1 Introduction

The Intel Unite® solution powers secure, connected meeting spaces that simplify collaboration. It is designed to quickly and easily connect everyone in a session. The Intel Unite® solution is a simple and instant collaboration solution available today, and it serves as a foundation for additional capabilities and innovation in the future. This document explains how to sign up for the Intel Unite® solution, install the Intel Unite® software, configure the Intel Unite® solution, and provides assistance for troubleshooting. This document can be downloaded from the support website for the Intel Unite® solution and is available in the following languages: English, French, German, Spanish, Italian, Brazilian Portuguese, Korean, Japanese, Traditional Chinese, and Simplified Chinese.

1.1 Audience

This deployment guide focuses on enabling users to launch and become familiar with the Intel Unite® application and its features. This guide is designed for IT professionals in an enterprise environment and any other people involved in deploying the Intel Unite® solution.

1.2 Terminology

This section defines terms used in this document.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Directory (AD)</td>
<td>A Microsoft developed directory service for the Windows domain network.</td>
</tr>
<tr>
<td>Active Directory Group</td>
<td>A container that contains user and computer objects within them as members.</td>
</tr>
<tr>
<td>Active Directory Organizational Unit (AD OU)</td>
<td>A subdivision within an Active Directory into which you can place users, groups, computers, and other organizational units.</td>
</tr>
<tr>
<td>Admin portal</td>
<td>The web interface that manages an organization and provides configuration settings for the Intel Unite® solution.</td>
</tr>
<tr>
<td>App</td>
<td>A software component that extends the functionality of the Intel Unite® solution.</td>
</tr>
<tr>
<td>Certificate Authority (CA)</td>
<td>An entity that issues digital certificates.</td>
</tr>
<tr>
<td>Certificate Revocation List (CRL)</td>
<td>A list of digital certificates that have been revoked by the issuing certificate authority (CA) before their scheduled expiration date and should no longer be trusted.</td>
</tr>
<tr>
<td>Client</td>
<td>A device (running Windows*, macOS*, iOS*, Android*, Chrome OS*, or Linux*) that connects to a hub.</td>
</tr>
<tr>
<td>Digital Certificate</td>
<td>An electronic document used to prove the ownership of a public key.</td>
</tr>
<tr>
<td>DNS TXT record</td>
<td>A type of resource record in the Domain Name System (DNS) used to provide the ability to associate arbitrary text with a host or other name, such as human readable information about a server, network, data center, or other accounting information.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>------</td>
<td>------------</td>
</tr>
<tr>
<td>Domain Controller (DC)</td>
<td>A server computer that responds to security authentication requests (logging in, checking permissions, etc.) within a Windows domain.</td>
</tr>
<tr>
<td>Domain Name System (DNS)</td>
<td>A hierarchical decentralized naming system for computer, services, or other resources connected to the Internet or a private network.</td>
</tr>
<tr>
<td>Enterprise Server (Server)</td>
<td>The web server and the PIN service running on the server that assigns and resolves PINs. It provides a download page for the clients and the admin portal for configuration.</td>
</tr>
<tr>
<td>Firewall</td>
<td>A network security system that monitors and controls incoming and outgoing network traffic based on predefined security rules.</td>
</tr>
<tr>
<td>Fully Qualified Domain Name (FQDN)</td>
<td>The complete domain name of a computer or host consisting of two parts: the host name and the domain name.</td>
</tr>
<tr>
<td>Hub</td>
<td>Mini form factor PCs, all-In-one PCs, and devices conforming to the Open Pluggable Specification (OPS) with Intel vPro® technology that is list on the support website for the Intel Unite® solution. The device is connected to a display in a conference room running the Intel Unite® application.</td>
</tr>
<tr>
<td>Internet Information Services* (IIS*)</td>
<td>A web server provided by Microsoft.</td>
</tr>
<tr>
<td>Information Technology (IT)</td>
<td>The usage of computers to store, retrieve, transmit, and manipulate data or information, often in the context of a business or other enterprise.</td>
</tr>
<tr>
<td>Secure Hash Algorithm (SHA)</td>
<td>A family of cryptographic hash functions published by the National Institute of Standard and Technology (NIST) as a U.S. Federal Information Processing Standard (FIPS).</td>
</tr>
<tr>
<td>Secure Sockets Layer (SSL)</td>
<td>A cryptographic protocol designed to provide communications security over a computer network.</td>
</tr>
<tr>
<td>Single Sign-On (SSO)</td>
<td>A property of access control of multiple related software systems, allowing a user to log in with a single ID and password to gain access to connected systems.</td>
</tr>
<tr>
<td>Unified Extensible Firmware Interface (UEFI)</td>
<td>A specification for a software program that connects a computer's firmware to its operating system.</td>
</tr>
<tr>
<td>Uniform Resource Identifier (URI)</td>
<td>A string of characters designed for unambiguous identification of resources and extensibility via the URI scheme.</td>
</tr>
<tr>
<td>Uniform Resource Locater (URL)</td>
<td>A reference to a web resource that specifies its location on a computer network and a mechanism for retrieving it.</td>
</tr>
<tr>
<td>Virtual Private Network (VPN)</td>
<td>Extension of a private network across a public network, enabling users to send and receive data across a public network as if their computing devices were connected directly to the private network.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Intel vPro® Technology</td>
<td>A set of security and manageability capabilities built into the processor aimed at addressing four critical areas of IT security:</td>
</tr>
<tr>
<td></td>
<td>1. Threat management, including protection from rootkits, viruses, and malware.</td>
</tr>
<tr>
<td></td>
<td>2. Identity and website access point protection.</td>
</tr>
<tr>
<td></td>
<td>3. Confidential personal and business data protection.</td>
</tr>
<tr>
<td></td>
<td>4. Remote and local monitoring, remediation, and repair of PCs and workstations.</td>
</tr>
</tbody>
</table>
2 Intel Unite® Solution Prerequisites

This section explains the hardware and software requirements for hub and client devices that are used with the Intel Unite® solution, along with some IT considerations and network requirements and mobile device considerations.

2.1 Enterprise Server Prerequisites

- Microsoft Windows Server* 2012 R2, 2016, or 2019
  - Recommended latest patch level
  - Microsoft*.NET Framework 4.8 or greater
- Microsoft Internet Information Services* (IIS) requirements:
  - IIS 7, 8, or 10
  - SSL enabled
    - At a minimum, SHA2-based web server certificate with an internal or public root of trust
  - Required IIS features:
    - ASP.NET 4.8
    - WCF services
    - HTTP activation enabled for .NET 4.8
  - Required IIS roles:
    - Common HTTP features
    - Default document
  - IIS extensions:
    - URL Rewrite* 2.1 (requires Microsoft Web Platform Installer*)
  - SMTP email server configured under Microsoft Internet Information Services
- SQL database (Microsoft SQL* or MySQL*): For full SQL support from the vendor, use the paid version of Microsoft SQL and MySQL. There is limited SQL support from the vendor and community when using the free versions (Microsoft SQL Express Edition and MySQL Community Edition).
  - Microsoft SQL Server 2012 SP4, 2014 SP2, 2016 SP1, or 2017 CU7
  - Database server running with mixed mode authentication (SQL Server and Windows Authentication mode)
  - MySQL 5.7
  - It is recommended that you enable Transparent Data Encryption (TDE). Refer to your database vendor documentation to enable TDE.
- 4 GB RAM
- 32 GB available storage

**Note 1:** The Intel Unite® solution 3.x IIS components, the Intel Unite® solution 4.0 IIS components, and the SQL database can coexist on the same server.

**Note 2:** For environments where the web services and the database needs or is desired to be on separate servers, the IIS components and the SQL database can be installed on separate servers.
2.2 Hub Prerequisites

- A supported platform
  - **Note:** Devices that are not explicitly approved by Intel but meet the remainder of the prerequisites may be used, but performance is not guaranteed.
- Microsoft Windows* 10 RS5, RS4, RS3, RS2 (64-bit only)
  - Recommended latest patch level
  - Microsoft .NET 4.8 or greater
- 4 GB RAM
- Network connection (wired or wireless)
- 32 GB available storage
- 7th gen Intel® Core™ i5 processor (or greater)
- The Intel Unite® application, available by subscription
  - **Note:** OEMs may offer bundled SKUs which are prequalified for use as hubs and include the hub application.

2.3 4K Screen-Sharing Prerequisites

4K video is currently available only for Mac and Windows clients. The following are the prerequisites for 4K video.

2.3.1 Hub Prerequisites

- 7th gen Intel® Core™ i5 processor (or greater) with a 4K display

2.3.2 Client Prerequisites

- Windows* OS - 10th gen Intel® Core i5™ processor (or greater) with a 4K screen
- macOS - 7th gen Intel® Core i5™ processor (or greater) with a 4K screen

2.4 Client Prerequisites

- 32-bit or 64-bit Microsoft Windows* 10 RS5, RS4, RS3, or RS2
  - Recommended latest patch level
  - Microsoft .NET 4.8 or greater
- macOS* 10.12, 10.13, 10.14, or 10.15
- iOS* 13 or 14
- Android* Version 6 (Marshmallow), Version 7 (Nougat), or Version 8 (Oreo)
- Chrome OS* (latest version)
- Linux* Fedora* 27 or 28, Red Hat* Enterprise 7, Ubuntu* 16 LTS or 18 Non-LTS
- Wired or wireless network connection

2.5 IT Considerations and Network Prerequisites

Primary IT considerations and network prerequisites include the following:

- Hub and client installations should be managed using the IT department’s established procedures.
- To ensure reliability, Intel strongly recommends that the hubs use wired network connections. This prevents wireless bandwidth saturation, especially in congested areas.
- The Intel Unite® software must be allowed to accept incoming connections. This may require adding an exception to the firewall installed on the hub. Refer to the firewall help guide for the Intel Unite® solution for
more information. For other firewall vendors not in the help guide document, contact the firewall vendor for specific details on how to create application exceptions.

- In production environments, Intel strongly recommends using fully qualified domain names (FQDNs) and setting up a DNS TXT record that points to the Intel Unite® solution. This provides the easiest method for hubs and clients to locate the Intel Unite® solution.
- For security purposes, the Intel Unite® application accepts only SHA-2 or greater certificates due to the end of life of SHA-1.

### 2.6 Mobile Client Devices

Some organizations deploy mobile client devices as part of the Intel Unite® solution. To connect to the Intel Unite® solution, all client devices (including iOS® and Android® devices) must be connected to the corporate network or use an appropriately configured VPN if Active Directory Federation Services is used to log into the admin portal for Intel Unite® solution. Mobile devices not connected to the corporate network (for example, personal laptops, tablets, and phones) may not be able to log into the admin portal. When enabling mobile client devices, IT administrators should do the following:

- If Intel Unite® app users are using personal mobile devices, require them to be on the same network as the hub to connect to Intel Unite® solution, or create another way to allow the connections.
- Utilize and adhere to your business' IT tools and strategies to manage devices and keep the network safe.
- Implement a mobile device management policy for personal and mobile devices used for work.
- Tailor security to provide the correct amount of protection in accordance with the sensitivity of the data to be protected. The amount of tailoring depends on the data the company considers critical and how strictly the company wants to apply protections.

### 2.7 Deployment Overview

This section explains the basic components and resources of an enterprise deployment of the Intel Unite® solution.

#### 2.7.1 Components

The Intel Unite solution consists of four components—enterprise server, hub, clients, and SMTP mail server (or mail relay):

- The **enterprise server** is the first component that needs to be set up. When the hub and client applications are launched, they use the enterprise server to exchange connection information and receive connection information necessary to complete registration.
- The **hub** is an Intel® Core™ processor-based mini PC that meets the hub requirements described in Section 2.2. The hub is typically connected to a display or a projector in a conference room. Consult user manual for the display or projector for instructions on how to properly connect it to the hub.
- **Clients** are systems that connect to a hub for collaboration in a session.
- An **SMTP mail server** or mail relay is used to send users a link for client registration and to send alert messages to IT administrators.

### 2.7.2 Resources

The following resources are required to complete the installation:

- Administrative rights on the SQL database
- Administrative rights on the enterprise server
- Administrative rights on the hub
- Ability to send mail from the SMTP mail server

Requirements may also include the following:
- IT security administrator to issue the SHA-2 certificate
- IT security administrator for firewall policies
- IT administrator to create a DNS TXT record, which is used by hub and clients to locate the enterprise server (strongly recommended)
- Enterprise server configured with valid SMTP settings
3 Enterprise Server Installation

3.1 Overview

The enterprise server installer includes the database, PIN server, admin web portal, and client download page. The enterprise server consists of four components:
  - Microsoft® SQL or MySQL database—Maintains all status information for the Intel Unite solution infrastructure.
  - IIS web service—A standardized messaging service that communicates with the database, hubs, clients, and SMTP server.
  - Administration portal website—Enables administrators to manage hubs and clients, generate statistics, and access monitoring and alerting features.
  - Client download landing webpage—Contains the Intel Unite client software.

