1.0 Overview of the Release

1.1 Introduction

This document provides a brief overview of the changes introduced into the Intel® Omni-Path Software by this release. References to more detailed information are provided where necessary. The information contained in this document is intended as supplemental information only; it should be used in conjunction with the documentation provided for each component.

These Release Notes list the features supported in this software release, open issues, and issues that were resolved during release development.

1.2 Audience

The information provided in this document is intended for installers, software support engineers, service personnel, and system administrators.

1.3 Software License Agreement

This software is provided under license agreements and may contain third-party software under separate third-party licensing. Please refer to the license files provided with the software for specific details.

1.4 If You Need Help

Technical support for Intel® Omni-Path products is available 24 hours a day, 365 days a year. Please contact Intel Customer Support or visit http://www.intel.com/omnipath/support for additional detail.

1.5 Enhancements and Features in this Release

The following enhancements and features are new in the 10.4.1 release:

- Additional operating systems supported. See Table 1-2 for details.
- Additional hardware. See Table 1-5 for details.
- Changes to the installation path for all Intel® Omni-Path Software files. See Section 1.14.3 for details and recommended user action.
- Product Constraint described in Section 1.15.
- Support for GPU Direct* RDMA, which is a technology that enables a direct path for data exchange between a graphics processing unit (GPU) and a third-party peer device using standard features of PCI Express.
- Support for OpenFabrics Interfaces (OFI), a framework that includes libraries (including libfabric) and applications used to export fabric communication services to applications.
Overview of the Release

- Updated Accelerated RDMA support to include RHEL* 6.7. See Section 1.18 for details.
- Signed Kernel Modules, as required to support UEFI Secure Boot
- Support for NVMe over Fabric Protocol
- Support for Power Class 2 active optical cables (AOC)
- Support for IBM* Platform MPI and IBM* Spectrum MPI. See Table 1-3 for details.
- Virtual Fabric creation has been enhanced to better support advanced topologies, including the ability to place multicast traffic on a separate SL from unicast traffic. For details, see the Intel® Omni-Path Fabric Suite Fabric Manager User Guide, section 2.

1.6 Supported Features

- The list of supported operating systems is in Table 1-2.
- The list of supported hardware is in Table 1-5.
- Coexistence with Intel® True Scale Architecture. This release supports True Scale hardware serving as an InfiniBand* storage network with the Intel® Omni-Path hardware used for computing. Note that connecting a True Scale adapter card to an Omni-Path switch, or vice-versa, is not supported. For more details on this feature, refer to the Intel® Omni-Path Fabric Host Software User Guide.
- Supports multi-rail and multi-plane configurations. For more details, refer to the Intel® Omni-Path Fabric Host Software User Guide.
- Limited validation testing performed on network storage file systems:
  - NFS over TCP/IP
- MPI applications are provided in a stand-alone package.
- Intel® Xeon® v4 processor (codename Broadwell) support
- Intel® Xeon Phi™ support
- Monitored Intel® Omni-Path Host Fabric Interface
- DHCP and LDAP supported on Intel® Omni-Path Edge Switch 100 Series and Intel® Omni-Path Director Class Switch 100 Series hardware.
- Support for the Enhanced Hypercube Routing Engine is outside the scope of Intel® OPA support. However, Intel partners may offer such support as part of their solutions. In addition there is an open source community who may be able to answer specific questions and provide guidance with respect to the Enhanced Hypercube Routing Engine.
- Support for Accelerated RDMA, also called Token ID (TID) RDMA, which is a Verbs protocol extension. See Section 1.18 for details.
- Support for SKX and SKX-F hardware.
- Supports RHEL* 6.7 and CentOS* 6.7.
- Support for active optical cables (AOC) on server platforms using integrated HFI for OPA (commonly known as "-F").
### 1.7 Release Packages

There are two Intel® Omni-Path Fabric Software packages:

- **Basic** for compute nodes
- **IFS** for the management node

The Basic package includes:

- Software that installs the following packages to the distribution OpenFabrics Alliance* (OFA):
  - libibumad is based on the RHEL* or SLES* release package. It contains Intel patches that support Intel® Omni-Path Architecture (Intel® OPA) technology.
  - ibacm is the latest upstream code applied with RHEL* patches.
  - hfi1-firmware, hfi1-psm, hfi1-diagtools-sw, libhfi1verbs
  - Open MPI built for verbs and PSM2 using gcc, and Intel compilers.
  - MVAPICH2 built for verbs and PSM2 using gcc, and Intel compilers.
  - mpitests
  - mpi-selector
  - GASnet
  - openSHMEM
  - srptools (includes the latest upstream code)
  - Firmware files listed in Table 1-1.

