tr>
<tr>
<td>3.</td>
<td>Configure the Software</td>
<td></td>
</tr>
</tbody>
</table>
| a)   | Configure the Chassis              | • When creating the chassis file, list all Intel internally-managed switches in all subnets. If required, additional files may be created per subnet that list only the Intel chassis in each subnet.  
  • When editing the ports file, list all the Fabric Management Node ports that access the managed fabrics. If required, additional files may be created per subnet that list only the Fabric Management Node port connected to the given managed fabric. |
| b)   | Configure an FM instance for each subnet. | Each subnet requires an FM instance and a unique Subnet Prefix.  
  • If the FM nodes are connected to both subnets, refer to Configuring Dual Rails for Dual Subnets.  
  • If the FM nodes are each connected to a single subnet, refer to Setting Up Dual Rails for a Single Subnet. Set up each FM with a unique subnet prefix. |
| c)   | Configure the Externally-Managed Switches | • When editing the ports file, list all the Fabric Management Node ports that access the managed fabrics. If required, additional files may be created per subnet that list only the Fabric Management Node port connected to the given managed fabric. |
### Additional Installation and Setup Tasks—Intel® Omni-Path Fabric

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• If required, the switches file may specify a hfi:port per switch. However, if hfi:port is not specified, all the hfi:port entries specified in the ports file are searched to locate the given switch's node GUID.</td>
</tr>
</tbody>
</table>
| d)  | Install the Host Software on the Remaining Hosts Using the FastFabric TUI Menu | • When creating the hosts file, list the hosts in all subnets except the Fabric Management Node where FastFabric is being run. If required, additional files may also be created per subnet that list the hosts in each subnet, except the Fabric Management Node.  
• For hosts that are connected to more than one subnet, IPoIB must be configured such that each subnet is an independent IPoIB network interface, typically with different IP subnets. Refer to the Intel® Omni-Path Fabric Host Software User Guide for more information on configuring IPoIB. |
| e)  | Verify the Host Software on the Remaining Servers Using the FastFabric TUI Menu | • Edit Configuration and Select/Edit Host File  
Create the allhosts file as per the instructions. Next, create additional files per subnet that list all the hosts in each subnet including the Fabric Management Node. When editing the ports file, list all the Fabric Management Node ports that access the managed fabrics. If required, additional files may be created per subnet that list only the Fabric Management Node port connected to the given managed fabric.  
• Verify Hosts See Each Other  
This can be run for each subnet by using the allhosts files specific to each subnet (i.e., those listing only hosts in a single subnet).  
• Check MPI Performance  
This can be run for each subnet by using the allhosts files specific to each subnet (i.e., those listing only the hosts in a single subnet). |
| f)  | Configure Additional Management Nodes Using FastFabric TUI Menus | When copying FastFabric configuration files to the additional Fabric Management Nodes, be sure to also copy the additional hosts, chassis, and allhosts files that were created per subnet.  
Note: In asymmetrical configurations where the Fabric Management Nodes are not all connected to the same set of subnets, the files copied to each management node may need to be slightly different. For example, configuration files for opafabricanalysis may indicate different port numbers or host files used for FastFabric, and MPI may need to list different hosts. |
| g)  | Configure and Initialize Health Check Tools Using FastFabric CLI Commands | Make sure the /etc/opa/ports file lists each of the Fabric Management Node local HFIs and ports that are connected to a unique subnet.  
When running opareports, opafabricinfo, opafabricanalysis, or opaallanalysis, the default is to use the ports file. If required, the -p and -t options or the PORTS/PORTS_FILE environment variables may be used to specify all the HFIs and ports on the Fabric Management Node such that all subnets are checked. Similarly, the esm_chasssis and chassis files used must list all relevant Intel chassis in all subnets. |
### Multi-Rail Usage

This section provides an overview and instructions for configuring the common multi-rail scenarios.

### Multi-Rail Overview

A multi-rail configuration provides load balancing and failover capabilities, adding a higher degree of fabric redundancy. If one HFI or an entire subnet fails, traffic can be moved to the remaining switches.

The multi-rail feature can be applied to a single subnet or multiple subnets. By enabling multi-rail, a process can use multiple network interface cards (HFIs) to transfer messages.

**TERMINOLOGY**

- Subnets can also be referred to as *planes* or *fabrics*.
- Hosts can also be referred to as *nodes*.
- HFIs can also be referred to as *rails*.

Three basic scenarios include:

- Single-rail in a single subnet: This scenario, shown in the following figure, consists of one HFI in a server connected to one subnet. This is the default configuration during installation. This configuration provides the performance required by most applications in use today.
• Dual-rail in a single subnet: This scenario, shown in the following figure, consists of two HFIs in the same server connected to the same subnet. This configuration also provides improved MPI message rate, latency, and bandwidth to the node.

• Dual-rail in dual subnets: This scenario, shown in the following figure, consists of two HFIs in the same server connected to separate subnets. Depending on the platform, this configuration may provide improved MPI message rate, latency, and bandwidth to the node.

NOTE
Other multi-rail scenarios can be configured. A single Host FM server can manage multiple subnets up to the supported number of FM instances.
14.3.2 Setting Up Dual Rails for a Single Subnet

Support for single rail or dual rails in a single subnet is the default scenario expected during installation. The driver will detect that there are one or two HFIs connected to the host on the same fabric. In most scenarios, no adjustments to opafm.xml are required for this configuration.

If opafm.xml is not modified, some APIs may not function correctly or may issue a warning (such as older versions of Open MPI) as shown below; however, both rails participate in the MPI application correctly.

```
WARNING: There are more than one active ports on host 'a', but the default subnet GID prefix was detected on more than one of these ports. If these ports are connected to different physical IB networks, this configuration will fail in Open MPI. This version of Open MPI requires that every physically separate IB subnet that is used between connected MPI processes must have different subnet ID values.
```

In this case, in order to prevent this warning, you need to change the SubnetPrefix for fm0 as described in the steps below.

**Assumptions**

- HFIs have been installed in the host servers.
- HFIs have been cabled as shown below:

```
   Host
     HFI1_0
     HFI1_1
   Subnet
```

**Important Information**

Below is an overview of the steps you should take:

1. Stop all standby Fabric Manager using `systemctl stop opafm`.
2. Stop the master Fabric Manager using `systemctl stop opafm`.
3. Update the opafm.xml file of the master Fabric Manager as described below.
4. Update the opafm.xml file of all standby Fabric Manager as described below.
5. Restart the master Fabric Manager using `systemctl restart opafm`.
6. Restart the standby Fabric Managers using `systemctl restart opafm`.
7. Run `service opafm status` to verify that the Fabric Managers are running.