3.2 Pre-Installation

The enterprise server pre-installation requirements include:
  - Software requirements described Section 2.1.
  - Additional security considerations (optional). Refer to Appendix E.

3.2.1 SQL Server

A SQL database is required, and the Intel Unite® solution is designed to work with either Microsoft® SQL server or MySQL server. The SQL server can be on the same system as the Intel Unite solution server.

3.2.1.1 Microsoft® SQL Server Installation

The enterprise server can be configured to work with MS SQL version 2012 or higher. Administrators can install a new, dedicated SQL server to run a test environment; however, it is not required. The Intel Unite application creates its own database, data tables, and indexes in an existing database without interfering with other tables or existing data.

The following steps describe how to install MS SQL 2012:
1. Run the SQL server setup and open the SQL server installation center.
2. In the left pane, click Installation, and choose New SQL Server stand-alone installation or add features to an existing installation.
3. Enter the product key, accept the license terms, and click Next.
4. Select Use Microsoft Update to check for updates (recommended) to check for updates and click Next.
5. The setup will look for product updates and installs the necessary updates. To continue, click Next.
6. The setup will check for potential failures and requirements to be met before installation. To continue, click Next.
7. Select SQL Server Feature Installation and click Next.
8. Under the Feature Selection, select Database Engine Services and Management Tools-Complete, and then click Next.
9. Specify the name and instance ID for the SQL server and click Next.
10. Specify the service accounts for each service, and click Next.
11. Select Mixed Mode Authentication (which includes SQL server and Windows® authentication), specify the SQL server administrators, and click Next on each screen until the verify features screen appears.
12. Verify the features to be installed and click Install.
13. Close the dialog box after the installation completes.

3.2.1.2 MySQL Server Installation

The enterprise server can be configured to work with MySQL version 2008 R2 or higher. Administrators can install a dedicated MySQL server to run a test environment, but it is not required. The Intel Unite® solution creates its own database, data tables, and indexes in an existing database without interfering with other tables or existing data. MySQL 5.7 requires Microsoft Visual C++ Redistributable Packages for Visual Studio 2013 (MySQL 5.7)

The following steps describe how to install MySQL 5.7:

1. Double-click the .msi file.
2. Click the Run button.
3. The User Account Control dialog box may display. If so, click Yes to continue.
4. Place a check in the checkbox to accept the license terms on the License Agreement screen, then click Next.
5. Select Custom and click Next.
6. On the next screen, expand MySQL Server, expand MySQL Server <version number>, and then select MySQL Server 5.7.22 – X64 if installing on a 64-bit OS, or select MySQL Server 5.7.22 – X86 if installing on a 32-bit OS.
7. Click the green arrow to add the product to the Products/Features To Be Installed column, then click Next.
8. Click Execute to install MySQL.
9. After installation, verify that a green check is next to MySQL Server <version number>, which indicates a successful installation, then click Next.
10. Click Next again.
11. For Group Replication, select Standalone MySQL Server/Classic MySQL Replication, then click Next.
12. Leave the Type and Networking default settings unchanged and click Next.
13. For Accounts and Roles, enter a password for the root account, then click Next.
14. Leave the Windows® Service default settings unchanged and click Next.
15. Leave the Plugins and Extensions default settings unchanged and click Next.
16. Leave the Advanced Options default settings unchanged and click Next.
17. Click Execute on the Apply Configuration page.
18. Click Finish, click Next, then click Finish again.

3.2.2 Verify .NET Framework 4.8 Installation

Verify that .NET Framework 4.8 is installed on the system targeted for the Intel Unite solution server installation (refer to How to: Determine which .NET versions are Installed for details). If the system targeted for the server installation does not have .NET Framework 4.8 is not installed, refer to the Microsoft .NET Framework 4.8 website for instructions on how to install it.

3.2.3 Enable Internet Information Services (IIS)

Enable Internet Information Services (IIS) on the system targeted for the Intel Unite® solution server installation. The following sections show the steps for enabling IIS on Windows Server* 2012, 2016, and 2019.

3.2.3.1 Windows Server* 2012

Follow the steps below to enable IIS on Windows Server* 2012:

1. Open Server Manager and click Manage, then click Add Roles and Features.
2. In the Add Roles and Features Wizard, click Next.
3. On the Manage menu, select Add Roles and Features.
4. Select role-based or feature-based installation, then click Next.
5. Select the appropriate server (local is selected by default).
7. In the Add features that are required for Web Server (IIS) dialog box, click Add Features.
8. Click Next. On the Features page, add the following features for IIS:
   - .NET Framework 4.8 Features
     - ASP.NET 4.8 (Note: Some versions of Windows Server may not have .NET Framework version 4.8 available. To get the latest version, go to the Microsoft .NET Framework 4.8 website.)
   - WCF Services
   - HTTP Activation (click Add Features in the Add features that are required for HTTP Activation? dialog box).
9. Click Next.
10. On the Web Server Role (IIS) page, click Next.
11. On the Role Services page, click Next.

### 3.2.3.2 Windows Server® 2016 and 2019

Follow the steps below to enable IIS on Windows Server® 2016 and 2019:

1. Open Server Manager.
2. On the Manage menu, select Add Roles and Features, then click Next.
3. For the Installation Type, select Role-based or feature-based installation, then click Next.
4. Select the appropriate server (local is selected by default) and click Next.
5. Select Web Server (IIS), click Add Features that are required for Web Server (IIS), then click Next.
6. Add the following features for IIS:
   - .NET Framework 4.8 Features
     - ASP.NET 4.8
   - Windows Process Activation Service
   - Configurations APIs
   - Process Model
7. Click Add Features to continue, and add the following features:
   - .Net Framework 4.8 Features (2 of 7 installed)
   - .NET Framework 4.8
   - ASP.NET 4.8
     - WCF Services (1 of 5 installed)
       - TCP Port Sharing (installed)
       - HTTP Activation (Note: Placing a check in the HTTP Activation check box opens a dialog box with the following features selected.)
         - Web Server (IIS)
           - Application Development
           - ASP.NET 4.8
           - ISAPI Filters
           - ISAPI Extensions
           - .NET Extensibility 4.8
8. Click Add Features to continue.
9. Accept the default features on the Select Role Services page and click Next.
10. Read the information provided on the Web Server Role (IIS) page and click Next.
11. Click Next to continue.
12. Finally, on the Confirm Installation Selections page, review the items to be installed, and click Install.

3.2.4 Install URL Rewrite

Install URL Rewrite on the system targeted for the Intel Unite solution server installation. Two methods are available for installing URL Rewrite, as described in the next two sections.

3.2.4.1 RL Rewrite Installation – Method 1

1. Download and install the Web Platform Installer.
2. Launch the Web Platform Installer.
3. Click the Products tab.
4. Search for URL Rewrite.
5. Select URL Rewrite 2.1 from the list, then click Add.
6. Click Install.
7. Review and accept the license agreement to begin the installation.
8. Click Exit to close the Web Platform Installer.

3.2.4.2 URL Rewrite Installation – Method 2

1. Download the URL Rewrite installer.
2. Run the installer and follow the wizard.

3.3 Enterprise Server Installation

After completing all enterprise server pre-installation steps, the server software for the Intel Unite® solution can be installed. This process must be run on the server that hosts the IIS environment.

3.3.1 Install the Enterprise Server Using the MSI

The following steps describe how to use the .msi file to install an enterprise server:

1. Locate the Intel_Unite_Server_vx.x.x.mui.msi file (either copied to local storage or on network storage).
2. After launching .msi file, place a check in the checkbox next to I accept the terms of the License Agreement.
3. Click Next to continue.
4. Choose the type of database:
   - If using Microsoft SQL Server, select Choose SQL.
   - If using MySQL, select Choose MySQL.
5. Click Next to continue.
6. In the Server Instance window, set the SQL database options. The available options are:
   - Database Server Connection Details section:
     - The Server Name default value is (local) for the SQL server. Replace the default with a hostname or leave the default value. If using MS SQL and MS SQL is installed on the same server, leave the Server Name as (local). If using MySQL and MySQL is on the same server, the Hostname should be localhost instead of (local).
- If MS SQL is selected, the default value for database server authentication is Windows Authentication. If SQL authentication is preferred, select SQL Authentication, then fill in the Login ID and Password of an MS SQL account that has create database and read/write access.

- If MySQL is selected, enter the account name in the Login ID text box and the account password in the Password text box. The account should have create database and read/write access.

- Click the Test Connection button to verify the account information.

  o Database Server Connection/Setup Details section:
    - Create a password and enter the password into the Service Account Password text box. The password is for the api_user, which is used to access the database named unite_server.
    - Retype the password into the Confirm Password text box. (Note: The password must contain at least eight characters, one uppercase character, one lowercase character, one digit, and one symbol.)

7. Click Next to configure the installation path. The default path for the installation is C:\Program Files (x86)\Intel\Intel Unite. If a different location is preferred, enter the new location in the text box or click the Change button to use the Change Destination Folder dialog box to select the location. If using the Change Destination Folder dialog box, browse to the location, and click OK.

8. Click Next.

9. If you are using a load balancer, proceed to Appendix H to complete the configuration. If you are not using a load balancer, click Next to accept the default settings.

10. Enter an organization name in the Organization Name text box, and enter a description in the Organization Description text box. The organization name is used to create a hub group and client group.

11. Select either Enhanced Pairing Mode or Standard Pairing Mode.

   o Enhanced pairing mode requires email confirmation when registering a client device.
   o Standard pairing mode does not require email confirmation when registering a client device.

12. Click Next.

13. Click Install to start the installation. When the installation process completes, the enterprise server is installed.

### 3.3.2 Verify the Successful Creation of the Database for the Intel Unite® Solution (Optional)

To verify the successful creation of the database for the Intel Unite solution on MS SQL or MySQL, use one of the following procedures:

**For MS SQL:**

1. Open SQL Management Studio, and connect to the SQL server.
2. Expand Databases on the left side pane and ensure the unite_server is listed.
3. Confirm that api_user exists under Security > Logins.

**For MySQL:**

1. Open a command-line window on the MySQL server.
2. Start the MySQL interpreter by typing `mysql -h <host-name> -u=<your-user-name> -p` at the command prompt, where `<host-name>` is localhost, since the command is running from the computer with My SQL, and `<your-user-name>` is the user name used during server installation.
3. Enter the password for the user.
4. Type `SHOW DATABASES;` and ensure the unite_server database is listed.
3.3.3 Install the Enterprise Server Using a Command Line

The Intel Unite application installer for the enterprise server supports command-line installations. The installer .msi file must be in a known location, either on the local system or a network share. The command and parameters for installation are shown and must be executed as administrator:

msiexec /i "Installer_Path.msi" /l*v "Log_Path" /q INSTALLFOLDER=Value DBTYPE=[1|0] DBHOSTNAME=Value DBLOGONTYPE="[WinAccount|SqlAccount]" DBPASSWD=Value DBLOGONPASSWDCONF=Value ORGNAMEPROPERTY=Value ORGDESCPROPERTY="Value" PUBLISH_WEBAPI_HELP=Value PAIRMODEPROPERTY="[0|1]" ADDLOCAL="Value"

**Note:** A Start/Wait command can be used for scripted installations of the Intel Unite® solution on Windows based servers, hubs, and clients. This command will hold the Command Prompt until the installation or uninstall to complete before giving the prompt back to the user. This is is useful for letting the user know when msiexe has completed. For example:

Start/Wait msiexec /i "Intel_Unite_Client_v4.1.6111.13_x64.mui.msi" /q /l*v "C:\temp\install.txt"

3.3.3.1 Enterprise Server Command-Line Installation Parameters

The enterprise server installation parameters are case-sensitive. The result of the installation can be determined by parsing the log file. Double quotes are only required for input values that include one or more spaces. When in doubt, use double quotes to surround input values.

Capitalized names in the table below are the supported properties. They can be combined depending on the setup. The values inside brackets are predefined options (choose one, and do not include brackets or the pipe character).

**Table 2: Enterprise Server Command-Line Installation Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/i</td>
<td>The switch for installation.</td>
</tr>
<tr>
<td>&quot;Installer_Path.msi&quot;</td>
<td>The path including the filename of the msi file (for example, &quot;c:\my downloads\installer.msi&quot;).</td>
</tr>
<tr>
<td>/l*v</td>
<td>The switch for generating a log file.</td>
</tr>
<tr>
<td>&quot;Log_Path&quot;</td>
<td>The path including the log file name (for example, &quot;c:\my logs\serverinstalllog.txt&quot;).</td>
</tr>
<tr>
<td>/q</td>
<td>The switch for silent, no user interaction.</td>
</tr>
<tr>
<td>INSTALLFOLDER=Value</td>
<td>The location specifying where to install the server application. Replace Value with the full path, including the double quotes (for example, &quot;c:\my apps\unite server&quot;).</td>
</tr>
<tr>
<td>DBTYPE=[0</td>
<td>1]</td>
</tr>
<tr>
<td>DBHOSTNAME=Value</td>
<td>The host name of the SQL server. Replace Value with the FQDN of the SQL server.</td>
</tr>
<tr>
<td>DBLOGONTYPE=&quot;[WinAccount</td>
<td>SqlAccount]&quot;</td>
</tr>
</tbody>
</table>
**DBUSER=Value**
The user name of the account used to log in to the SQL database to create the database tables and create the service account. Replace Value with the database user name.