- compat-rdma which delivers kernel changes based on the OFA version. The components installed are the hfi1 driver and Intel-enhanced versions of other kernel packages. See the Building Lustre* Servers with Intel® Omni-Path Architecture Application Note for details.

  **Note:** In the Intel® Omni-Path Software package for RHEL* 7.2, the hfi1 driver and ifs-kernel-updates are supplied as a smaller package.

The IFS package includes the Basic package plus:

- **Fabric Manager**, which allows comprehensive control of administrative functions using a mature Subnet Manager. Fabric Manager simplifies subnet, fabric, and individual component management, easing the deployment and optimization of large fabrics.

- **Fabric Suite FastFabric Toolset**, which enables rapid, error-free installation and configuration of Intel® OPA host software and management software tools, as well as simplified installation, configuration, validation, and optimization of HPC fabrics. For details, refer to the Fabric Suite FastFabric documentation.
1.8 **Firmware Files**

This release of the Intel® Omni-Path Software contains the firmware files listed in Table 1-1.

<table>
<thead>
<tr>
<th>Description</th>
<th>File Name</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>HFI1 UEFI Option ROM</td>
<td>HfiPcieGen3_1.4.0.0.0.efi</td>
<td>1.4.0.0.0</td>
</tr>
<tr>
<td>UEFI UNDI</td>
<td>HfiPcieGen3Loader_1.4.0.0.0.rom</td>
<td>1.4.0.0.0</td>
</tr>
<tr>
<td>HFI1 SMBus Microcontroller Firmware (Thermal Monitor)</td>
<td>hfi1_smbus.fw</td>
<td>10.4.0.0.146</td>
</tr>
</tbody>
</table>

1.9 **Operating Systems**

This release of the Intel® Omni-Path Software supports the operating systems listed in Table 1-2.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Update/SP</th>
<th>Kernel Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red Hat* Enterprise Linux* (RHEL*) 6.7 X86_64</td>

<tr>
<td>SUSE* Linux* Enterprise Server (SLES*) 12.1 X86_64</td>
<td>Service Pack 1</td>
<td>3.12.49-11.1-default</td>
</tr>
<tr>
<td>SUSE* Linux* Enterprise Server (SLES*) 12.2 X86_64</td>
<td>Service Pack 2</td>
<td>4.4.21-69-default</td>
</tr>
</tbody>
</table>

*Note:* The Intel® Xeon Phi™ Processor x200 product family (Knights Landing CPU-based servers) supports the following operating systems: RHEL* 7.3, Centos* 7.3, and SLES* 12.2.

*Note:* PSM2 GPUDirect* RDMA is supported on RHEL* 7.2, RHEL* 7.3, and SLES* 12.2.

1.10 **Parallel File Systems**

The following parallel file systems have been tested with this release of the Intel® Omni-Path Software:

- Intel® Enterprise Edition for Lustre* software v3.1
  - RHEL* versions supported by Intel® Omni-Path Software.
- IBM* Spectrum Scale version 4.2.1.0
  - RHEL* 7.2.

Refer to the *Intel® Omni-Path Fabric Performance Tuning User Guide* for details on optimizing parallel file system performance with Intel® Omni-Path Software.
1.11 MPI Libraries

1.11.1 Supported MPI Libraries

The table below lists the different MPI libraries supported by Intel® Omni-Path Fabric Software with the corresponding version, fabric support, and compiler used. Note that the second column indicates whether the MPI library is included in the Intel® Omni-Path Software package or not.