**Procedures**

Perform the following steps to set the SubnetPrefix:
1. Open the `/etc/opa-fm/opafm.xml` file for editing.
2. Search for "<Shared>" to review the fm0 settings.

An example of the shared instance for fm0 with key items in bold is shown below. Note that this is the default configuration for a single-rail in a single subnet.

```
<!-- Shared Instance config, applies to all components: SM, FM and FE -->
<Shared>
  <!-- Fm.Shared.Start controls overall startup of the Instance. -->
  <!-- If 0, none of the components in the Instance are started. -->
  <!-- If 1, instance is enabled and Fm.Sm.Start, Fm.Fm.Start, etc -->
  <!-- control startup of each manager. The default for each manager -->
  <!-- is defined by Common.Sm.Start, Common.Fm.Start, etc -->
  <!-- ESM does not support Start via XML configuration. Use CLI commands -->
  <Start>1</Start>
  <!-- <StartupRetries>5</StartupRetries> -->
  <!-- <StartupStableWait>10</StartupStableWait> -->
  
  <!-- Name, Hfi, Port, and PortGUID are ignored for ESM since they -->
  <!-- are automatically set -->
  <Name>fm0</Name> <!-- also for logging with _sm, _fe, _pm appended -->
  <Hfi>1</Hfi> <!-- local HFI to use for FM instance, 1-1st HFI -->
  <Port>1</Port> <!-- local HFI port to use for FM instance, 1-1st Port -->
  <PortGUID>0x0000000000000000</PortGUID> <!-- local port to use for FM -->
  <SubnetPrefix>0xfe80000000000000</SubnetPrefix> <!-- should be unique -->
  
  <!-- Overrides of the Common.Shared parameters if desired -->
  <!-- ESM does not support LogFile -->
  <!-- <LogFile>/var/log/fm0_log</LogFile> --> <!-- log for this instance -->
</Shared>
```

3. Change the `<SubnetPrefix>` for fm0 to a unique value other than `0xfe80000000000000`. A recommended value to use would be `0xfe80000000001000`.

An example of the change is shown below.

```
<!-- Shared Instance config, applies to all components: SM, FM and FE -->
<Shared>
  <!-- Fm.Shared.Start controls overall startup of the Instance. -->
  <!-- If 0, none of the components in the Instance are started. -->
  <!-- If 1, instance is enabled and Fm.Sm.Start, Fm.Fm.Start, etc -->
  <!-- control startup of each manager. The default for each manager -->
  <!-- is defined by Common.Sm.Start, Common.Fm.Start, etc -->
  <!-- ESM does not support Start via XML configuration. Use CLI commands -->
  <Start>1</Start>
  <!-- <StartupRetries>5</StartupRetries> -->
  <!-- <StartupStableWait>10</StartupStableWait> -->
  
  <!-- Name, Hfi, Port, and PortGUID are ignored for ESM since they -->
  <!-- are automatically set -->
  <Name>fm0</Name> <!-- also for logging with _sm, _fe, _pm appended -->
  <Hfi>1</Hfi> <!-- local HFI to use for FM instance, 1-1st HFI -->
  <Port>1</Port> <!-- local HFI port to use for FM instance, 1-1st Port -->
  <PortGUID>0x0000000000000000</PortGUID> <!-- local port to use for FM -->
  <SubnetPrefix>0xfe80000000001000</SubnetPrefix> <!-- should be unique -->
  
  <!-- Overrides of the Common.Shared parameters if desired -->
  <!-- ESM does not support LogFile -->
  <!-- <LogFile>/var/log/fm0_log</LogFile> --> <!-- log for this instance -->
</Shared>
```

4. Save the `opafm.xml` file.
14.3.3 Configuring Dual Rails for Dual Subnets

A common multi-rail, multi-subnet scenario is to set up dual rails for dual subnets where you configure two HFIs in each host to two different subnets to provide failover and load-balancing functions.

Assumptions

- HFIs have been installed in the host servers.
- HFIs have been cabled as shown below:

![Diagram showing cabling for dual rails and subnets]

- Similarly, HFIs in the FMs have been cabled as shown below:

![Diagram showing cabling for dual rails and subnets in FMs]

Important Information

Below is an overview of the steps you should take:

1. Stop all standby Fabric Manager using `systemctl stop opafm`.
2. Stop the master Fabric Manager using `systemctl stop opafm`.
3. Update the `opafm.xml` file of the master Fabric Manager as described below.
4. Update the `opafm.xml` file of all standby Fabric Manager as described below.
5. Restart the master Fabric Manager using `systemctl restart opafm`.
6. Restart the standby Fabric Managers using `systemctl restart opafm`.
7. Run `service opafm status` to verify that the Fabric Managers are running.

Procedures

Perform the following steps to set up the master Fabric Manager and standby Fabric Manager:

1. On the host, open the `/etc/opa-fm/opafm.xml` file for editing.
2. Search for "<Shared>" to review the fm0 settings.
   An example of the shared instance for fm0 with key items in bold is shown below.

```xml
<!-- Shared Instance config, applies to all components: SM, FM and FE -->
<Shared>
  <!-- Fm.Shared.Start controls overall startup of the Instance. -->
  <!-- If 0, none of the components in the Instance are started. -->
  <!-- If 1, instance is enabled and Fm.Sm.Start, Fm.Pm.Start, etc -->
  <!-- control startup of each manager. The default for each manager -->
  <!-- is defined by Common.Sm.Start, Common.Pm.Start, etc -->
  <!-- ESM does not support Start via XML configuration. Use CLI commands -->
  <Start>1</Start>
  <!-- <StartupRetries>5</StartupRetries> -->
  <!-- <StartupStableWait>10</StartupStableWait> -->
  <!-- Name, Hfi, Port, and PortGUID are ignored for ESM since they -->
  <!-- are automatically set -->
  <Name>fm0</Name> <!-- also for logging with _sm, _fe, _pm appended -->
  <Hfi>1</Hfi> <!-- local HFI to use for FM instance, 1=1st HFI -->
  <Port>1</Port> <!-- local HFI port to use for FM instance, 1=1st Port -->
  <PortGUID>0x0000000000000000</PortGUID> <!-- local port to use for FM -->
  <SubnetPrefix>0xfe80000000000000</SubnetPrefix> <!-- should be unique -->
  <!-- Overrides of the Common.Shared parameters if desired -->
  <!-- ESM does not support LogFile -->
  <!-- <LogFile>/var/log/fm0_log</LogFile> --> <!-- log for this instance -->
</Shared>
```