**DBPASSWORD=Value**
The password of the database account used to log in to the SQL database to create the database tables and create the service account. Replace Value with the password.

**DBLOGONPASSWORD=Value**
The password for the service account. Replace Value with the password.

**DBLOGONPASSWORDCONF=Value**
The confirmation of the password for the service account. Replace Value with the password. This must be the same as DBLOGONPASSWORD.

**ORGNAMEPROPERTY=Value**
The organization name, which is used to create a hub group and a client group. Replace Value with the organization name.

**ORGDESCPROPERTY="Value"**
A detailed description for the organization. Replace Value with the description in double quotes.

**PUBLISH_WEBAPI_HELP={0|1}**
The switch to install the help webapi. A Value of 1 means to install the help webapi, and a Value of 0 means to not install the help webapi.

**PAIRMODEPROPERTY={0|1}**
The switch to set the pairing mode. A Value of 1 means Standard Pairing Mode, and a Value of 0 means Enhanced Pairing Mode.

**ADDLOCAL="Value"**
The list of server component features to install on this server. Replace Value with a server component feature or a list of server component features separated with commas. Following is a list of server component features:
- DatabaseFeature – Install the database on this server.
- DatabaseFeature – Install the WebAPI on this server.
- AdminPortalFeature – Install the admin portal on this server.
- TelemetryFeature – Install the Telemetry service on this server.
- MaintenanceFeature – Install the Maintenance service on this server.
- ALL – Install all the above features on this server.

### 3.4 Configure IIS for the Admin Portal Website (Quick Start)

This section describes the basic configuration needed for the admin portal to be set up to pair with hubs and client registrations, which enables clients to connect to the hubs. Refer to Section 6 for a complete set of admin portal configuration options.
3.4.1 Obtaining a Certificate

The Intel Unite® solution can be configured to work with SHA-2 certificates from public root of trust certificate authorities or self-signed certificates.

3.4.1.1 Option 1: Obtain a Certificate from a public root of trust certificate authority

Using a public root of trust or external certificates authority allows Intel Unite® clients and hubs to establish a reliable, secure connection to the enterprise server. Major operating systems inherently trust these certificate authorities as part of normal operating system process.

Below are a couple of examples of certificate authorities that can provide SHA-2 certificates:

- www.godaddy.com
- www.verisign.com

3.4.1.2 Option 2: Create a self-signed Web Server Certificate

For test environment, a self-signed certificate can work well. However, attempting to use self-signed certificates in a production environment can limit connectivity of some platforms. Not all platforms are capable of trusting self-signed certificates, such as iOS and Chrome OS.

With the end of life of SHA-1 certificates, the latest version of the Intel Unite solution only accepts SHA-2 certificates or greater. The organization’s IT department should ensure the trusted web server certificate issued is a SHA-2 certificate and the certification path is valid.

For a test environment, a self-signed SHA 2 certificate can be created following the steps below:

1. Run PowerShell as administrator.
2. Run the following command, replacing `<Computer Name>` with the FQDN used to access the enterprise server. For example, mytestserver.mycompany.com:
   ```powershell
   New-SelfSignedCertificate -DnsName <Computer Name> -CertStoreLocation "cert:\LocalMachine\My"
   ```
3. To run MMC as an administrator, click the Search icon on the Windows* task bar, type Run, press Enter or Return, and type `mmc`.
4. In the Console window, click File, and select Add or Remove Snap-ins.
5. Select Certificates and click Add.
7. Select Local Computer.
8. Click Finish, then click OK.
9. In the left pane, click Expand Certificate (Local Computer), select Personal, and select Certificates.
10. In the middle pane, right-click the certificate created previously, and enter a Friendly Name (this name is used in a later step).
11. Right-click the certificate again and click Copy.
12. In the left pane, click Trusted Root Certification Authorities.
13. In the center pane, right-click anywhere, and click Paste.
14. To close the mmc, click File, and click Exit. On exit, a prompt to save may be displayed. Saving the settings enables loading the settings later, including the certificate snap-in. If the settings are not saved, the certificate snap-in will have to be added again.
3.4.2 Install the Web Server Certificate and Configure Web Server Bindings

This section describes how to open the Internet Information Services (IIS) Manager, expand the server name, and remove a port binding.

3.4.2.1 Open IIS Manager

Follow the steps below to open the IIS Manager;
1. On the Start menu, click All Programs, click Accessories, then click Run.
2. In the Run text box, type control panel, then click OK.
3. In the Control Panel window, click Classic View, and then double-click Administrative Tools.
4. In the Administrative Tools window, double-click Internet Information Services (IIS).

3.4.2.2 Expand the Server Name

Follow the steps below to expand the server name:
1. In the left Connections pane, expand Sites, then click Default Web Site.
2. In the right Actions pane, find Edit Site, then select Bindings.
3. In the Site Bindings window, click Add.
4. Configure the following settings:
   - Type: https (Note: not http)
   - IP Address: All Unassigned
   - Port: 443
   - Hostname: (leave blank)
   - SSL Certificate: (select the one you installed in the previous steps)
5. Click OK.
6. Click Close.

Note: The web service for the Intel Unite® app communicates with the clients and hubs using port 443.

3.4.2.3 Remove Port 80 Binding

The following steps describe how to remove the port 80 binding:
1. In the left navigation pane, find Sites, and then select Default Web Site.
2. In the right Actions pane, find Edit Site, and then select Bindings.
3. Select the item with Port equal to 80.
4. Click the Remove button and click Close.

3.4.3 Enable Anonymous Authentication

Anonymous Authentication MUST be enabled for the Intel Unite® solution to work properly. Follow the steps below to enable Anonymous Authentication:
1. In the left navigation pane, find Sites, and then select Default Web Site.
2. In the middle pane, double click Authentication.
4. In the Actions pane, select Edit.
5. Select Specific user.
6. Click Set.
7. Enter IUSR for the User name and leave the Password Confirm password fields blank.
8. Click OK.

3.4.4 Configure IIS SMTP Email Settings

Follow the steps below to configure IIS SMTP email settings:

1. In the left navigation pane, find Sites, and select Default Web Site.
2. Double-click the SMTP Email icon.
3. On the SMTP Email page, type the sender's email address in the Email address text box.
4. Select Deliver email to SMTP server. (This delivers email messages immediately. This requires an operational SMTP server for which the user has credentials.)
5. In the SMTP Server text box, type the SMTP server's unique FQDN, or select the Use localhost check box to set the name to LocalHost. Setting the name to LocalHost means ASP.NET uses an SMTP server on the local computer. Typically, this is the default SMTP virtual server.
6. In the Port text box, enter a TCP port. Port 25 is the SMTP standard TCP port and is the default setting. More than one virtual server can use the same TCP port if all servers use different IP addresses.
7. Under Authentication Settings, specify the authentication mode and credentials, if your SMTP server requires these.
8. If the SMTP server is set up for email relaying, find Authentication Settings, and choose Not required.
9. Click Apply in the Actions pane.

Note: For third-party SMTP servers that have SSL enabled, add enableSsl="true" between the SMTP tags to the web.config file.

Example: Web.config - SMTP with SSL Enabled

```xml
<system.net>
 <mailSettings>
 <smtp from="water@test.com">
 <network host="mail.test.com" port="25" userName="tester@test.com" password="xxxxx" defaultCredentials="false" enableSsl="true"/>
 </smtp>
 </mailSettings>
 </system.net>
```

Note: The Active Directory identity used by the enterprise server to access Active Directory should be limited to "read only" for additional security.

3.4.4.1 Configure IIS for Active Directory Access

Once read permissions are granted for the enterprise server to the Active Directory hub and user groups, the enterprise server's IIS needs to be configured with the desired identity.

1. Open Internet Information Services (IIS) manager on the enterprise server.
2. In the left navigation pane, expand the server name, and then expand Sites.
4. In the middle pane, double-click Application Settings.
5. In the right Actions pane, click Add.
6. Add the following Application Settings:
   - ActiveDirectoryServer
     - Name: ActiveDirectoryServer
     - Value: Enter the domain controller's FQDN. If there are multiple domains, enter each domain controller separated by a pipe. The port number can be appended to the FQDN (for example, DC1.abc.corp.mycompany.com|DC1.xyz.corp.mycompany.com:1234).
   - ActiveDirectoryServerUsername
     - Name: ActiveDirectoryServerUsername
     - Value: Enter a valid user name with read permission to the Active Directory hub and user group(s).
   - ActiveDirectoryServerPassword
     - Name: ActiveDirectoryServerPassword
     - Value: Enter the password for the account.
   - ActiveDirectoryServerUseSSL
     - Name: ActiveDirectoryServerUseSSL
     - Value: Enter True if SSL is used. Enter False if SSL is not used. By default, this value is False.
   - ActiveDirectoryGroupsCacheLifeSpan
     - Name: ActiveDirectoryGroupsCacheLifeSpan
     - Value: Enter the number of hours between group cache refresh. By default, this value is 24 hours.
   - ActiveDirectoryGlobalCatalog
     - Name: ActiveDirectoryGlobalCatalog
     - Value: Enter the forest (for example, corp.mycompany.com).
   - ActiveDirectoryServer
     - Name: ActiveDirectoryServer
     - Value: Enter the domain controller's FQDN. If there are multiple domains, enter each domain controller separated by a pipe. The port number can be appended to the FQDN (for example, DC1.abc.corp.mycompany.com|DC1.xyz.corp.mycompany.com:1234).

7. Click OK.

8. Repeat Steps 6 and 7 for each of the following entries:
   - ActiveDirectoryGlobalCatalog
     - Name: ActiveDirectoryGlobalCatalog
     - Value: Enter the forest (for example, corp.mycompany.com).
   - ActiveDirectoryServerUseSSL
     - Name: ActiveDirectoryServerUseSSL
     - Value: Enter True if SSL is used. Enter False if SSL is not used. By default, this value is False.
   - ActiveDirectoryGroupsCacheLifeSpan
     - Name: ActiveDirectoryGroupsCacheLifeSpan
     - Value: Enter the number of hours between group cache refresh. By default, this value is 24 hours.
   - ActiveDirectoryServerUsername
     - Name: ActiveDirectoryServerUsername
     - Value: Enter a valid user name with read permission to the Active Directory hub and user group(s).
   - ActiveDirectoryServerPassword
     - Name: ActiveDirectoryServerPassword
     - Value: Enter the password for the account.
   - ActiveDirectoryGlobalCatalog
     - Name: ActiveDirectoryGlobalCatalog
     - Value: Enter the forest (for example, corp.mycompany.com).

If the AD machine account that hosts the admin portal has read access to the Active Directory groups, the ActiveDirectoryServerUsername and ActiveDirectoryServerPassword values are not needed.

Reference: Microsoft Windows server* library article for installing IIS on Windows Server* 2012

### 3.4.4.2 Add Proxy Configuration to the Web.config File

For solutions where the server is not hosted behind a proxy, skip this section and continue to Section 3.5. For solutions where the server is behind a proxy, the proxy configuration must be added to the Web.config file, or authentication errors will occur. Follow the steps below to add the proxy configuration to the Web.config file:

1. From the machine that operates as the server for the Intel Unite® solution, log into an account that has administrative capabilities and launch the Internet Information Services (IIS) Manager.
2. Using the navigation panel on the left side of the screen, expand Sites, then expand IntelUnite.
3. Right-click Api and select Explore from the pop-up menu.
4. In the resulting window, find the Web.config file and open it with a text-editor.
5. Add the following lines inside <system.net>, replacing <Proxy address> with the path to your proxy:
   ```xml
   <defaultProxy>
   <proxy
     usesystemdefault = "false"
     proxyaddress="<Proxy address>"
     bypassonlocal="true"
   />
   </defaultProxy>
   ```
6. Save the Web.config file and close it.

After the proxy configuration has been added to the Web.config file, follow the steps below to reset IIS:
1. Run a command prompt as administrator.
2. Enter `iisreset /noforce`, then press return.
   Note: The `/noforce` parameter helps prevent data loss if IIS cannot be stopped within the default time-out period of one minute. It is optional, but recommended.
3. Once IIS has restarted, the command prompt will automatically close.

### 3.5 DNS TXT Record

The DNS TXT record is a resource record used to provide information needed for the Intel Unite® solution. The specific information provided by the DNS TXT record is the URL of the server hosting the Web API component of the Intel Unite software and the organization ID.

#### 3.5.1 DNS Hierarchy and Proper Placement of DNS TXT Record

The DNS TXT record facilitates the auto-discovery of the PIN service for the Intel Unite solution. The DNS TXT record placement must match the primary DNS suffix or parent zone suffix of the hubs and clients. A PIN service can reside in any site if network traffic is permitted between sites. The following diagram and examples show the proper placement of the DNS TXT record.