Table 1-3. Supported MPI Libraries

<table>
<thead>
<tr>
<th>MPI Implementation</th>
<th>Included in IFS package?</th>
<th>Runs Over</th>
<th>Compiled With</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open MPI 1.10.4</td>
<td>Yes</td>
<td>Verbs</td>
<td>GCC</td>

<td>N/A</td>
</tr>
</tbody>
</table>

1.11.2 Compiler Versions and Distributions

The MPI libraries listed in the preceding table that are included in the release and built with PSM2 support were built with the following compiler versions:

Table 1-4. Compiler Versions and Distributions

<table>
<thead>
<tr>
<th>Compiler</th>
<th>Linux* Distribution</th>
<th>Compiler Version</th>

</tr>
<tr>
<td>(Intel) icc</td>
<td>SLES* 12 SP 2</td>
<td>icc (ICC) 15.0.1</td>
</tr>
</tbody>
</table>

Note: Refer to the Intel® Omni-Path Fabric Host Software User Guide for set up information when using Open MPI with the SLURM PMI launcher and PSM2.
Overview of the Release

1.12 Hardware

Table 1-5 lists the hardware supported in this release.

Note: The Intel® PSM2 implementation has a limit of four (4) HFI.

Table 1-5. Supported Hardware

<table>
<thead>
<tr>
<th>Hardware</th>
<th>Description</th>

<tr>
<td>Intel® Omni-Path Switch 100SWE48QFH</td>
<td>Managed 48-port Edge Switch, hot-swap power and fans</td>
</tr>
<tr>
<td>Intel® Omni-Path Switch 100SWE24Q</td>
<td>Managed 24-port Edge Switch</td>
</tr>
<tr>
<td>Intel® Omni-Path Switch 100SWE24U</td>
<td>Externally-managed 24-port Edge Switch</td>
</tr>
<tr>
<td>Intel® Omni-Path Director Class Switch 100SWD24</td>
<td>Director Class Switch 100 Series, up to 768 ports</td>
</tr>
<tr>
<td>Intel® Omni-Path Director Class Switch 100SWD06</td>
<td>Director Class Switch 100 Series, up to 192 ports</td>
</tr>
</tbody>
</table>

Note: For RHEL* 6.7 and CentOS* 6.7, only the following processors are supported:
- Intel® Xeon® Processor E5-2600 v3 product family
- Intel® Xeon® Processor E5-2600 v4 product family
1.13 Documentation Versions

Key:
Shading indicates the URL to use for accessing the particular document.

For details on which document to use for a particular task, see Table 3-1 on page 24.

1.14 Installation Requirements

1.14.1 Software and Firmware Requirements

Table 1-2 lists the operating systems supported by this release. Refer to the Intel® Omni-Path Fabric Software Installation Guide for the required packages.
1.14.2 Installation Instructions

There are two Intel® Omni-Path Fabric Software packages:

- IntelOPA-IFS.<distro>-x86_64.<version>.tgz for the management node.
- IntelOPA-Basic.<distro>-x86_64.<version>.tgz for compute nodes.

The packages in the tgz file are RPMs. Installing individual RPMs is not supported in the 10.4.1 release.

Refer to the Intel® Omni-Path Fabric Software Installation Guide for related software requirements and complete installation procedures. Refer to the Intel® Omni-Path Fabric Hardware Installation Guide for related firmware requirements.

1.14.3 Installation Path Changes

If you are upgrading from a previous Intel® Omni-Path Fabric Software installation, Intel recommends that you remove certain RPMs prior to upgrading, due to changes in installation paths for RPMs and configuration files.

Intel recommends that you run the following command:

```
rpm -e opa-fm opa-fastfabric
```

If `opa-mpi-apps` is installed, run this command also:

```
rpm -e opa-mpi-apps
```

Pre-existing configuration files are automatically saved by the RPM as `.rpmsave` files. (RPM will notify you about these files during removal.) If you want to keep these configuration files, you should move them to their new locations. A mapping of old configuration file locations to new locations is shown in the following table.

<table>
<thead>
<tr>
<th>Old Location</th>
<th>New Location (Release 10.4)</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc/sysconfig/opafm.xml</td>
<td>/etc/opafm/opafm.xml</td>
</tr>
<tr>
<td>/etc/sysconfig/allhosts</td>
<td>/etc/opa/allhosts</td>
</tr>
<tr>
<td>/etc/sysconfig/chassis</td>
<td>/etc/opa/chassis</td>
</tr>
<tr>
<td>/etc/sysconfig/esm_chasis</td>
<td>/etc/opa/esm_chasis</td>
</tr>
<tr>
<td>/etc/sysconfig/hosts</td>
<td>/etc/opa/hosts</td>
</tr>
<tr>
<td>/etc/sysconfig/opafastfabric.conf</td>
<td>/etc/opa/opafastfabric.conf</td>
</tr>
<tr>
<td>/etc/sysconfig/opaff.xml</td>
<td>/etc/opa/opaff.xml</td>
</tr>
<tr>
<td>/etc/sysconfig/opamon.conf</td>
<td>/etc/opa/opamon.conf</td>
</tr>
<tr>
<td>/etc/sysconfig/ports</td>
<td>/etc/opa/ports</td>
</tr>
<tr>
<td>/etc/sysconfig/switches</td>
<td>/etc/opa/switches</td>
</tr>
</tbody>
</table>