3. Change the `<SubnetPrefix>` for fm0 to a unique value other than 0xfe80000000000000. A recommended value to use would be 0xfe8000000001000.
   An example of the change is shown below.

```xml
<!-- Shared Instance config, applies to all components: SM, FM and FE -->
<Shared>
  <!-- Fm.Shared.Start controls overall startup of the Instance. -->
  <!-- If 0, none of the components in the Instance are started. -->
  <!-- If 1, instance is enabled and Fm.Sm.Start, Fm.Pm.Start, etc -->
  <!-- control startup of each manager. The default for each manager -->
  <!-- is defined by Common.Sm.Start, Common.Pm.Start, etc -->
  <!-- ESM does not support Start via XML configuration. Use CLI commands -->
  <Start>1</Start>
  <!-- <StartupRetries>5</StartupRetries> -->
  <!-- <StartupStableWait>10</StartupStableWait> -->
  <!-- Name, Hfi, Port, and PortGUID are ignored for ESM since they -->
  <!-- are automatically set -->
  <Name>fm0</Name> <!-- also for logging with _sm, _fe, _pm appended -->
  <Hfi>1</Hfi> <!-- local HFI to use for FM instance, 1=1st HFI -->
  <Port>1</Port> <!-- local HFI port to use for FM instance, 1=1st Port -->
  <PortGUID>0x0000000000000000</PortGUID> <!-- local port to use for FM -->
  <SubnetPrefix>0xfe8000000001000</SubnetPrefix> <!-- should be unique -->
  <!-- Overrides of the Common.Shared parameters if desired -->
  <!-- ESM does not support LogFile -->
  <!-- <LogFile>/var/log/fm0_log</LogFile> --> <!-- log for this instance -->
</Shared>
```

4. Find the next occurrence of `<Shared>`.
An example of the shared instance for fm1 with key items in bold is shown below.

```xml
<!-- Shared Instance config, applies to all components: SM, PM and FE -->
<Shared>
  <Start>0</Start> <!-- Overall Instance Startup, see fm0 for more info -->
  <Name>fm1</Name> <!-- also for logging with _sm, _fe, _pm appended -->
  <Hfi>1</Hfi> <!-- local HFI to use for FM instance, 1=1st HFI -->
  <Port>2</Port> <!-- local HFI port to use for FM instance, 1=1st Port -->
  <PortGUID>0x0000000000000000</PortGUID> <!-- local port to use for FM -->
  <SubnetPrefix>0xfe80000000001001</SubnetPrefix> <!-- should be unique -->
  <!-- Overrides of the Common.Shared or Fm.Shared parameters if desired -->
  <!-- <LogFile>/var/log/fm1_log</LogFile> --> <!-- log for this instance -->
  <!-- <StartupRetries>5</StartupRetries> -->
  <!-- <StartupStableWait>10</StartupStableWait> -->
</Shared>
```

5. Edit fm1 settings as shown below:
   - Start = 1 (enables FM to start an instance on the second HFI)
   - HFI = 2
   - Port = 1

6. Verify that the SubnetPrefix is the second, unique subnet ID set up during software installation.

An example of the final settings for fm1 is shown below.

```xml
<!-- Shared Instance config, applies to all components: SM, PM and FE -->
<Shared>
  <Start>1</Start> <!-- Overall Instance Startup, see fm0 for more info -->
  <Name>fm1</Name> <!-- also for logging with _sm, _fe, _pm appended -->
  <Hfi>2</Hfi> <!-- local HFI to use for FM instance, 1=1st HFI -->
  <Port>1</Port> <!-- local HFI port to use for FM instance, 1=1st Port -->
  <PortGUID>0x0000000000000000</PortGUID> <!-- local port to use for FM -->
  <SubnetPrefix>0xfe80000000001001</SubnetPrefix> <!-- should be unique -->
  <!-- Overrides of the Common.Shared or Fm.Shared parameters if desired -->
  <!-- <LogFile>/var/log/fm1_log</LogFile> --> <!-- log for this instance -->
  <!-- <StartupRetries>5</StartupRetries> -->
  <!-- <StartupStableWait>10</StartupStableWait> -->
</Shared>
```

7. Save the opafm.xml file.

**14.3.4 IP Routing Guidance**

In scenarios where two IPoFabric interfaces on the same host (for example, ib0/ib1) are configured on the same subnet, care must be taken to define the Linux routing tables for the desired behavior. This is because Linux may always use ib0 to send return packets even if the communication request is initiated over ib1. This also should be configured for proper VRRP operation (refer to the [Intel® Omni-Path IP and LNet Router Design Guide](https://www.intel.com) for details on setting up VRRP).

**HostA:**
ib0: 192.168.1.1
ib1: 192.168.2.1

**HostB:**
ib0: 192.168.1.2
ib1: 192.168.2.2
If a netmask, such as 255.255.0.0, is defined for the above hosts, communication over ib1 between the hosts may not work correctly. In this scenario, define the following routes on both hosts:

```bash
ip route add 192.168.1.0/24 via ib0
ip route add 192.168.2.0/24 via ib1
```

Alternatively, you can add these definitions to route-ib0/ib1 files. Refer to the Intel® Omni-Path IP and LNet Router Design Guide, Adding Static Routes for more detail.
15.0 Installation Verification and Additional Settings

This section provides instructions for verifying that the software has been properly installed and configured, the Intel® Omni-Path Fabric drivers are loaded, and that the fabric is active and ready to use. Information on HFIs and performance tuning is also provided.

15.1 LED Link and Data Indicators

For information on the LEDs function as beaconing, link, and data indicators, refer to *Intel® Omni-Path Fabric Switches Hardware Installation Guide* and/or *Intel® Omni-Path Host Fabric Interface Installation Guide*.

15.2 Thermal Monitoring Module Verification

The following procedure provides steps to check the version of your Thermal Monitoring Module (TMM) and to update it to the latest version.

Note the new field for TMM firmware version, an optional micro-controller for thermal monitoring on vendor-specific HFI adapters using the SMBus.