**Figure 1: DNS TXT Record Placement Example**

![Diagram showing DNS TXT record placement](image)

Examples based on the diagram:

Option 1: The DNS TXT record is created in example.com, and the PIN service resides in Site 1. Clients from any site can auto-discover the service.

Option 2: Three DNS TXT records are created in Sites 1, 2, and 3 in example.com, and the PIN service resides in Site 1. Clients from any site can auto-discover the service.

#### 3.5.2 Create a DNS TXT Record

The hub and clients can locate the enterprise server by using a DNS TXT record during an automatic lookup for the enterprise server. The string in the DNS TXT record is not case-sensitive. To add a DNS TXT record in Microsoft® Windows®, complete the following steps:

1. On your DNS server, open DNS Manager.
2. In the left pane, expand Forward Lookup Zones.
3. Right-click the zone that contains the systems used for the Intel Unite solution. For a DNS setup that contains multiple forward lookup zones, select the zone that matches the primary DNS suffix for devices that will be used with the Intel Unite® solution.

4. Select Other New Records.

5. In the Select a Resource Record Type area, select Text (TXT).

6. Click Create Record.

7. For Record Name, enter uniteservice. The FQDN is filled in automatically.

8. For the Text option, enter SERVICEURL=https://<FQDN of the admin portal Server>/intelunite/api|ORGID=<OrgID>|OrgName=<OrgName>, where <OrgID> is the GUID for the organization and <OrgName> is the name of the organization. The OrgID is randomly generated, and the OrgName is set during installation of the Intel Unite® solution. Both values can be found by browsing to https://<FQDN of the server>/intelunite/admin/landing.

9. Click OK to create the record.

10. Click Done to close the Resource Record Type window.

### 3.5.3 Disable Use of the DNS TXT Record

The use of the DNS TXT Record for auto-discovery can be disabled by adding the registry key DisableAutoDiscovery of the type DWORD to the following registry paths. A DWORD value of 1 means do not use DNS TXT Record for auto-discovery. A DWORD value of 0 means, use the DNS TXT Record for auto-discovery. Any other value will result in default behavior of using the DNS TXT Record for auto-discovery. If the key is not present, the device will use the DNS TXT Record for auto-discovery.

32bit Windows:
- Hub: HKLM\SOFTWARE\Intel\Intel Unite\Hub
- Client: HKLM\SOFTWARE\Intel\Intel Unite\Client

64bit Windows:
- Hub: HKLM\SOFTWARE\(WOW6432Node)\Intel\Intel Unite\Hub
- Client: HKLM\SOFTWARE\(WOW6432Node)\Intel\Intel Unite\Client

Once DNS TXT Record is disabled for auto-discovery, the use of the Intel Unite solution landing page is needed to provide the information provided by the DNS TXT Record. To access the landing page, browse to the following URL: https://<Intel Unite solution portal FQDN>/intelunite/admin/landing. On the landing page, click the link which will set the registry keys with needed values and open the Intel Unite application on the device.

### 3.6 Configure the Enterprise Server for the Intel Unite® Solution

This section describes how to use the admin portal to configure the enterprise server for the Intel Unite solution.

#### 3.6.1 Log in to the Admin Portal

The following steps describe how to connect to the admin portal.

1. Open a web browser. Internet Explorer* may not work. If that occurs, Intel recommends using Chrome*.
2. Go to https://<FQDN of the server>/intelunite/admin.
3. In the User Name text box, enter admin.
4. In the Password text box, enter Admin@1.

The first time the built-in admin account is used to log in to the admin portal, the admin portal prompts for a change of the admin password. Set a new password, and use the new password to log in to the admin portal. Click the information symbol (i) next to password rule to see more information about the password requirements.
3.6.2 Set Privacy Policy

After logging into the admin portal for the first time, a dialogue displays the available privacy policies. Select one of these options to continue.

Available privacy policies include:

- Collect locally and share anonymous data with Intel – Telemetry data is collected and forwarded to Intel.
- Collect locally and DO NOT share anonymous data with Intel – Telemetry data is collected and stored on the admin portal, but not forwarded to Intel.
- Do not collect – No telemetry data is collected.
- Prompt user to potentially share anonymous data with Intel – Asks the user to opt-in or opt-out of telemetry data collection and the forwarding of the telemetry data to Intel.

3.6.3 Upload the Hub and Client Package Files to the Admin Portal

Packages contain the core configuration and feature/apps modules used to configure and extend the capabilities of the hubs and clients. If packages are not uploaded to the server, the hubs and clients will not be configured, and they will not be functional.

Core client and hub packages, along with the file transfer package, are included in the Intel Unite® solution installer ZIP file. The packages included in the installer ZIP file are listed in the table below.

Table 3: Included Packages

<table>
<thead>
<tr>
<th>Package</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unite_Client_vXXX.cab</td>
<td>The core module needed by the client devices.</td>
</tr>
<tr>
<td>Unite_ClientRemoteView_vXXX.cab</td>
<td>The module that allows clients to view remotely.</td>
</tr>
<tr>
<td>Unite_ClientScreenSharing_vXXX.cab</td>
<td>The module that allows clients to share.</td>
</tr>
<tr>
<td>Unite_Hub_vXXX.enabled.cab</td>
<td>The core module needed by the hub devices.</td>
</tr>
<tr>
<td>Unite_HubRemoteView_vXXX.cab</td>
<td>The module that allows hubs to view remotely.</td>
</tr>
<tr>
<td>Unite_HubScreenSharing_vXXX.cab</td>
<td>The module that allows hubs to share.</td>
</tr>
<tr>
<td>Unite_FileTransfer_vXXX.cab</td>
<td>The module that allows file transfers between clients.</td>
</tr>
</tbody>
</table>

To obtain other app packages, visit the Intel Unite® App Showcase website. Refer to the Intel Unite® solution 4.0 SDK documentation for package creation.

Follow the steps below to upload packages.

1. Log in to the admin portal.
2. Open the Device Management menu and click Upload Package.
3. Browse to the installation files for Intel Unite® solution and open the Manifests directory.
4. Select Unite_Client_vXXX.cab and click Open. A Success message should appear temporarily to indicate a successful upload.
5. Click Upload Package again.
6. Browse to the installation files for Intel Unite® solution, and open the Manifests directory.
7. Select Unite_ClientRemoteView_vXXX.cab and click Open. A Success message should appear temporarily to indicate a successful upload.
8. Click Upload Package again.
9. Browse to the installation files for Intel Unite® solution and open the Manifests directory.
10. Select Unite_ClientScreenSharing_vXXX.cab and click Open. A Success message should appear temporarily to indicate a successful upload.
11. Click Upload Package again.
12. Browse to the installation files for Intel Unite® solution and open the Manifests directory.
13. Select Unite_Hub_vXXX_enabled.cab and click Open. A Success message should appear temporarily to indicate a successful upload.

14. Click Upload Package again.

15. Browse to the installation files for Intel Unite® solution and open the Manifests directory.

16. Select Unite_HubRemoteView_vXXX.cab and click Open. A Success message should appear temporarily to indicate a successful upload.

17. Click Upload Package again.

18. Browse to the installation files for Intel Unite® solution and open the Manifests directory.

19. Select Unite_HubScreenSharing_vXXX.cab and click Open. A Success message should appear temporarily to indicate a successful upload.

20. (Steps 20–22 are optional) If the file transfer feature is needed, click Upload Package again.

21. Browse to the installation files for Intel Unite® solution and open the Manifests directory.

22. Select Unite_FileTransfer_vXXX.cab and click Open. A Success message should appear temporarily to indicate a successful upload.

### 3.6.4 Approve Packages for Deployment

Configuration of core components, apps, and features in a package is not available for assignment until the package is approved. These components are needed for hub and client configurations.

Follow the steps below to approve packages:

1. Log in to the admin portal.
2. Open the Device Management menu and click Features/Apps.
3. Click the Package Approval tab.
4. For each package shown, click the Approve button to approve the package.

### 3.6.5 Create a Hub Configuration

Follow the steps below to create a hub configuration:

1. Log in to the admin portal.
2. Open the Device Management menu and click Configurations.
3. Click the Create Configuration button.
4. In the Configuration Name text field, enter a name for the configuration.
5. Open the Intel Unite® Software Version menu, and select Intel Unite® Solution Hub - x.x.x.x, where x.x.x.x is the release version number.
6. To add features or apps to the configuration, click the white plus sign with the blue background associated with the feature or app.
7. Click Create Configuration to save the new configuration.

### 3.6.6 Create a Client Configuration

Follow the steps below to create a client configuration:

1. Log in to the admin portal.
2. Open the Device Management menu and click Configurations.
3. Click the Create Configuration button.
4. Click the Client Configuration checkbox.
5. In the Configuration Name text box, enter a name for the configuration.
6. Open the Intel Unite® Software Version menu, and select Intel Unite(R) Client version - x.x.x.x, where x.x.x.x is the release version number.
To add features or apps to the configuration, click the **white plus sign with the blue background** icon associated with the feature or app.

8. Click the **Create Configuration** button to save the new configuration.

### 3.6.7 Assign Configurations to Hubs

To view defined hub configurations, open the Device Management menu, and click Configurations. To view a list of hub configurations, click the Hub Configurations tab.

Follow the steps below to assign configurations to hubs:

1. Log in to the admin portal.
2. Open the **Device Management** menu and click **Hubs and Clients**.
3. Click the **Hubs** tab.
4. Click the group with the name that contains the organization name used during server installation. Note: Subgroups can be created, and configurations can be assigned to them. When assigning a configuration to a subgroup, expand the subgroup and click the group name under the subgroup.
5. Open the **Select Action** menu and select **Assign Configuration**.
6. Choose the hub configuration created in the previous steps.
7. Click **Assign**.

**Note:** If a group has custom/overridden properties configured, their values will retained when the new configuration is assigned, if possible. A confirmation dialog will appear that list custom/overridden properties and indicate whether or not they will be retained.

If a group has custom/overridden properties, this confirmation dialog will be shown in the following events:

- A new configuration is assigned to the group.
- The version of a module of the configuration assigned to the group is changed.
- The group is moved or deleted.
- Device(s) are moved from or to the group.

### 3.6.8 Assign Configurations to Client Groups

Follow the steps below to assign configurations to clients:

1. Log in to the admin portal.
2. Open the **Device Management** menu and click **Hubs and Clients**.
3. Click the **Clients** tab.
4. Click the group with the name that contains the organization name used during server installation. Note: Subgroups can be created, and configurations can be assigned to them. When assigning a configuration to a subgroup, expand the subgroup, and click the group name under the subgroup.
5. Open the **Select Action** menu and select **Assign** Configuration.
6. Choose the client configuration created in the previous steps.
7. Click **Assign**.

**Note:** To view defined client configurations, open the Device Management menu, and click Configurations. To view a list of client configurations, click the **Client Configurations** tab.

### 3.7 Enterprise Server Software Uninstallation

If the server application needs to be uninstalled, the unite_server database also needs to be deleted. Before uninstalling, back up the database.

1. Locate the **Intel_Unite_Server_vx.x.x_x86.msi** file (copied to local storage or on network storage).
2. Launch the Intel_Unite_Server_vx.x.x.x_86.msi installer.
3. Click Remove, then click Next to uninstall the Intel Unite® solution server application.
4. Delete the SQL database using one of the following procedures:
   - Microsoft SQL—Go to Microsoft SQL Server Management Studio, and manually delete the unite_server SQL database and the api_user.
   - MySQL—Open a command-line window on the MySQL server. Start the MySQL interpreter by typing mysql -h <host-name> -u=<your-user-name> -p at the command prompt, where <host-name> is localhost, and <your-user-name> is the user name used during server installation. Enter the password. Type drop databases unite_server; to delete the database. Type show databases; to verify that the unite_server database is deleted. Type drop user api_user; to delete the api_user.

### 3.7.1 Enterprise Server Command-Line Uninstallation

The Intel Unite® application installer for the enterprise server supports command-line uninstallation. The installer msi file must be in a known location on the local system or network share. The following command and parameters for uninstallation must be executed as an administrator:

```
msiexec /x "Installer_Path.msi" /l*v "Log_Path" /q
```

### 3.7.1.1 Enterprise Server Command-Line Uninstallation Parameters

The uninstallation parameters are case-sensitive. The result of an uninstallation can be determined by parsing the log file. Double quotes are only required for input values that include one or more spaces. When in doubt, use double quotes to surround input values.

**Table 4: Uninstallation Parameters**

<table>
<thead>
<tr>
<th>Package</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/x</td>
<td>The switch for uninstall.</td>
</tr>
<tr>
<td>&quot;Installer_Path.msi&quot;</td>
<td>The path and filename of the msi file, including double quotes.</td>
</tr>
<tr>
<td>/l*v</td>
<td>The switch for generating a log file (for example, &quot;c:\my logs\serveruninstalllog.txt&quot;).</td>
</tr>
<tr>
<td>&quot;Log_Path&quot;</td>
<td>The path including the log filename, with double quotes (for example, &quot;c:\my downloads\installer.msi&quot;).</td>
</tr>
<tr>
<td>/q</td>
<td>The switch for silent, no user interaction.</td>
</tr>
</tbody>
</table>

### 3.8 Enterprise Server Log Files

The server saves log files at the following path:

```
C:\Users\IntelUniteWebApiPool\AppData\Local\Temp
```

The following log files are found in the above path:

- IntelUniteServerLog.txt
- IntelUniteTransactionLog.txt
- UniteServerLog.txt
4 Hub Installation

This section explains how to install the hub components of the Intel Unite® solution.