1.14.4 Installation Prerequisites for RHEL* 6.7 and CentOS* 6.7

Install the following packages using yum from the RHEL* or CentOS* distributions:

- `libibverbs`
- `librdmacm`
- `libibcm`
- `qperf`
- `perftest`
• rdma
• infinipath-psm
• opensm-devel
• expat
• elfutils-libelf-devel
• libstdc++-devel
• gcc-gfortran
• atlas
• c-ares
• tcl
• expect
• tcsh
• sysfsutils
• pciutils
• bc (command line calculator for floating point math)
• rpm-build
• redhat-rpm-config
• kernel-devel
• opensm-libs

1.15 Product Constraints

To take advantage of the features supported in this release, as well as avoid potential link initialization issues, this release (10.4.1) requires that all Intel® Omni-Path devices in the fabric use the same version levels of software and firmware. The specific requirements are:

• Switch firmware version: 10.4.1
• Host software version: 10.4.1
• HFI firmware (UEFI): 1.4

Note: This constraint does not apply to the Intel® Fabric Manager GUI.

1.16 Product Limitations

This release has the following product limitations:

• The embedded version of the Fabric Manager supports a maximum of 100 nodes within a fabric. This is due to the memory and processing resources available in the embedded environment.

• Performance Administration (PA) Failover should not be enabled with FMs running on differing software versions. PA Failover is enabled via configuration:<PM>/<ImageUpdateInterval> > 0

• Enabling UEFI Optimized Boot on some platforms can prevent the HFI UEFI driver from loading during boot. To prevent this, do not enable UEFI Optimized Boot.
Overview of the Release

1.17  RHEL* 6.7 and CentOS* 6.7 Support

1.17.1  RHEL* 6.7 and CentOS* 6.7 Limitations

RHEL* 6.7 and CentOS* 6.7 are supported in this release with the following limitations:

- Processor support:
  - Intel® Xeon® Processor E5-2600 v3 product family
  - Intel® Xeon® Processor E5-2600 v4 product family
- File system support:
  - GPFS
  - NFS
  - Intel® Enterprise Edition for Lustre* software

Note: For Intel® Enterprise Edition 3.0 Clients (support RHEL* 6.7) and Intel® Enterprise Edition 3.1 Servers (support RHEL* 7.3): You cannot upgrade your Clients beyond version 3.0 until you move to a newer RHEL* version.

- MVAPICH2 and Open MPI have been compiled for PSM2 to support the following versions of the compilers:

<table>
<thead>
<tr>
<th>Compiler</th>
<th>Linux* Distribution</th>
<th>Compiler Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>(GNU) gcc</td>
<td>RHEL* 6.7, CentOS* 6.7</td>
<td>gcc (GCC) 4.4.7</td>
</tr>
<tr>
<td>(Intel) icc</td>
<td>RHEL* 6.7, CentOS* 6.7</td>
<td>icc (ICC) 15.0.1</td>
</tr>
</tbody>
</table>

- Performance is within 2%-5% of RHEL* 7.2 performance for the following features:
  - PSM bandwidth
  - MPI latency
  - Verbs bandwidth

1.17.2  RHEL* 6.7: Building Lustre* Kernel Modules for Intel® Omni-Path Support

The Intel® Enterprise Edition for Lustre* kernel modules are dependent on InfiniBand* core modules. In order for them to load properly in a system where the OPA stack is installed, they must have been compiled against Module.symvers. The IFS package installs Module.symvers, which is generated while building InfiniBand* core and Intel® Omni-Path kernel modules. This file contains symbol information that can be used to build higher-level kernel modules such as Lustre* that are dependent on InfiniBand* core or Intel® Omni-Path kernel modules.