1. Navigate to the Intel® Omni-Path Host Fabric Interface (HFI) firmware updates directory:

   ```bash
   cd /lib/firmware/updates
   ```

2. Check the file TMM firmware version in the `hfi1_smbus.fw` file using:

   ```bash
   opatmmtool -f hfi1_smbus.fw fileversion
   ```

3. Check the current TMM firmware version using: `opatmmtool -fwversion`.

4. Check the TMM firmware version in the HFI revision snapshot:

   ```bash
   # opahfirev
   ```

   Output Example, TMM version is shown in bold type:

```
# opahfirev
#########################
node145  - HFI 0000:81:00.0
HFI: hfii 0
Board: ChipABI 3.0, ChipRev 7.17, SW Compat 3
SN: 0x0063be82
Location:Discrete  Socket:1 PCISlot:00 NUMANode:1  HFI0
Bus: Speed 8GT/s, Width x16
GUID: 0011:7501:0163:be82
SiRev: B1 (11)
TMM: 10.0.0.696
#########################
```
5. If the `fwversion` in step 3 and 4 is less than the `fileversion` in step 2, update the TMM firmware version in the HFI:

```
   opatmmtool -f hf1_smbus.fw update
```

### 15.3 Adapter and Other Settings

The following settings can be adjusted for better performance.

- **Ensure that an MTU of 8k bytes, is used with the Intel® Omni-Path Host Fabric Interface.**
  
  8K MTU is enabled in the Intel® Omni-Path driver by default. To change this setting for the driver, refer to the *Intel® Omni-Path Fabric Performance Tuning User Guide*.

- **Use a PCIe Max Read Request size of at least 512 bytes with the Intel® Omni-Path Host Fabric Interface.**
  
  The Intel® Omni-Path Host Fabric Interface can support sizes from 128 bytes to 4096 bytes in powers of two. This value is typically set in the BIOS.

- **Use a PCIe MaxPayload size of 256, where available, with the Intel® Omni-Path Host Fabric Interface.**
  
  The Intel® Omni-Path Host Fabric Interface can support 128, 256, or 512 bytes. This value is typically set by the BIOS as the minimum value supported both by the PCIe card and the PCIe root complex.

- **Check the PCIe bus width.**
  
  If slots have a smaller electrical width than mechanical width, a lower than expected performance may occur. Use the following command to check PCIe Bus link speed and width.

```
   lspci -vv -d :24f0 | grep LnkSta:
```

### 15.4 ARP Neighbor Table Setup for Large Clusters

On large clusters or subnets, the ARP neighbor table may overflow and produce a neighbor table overflow message to `/var/log/messages` along with other effects such as ping failing. The Intel® Omni-Path Fabric Suite includes a script, enabled by default during installation, that automatically tunes the ARP Neighbor Table when invoked. The script, `opa-arptbl-tuneup`, is run once by `opa.service` when a node starts or restarts, but it can also be run manually.

To run `opa-arptbl-tuneup` manually, it must execute at the root. The syntax for the parameter options is as follows:

- **`opa-arptbl-tuneup start` - adjust kernel ARP table size**
- **`opa-arptbl-tuneup stop` - restore previous configuration**
- **`opa-arptbl-tuneup status` - check if original table size was changed**
- **`opa-arptbl-tuneup restart` - stop then start**
- **`opa-arptbl-tuneup force-reload` - stop then start**
- **`opa-arptbl-tuneup --help` - usage information for the script**
There are two ARP/Neighbor Tables in the kernel, one for IPv4 networks and one for IPv6 networks. The operating system uses the table for the particular network in use. There are three threshold parameters for each table: gc_thresh1, gc_thresh2, and gc_thresh3. You can check the present threshold level 1 by entering the command:

```
cat /proc/sys/net/ipv4/neigh/default/gc_thresh1
```

You may repeat for gc_thresh2 and gc_thresh3.

## 15.5 SM Loop Test

The SM loop test is a diagnostic test provided in the Fabric Manager. As part of this test, the Subnet Manager stress tests inter-switch links (ISLs) by continuously passing traffic through them. Other tools, like FastFabric, can be used to monitor the links for signal integrity issues or other errors. The advantage of the loop test is that it provides a guaranteed way to test all of the ISLs in the fabric, without the need for a large number of end hosts or applications. For information on the SM Loop Test and how to use the test, refer to the *Intel® Omni-Path Fabric Suite Fabric Manager User Guide*. 
Part 3: Upgrading the Software
16.0 Upgrade Getting Started

This section provides instructions and information for getting started with the Intel® Omni-Path Fabric Suite upgrade.

16.1 Upgrade Prerequisites

Prior to upgrading the OPA software, ensure the following items have been completed:

- Review the Release Notes for a list of compatible software.
- Uninstall all versions of third-party IB stacks.
- Back up the following configuration files, if applicable, in case the upgrade fails:
  - /etc/opa-fm/opafm.xml
  - /etc/opafm.xml
  - /etc/sysconfig/opafm.xml
  - /var/usr/lib/opa/analysis/baseline/*
  - Refer to the OS documentation for a list of any other OS-specific files that should be included in any backups.
- Add or remove OS RPMs per Intel® Omni-Path Fabric Software Release Notes, OS RPMs Installation Prerequisites.

16.2 Download the Intel® Omni-Path Software

If the OS you installed did not include the OPA RPMs, download the software package from an Intel web page or other Intel secured location using the following procedures.

   **NOTES**
   You can manually navigate to the software using the following steps:

   a. Using a web browser, type downloadcenter.intel.com in the address field and press Enter.
   b. In the "Search downloads" field, type Omni-Path and press Enter.

2. In the Description list select the "Intel® Omni-Path Fabric Software" for the version you are wanting to install.

   **NOTE**
   The latest version of each type of each download type is showing in the list. To show previous versions select "Show more" at the bottom of the list.
3. In the "Available Downloads" list, select the files you need for the OS you have installed on your fabric.
   - For OPA-Basic software, select:
     ```
     IntelOPA-Basic.DISTRO.VERSION.tgz
     ```
   - For OPA-IFS software, select:
     ```
     IntelOPA-IFS.DISTRO.VERSION.tgz
     ```

**NOTE**

DISTRO.VERSION refers to the distribution and CPU.

4. Review the Intel Software License Agreement.
5. Click "I accept the terms in the license agreement."
6. Save the download to your hard drive.

### 16.3 Unpack the Tar File

You unpack the tar file using the following procedure.