4.1 Hub Pre-Installation

A hub needs to be able to locate and pair with the admin portal for Intel Unite® solution. The Intel Unite® application needs an exemption in the hub firewall to communicate with the clients. By default, the port used by the Intel Unite® application is randomly set, but can be manually set through the admin portal for Intel Unite® solution under hub configuration properties. Additionally, complete the following verifications:

- Verify a network connection with the server by pinging to the server from the hub using the FQDN of the server and pinging from the server to the hub using the FQDN of the hub.
- Verify a DNS TXT record has been created for the Intel Unite® solution. If not using a DNS TXT record, confirm that the hub has access to the provisioning URL.
- Verify that the hub meets the minimum software and hardware requirements specified in Section 2.2.

4.1.1 Use Self-Signed Certificates

If the server uses a self-signed certificate, the certificate needs to be imported into the Trusted Root of the hub’s certificate store. To do this, the certificate must be exported from the admin portal, saved locally, and then imported on a hub. This section describes how to export, save, and import self-signed certificates on Windows* and macOS* clients.

4.1.1.1 Export/Import Certificates on Windows* Clients

To Export a self-signed certificate for a Windows* client using Chrome*:
2. Right-click the red lock icon in the address bar and click Certificate.
3. Click the Details tab and click Copy to File. The Certificate Export Wizard will open.
4. In the Certificate Export Wizard, click Next to go to the Export File Format screen.
5. Choose DER encoded binary X.509 (.CER), then click Next.
6. Click Browse and save the file to the computer using a descriptive name.
7. Click Next, then click Finish to close the wizard.

To Export a self-signed certificate for a Windows client using Internet Explorer*:
1. Open Internet Explorer and browse to the admin portal (https://<FQDN of the Server>/intelunite/admin).
2. Click the lock icon in the address bar and click View Certificate.
3. Click the Details tab and click Copy to File. The Certificate Export Wizard will open.
4. In the Certificate Export Wizard, click Next to go to the Export File Format screen.
5. Choose DER encoded binary X.509 (.CER) and click Next.
6. Click Browse and save the file to the computer using a descriptive name.
7. Click Next and then click Finish to close the wizard.

To Import a self-signed certificate for a Windows client using Chrome:
1. Open Chrome settings, scroll to the bottom, and click Advanced.
2. Under Privacy and Security, click Manage certificates.
3. Click the Trusted Root Certification Authorities tab, and then click the Import button. The Certificate Import Wizard will open.
4. In the Certificate Import Wizard, click Next to go to the File to Import screen.
5. Click Browse, select the certificate file saved earlier, and then click Next.
6. Select **Place all certificates in the following store**. The selected store should be Trusted Root Certification Authorities. If it isn’t, click **Browse**, and select it.

7. Click **Next**, then click **Finish**.

8. Click **Yes** on the security warning.

Import a self-signed certificate for a Windows client using Internet Explorer:

1. Open Internet Explorer Internet Options.
2. Click the **Content** tab.
3. Click the **Certificates** button.
4. Click the **Import** button to open the Certificate Import Wizard and click **Next**.
5. Click **Browse**, select the certificate file saved earlier, and then click **Next**.
6. Select **Place all certificates in the following store**. The selected store should be Trusted Root Certification Authorities. If it isn’t, click **Browse**, and select it.
7. Click **Next**, and then click **Finish**.
8. Click **Yes** on the security warning.

### 4.1.2 Certificate Verification

In certain scenarios, such as no access to the internet, it is desirable to disable or limit the verification of certificates. To disable certificate verification, set the following registry key to a **REG_DWORD** value of 1.

```
HKLM\SOFTWARE\Wow6432Node\Intel\Intel Unite\DisableCertificateChainVerification
```

Value meaning:
- **1** = Disables certificate chain verification
- **0** = Enables certificate chain verification (default behavior/also when key is not present)

To ensure that SSL certificates being used are verified, set the following registry key to a **REG_DWORD** value of 1.

```
HKLM\SOFTWARE\Wow6432Node\Intel\Intel Unite\EnforceSslCrlCheck
```

Value meaning:
- **1** = Ensures SSL CRL check
- **0** = Does not enforce SSL CRL check (default behavior/also when key is not present)

### 4.2 Recommended Hub System Settings

To ensure the best possible end user experience, the hub should be configured so it is always ready to be used, and system alerts or pop-ups are suppressed. The recommended system settings are:

- Windows® automatically logs in with the account that executes the Intel Unite application.
- Screen savers are disabled.
- The system is set to never go into standby mode.
- The system is set to never log out.
- The display is set to never turn off.
- System alerts are suppressed.

### 4.3 Hub Software Installation

The following steps describe how to install the hub software:

1. Locate the **Intel_Unite_Hub_vx.x.x_x86.mui.msi** file (either copied to local storage or on network storage).
2. Launch the **Intel_Unite_Hub_vx.x.x_x86.mui.msi** file.
3. Click **Next**.
4. Accept the license agreement by checking the **I accept the terms of the License Agreement** box.
5. Click Next.
6. The default path for the installation is C:\Program Files (x86)\Intel\Intel Unite\Hub <version number>, where <version number> is the version number of the hub software. If a different location is preferred, enter the new location into the text box or click the Change button to use the Change destination folder dialog box to select the installation location. If using the Change destination folder dialog box, browse to the install location and click OK.
7. Click Next.
8. Click Install to start the installation.
9. When the installation completes, leave the box for launching the application unchecked, and click Finish.

### 4.3.1 File Sharing App Installation (Optional)

The following steps are optional and are for the installation of the File Sharing App:

1. Locate the Intel-Unite-FileTransfer_x86.mui.msi and launch it.
2. Click Next.
3. Accept the license agreement by checking the I accept the terms of the License Agreement box.
4. Click Next.
5. Click Install to install the module.
6. Click Finish.

### 4.3.2 Hub Software Command-Line Installation (Optional)

The Intel Unite application installer for the hub supports command-line installations. The installer msi file must be in a known location on the local system or network share. The following command and parameters for a hub software command-line installation must be executed as an administrator:

```bash
msiexec /i "Installer_Path.msi" /l*v "Log_Path" /q HUBINSTALLFOLDER="Value"
ORGID="Value" PINSERVERURI="Value" ORGNAME="Value" ACCEPTPRIVACYSTATEMENT="yes|no"
REGISTRYMODE="HKCU|HKLM" OTP="Value"
```

#### 4.3.2.1 Hub Installation Parameters

The hub installation parameters are case-sensitive. The result of the installation can be determined by parsing the log file. Double quotes are only required for input values that include one or more spaces. When in doubt, use double quotes to surround input values.

<table>
<thead>
<tr>
<th>Table 5: Hub Installation Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>/i</td>
</tr>
<tr>
<td>&quot;&lt;.msi Installer Path&gt;&quot;</td>
</tr>
<tr>
<td>/l*v</td>
</tr>
<tr>
<td>&quot;&lt;Log Path&gt;&quot;</td>
</tr>
<tr>
<td>/q</td>
</tr>
<tr>
<td>HUBINSTALLFOLDER=&quot;&lt;Value&gt;&quot;</td>
</tr>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>---------------------------</td>
</tr>
<tr>
<td>ORGID=&quot;&lt;Value&gt;&quot;</td>
</tr>
<tr>
<td>PINSERVERURI=&quot;&lt;Value&gt;&quot;</td>
</tr>
<tr>
<td>ORGNAME=&quot;&lt;Value&gt;&quot;</td>
</tr>
<tr>

</tr>
<tr>
<td>REGISTRYMODE=&quot;HKCU</td>
</tr>
<tr>
<td>OTP=&quot;&lt;Value&gt;&quot;</td>
</tr>
<tr>
<td>DISABLEAUTODISCOVERY=&quot;yes</td>
</tr>
</tbody>
</table>

### 4.4 Configure Windows Firewall

The Windows firewall may prevent the hub from communicating with the Intel Unite® solution and client devices. This section explains how to configure the firewall to allow network access for the hub application for the Intel Unite® solution. Review and consult with your IT administrator prior to making any changes to the device.

#### 4.4.1 Create Inbound Rule

Follow the steps below to create an inbound rule for the firewall:

1. Open the **Control Panel**.
2. Enter **Windows Defender Firewall** into the search box.
3. Click **Windows Defender Firewall** in the search results.
4. Click **Advanced settings**.
5. Click **Yes** on the User Account Control dialog box.
6. Select **Inbound Rules**.
7. Select **New Rule...** under the Actions pane.
8. Select **Program** and click **Next >**.
9. Select **This program path**, browse to the location of the hub application launcher, and select **Intel.Unite.HubLauncher.exe**. The default path of the hub application launcher is C:\Program Files (x86)\Intel\Intel Unite\Hub <version number>\Intel.Unite.HubLauncher.exe.
10. Click **Next >** once the program path is set.
11. Select **Allow the connection** and click **Next >**.
12. Place a check in the checkboxes for Domain, Private, and Public, then click **Next >**.
13. Enter a name and a description for this rule and click **Finish**.
14. Repeat Steps 6 through 13 to add a rule for C:\ProgramData\Intel\Intel Unite\Hub\<version number>\Intel.Unite.Module.Process.exe.
15. Repeat Steps 6 through 13 to add a rule for `C:\ProgramData\Intel\Intel Unite\Hub\<version number>\Intel Unite Hub.exe`

16. Select **Inbound Rules**.

17. Select **New Rule...** under the Actions pane.

18. Select **Port** and click **Next >**.

19. Select **TCP** and **Specific local ports**:

20. Enter `443` in the text field next to **Specify local ports**: and click **Next >**.

21. Select **Allow the connection** and click **Next >**.

22. Place a check in the checkboxes for **Domain**, **Private**, and **Public**, then click **Next >**.

23. Enter a name and a description for this rule and click **Finish**.

### 4.4.2 Create Outbound Rule

Follow the steps below to create an outbound rule for the firewall:

1. Open the **Control Panel**.

2. Enter **Windows Defender Firewall** into the search box.

3. Click **Windows Defender Firewall** in the search results.

4. Click **Advanced settings**.

5. Click **Yes** on the User Account Control dialog box.

6. Select **Outbound Rules**.

7. Select **New Rule...** under the Actions pane.

8. Select **Program** and click **Next >**.

9. Select **This program path**, browse to the location of the hub application launcher, and select `Intel.Unite.HubLauncher.exe`.

   The default path of the hub application launcher is `C:\Program Files (x86)\Intel\Intel Unite\Hub <version number>\Intel.Unite.HubLauncher.exe`.

10. Click **Next >** once the program path is set.

11. Select **Allow the connection** and click **Next >**.

12. Place a check in the checkboxes for Domain, Private, and Public, then click **Next >**.

13. Enter a name and a description for this rule and click **Finish**.

14. Repeat Steps 6 through 13 to add a rule for `C:\ProgramData\Intel\Intel Unite\Hub\<version number>\Intel.Unite.Module.Process.exe`.

15. Repeat Steps 6 through 13 to add a rule for `C:\ProgramData\Intel\Intel Unite\Hub\<version number>\Intel Unite Hub.exe`.

16. Select **Outbound Rules**.

17. Select **New Rule...** under the Actions pane.

18. Select **Port** and click **Next >**.

19. Select **TCP** and **Specific local ports**:

20. Enter `443` in the text field next to **Specify local ports**: and click **Next >**.

21. Select **Allow the connection** and click **Next >**.

22. Place a check in the checkboxes for **Domain**, **Private**, and **Public**, then click **Next >**.

23. Enter a name and a description for this rule and click **Finish**.

### 4.5 Hub Privacy

Upon the first launch of the hub application, a privacy statement dialogue will be displayed if the Privacy Mode server property is set to **Prompt User**. To proceed, place a check in the checkbox next to **I consent to the collection of the information and would like to use the software**, then click the **Agree** button.
4.6 Hub Pairing

Before a hub can be used, it must be paired with an Organization on the admin portal. Part of the hub pairing process is hub configuration, which sets the OrganizationID, OrganizationName, and ServerURL values.

4.6.1 Hub Preconfig

The OrganizationID, OrganizationName, and ServerURL values must be set on the hub before it can be paired with an organization. These values can be obtained using DNS TXT record or URI.

DNS TXT Record

When a hub application first starts, it checks to see if the OrganizationID, OrganizationName, and ServerURL are set. If the values are not set, the hub attempts to obtain the values by looking for the DNS TXT record. Once the hub finds the DNS TXT record, it parses the text string to set the OrganizationID, OrganizationName, and ServerURL. Refer to Section 4.6.1.1 for instruction on creating a DNS TXT Record.