It is installed in:
/lib/modules/<kernel_ver>/include-ifs-kernel/Module.symvers

Build Lustre* modules using the following command:

```
# KBUILD_EXTRA_SYMBOLS="/lib/modules/<kernel_ver>/include-ifs-kernel/Module.symvers" rpmbuild --rebuild --without servers <path-to-my-rpm>
```
1.18 **Accelerated RDMA Information**

Accelerated RDMA is a Verbs protocol extension to improve the performance of RDMA write and RDMA read operations on Intel® Omni-Path hardware.

This extension improves the efficiency of large message transfers to provide performance benefits for storage protocols and other Verbs-based protocols. The benefits include increased achievable bandwidth with reduced CPU utilization. The Token ID (TID) RDMA protocol accelerates the OpenFabrics Alliance* (OFA) Verbs API with no changes required to API consumers. The acceleration technique is performed by the host driver and the application running over the OFA Verbs API does not need to make any code change.

Accelerated RDMA is off by default.

To enable it, add `cap_mask=0x4c09a01cbba` to the `/etc/modprobe.d/hfi1.conf` file. Instructions on how to do this are in the *Intel® Omni-Path Fabric Performance Tuning User Guide*, ”Setting HFI1 Driver Parameters” section.

*Note:* Accelerated RDMA must be enabled on all nodes to function. Mixing of Accelerated RDMA enabled and disabled nodes is not supported.
2.0 Issues

2.1 Introduction

This section lists the resolved and open issues in the Intel® Omni-Path Software.

2.2 Resolved Issues

Table 2-1 lists issues that are resolved in this release.

Table 2-1. Issues resolved in this release (Sheet 1 of 2)

<table>

| 137708 | Following a link bounce event, there is a possibility that a link will fail to reach the Armed/Active state. The likelihood of this issue depends largely on the link type:  
  • Compute Nodes: These links are very unlikely to be affected.  
  • FM Nodes: These links are the most exposed. If an FM link is affected and not recovered, there may be downstream effects over time.                                                                                                                                                                                                                                                                         | 10.4.1              |
| 130336 | `hfi1stats` cannot be run at user level due to mount-point privileges.                                                                                                                                                                                                                                                                                                                                                                                                     | 10.4                |
| 131017 | Verbs `ib_send_bw`, `ib_read_bw`, and `ib_write_bw` are not working with the `-R` option to use the RDMA CM API to create QPs and exch data.                                                                                                                                                                                                                                                                                                                                 | 10.4                |
| 134268 | The Option ROM image (e.g. containing a UEFI driver) may not be executed if the BIOS configures the HFI Expansion ROM BAR with an address that is not 16MB aligned.                                                                                                                                                                                                                                                                                                                                 | 10.4                |
| 134353 | Very infrequently, when a link goes down, the logical link state can remain stuck in the 'Init' state.                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 10.4                |
| 134493 | When using Mvapich2 with Intel® Omni-Path PSM2, users will notice unexpected behavior when seeding the built-in random number generator with functions like srand or srandom before MPI_Init is called. MPI_Init re-seeds the random number generator with its own value and does not restore the seed set by the user application. This causes different MPI ranks to generate different sequences of random numbers even though they started with the same seed value.                                                                 | 10.4                |
| 134821 | The UEFI network stack is initialized with a default network address before the driver receives a MAD packet containing an updated and actual subnet prefix. Therefore, in ARP and IP UEFI drivers the old (default) HW address is still used, causing problems with packet receiving and transmitting.                                                                                                                                                                                                                                                                  | 10.4                |
| 135040 | You can't currently specify portions of an Intel® DCS chassis that is not populated and is not expected to be populated. If CoreFull is 1, all the internal links for that chassis are generated when run against opaixlattopology. If CoreFull is 0, none of the links are generated.                                                                                                                                                                                                                               | 10.4                |
| 135180 | OpenMPI/PSM2 timeouts during MPI stress tests on Haswell and Intel® Xeon Phi™ mixed fabrics.                                                                                                                                                                                                                                                                                                                                                                                   | 10.4                |
| 135326 | Calling `opasmaquery` fails when called from a non-SM node to a node which has not booted to the OS.                                                                                                                                                                                                                                                                                                                                                                                                                                           | 10.4                |
| 135355 | Due to changes in where the IFS packages are installed, customers using the FastFabric tools and upgrading to 10.3 from an earlier release must find each occurrence of `/opt/opa` in the `opafastfabric.conf` file and replace the string with `/usr/lib/opa`.                                                                                                                                                                                                                                               | 10.4                |
| 135545 | A change has been made to several SA record attributes which causes incompatibilities between the Fabric tool suite and the SA.                                                                                                                                                                                                                                                                                                                                                                                                            | 10.4                |
| 135648 | MPI applications are installed under the `/usr/lib` directory structure, which may be set up to be read-only overall. This causes resulting FastFabric operations to fail since mpi_apps contain source code and run scripts for sample MPI applications, test programs and benchmarks.                                                                                                                                                                                                                              | 10.4                |