1. Open an SSH client session and log into the host where the package is being installed.
2. Copy the tar file to the /root directory.
3. Change directory to /root.
   ```
   cd /root
   ```
4. Unpack the tar file.
   - For OPA-Basic, use:
     ```
     tar xvfz IntelOPA-Basic.DISTRO.VERSION.tgz
     ```
   - For OPA-IFS, use:
     ```
     tar xvfz IntelOPA-IFS.DISTRO.VERSION.tgz
     ```
17.0 Upgrade the Intel® Omni-Path Software

This section provides information and procedures to upgrade to the Intel® Omni-Path Software.

17.1 Before You Begin

Before starting the upgrade, perform the following:

- Refer to the Release Notes for the list of compatible operating systems.
- Be sure you have completed all Upgrade Prerequisites on page 148.
- You have downloaded and extracted the software package per Upgrade Getting Started on page 148.
- If your opafm.xml configuration file contains custom changes that you want to carry forward, make a backup copy of it.
- To upgrade the IFS software, you must first stop the standby Fabric Managers, then stop the master Fabric Manager. See Stopping the Fabric Manager on page 152.

17.2 Upgrade Scenarios

The following upgrades are available:

- To upgrade to a new version of the Intel® Omni-Path Software for compute nodes (Basic), go to Upgrade the OPA-Basic Software.
- To upgrade to a new version of the Intel® Omni-Path Software for Management Nodes (IFS), go to Upgrade the OPA-IFS Software.
- To upgrade a Management Node from OPA-Basic to OPA-IFS, go to Upgrade from OPA-Basic to OPA-IFS Software Package.

17.3 Upgrade the OPA-Basic Software

You upgrade the Intel® Omni-Path Software using the IntelOPA-Basic.DISTRO.VERSION.tgz package file.

Assumption

- You are logged in.

Procedures

Perform the following steps to upgrade the Intel® OP Software:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>At the command prompt, change directory to the location of the new Basic software package.</td>
<td>Type the following and press Enter:</td>
</tr>
<tr>
<td>Step</td>
<td>Task/Prompt</td>
<td>Action</td>
</tr>
<tr>
<td>------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>1.</td>
<td>Stop all standby Fabric Managers.</td>
<td>Act as necessary.</td>
</tr>
<tr>
<td>2.</td>
<td>Stop the master Fabric Manager.</td>
<td>Accept the defaults.</td>
</tr>
<tr>
<td>3.</td>
<td>Upgrade the master Management Node.</td>
<td>Type P to perform the actions.</td>
</tr>
<tr>
<td>4.</td>
<td>Reboot the master node. (See note below.)</td>
<td>Press any key.</td>
</tr>
<tr>
<td>5.</td>
<td>Upgrade the standby Management Nodes.</td>
<td><em>NOTE:</em> When the installation completes, you are returned to the main menu.</td>
</tr>
<tr>
<td>6.</td>
<td>Update the opafm.xml file, as needed.</td>
<td>Thank you.</td>
</tr>
<tr>
<td>7.</td>
<td>Reboot the standby nodes. (See note below.)</td>
<td>Thank you.</td>
</tr>
<tr>
<td>8.</td>
<td>Upgrade the remaining servers.</td>
<td>Thank you.</td>
</tr>
<tr>
<td>9.</td>
<td>Reboot the remaining servers.</td>
<td>Thank you.</td>
</tr>
</tbody>
</table>

### 17.4 Upgrade the OPA-IFS Software

You can upgrade the OPA-IFS software to a new version using the Intel OPA Software and FastFabric TUI menus.

Optimally, to upgrade the OPA-IFS software, you perform the following sequence:

1. Stop all standby Fabric Managers.
2. Stop the master Fabric Manager.
3. Upgrade the master Management Node.
4. Update the opafm.xml file, as needed.
5. Reboot the master node. (See note below.)
6. Upgrade the standby Management Nodes.
7. Update the opafm.xml file, as needed.
8. Reboot the standby nodes. (See note below.)
9. Upgrade the remaining servers.
10. Reboot the remaining servers.

*NOTE:* If you need to change any item, enter the alphanumeric character associated with the item to toggle between Upgrade or Don’t Install.
17.4.1 Stopping the Fabric Manager

This section provides instructions for stopping the Fabric Manager using CLI commands.

**NOTE**
You can also stop the Fabric Manager using the Chassis Viewer. Refer to Intel® Omni-Path Fabric Switches GUI User Guide, Stopping the Fabric Manager.

To stop the Fabric Manager, perform the following steps:

1. Log into the Fabric Manager system as root or as a user with root privileges.
2. Stop the Fabric Manager:
   ```
   systemctl stop opafm
   ```

17.4.2 Upgrade the Software on the Management Nodes

To upgrade the Intel® Omni-Path Software, you first upgrade the Management Nodes using the IntelOPA-IFS.DISTRO.VERSION.tgz package file.

**Assumption**
- You have stopped all standby FMs, followed by the master FM.
- You are logged in to the target Management Node.

**Procedures**

Perform the following steps to upgrade the Intel® OP Software on each Management Node:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>At the command prompt, change directory to the location of the new IFS software package.</td>
<td>For IFS, type the following and press Enter: cd IntelOPA-IFS.DISTRO.VERSION where DISTRO.VERSION is the distribution and CPU.</td>
</tr>
<tr>
<td>2.</td>
<td>At the command prompt, start the install script.</td>
<td>Type ./INSTALL and press Enter.</td>
</tr>
<tr>
<td>3.</td>
<td>Select 1) Install/Uninstall Software.</td>
<td>Type 1.</td>
</tr>
<tr>
<td>4.</td>
<td>Review the items to be upgraded.</td>
<td>Accept the defaults. Type N to go to the next page. NOTE: If you need to change any item, enter the alphanumeric character associated with the item to toggle between Upgrade or Don't Install.</td>
</tr>
<tr>
<td>5.</td>
<td>Start the upgrade.</td>
<td>Type P to perform the actions.</td>
</tr>
<tr>
<td>6.</td>
<td>For each system prompt...</td>
<td>Accept the defaults by pressing Enter to continue.</td>
</tr>
</tbody>
</table>

*continued...*
Step | Task/Prompt | Action
--- | --- | ---
7. | When the Intel OPA Autostart Menu displays, review the items. | Intel recommends leaving all of the Autostart selections set to the default values. **NOTE:** If you need to change any item, enter the alphanumeric character associated with the item to toggle between *Enable* or *Disable*.
8. | Run the OPA Autostart operations. | Type `P`.
9. | For each system prompt, "Hit any key to continue..." | Press any key. **NOTE:** When the installation completes, you are returned to the main menu.
10. | Exit the installation menu. | Type `X`.
11. | Reboot the server.  
**Note:** If your next step is to update the `opafm.xml` configuration file, do not reboot the server at this time. | Type `reboot` and press `Enter`.  
**Note:** If OPA Autostart was disabled, you must restart the master FM, followed by the standby FMs. Refer to *Starting the Fabric Manager*.