URI

On the hub, browse to the admin portal, go to the provision device page, and click the link. The following steps explain how to use a URI to set the OrganizationID, OrganizationName, and ServerURL values.

1. Open a browser and navigate to the admin portal.
2. Select the Organization this hub belongs to.
3. Click Device Management and select Provision Device to open the Provision Device page.
4. Click the link displayed on the Provision Device page (the link starts with intelunite4://) or copy and paste the link into a run command line on the hub.

Note: If clicking on the link, a prompt may appear with a request to open the hub application for the Intel Unite® solution. If the prompt appears, click Open Intel Unite® Hub Launcher to open the hub application.

5. The hub application for the Intel Unite® solution will open to set the OrganizationID, OrganizationName, and ServerURL values. To continue with auto pairing, close the hub application and go to Section 6.4.2.2. To continue with manual pairing, refer to Hub Manual Pairing Using the admin portal in Section 4.6.2.

4.6.1.1 DNS TXT Record

The DNS TXT record is a resource record used to provide Intel Unite® clients with necessary information for the Intel Unite® solution. The specific information provided by the DNS TXT record is the URL of the server hosting the Intel Unite® solution and the organization ID. Refer to Section 3.5 for details.

4.6.1.1.1 DNS Hierarchy and Proper Placement of DNS TXT Record

The DNS TXT record facilitates the auto-discovery of the PIN service for Intel Unite®. The DNS TXT record placement must match the primary DNS suffix or parent zone suffix of the hubs and clients. A PIN service can reside in any site if network traffic is permitted between sites. Figure 2 and the examples below demonstrate the proper placement of the DNS TXT record.
Figure 2: DNS TXT Record Placement Example

The following examples are based on the diagram in Figure 2:

- **Option 1:** The DNS TXT record is created in example.com, and the PIN service resides in Site 1. Clients from any site can auto-discover the service.
- **Option 2:** Three DNS TXT records are created in Sites 1, 2, and 3 in example.com, and the PIN service resides in Site 1. Clients from any site can auto-discover the service.

### 4.6.1.1.2 Create a DNS TXT Record

The hub and clients can locate the Intel Unite® solution by using a DNS TXT record during an automatic lookup for the Intel Unite® solution. The string in the DNS TXT record is not case-sensitive. Follow the steps below to add a DNS TXT record in Microsoft® Windows®:

1. Open **DNS Manager** on your DNS server.
2. In the left pane, expand **Forward Lookup Zones**.
3. Right-click the zone that contains the systems used for the Intel Unite® solution. For a DNS setup that contains multiple forward lookup zones, select the zone that matches the primary DNS suffix for devices that will be used with the Intel Unite® solution.
4. Select **Other New Records**.
5. In the Select a Resource Record Type area, select **Text (TXT)**.
6. Click **Create Record**.
7. For Record Name, enter `uniteservice`. The FQDN will be filled in automatically.
8. The Text option should be automatically populated with `SERVICEURL=https://<admin portal for the Intel Unite® solution FQDN>/intelenite/api|ORGID=<Organization ID>|OrgName=<Organization Name>`, where `<Organization ID>` is the GUID for the organization, and `<Organization Name>` is the name of the organization. The OrgID is randomly generated, and the OrgName is set during creation of the organization. Both values can be found by browsing to the **Provision Device** page on the admin portal for Intel Unite® solution. Refer to **Section 6.4** for additional details.
9. Click **OK** to create the record.
10. Click **Done** to close the Resource Record Type window.
4.6.1.1.3 Disable Use of the DNS TXT Record

The use of the DNS TXT Record for auto-discovery can be disabled. Below are the methods for disabling auto-discovery on Windows and macOS platforms.

Note: macOS and iOS platforms do not support auto-discovery with the .local domain.

Windows Platforms:

On Windows platforms, auto-discovery can be disabled by adding the registry key DisableAutoDiscovery of the type DWORD to the following registry paths. A DWORD value of 1 means the DNS TXT Record will not be used for auto-discovery. A DWORD value of 0 means, the DNS TXT Record will be used for auto-discovery. Any other value will result in the default behavior of using the DNS TXT Record for auto-discovery. If the key is not present, the device will use the DNS TXT Record for auto-discovery. Below are the registry locations for the DisableAutoDiscovery key.

For 32bit Windows
- Hub Device: HKLM\SOFTWARE\Intel\Intel Unite\Hub
- Client Device: HKLM\SOFTWARE\Intel\Intel Unite\Client

For 64bit Windows
- Hub Device: HKLM\SOFTWARE\{WOW6432Node}\Intel\Intel Unite\Hub
- Client Device: HKLM\SOFTWARE\{WOW6432Node}\Intel\Intel Unite\Client

Once DNS TXT Record is disabled for auto-discovery, the use of the provision device page of the admin portal is needed to provide the information provided by the DNS TXT Record. On the Provision Device page, click the link that opens the Intel Unite® application on the device and set the registry keys with needed values.

macOS Platforms

There are several methods to disable auto-discovery on a macOS platform. Below are the methods for disabling auto-discovery:

Method 1 - Uncheck the Automatic checkbox next to Enterprise Server in the Configuration tab of the Intel Unite® application settings.
   1. Open the Intel Unite® app.
   2. Enter settings by clicking the gear icon in the upper right corner.
   3. Click Configuration.
   4. Uncheck the Automatic checkbox next to Enterprise Server.
   5. Click Save Settings at the bottom.

Method 2 - Launch the Intel Unite® app from a terminal using the disableautodiscovery parameter.
   1. Open a terminal. (Application -> Utilities -> Terminal)
   2. Enter the following: open -a "Intel Unite" disableautodiscovery

Method 3 - Modify the plist to set DisableAutoDiscovery to true.
   1. Open a terminal. (Application -> Utilities -> Terminal)
   2. Enter the following: defaults write com.intel.Intel-Unite DisableAutoDiscovery -bool true

4.6.2 Hub Pairing Methods

Hubs can be paired automatically using a pairing token, or manually using the admin portal.
**Note:** Upon the first start of the hub application on Windows* platforms, a Windows* Defender pop-up may appear requesting permission to allow network access for the Intel Unite® application. Until permission is given for the Intel Unite® application, the hub will not be able to connect to the Intel Unite® solution. In some cases, the hub application may hide the pop-up; to resolve this issue, use Task Manager to close the Intel Unite® application, then click Allow access in the Windows Defender pop-up.

### 4.6.2.1 Hub Auto Pairing

The auto pairing steps are only applicable on hubs that have the OrganizationID, OrganizationName, and ServerURL set. If these values are not set, the hub will not be able to find the admin portal for pairing. Follow the steps below to use auto pairing:

1. Sign in to the admin portal.
2. Select the Organization this hub belongs to.
3. Open the **Device Management** menu.
4. In the Duration (hours) text box, enter the number of hours the token will be valid.
5. Click the **Generate Token** button to generate a one-time pairing token.
6. From the hub device, open a web browser, and browse to the URI, `intelunite4://localhost/pair?otp=<token>`, where `<token>` is the value from Step 4.

The token is saved to the Auto Pairing Management page. To access the token at a later time, log in to the admin portal, open the Device Management menu, and select Auto Pairing Management. The Auto Pairing Management page displays a list of pairing tokens, along with the date and time when the tokens will expire.

### 4.6.2.2 Hub Manual Pairing Using the Admin Portal

Follow the steps below to use manual pairing:

1. Sign in to the admin portal.
2. Select the Organization this hub belongs to.
3. Click **Device Management** and select **Provision Device** to open the Provision Device page.
4. Click the link displayed on the Provision Device page (the link starts with `intelunite4://`) or copy and paste this link into a run command line on the hub. If clicking the link, a prompt may appear with a request to open the hub application for the Intel Unite® solution. If the prompt appears, click **Open Intel Unite® Hub Launcher** to open the hub application.
5. The hub application for the Intel Unite® solution will open and display a Ready to Pair prompt and a pairing code.
6. On a different device with access to the Internet, sign in to the admin portal.
7. Select the same Organization that was selected in Step 2.
8. Click **Device Management**.
9. In the Pair Hub field, enter the pairing code displayed on the hub and click **Pair Hub**.
10. A Windows Defender Firewall dialog may appear on the hub. If the dialog appears, click **Allow Access**.
11. Once paired, the hub will download configuration settings and apps from the Intel Unite® solution.
12. After downloading, the hub will display a welcome screen with a PIN in the upper-right corner.

The hub is now configured and ready for use.

### 4.7 Uninstall Hub Software

Follow the steps below to uninstall the hub application:

1. Locate the `Intel_Unite_Hub_vx.x.x_x86.mui.msi` file (either on local storage or network storage).
2. Launch the `Intel_Unite_Hub_vx.x.x_x86.mui.msi` client installer.
3. Click **Remove**, then click **Next**.

   **Note:** Removing the hub application does not remove the device from the admin portal. An administrator needs to manually delete the device from the admin portal. Until removed, a paired hub with an identical machine name is tagged as a "duplicate" entry.

### 4.7.1 Uninstall Hub Software by Command Line

The Intel Unite® application installer for the hub supports command-line uninstallations. The installer msi file must be in a known location on the local system or network share. The following command and parameters for uninstallation must be executed as an administrator:

```
msiexec /x "<.msi Installer Path>" /l*v "<Log Path>" /q
```

The hub command-line uninstallation parameters are case-sensitive. The result of the uninstallation can be determined by parsing the log file. Double quotes are only required for input values that include one or more spaces. When in doubt, use double quotes to surround input values.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>/x</td>
<td>The switch for uninstall.</td>
</tr>
<tr>
<td>&quot;&lt;.msi Installer Path&gt;&quot;</td>
<td>The path and filename of the msi file, with double quotes (for example, &quot;c:\my downloads\installer.msi&quot;).</td>
</tr>
<tr>
<td>/l*v</td>
<td>The switch for generating a log file (for example, &quot;c:\my logs\hubuninstallog.txt&quot;).</td>
</tr>
<tr>
<td>&quot;&lt;Log Path&gt;&quot;</td>
<td>The path including the log filename, with double quotes.</td>
</tr>
<tr>
<td>/q</td>
<td>The switch for silent, no user interaction.</td>
</tr>
</tbody>
</table>

### 4.7.2 Hub Security

The hub administrator should ensure that recommended security practices are followed for each hub. If the local user is logged on automatically, ensure that the user does not run with administrative privileges. For additional security considerations, refer to Appendix E.

### 4.7.3 Hub Log File

The hub saves a log file in `%temp%\UniteLog\<yyyymmdd>_log.txt`, where `<yyyymmdd>` is the number of the year, month, and day of the log file.

   **Note:** Log files are automatically deleted after 7 days.
5 Client Software Installation and Pairing

Clients must be registered with an organization through the admin portal before they join sessions hosted by hubs that are paired with the same organization.

5.1 Client Provisioning/Preinstallation Considerations

Refer to Section 2.4 for a detailed explanation of client requirements.

A client must be able to locate and check in with the enterprise server. The Intel Unite® application needs an exemption in the client firewall allowing the client application to communicate to the admin portal. The client port is the same as the hub port, which is randomly generated by default; the port number can be manually set through the admin portal under the hub configuration properties. Refer to Appendix E for a detailed explanation of security considerations.

All client devices must be connected to the corporate network or must use an appropriately configured VPN, including Windows®, iOS®, macOS®, Linux®, Chrome OS®, and Android® devices. Tablets and phones connected to their own carrier provider may not be able to connect to an Intel Unite® app session due to corporate firewall configurations. Refer to the specific mobile device sections for more information.

5.1.1 Use Self-Signed Certificates

If the server uses a self-signed certificate, the certificate needs to be imported into the Trusted Root of the client's certificate store. To do this, the certificate must be exported from the admin portal, saved locally, and then imported on a client. This section describes how to export, save, and import self-signed certificates on supported clients.

Note: Operating systems have different validation rules for certificates. Check vendor-specific validation rules before using certificates.

5.1.1.1 Export a Certificate

Follow the steps below to export a self-signed certificate using Chrome*:

2. Right-click the red lock icon in the address bar and click Certificate.
3. Click the Details tab and click Copy to File. The Certificate Export Wizard will open.
4. In the Certificate Export Wizard, click Next to go to the Export File Format screen.
5. Choose DER encoded binary X.509 (.CER), then click Next.
6. Click Browse and save the file to the computer using a descriptive name.
7. Click Next, then click Finish to close the wizard.

Follow the steps below to export a self-signed certificate using Internet Explorer*:

1. Open Internet Explorer and browse to the admin portal (https://<FQDN of the Server>/intelunite/admin).
2. Click the lock icon in the address bar and click View Certificate.
3. Click the Details tab and click Copy to File. The Certificate Export Wizard will open.
4. In the Certificate Export Wizard, click Next to go to the Export File Format screen.
5. Choose DER encoded binary X.509 (.CER) and click Next.
6. Click Browse and save the file to the computer using a descriptive name.
7. Click Next and then click Finish to close the wizard.