## Open Issues

Table 2-3 lists the open issues for this release.

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
<th>Workaround</th>
</tr>
</thead>
<tbody>
<tr>
<td>129563</td>
<td>Memory allocation errors with Mvapich2-2.1/Verbs.</td>
<td>When running mvapich2 jobs with a large number of ranks (for example, between 36 and 72 ranks), you must set the following parameters in <code>/etc/security/limits.conf</code>:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>* hard memlock unlimited</td>
</tr>
<tr>
<td></td>
<td></td>
<td>* soft memlock unlimited</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Also, you must increase the lkey_table_size:LKEY table size in bits (2^n, 1 &lt;= n &lt;= 23) from its default of 16 to 17. For instructions on setting module parameters, refer to Appendix A in the Intel® Omni-Path Fabric Performance Tuning User Guide.</td>
</tr>
<tr>
<td>131745</td>
<td>When running OpenMPI 1.10.0 on SLES* 12 with large number of ranks per node (over 40), it may happen that the ORTE daemon (orted) &quot;hangs&quot; during the finalization of job. This is an issue in Open MPI with the version of glibc used in SLES* 12. It is being researched by the Open MPI community in issue: <a href="https://github.com/open-mpi/ompi/issues/1136">https://github.com/open-mpi/ompi/issues/1136</a></td>
<td>Stopping and resuming the &quot;hung&quot; orted process allows the job to finish normally. To find the hung process, run the ps and find a node with several job zombie processes. In that same node, identify the orted process ID and send a stop signal (kill -19 &lt;PID&gt;) and a continue signal (kill -18 &lt;PID&gt;).</td>

</table>
136160 On some Intel® Xeon Phi™ with integrated Intel® Omni-Path fabric platforms, the second integrated HFI is discovered first and is subsequently identified as the first HFI device. As a result, when issuing Intel® Omni-Path commands, the second HFI appears first in the results. In Linux* and various Intel® Omni-Path tools, the HFI reporting order may be the opposite of the order appearing on the Intel® Xeon Phi™ with integrated Intel® Omni-Path fabric cable/faceplate.

You can identify the second integrated HFI by inspecting the Node GUID or Port GUID/Port GID reported by `opainfo` or other commands such as `hfi1_control -i`. Note that bit 39 of the PortGUID, the most significant bit, is set for the second HFI, and is clear for the first HFI.

Keep in mind that when issuing various Intel® Omni-Path CLI commands targeted at a specific HFI using the `-h` option, `-h 1` correlates to the device that is listed as `hfi1_0`. As a result, the issued command affects the second HFI instance in cases where the second HFI port instance appears first.

By default, ports are ordered as enumerated by the kernel. There is a new module parameter called `port_reorder`. When set, the HFI1 ports on the same ASIC will be enumerated in increasing order.

To enable this feature, use the command: `modprobe hfi1 port_reorder=1`.

136419 When running SLES* 12.2 with inbox OPA drivers installed, the state may not change from "Offline" to "Physical Linkup (Init)" as expected.

Add a `platform.dat` file in `/lib/firmware/updates`, then restart.

136432 Certain perftest tools such as `ib_write_bw` do not work on RHEL* 7.3 when using the RDMA CM with UD QPs.

Roll back the perftest package to the level found in RHEL* 7.2, which is perftest-2.4. Then install this package on RHEL* 7.3.
### Issues

136436 On SLES* 12.2, node_desc is not populated with the host name when system is booted up.

Install and run the rdma-ndd daemon on each node.