---

**Next Steps**
- If you have customizations to add to your `opafm.xml` configuration file, go to *Update the Fabric Manager opafm Configuration File*.
- If you are ready to upgrade the fabric, go to *Upgrade the Software on the Remaining Servers*.

**17.4.3 Update the Fabric Manager opafm Configuration File**

The `opafm` is designed so that any new parameters that might not appear in your old `opafm.xml` file will automatically be set to their defaults in the software. If you have customized your pre-upgrade `opafm.xml` file, it is recommended that you manually update your new `opafm.xml` file with the latest comments and defaults. This will aid you with future customizations and make comparisons with the `opafm.xml` in future upgrades easier.

**Assumption**
- You have upgraded the Fabric Manager, accepting all the defaults.

**Procedures**

Perform the following steps to transfer customizations into a new `opafm.xml` file:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1. | Compare your retained customized `/etc/opa-fm/opafm.xml` file to the new default `/usr/share/opa-fm/opafm.xml` file. | Use the following command to compare files: `opafmconfigdiff /etc/opa-fm/opafm.xml /usr/share/opa-fm/opafm.xml`.  
**NOTE:** The resulting differences will highlight your previous customizations. Refer to the *Intel® Omni-Path Fabric Suite Fabric Manager User Guide* for more information on `opafmconfigdiff`. |
| 2. | Create a new `opafm.xml`. | Use `/usr/share/opa-fm/opafm.xml` file as a base for the new file by copying this read-only file to a temporary location to make the subsequent edits. |

---

 continued...
3. Update the new opafm.xml with customizations necessary for your fabric. Use the resulting differences file from Step 1 to locate the customizations and add them to the new opafm.xml.

4. Update /etc/opafm/opafm.xml. Use the new file from Step 3 to replace your /etc/opafm/opafm.xml file.

5. Restart the Fabric Manager
   • If you previously upgraded the management node, type reboot and press Enter.
     Note: If OPA Autostart was disabled, you must restart the master FM, followed by the standby FMs. Refer to Starting the Fabric Manager.
   • If you only updated the opafm.xml file, type systemctl restart opafm and press Enter.

End Task

Next Steps
- If you are ready to upgrade the fabric, go to Upgrade the Software on the Remaining Servers.

17.4.4 Starting the Fabric Manager

This section provides instructions for starting the Fabric Manager using CLI commands.

**NOTE**
You can also start the Fabric Manager using the Chassis Viewer. Refer to Intel® Omni-Path Fabric Switches GUI User Guide, Starting the Fabric Manager.

To start the Fabric Manager, perform the following steps:
1. Log into the Fabric Manager system as root or as a user with root privileges.
2. Start the Fabric Manager:
   ```
   systemctl start opafm
   ```
3. Verify that all the tasks are up and running:
   ```
   systemctl status opafm
   ```

17.4.5 Upgrade the Software on the Remaining Servers

After upgrading the Management Nodes, you upgrade the fabric software on the remaining servers using the FastFabric OPA Host Setup menu.

**Assumptions**
- You have upgraded the Management Nodes.
- You are logged in.

**Procedures**
Perform the following steps to upgrade the servers:
## Configuring the Hosts

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Access the <strong>FastFabric OPA Host Setup menu</strong>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>a) If you are not already logged into Intel FastFabric OPA Tools, at the command prompt...</td>
<td>Type <code>opafastfabric</code> and press Enter.</td>
</tr>
<tr>
<td></td>
<td>b) Access the <strong>FastFabric OPA Host Setup menu</strong>.</td>
<td>Press 3.</td>
</tr>
<tr>
<td></td>
<td>c) Select menu items.</td>
<td>• Select items 0 (optional) and 5.</td>
</tr>
<tr>
<td></td>
<td>d) Start the operations.</td>
<td>Press P. <strong>NOTE:</strong> Each selected item is performed in the order of the menu list.</td>
</tr>
<tr>
<td>2.</td>
<td>(Optional) <strong>Edit Configuration and Select/Edit Host File</strong> (menu item 0)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>a) Edit the <code>opafastfabric.conf</code> file.</td>
<td>Review the file and change as needed. If you made any changes, save and close the file. Press any key to continue.</td>
</tr>
<tr>
<td></td>
<td>b) Edit the <code>hosts</code> configuration file.</td>
<td>Review the file and change as needed. If you made any changes, save and close the file.</td>
</tr>
<tr>
<td></td>
<td>c) Do you want to edit/review/change the files? [y]:</td>
<td>Type <code>n</code> and Press Enter.</td>
</tr>
<tr>
<td></td>
<td>e) Continue to next step.</td>
<td>Press any key to continue.</td>
</tr>
<tr>
<td>3.</td>
<td><strong>Install/Upgrade OPA Software</strong> (menu item 5)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>a) Do you want to use `./IntelOPA-[Basic</td>
<td>IFS].DISTRO.VERSION.tgz`? [y]:</td>
</tr>
<tr>
<td></td>
<td>b) Would you like to do a fresh [i]install, an [u]grade or [s]kip this step? [u]:</td>
<td>Press Enter to accept the default.</td>
</tr>
<tr>
<td></td>
<td>c) Are you sure you want to proceed? [n]:</td>
<td>Type <code>y</code> and press Enter.</td>
</tr>
<tr>
<td></td>
<td>d) When the Intel OPA Autostart Menu displays, review the items.</td>
<td>Intel recommends leaving all of the Autostart selections set to the default values. <strong>NOTE:</strong> If you need to change any item, enter the alphanumeric character associated with the item to toggle between <strong>Enable</strong> or <strong>Disable</strong>.</td>
</tr>
<tr>
<td></td>
<td>e) Run the OPA Autostart operations.</td>
<td>Type P.</td>
</tr>
<tr>
<td></td>
<td>f) For each system prompt, &quot;Hit any key to continue...&quot;</td>
<td>Press any key. <strong>NOTE:</strong> When the installation completes, you are returned to the main menu.</td>
</tr>
<tr>
<td></td>
<td>g) Complete the installation.</td>
<td>Press any key to continue.</td>
</tr>
<tr>
<td></td>
<td>• If all hosts install...</td>
<td>Press any key to continue.</td>
</tr>
<tr>
<td></td>
<td>• If any hosts fail to install...</td>
<td>Use the <strong>View opahostadmin Result Files</strong> menu item to review the result files from the update.</td>
</tr>
</tbody>
</table>

## Optional Tasks
Refer to the *Intel® Omni-Path Fabric Suite FastFabric User Guide* for more information.

| 4.   | **Reboot Hosts** (menu item 8) | *Linux* This menu item reboots all the selected hosts and ensures they go down and come back up properly, as verified through ping over the management network. When the hosts come back up, they are running the installed Intel® Omni-Path Fabric Host Software. |

*continued...*
5. **Run a Command on All Hosts** (menu item b)  
   (Linux) For any other setup operations that need to be performed on all hosts, this menu item executes the specified Linux* shell command against all selected hosts. It can also execute a sequence of commands separated by semicolons.