5.1.1.2 Import Certificates on Windows® Clients

Follow the steps below to import a self-signed certificate for a Windows client using Chrome:
1. Open Chrome settings, scroll to the bottom, and click **Advanced**.
2. Under Privacy and Security, click **Manage certificates**.
3. Click the **Trusted Root Certification Authorities** tab, and then click the **Import** button. The Certificate Import Wizard will open.
4. In the Certificate Import Wizard, click **Next** to go to the File to Import screen.
5. Click **Browse**, select the certificate file saved earlier, and then click **Next**.
6. Select **Place all certificates in the following store**. The selected store should be Trusted Root Certification Authorities. If it isn't, click **Browse**, and select it.
7. Click **Next**, then click **Finish**.
8. Click **Yes** on the security warning.

Follow the steps below to import a self-signed certificate for a Windows client using Internet Explorer:

1. Open Internet Explorer Internet Options.
2. Click the **Content** tab.
3. Click the **Certificates** button.
4. Click the **Import** button to open the Certificate Import Wizard and click **Next**.
5. Click **Browse**, select the certificate file saved earlier, and then click **Next**.
6. Select **Place all certificates in the following store**. The selected store should be Trusted Root Certification Authorities. If it isn't, click **Browse**, and select it.
7. Click **Next**, and then click **Finish**.
8. Click **Yes** on the security warning.

### 5.1.1.3 Import Certificates on macOS* Clients

Follow the steps below to import a self-signed certificate on a macOS* client:

1. Copy the self-signed certificate to the Mac.
2. Double-click the self-signed certificate to open it in Keychain Access.
3. The self-signed certificate appears in login. Copy the self-signed certificate to System. The certificate must be copied to System to ensure it is trusted by all users and local system processes, including the virtual machine (.vmx) processes in Fusion Pro*.
4. Open the self-signed certificate in System, click to expand **Trust**, select **Use System Default**, and click **Save**.
5. Reopen the self-signed certificate in System, click to expand **Trust**, select **Always Trust**, and click **Save**.
6. Delete the self-signed certificate from login.

### 5.1.1.4 Import Certificates on Linux* Clients

Follow the steps below to import a self-signed certificate on a Linux client using Fedora/Red Hat, open a terminal, and run the following commands:

```bash
sudo cp <the certificate filename> /etc/pki/ca-trust/source/anchors/
sudo update-ca-trust extract.
```

To import a self-signed certificate on a Linux client using Ubuntu, open a terminal, and run the following commands:

```bash
sudo cp <the certificate filename> /usr/local/share/ca-certificates/
sudo update-ca-certificates.
```

### 5.1.1.5 Import Certificates on Chrome OS* Clients

Follow the steps below to import a self-signed certificate on a Chrome OS* client:
1. Open Chrome settings, scroll to the bottom, and click Advanced.
2. Under Privacy and Security, click Manage certificates.
3. Click the Trusted Root Certification Authorities tab and then click the Import button. The Certificate Import Wizard will open.
4. In the Certificate Import Wizard, click Next to go to the File to Import screen.
5. Click Browse, select the certificate file saved earlier, and then click Next.
6. Select Place all certificates in the following store. The selected store should be Trusted Root Certification Authorities. If it isn’t, click Browse and select it.
7. Click Next, then click Finish.
8. Click Yes on the security warning.

5.1.1.6 Import Certificates on iOS* Clients

Follow the steps below to import a self-signed certificate on an iOS* client:
1. Email the certificate to an account that can be accessed by the iOS client.
2. Open the email and select the certificate file.
3. On the Profile Download screen, select Close.
4. On the device, select Settings – Profile Downloaded.
5. Select the correct profile.
6. Select Install.
7. On the Install Profile window, select Install.
8. Select Done.
10. Select Certificate Trust Settings.
11. Enable Trust Settings for the correct profile.

5.1.1.7 Import Certificates on Android* Clients

Follow the steps below to import a self-signed certificate on an Android* client:
1. Put the certificate onto the SD card of your Android device (usually to internal one). It should be in the root directory.
2. Click Settings, click Security, click Credential storage, and select Install from device storage.
3. When the .crt file is detected, enter a certificate name.
4. To find the certificate after importing it, click Settings, click Security, click Credential storage, click Trusted credentials, and then click User.

5.1.2 Certificate Validation

In certain scenarios, such as when there is no access to the internet, it is desirable to disable or limit the validation of certificates.
To disable certificate validation, set the following registry key to a REG_DWORD value of 1.
HKLM\SOFTWARE\Wow6432Node\Intel\Intel Unite\Client\DisableCertificateChainValidation
Value meaning:
- 1 = Disables certificate chain validation
- 0 = Enables certificate chain validation (default behavior/also when key is not present)
To ensure that SSL certificates being used are validate, set the following registry key to a REG_DWORD value of 1.
HKLM\SOFTWARE\Wow6432Node\Intel\Intel Unite\Client\EnforceSslCertCheck
Value meaning:
• 1 = Enforces SSL CRL check
• 0 = Does not enforce SSL CRL check (default behavior/also when key is not present)

5.2 Windows* Client Software Installation

Only a single client application for Intel Unite® solution should be installed on a client device. Having more than a single client application for Intel Unite® solution installed on a client device is not supported and may result in inability to use the clients to connect to sessions.

Follow the steps below to install the Intel Unite® app on a Windows* client device:

1. Download the Intel_Unite_Client_vx.x.x_x86.msi file.
2. Locate and launch the Intel_Unite_Client_vx.x.x_x86.msi file, then click Next.
3. Accept the license agreement by checking the I accept the terms of the License Agreement box, then click Next.
4. The default path for the installation is C:\Program Files (x86)\Intel\Intel Unite\Client <version number>, where <version number> is the version number of the client software. If a different location is preferred, enter the new location into the text box or click the Change button to use the Change Destination Folder dialog box to select the install location. If using the Change Destination Folder dialog box, browse to the install location and click OK.
5. Click Next, then click Install.
6. When the installation completes, click Finish.

Note: Support for extended displays requires that the Intel_UniteExtended_Display_vx.x.x.x_x86.msi be installed.

5.2.1 Windows* Client Software Command Line Installation (Optional)

The Windows* client software command-line installation parameters are case-sensitive. The result of the installation can be determined by parsing the log file. Double quotes are only required for input values that include one or more spaces. When in doubt, use double quotes to surround input values.

Table 7: Windows* Client Software Command-Line Installation Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>/l</td>
<td>The switch for install.</td>
</tr>
<tr>
<td>&quot;:.msi Installer Path:&quot;</td>
<td>The path and filename of the msi file, with double quotes (for example, &quot;c:\my downloads\installer.msi&quot;).</td>
</tr>
<tr>
<td>/lv</td>
<td>The switch for generating a log file (for example, &quot;c:\my logs\hubuninstall.log&quot;).</td>
</tr>
<tr>
<td>&quot;:Log Path:&quot;</td>
<td>The path including the log filename, with double quotes.</td>
</tr>
<tr>
<td>/q</td>
<td>The switch for silent, no user interaction.</td>
</tr>
<tr>
<td>CLIENTINSTALLFOLDER=&quot;&lt;Value&gt;&quot;</td>
<td>The location specifying where to install the client application. Replace &lt;Value&gt; with the full path (for example, &quot;c:\my apps\unite client&quot;).</td>
</tr>
<tr>
<td>ORGID=&quot;&lt;Value&gt;&quot;</td>
<td>The organization ID, replace &lt;Value&gt; with the organization ID.</td>
</tr>
<tr>
<td>PINSERVERURL=&quot;&lt;Value&gt;&quot;</td>
<td>The PIN server URL, replace &lt;Value&gt; with the PIN server URL which has this format: https://&lt;FQDN of the admin portal for the Intel Unite* solution&gt;/intelunite/api.</td>
</tr>
<tr>
<td>ORGNAME=&quot;&lt;Value&gt;&quot;</td>
<td>The organization name, replace &lt;Value&gt; with the organization name.</td>

</tbody>
</table>

### 5.3 macOS* Client Installation

It is possible to install the macOS* Intel Unite® client from both the Mac* App Store in addition to a direct download from Intel, resulting in two or more client applications for the Intel Unite® solution on the macOS device. Having multiple client applications for the Intel Unite® solution on a single device is not supported and may result in the malfunction of the Intel Unite® solution.

The macOS client supports connecting to 3.x and 4.x hubs. It is recommended that only a single 4.x version of the client application for the Intel Unite® solution be installed on a device allowing connection to both 3.x and 4.x hubs. Follow the steps below to identify if more than a single client application for the Intel Unite® solution is installed on a client:

1. Open Finder.
2. Type Intel Unite in the search box located at the upper right corner and press return.
3. Right-click or two-finger-tap on the results area and select Arrange By->Kind.
4. Confirm that there is only one Intel Unite® application present. If more than one Intel Unite® application is present, remove all but one of the Intel Unite® application.

Follow the steps below to install a macOS client:

1. Locate the Intel Unite macOS X.X.X.X.dmg file and download the software to the macOS* client.
2. Double-click the file to extract the application.
3. After reviewing the End User License Agreement, click Agree to continue.
4. Drag the extracted file to the Applications folder.
5. Go to the Applications folder, locate the application, and click it to launch it.

### 5.4 iOS* Client Installation

The app is compatible with all iPads* except the original 2010 iPad. Follow the steps below to install the Intel Unite® client on an iOS* device:

1. On an iOS* client (such as an iPad), go to the Apple* app store and download the Intel Unite® software for the client.
2. Once the app has been downloaded and installed, open the app.

### 5.5 Android* Client Installation

Follow the steps below to install the Intel Unite® client on an Android* device:

1. On an Android* device, go to the Google* app store and download the Intel Unite® software for the client.
2. Once the app has been downloaded and installed, open the app.

### 5.6 Chrome OS* Client Installation

Follow the steps below to install the Intel Unite® client on a Chrome OS* device:
1. On a Chromebook* device, go to the Google app store and download the Intel Unite® software for the client.  
2. Once the app has been downloaded and installed, open the app.  

5.7 Linux* OS Client Installation

Follow the steps below to install the Intel Unite® client on a Linux* OS device:

1. Obtain the corresponding Linux* client binary from the Intel Unite® solution support site:
   - Fedora*/Red Hat* – .rpm
   - Ubuntu* – .deb
   - Manual (advanced users) – .bz2
2. Install the client using the following commands:
   - Red Hat Enterprise and Fedora – sudo yum install /<rpm path>/<unite pack.rpm>  
   - Ubuntu – sudo apt-get install ./<unite pack.deb>  
   - Manual (advanced users) – Unpack the .bz2 file to a specified location

5.8 Configure Client Firewall

A firewall may prevent the client from communicating to the Intel Unite® solution and hub devices. The steps below explain how to configure the firewall to allow network access for the client application for the Intel Unite® solution. Review and consult with your IT administrator prior to making any changes to the device.

5.8.1 Windows Platform – Create Inbound Rule

Follow the steps below to create an inbound rule for Windows platform firewalls:

1. Open Control Panel.  
2. Enter Windows Defender Firewall into the search box.  
3. Click Windows Defender Firewall in the search results.  
4. Click Advanced settings.  
5. Click Yes on the User Account Control dialog box.  
7. Select New Rule... under the Actions pane.  
8. Select Program and click Next >.  
9. Select This program path: and browse to the location of the client application launcher. The default path of the client application launcher is C:\Program Files (x86)\Intel\Intel Unite\Client <version number>\Intel.Unite.ClientLauncher.exe.  
10. Click Next > once the program path is set.  
11. Select Allow the connection and click Next >.  
12. Place a check in the checkboxes for Domain, Private, and Public, then click Next >.  
13. Enter a name and a description for this rule and click Finish.  
14. Repeat Steps 6 through 13 to create an inbound rule for the client application located at the following path: %program files%\Intel\Intel Unite\Client\Current\Intel Unite Client.exe  
15. Select Inbound Rules.  
16. Select Port and click Next >.  
17. Select New Rule... under the Actions pane.  
18. Select TCP and select Specific local ports.  
19. Enter 443 in the text field next to Specific local ports: and click Next >.  
20. Select Allow the connection and click Next >.
21. Place a check in the checkboxes for **Domain**, **Private**, and **Public**, then click **Next >**.
22. Enter a name and a description for this rule and click **Finish**.

### 5.8.2 Windows Platform – Create Outbound Rule

Follow the steps below to create an outbound rule for Windows platform firewalls:

1. Open **Control Panel**.
2. Enter **Windows Defender Firewall** into the search box.
3. Click **Windows Defender Firewall** in the search results.
4. Click **Advanced settings**.
5. Click **Yes** on the User Account Control dialog box.
6. Select **Outbound Rules**.
7. Select **New Rule...** under the Actions pane.
8. Select **Program and click Next >**.
9. Select **This program path**: and browse to the location of the client application launcher. The default path of the client application launcher is:
   `C:\Program Files (x86)\Intel\Intel Unite\Client <version number>\Intel.Unite.ClientLauncher.exe`
10. Click **Next >** once the program path is set.
11. Select **Allow the connection** and click **Next >**.
12. Place a check in the checkboxes for **Domain**, **Private**, and **Public**, then click **Next >**.
13. Enter a name and a description for this rule and click **Finish**.
14. Repeat Steps 6 through 13 to create an inbound rule for the client application located at the following path:
   `%Program Files%/Intel/Intel Unite/Client/Current/Intel Unite Client.exe`
15. Select **Outbound Rules**.
16. Select **New Rule...** under the **Actions** pane.
17. Select **Port** and click **Next >**.
18. Select **TCP** and select **Specific local ports**.
19. Enter 443 in the text field next to **Specific local ports** and click **Next >**.
20. Select **Allow the connection** and click **Next >**.
21. Place a check in the checkboxes for **Domain**, **Private**, and **Public**, then click **Next >**.
22. Enter a name and a description for this rule and click **Finish**.