1. Unpack IFS:
   ```
   # tar xzf IntelOPA-IFS.SLES122-x86_64.10.3.0.0.81.tgz
   # ls
   IntelOPA-IFS.SLES122-x86_64.10.3.0.0.81
   IntelOPA-IFS.SLES122-x86_64.10.3.0.0.81.tgz
   ```

2. Uninstall infiniband-diags and libibnetdisc5 libraries.
   ```
   # rpm -e infiniband-diags
   # rpm -e libibnetdisc5
   ```

3. Install the older version of infiniband-diags from the IFS package.
   ```
   # cd IntelOPA-OFED_DELTA.SLES122-x86_64.10.3.0.0.82/
   # rpm -Uvh ./infiniband-diags-1.6.7-2.x86_64.rpm
   ```

4. Enable rdma-ndd:
   ```
   # systemctl daemon-reload
   # systemctl status rdma-ndd
   ```

   rdma-ndd.service - RDMA Node Description Daemon
   Loaded: loaded (/usr/lib/systemd/system/rdma-ndd.service; disabled; vendor preset: disabled)
   Active: inactive (dead)
   # systemctl enable rdma-ndd
   Created symlink from /etc/systemd/system/multi-user.target.wants/rdma-ndd.service to /usr/lib/systemd/system/rdma-ndd.service.

5. Start rdma-ndd and check the status:
   ```
   # systemctl start rdma-ndd
   # systemctl status rdma-ndd
   ```

6. Test that it is working:
   ```
   # cat /sys/class/infiniband/hfi1_0/node_desc
   phs1fnive08u26 hfi1_0
   # hostname foo
   # cat /sys/class/infiniband/hfi1_0/node_desc
   foo hfi1_0
   # hostname phs1fnive08u26
   # cat /sys/class/infiniband/hfi1_0/node_desc
   phs1fnive08u26 hfi1_0
   # reboot
   ```

136437 When using RHEL* 7.2, the default generic PXE boot image does not work due to missing driver and firmware files.

Contact Intel Customer Support for assistance.

136500 RDMA perftests can hang on start on a client side when RDMA CM (-R option) is used.

Intel recommends that you use the same version of perftests across your fabric. Obtain the latest perftests version from the upstream repository.

136727 Initialization of PSM2 library fails with the following error message:

Error: PSM is in the finalized state

The openmpi-mca-params.conf file is automatically edited during IFS install. If you have edited the file after installation, then you may see this error.

To correct the error, edit the file /usr/mpil/gcc/openmpi-1.10.4-hfi/etc/openmpi-mca-params.conf and set the default parameters for mpirun to:

- mca pml cm -mca mtl psm2

---

   `-mca pml cm -mca mtl psm2` |
If hundreds of links are bouncing while the FM is sweeping, the FM sweep time may be significantly extended. This can result in unexpected delays in FM responsiveness to fabric changes or host reboots. (The issue is that active links bounce between the time FM discovers one side of the link versus the other side of the link.) In Release 10.3.1 a change was made to improve the FM responsiveness in large fabrics of >1000 nodes when numerous links bounce (or hosts are rebooted) at once.

The following workarounds are recommended:
- When rebooting nodes on a production cluster, perform reboots in batches of 300 nodes or less.
- During cluster deployment, carefully follow the procedures in the Intel® Omni-Path Fabric Setup Guide and use FastFabric to check signal integrity and placement of all cables. Correct or disable any problematic links before starting production use of the cluster.
- When replacing or expanding a production cluster, repeat the procedures in the Intel® Omni-Path Fabric Setup Guide to verify the new hardware. Correct or disable any problematic links before resuming production use of the cluster.
- Use the PM, FM logs, FM GUI, FastFabric, and other tools to monitor signal integrity and link stability. Correct or disable any problematic links when discovered.

When performing boot over fabric, links may take up to 6 minutes to become active.

The Intel UEFI driver contained in the server BIOS must be executed for proper support of Active Optical Cables (AOC) in an integrated HFI environment. Some BIOS do not execute the UEFI in Legacy BIOS Boot mode, and there are BIOS configuration settings that may prevent the UEFI from executing in any mode. Avoid the use of Legacy BIOS boot mode if your platform does not execute the HFI driver in that mode. Avoid BIOS settings or other configuration settings that do not execute the HFI driver during boot.

Occasionally, nodes may be dropped by the Fabric Manager while they are in a pre-boot mode. This can occur when the node has multiple HFIs on a single socket.

Bounce the link of the dropped pre-boot port.