   **Note:** Check the relevant release notes for the new Intel® Omni-Path Fabric Host Software release being installed for any additional required steps.

6. **Copy a File to All Hosts** (menu item c)  
   This menu item specifies a file on the local host to be copied to all selected hosts.

   **Note:** When using the Intel® Omni-Path Fabric software, you can use FastFabric to upgrade the Intel® Omni-Path Fabric software stack on the remaining hosts.

7. **View opahostadmin Result Files** (menu item d)  
   a) **About to:** vi /root/test.res /root/test.log  
      Press any key to review files.

   b) **Would you like to remove test.res test.log test_tmp* and save_tmp in /root ? [n]:**  
      Press Enter to save or type y to remove the files.

**End Task**

### Next Steps

- To verify the host software has been upgraded and running on the remaining servers, go to **Verify the Host Software on the Remaining Servers Using the FastFabric TUI Menu.**

## 17.5 Upgrade from OPA-Basic to OPA-IFS Software Package

You can upgrade from OPA-Basic to OPA-IFS in order to install the FastFabric and OPA FM software.

### Assumptions

- OPA-Basic is installed on the server.
- You are logged in.

### Procedures

Perform the following steps to upgrade to OPA-IFS:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>At the command prompt, change directory to the location of the new IFS software package.</td>
<td>For IFS, type the following and press Enter: cd IntelOPA-IFS.DISTRO.VERSION where DISTRO.VERSION is the distribution and CPU.</td>
</tr>
<tr>
<td>2.</td>
<td>At the command prompt, start the install script.</td>
<td>Type ./INSTALL and press Enter.</td>
</tr>
<tr>
<td>3.</td>
<td>Select 1) Install/Uninstall Software.</td>
<td>Type 1.</td>
</tr>
<tr>
<td>4.</td>
<td>Review the items to be upgraded. <strong>NOTE:</strong> Ensure that FastFabric and OPA_FM show Install and all other selections show Up To Date.</td>
<td>Type N to go to the next page. <strong>NOTE:</strong> If you need to change any item, enter the alphanumeric character associated with the item to toggle between Upgrade or Don’t Install.</td>
</tr>
</tbody>
</table>

*continued...*
### Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Task/Prompt</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.</td>
<td>Start the upgrade.</td>
<td>Type P to perform the actions.</td>
</tr>
<tr>
<td>6.</td>
<td>For each system prompt...</td>
<td>Accept the defaults by pressing Enter to continue.</td>
</tr>
<tr>
<td>7.</td>
<td>When the Intel OPA Autostart Menu displays, review the items.</td>
<td>Intel recommends leaving all of the Autostart selections set to the default values. <strong>NOTE:</strong> If you need to change any item, enter the alphanumeric character associated with the item to toggle between Enable or Disable.</td>
</tr>
<tr>
<td>8.</td>
<td>Run the OPA Autostart operations.</td>
<td>Type P.</td>
</tr>
<tr>
<td>9.</td>
<td>For each system prompt, &quot;Hit any key to continue...&quot;</td>
<td>Press any key. <strong>NOTE:</strong> When the installation completes, you are returned to the main menu.</td>
</tr>
<tr>
<td>10.</td>
<td>Exit the installation menu.</td>
<td>Type X.</td>
</tr>
<tr>
<td>11.</td>
<td>Reboot the server.</td>
<td>Type reboot and press Enter.</td>
</tr>
</tbody>
</table>

### End Task

**Next Steps**
- If you are setting up additional Management Nodes, go to Set Up Additional Management Nodes on page 122.
Appendix A Software Installation Checklists

This section includes checklists to help you track tasks during fabric installation, configuration, and upgrade.

Print the appropriate checklists to monitor your progress.

A.1 OPA-Basic Checklists

A.1.1 OPA-Basic Pre-Installation Checklist

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Complete</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Ensure that hardware is installed, cabled, and powered.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Refer to the Intel® Omni-Path Fabric Switches Hardware Installation Guide.</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>Ensure that an HFI is installed in each server.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Refer to the Intel® Omni-Path Host Fabric Interface Installation Guide.</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>The hardware configuration should be reviewed to ensure everything is installed properly, according to the plan.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Refer to the local hardware configuration plan.</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>Ensure that the required operating system is installed on each server with the following options:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Root user command prompt ends in &quot;#&quot; or &quot;$&quot;.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: A space must appear after &quot;#&quot; or &quot;$&quot;.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Fancy and colored prompts must be disabled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• TCL and Expect packages installed on all Fabric Management Nodes.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Refer to the Intel® Omni-Path Fabric Software Release Notes for supported operating systems.</td>
<td></td>
</tr>
<tr>
<td>5.</td>
<td>Ensure the capability of remote login as root enabled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• SSH server enabled</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• All servers configured with the same root password</td>
<td></td>
</tr>
<tr>
<td>6.</td>
<td>Ensure that there is a TCP/IP Host Name Resolution.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• If using /etc/hosts, update the /etc/hosts file on the Fabric Management Node.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• If using DNS, all Management Network and IPoIB host names are added to DNS.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The /etc/resolv.conf file is configured on Fabric Management Node.</td>
<td></td>
</tr>
<tr>
<td>7.</td>
<td>Ensure that an NTP server is set up.</td>
<td></td>
</tr>
<tr>
<td>8.</td>
<td>Ensure HFI Node Description Names are assigned.</td>
<td></td>
</tr>
</tbody>
</table>

A.1.2 Install the OPA-Basic Software Checklist

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Complete</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Download and Extract the OPA-Basic Software Package. Refer to Installation Getting Started.</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>Install the Intel® Omni-Path Software.</td>
<td></td>
</tr>
</tbody>
</table>
A.1.3 Upgrade the OPA-Basic Software Checklist

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Complete</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Complete the steps in the Upgrade Prerequisites.</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>Download and Unpack the new OPA-Basic Software Package per Download the Intel® Omni-Path Software and Unpack the Tar File, respectively.</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>Upgrade the OPA-Basic Software on each compute node per Upgrade the OPA-Basic Software.</td>
<td></td>
</tr>
</tbody>
</table>

A.2 OPA-IFS Checklists

A.2.1 OPA-IFS Pre-Installation Checklist

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Complete</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Ensure that hardware is installed, cabled, and powered. Refer to the Intel® Omni-Path Fabric Switches Hardware Installation Guide.</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>Ensure that an HFI is installed in each server. Refer to the Intel® Omni-Path Host Fabric Interface Installation Guide.</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>Ensure that all switch ports with management allowed are connected to the Management node.</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>The hardware configuration should be reviewed to ensure everything was installed and installed properly, according to the plan. Refer to the local hardware configuration plan.</td>
<td></td>
</tr>
<tr>
<td>5.</td>
<td>Ensure that the required operating system is installed on each server with the following options: • Root user command prompt ends in &quot;#&quot; or &quot;$&quot;. Note: A space must appear after &quot;#&quot; or &quot;$&quot;. • Fancy and colored prompts must be disabled. • TCL and Expect packages installed on all Fabric Management Nodes. Refer to the Intel® Omni-Path Fabric Software Release Notes for supported operating systems.</td>
<td></td>
</tr>
<tr>
<td>6.</td>
<td>Ensure the capability of remote login as root enabled. • SSH server enabled • All servers configured with the same root password</td>
<td></td>
</tr>
<tr>
<td>7.</td>
<td>Ensure that there is a TCP/IP Host Name Resolution. • If using /etc/hosts, update the /etc/hosts file on the Fabric Management Node. • If using DNS, all Management Network and IPoIB host names are added to DNS. • The /etc/resolv.conf file is configured on Fabric Management Node.</td>
<td></td>
</tr>
<tr>
<td>8.</td>
<td>Ensure that an NTP server is set up.</td>
<td></td>
</tr>
<tr>
<td>9.</td>
<td>Ensure HFI Node Description Names are assigned.</td>
<td></td>
</tr>
</tbody>
</table>

A.2.2 Install and Configure the OPA-IFS Software Checklist

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Complete</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Download and extract the OPA-IFS Software Package. Refer to Installation Getting Started.</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>Install the Intel® Omni-Path Software.</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>Configure the Chassis.</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>Configure the Externally-Managed Switches.</td>
<td></td>
</tr>
<tr>
<td>5.</td>
<td>Install the Host Software on the Remaining Hosts Using the FastFabric TUI Menu.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>continued...</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
<td>Complete</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>----------</td>
</tr>
<tr>
<td>8.</td>
<td>Verify the Host Software on the Remaining Servers Using the FastFabric TUI Menu.</td>
<td></td>
</tr>
<tr>
<td>10.</td>
<td>Run a Sample High Performance Linpack 2 Configuration.</td>
<td></td>
</tr>
</tbody>
</table>

### A.2.3 Upgrade the OPA-IFS Software Checklist

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Complete</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Complete the steps in the Upgrade Prerequisites.</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>Download and extract the new OPA-IFS Software Packages per Upgrade Getting Started.</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>Upgrade the Software on the Management Nodes.</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>Upgrade the Software on the Remaining Servers.</td>
<td></td>
</tr>
<tr>
<td>5.</td>
<td>Verify the Host Software on the Remaining Servers Using the FastFabric TUI Menu.</td>
<td></td>
</tr>
</tbody>
</table>
Appendix B Intel® OPA Software Components to Packages Mapping

To help you choose the proper packages for installation, the following table maps Intel® OPA Software components to their respective RPM packages.

### Table 2. Intel® OPA Software Components Mapping

<table>
<thead>
<tr>
<th>Component</th>
<th>Package</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opaconfig</td>
<td></td>
<td>Configuration tool for the Intel® Omni-Path Fabric Suite FastFabric</td>
</tr>
<tr>
<td>opa_stack</td>
<td>opa-scripts</td>
<td>User space initialization scripts for the Intel® Omni-Path Fabric</td>
</tr>
<tr>
<td></td>
<td>kmod-ifs-kernel-updates</td>
<td>Kernel modules built for the Linux* kernel family of processors</td>
</tr>
<tr>
<td>opa_stack_dev</td>
<td>ifs-kernel-updates-devel</td>
<td>Development headers for Intel HFI1 driver interface</td>
</tr>
<tr>
<td>oftools</td>
<td>opa-basic-tools</td>
<td>Basic tools for fabric management necessary on all compute nodes</td>
</tr>
<tr>
<td></td>
<td>opa-address-resolution</td>
<td>ibacm-distributed SA provider (dsap) for name and address resolution on Intel® OPA platform. It also contains the library and tools to access the shared memory database exported by dsap.</td>
</tr>
<tr>
<td>intel_hfi</td>
<td>hfi1-firmware</td>
<td>Firmware required by the Gen1 HFI driver</td>
</tr>
<tr>
<td></td>
<td>hfi1-firmware_debug</td>
<td>Debug signed firmware required by the Gen1 HFI driver</td>
</tr>
<tr>
<td>libpsm2</td>
<td></td>
<td>PSM2 Messaging API, or PSM2 API, is the low-level, user-level communications interface for the Intel® OPA family of products. PSM2 users are enabled with mechanisms necessary to implement higher level communications interfaces in parallel environments.</td>
</tr>
<tr>
<td>libpsm2-devel</td>
<td></td>
<td>Intel® PSM2, psm2*.h, headers and libpsm2.so files necessary for developing software using libpsm2</td>
</tr>
<tr>
<td>libpsm2-compat</td>
<td></td>
<td>Support for MPIs linked with PSM versions less than 2. This will allow software compiled to use Intel® True Scale PSM ibinfinipath to run with Intel® OPA PSM libpsm2.</td>
</tr>
<tr>
<td>libfabric</td>
<td></td>
<td>User-space API to access high-performance fabric services, such as RDMA</td>
</tr>
<tr>
<td>libfabric-devel</td>
<td></td>
<td>Development files for the libfabric library</td>
</tr>
</tbody>
</table>

*continued...*
<table>