When using the Accelerated RDMA feature (TID RDMA), certain Verbs Multi-PPN tests may cause error messages. To avoid errors when running Verbs Multi-PPN tests, limit the parallel processes to 16 or fewer.

Pinging an Intel® OPA UEFI permanent IP address from a DHCP server fails on subsequent reboots unless the corresponding network interface has first been initialized in the UEFI network stack. Before pinging a UEFI permanent IP address, first initialize the corresponding network interface in the UEFI network stack.

Run the utility without using the -z option.

When running SLES* 12.2 with inbox OPA drivers installed, the state may not change from "Offline" to "Physical Linkup (Init)" as expected. You must manually enable and start the rdma-ndd service on Intel® OPA software installations.

Add a platform.dat file in /lib/firmware/updates, then restart.

The node description of a node may change after rebooting. This issue has been seen on RHEL* and SLES*.

You must manually enable and start the rdma-ndd service on Intel® OPA software installations.

Packets may be stuck in kernel when attempting writes to file system via IPoIB interface. Underlying software should re-establish connection and retry sending the data.

Underlying software should re-establish connection and retry sending the data.

Packets may be stuck in kernel when attempting writes to file system via IPoIB interface.

You must manually enable and start the rdma-ndd service on Intel® OPA software installations.

HFI links may occasionally take several minutes to reach link up.

None.

opatmmtool does not provide a correct error message if it is run on a system that does not have a TMM.

Do not run opatmmtool on a system that does not have a TMM.

When booting in legacy BIOS boot mode on RHEL* 7.x and SLES* 12.x, the following message is present in the kernel:

Request for unknown module key 'Intel Corporation: Intel(R) Omni-Path HFI UEFI: 719ebaa125172ba69ad01b850b7458f85c89bb07' err -11

No workaround required. This does not prevent hfi1 driver functionality.

When booting in legacy BIOS boot mode on RHEL* 7.x and SLES* 12.x, the following message is present in the kernel:

Request for unknown module key 'Intel Corporation: Intel(R) Omni-Path HFI UEFI: 719ebaa125172ba69ad01b850b7458f85c89bb07' err -11

No workaround required. This does not prevent hfi1 driver functionality.
When using GPUDirect® RDMA, you must run INSTALL using the -G option.
In this release, the INSTALL script is not passing the -G argument to remote hosts.

Copy the Basic tarball to remote hosts, untar, and launch INSTALL with -G manually on the remote host. This will install the correct GPUDirect® enabled driver and PSM.
For clusters with many nodes, using opafastfabric to perform the installation of hosts that use GPUDirect® may be preferred.
To do this, create two different FastFabric hosts files, one with hosts that use GPUDirect® (for example, hosts_cuda) and another with all the other hosts (for example, hosts_other).
Run opafastfabric against the GPUDirect® hosts using the following command:
HOSTS_FILE=hosts_cuda FF_INSTALL_OPTIONS="-G" FF_UPGRADE_OPTIONS="-G" opafastfabric
When this is complete, exit opafastfabric and run opafastfabric against the other hosts using the following command:
HOSTS_FILE=hosts_other opafastfabric

Note: For other opafastfabric operations, the HOSTS_FILE selection can be made using the TUI menu option 0 as needed.

During execution of an opacapture command, the core file may not be properly copied. This can occur on systems running the SLES® operating system when the following message appears during the capture:
/usr/lib/opa-fm/bin/fm_capture: line 148: [: too many arguments
If a core file exists in the default directory, that core file will be copied.

Replace line 148 in /usr/lib/opa-fm/bin/fm_capture with the following:
if [ -n "$core_path" -a "${core_path:0:1}" = "/" ]

In this release, additional fields were added to the opareport -o snapshot -r XML output format that are not present in Release 10.3. Therefore, Release 10.3 snapshot files will report a "Mandatory Tag Not Found" parser error using Release 10.4 Fabric Manager tools.
Regenerate any such snapshot files using the opareport tool in Release 10.4.

Coexistence feature with Intel® True Scale HCA cards does not function on servers running RHEL® 7.3 OS.
Customers requiring this feature must use RHEL® 7.2 OS.

Active Optical Cables (AOC) may experience longer link up times. If the software and firmware levels on each end of the cable are not equivalent, the condition is worsened and some links may never come up.
Ensure the software and firmware levels on each end of the link are equivalent.
Bounce any link that fails to link up successfully.