### 5.8.3 macOS* Platforms

Follow the steps below to configure the firewall for macOS* platforms:

1. Choose **System Preferences** from the Apple menu.
2. Click **Security**.
3. Click the **Firewall** tab.
4. Click the **Firewall Options...** button.
5. Click the button with the **plus symbol** to add an application.
6. Select **Intel Unite** and click the **Add** button.
7. Click the **OK** button.
8. Close the System Preferences window.
9. Verify that port 443 is open by opening a browser and navigating to [https://www.intel.com](https://www.intel.com). If the browser does not load the webpage, contact IT support to open port 443 on the device.
5.8.4 Linux* Platforms

On Linux* platforms, the network port used by hubs and clients must be set before configuring the clients' firewall to allow traffic through that port.

5.8.4.1 Define Network Port on the Admin Portal for Hubs

The network port used by a client is communicated by the hub. Follow the steps below to configure the network port that is used by the Intel Unite® app running on a hub (which will be communicated to clients):

1. Open a browser and navigate to the admin portal.
2. Select the Organization that the client is registered with.
3. Select Hubs and Clients under the Device Management menu.
4. Click the Hub tab.
5. For each group, set the Network Port property to the same value. This is the value that will be used to configure the client firewall.
   a. Select a group.
   b. Select Group Details from the select action drop-down menu.
   c. Click the Edit Properties button.
   d. Enter a number for the Network Port property and click the Save Changes button.
6. All groups are set to use the same network port.

5.8.4.2 Configure Firewall with Network Port Value

Once the network port is set for the hubs on the admin portal, the client firewall can be configured to allow network traffic through that port.

1. On the Linux client device open a command terminal.
2. Type the following commands to allow network traffic through a port for the internal, external, public, trusted, and work zones, replacing <network port> with the value set on the admin portal:
   firewall-cmd --permanent --zone=internal --add-port=<network port>/tcp
   firewall-cmd --permanent --zone=external --add-port=<network port>/tcp
   firewall-cmd --permanent --zone=public --add-port=<network port>/tcp
   firewall-cmd --permanent --zone=trusted --add-port=<network port>/tcp
   firewall-cmd --permanent --zone=work --add-port=<network port>/tcp
   firewall-cmd --permanent --zone=internal --add-port=443/tcp
   firewall-cmd --permanent --zone=external --add-port=443/tcp
   firewall-cmd --permanent --zone=public --add-port=443/tcp
   firewall-cmd --permanent --zone=trusted --add-port=443/tcp
   firewall-cmd --permanent --zone=work --add-port=443/tcp

5.8.5 Alternative Firewall Configurations

IT security policies may result in unique firewall configurations. Contact the IT administrator for assistance in allowing internal and external network traffic for the Intel Unite® application or with setting specific ports that can be used by the Intel Unite® application for network traffic.

5.8.6 Client Pairing

Before a client can be used to connect to a session hosted by a hub, it must be paired with the same organization that the hub is paired with through the admin portal. Part of the client registration process is client
preconfiguration, which sets the OrganizationID, OrganizationName, and ServerURL values. Clients can be paired with multiple organizations.

### 5.8.6.1 Client Preconfiguration

The OrganizationID, OrganizationName, and ServerURL values must be set on the client before it can be registered with an organization. These values can be obtained in two ways – DNS TXT record and URI. Support for DNS TXT record and custom URI depends on the OSs running on client platforms. Due to these differences, not all methods for client configuration are available on all client platforms. For Chrome OS, the URI support requires user to copy and paste the URI into the client application. Table 8 shows the configuration methods supported on each client OS.

Table 8: Client Preregistration Configuration Support per OS

<table>
<thead>
<tr>
<th>Registration Method</th>
<th>Windows*</th>
<th>macOS*</th>
<th>Chrome OS*</th>
<th>Linux*</th>
<th>iOS*</th>
<th>Android*</th>

#### 5.8.6.1.1 DNS TXT Record

When a client first starts, it checks to see if the OrganizationID, OrganizationName, and ServerURL are set. If the values are not set, the client attempts to obtain the values by looking for the DNS TXT record. Once the client finds the DNS TXT record, it parses the text string to set the OrganizationID, OrganizationName, and ServerURL.

#### 5.8.6.1.2 URI (Windows*, macOS*, Linux*, Android*, and iOS*)

On the client, browse to the provision device page of the admin portal, and click the link. Follow the steps below to use an URI to set the OrganizationID, OrganizationName, and ServerURL values.

1. Sign in to the admin portal on the client device.
2. Select the organization that this client device belongs to.
3. Click **Device Management** and select ** Provision Device** to open the Provision Device page.
4. Click the link displayed on the Provision Device page (the link starts with intelunite4://) or copy and paste this link into a run command line on the hub. If clicking on the link, a prompt may appear with a request to open the hub application for the Intel Unite® solution. If the prompt appears, click Open Intel Unite® Hub Launcher to open the client application.
5. The client application for the Intel Unite® solution will open to set the OrganizationID, OrganizationName, and ServerURL values. To continue with auto pairing, close the client application and go to Section 6.4.2.2. To continue with enhanced pairing, go to Hub Manual Pairing Using the admin portal in Section 4.6.2.

#### 5.8.6.1.3 URI (Chrome OS*)

The OrganizationID, OrganizationName, and ServerURL values can be set manually through the client settings. Follow the steps below to set them manually:

1. Sign in to the admin portal on the client device.
2. Select the organization that this client device belongs to.
3. Click **Device Management** and select ** Provision Device** to open the Provision Device page.
4. Copy the URL.
5. Launch the Intel Unite® client.
6. Click the gear icon in the upper-right corner to enter client settings.
7. Click Update Server Information, paste the URL from provision page of the admin portal into the text box, and click Save Settings.

5.8.6.1.4 Google* Admin Console (Chrome OS*)

The ServerURL value can be set for Chrome OS* platforms through the Google* Admin console. Refer to Appendix A. Provisioning Guide for Google Admin* for details about using the Google Admin console.

5.8.6.1.5 Manual Provisioning (Android)

1. Launch Intel Unite and select the gear icon in the top right corner.
2. Select Configuration.
3. Select Add Organization.
   A text box appears.
4. Paste the provisioning URL from the Admin Portal (Device Management - Provision Device).
5. Select Save Settings.
   The device pairs.
6. If necessary, close and re-launch the app

5.8.6.1.6 Confirming OrganizationID, OrganizationName, and ServerURL

The process to confirm the values set for OrganizationID, OrganizationName, and ServerURL are different based on what OS is running on the client platform.

Windows* Platforms
The OrganizationID, OrganizationName, and ServerURL values are stored in the following registry keys on Windows* platforms:
- HKEY_CURRENT_USER\SOFTWARE\Intel\Intel Unite\Hub\OrganizationID
- HKEY_CURRENT_USER\SOFTWARE\Intel\Intel Unite\Hub\OrganizationName
- HKEY_CURRENT_USER\SOFTWARE\Intel\Intel Unite\Hub\ServerURL

The OrganizationID is a REG_SZ value with the format XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX, where X is a hexadecimal value. This value can be found on the provision page of the admin portal.

The OrganizationName is a REG_SZ with a string value that is determined during the server install.

The ServerURL is a REG_SZ with a string value of https://<admin portal for the Intel Unite® solution FQDN>/intelunite/api, where <admin portal for the Intel Unite® solution FQDN> is the fully qualified domain name of the server for the Intel Unite® solution.

Confirm that the three values match the values in the URI on the provision page of the admin portal (select Provision Device under the Device Management menu on the admin portal).

Non-Windows* Platforms
The OrganizationID, OrganizationName, and ServerURL values are shown in the client settings.

1. Open the client application and click on the gear icon in the upper-right corner.
2. Click Configuration to display the Configuration page.
3. If Automatic is selected, confirm the OrganizationID, OrganizationName, and ServerURL are populated with the values on the provision page of the admin portal (select Provision Device under the Device Management menu on the admin portal).
4. If Manual is selected, confirm the OrganizationID, OrganizationName, and ServerURL are entered with the values on the provision page of the admin portal (select Provision Device under the Device Management menu on the admin portal).
5.8.7 Pair a Client Device

There are three pairing modes that can be used to pair a client device:

- **Standard Pairing Mode** – This pairing mode does not require the user to click a verification token. If their email address is invalid or cannot be detected, they will be prompted to enter their email address manually.
- **Auto Pairing Mode** – This pairing mode does not require the user to click a verification token. If their email address is invalid or cannot be detected, an email address is automatically generated for them.
- **Enhanced Pairing Mode** – This pairing mode requires the user to click a token sent via email. If their email address is invalid or cannot be detected, they will be prompted to enter their email address manually.

The client pairing mode can be changed from the server properties in the admin portal. Follow the steps below to change the client pairing mode:

1. Sign in to the admin portal for the Intel Unite® solution.
2. Click **Server Management** and select **SERVER PROPERTIES** from the drop-down menu.
3. Click **Edit Properties**, then select properties for the desired pairing mode as described in Table 9 below:

<table>
<thead>
<tr>
<th>Pairing Mode</th>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto</td>
<td>Pairing Mode (Client) - Auto-Generate Email Address</td>
<td>True</td>
</tr>
<tr>
<td></td>
<td>Pairing Mode (Client)</td>
<td>Standard Pairing Mode</td>
</tr>
<tr>
<td>Standard</td>
<td>Pairing Mode (Client) - Auto-Generate Email Address</td>
<td>False</td>
</tr>
<tr>
<td></td>
<td>Pairing Mode (Client)</td>
<td>Standard Pairing Mode</td>
</tr>
<tr>
<td>Enhanced</td>
<td>Pairing Mode (Client) - Auto-Generate Email Address</td>
<td>False</td>
</tr>
<tr>
<td></td>
<td>Pairing Mode (Client)</td>
<td>Enhanced Pairing Mode</td>
</tr>
</tbody>
</table>

4. Click **Save Changes**.

**Note:** The first time the client application is started on a Windows® platforms, a Windows® Defender pop-up may appear requesting permission to allow network access for the Intel Unite® application. Until permission is given for the Intel Unite® application, the hub will not be able to connect to the Intel Unite® solution. In some cases, the hub application may hide the pop-up; to resolve this issue, use Task Manager to close the Intel Unite® application, then click Allow access in the Windows Defender pop-up.

5.8.7.1 Standard Pairing Mode

Standard pairing mode requires the user to have a valid email address, but does not require the user to click a verification token. The Intel Unite® app will query the device for the user’s email address. If the email address is invalid or cannot be found, the app will prompt the user to enter an email address manually.

Follow the steps below to pair a client device using standard pairing mode:

1. Open the Intel Unite® app on the client device.
   a. If the user’s email address auto-populates correctly, click **Submit**.
   b. If the user’s email address does not auto-populate correctly, enter the email address manually, then click **Submit**.
2. The device will now automatically pair.

5.8.7.2 Auto Pairing Mode

Auto pairing mode requires the user to have a valid email address, but does not require the user to click a verification token. If the email address is invalid or cannot be found, an email address will automatically generate.

Follow the steps below to pair a client device using auto pairing mode:
1. Open the Intel Unite® app on the client device.
2. The device will now automatically pair.

5.8.7.3 Enhanced Pairing Mode

Enhanced pairing mode requires the user to click a verification token sent to a valid email address. The Intel Unite® app will query the device for the user's email address. If the email address is invalid or cannot be found, the app will prompt the user to enter an email address manually.

Follow the steps below to pair a client device using enhanced pairing mode:

1. Open the Intel Unite® app on the client device.
   a. If the user's email address auto-populates correctly, click Submit.
   b. If the user's email address does not auto-populate correctly, enter the email address manually, then click Submit.
2. Open the verification email and click the link for the pairing token.
3. The device will now automatically pair.

5.9 Windows Client Software Uninstallation

Follow the steps below to uninstall the client application on a Windows® computer:

1. Locate and launch the Intel-Unite_Client_vx.xxx_x86.msi file (either on local storage or network storage).
2. Click Remove, then click Next.

Note: Removing the client application does not remove the device from the admin portal. An administrator must manually delete the device from the admin portal. Until removed, a paired client with an identical machine name will be tagged as a "duplicate" entry.

5.9.1 Windows® Client Software Uninstallation – Command Line (Optional)

The Intel Unite® application installer for the client supports command-line uninstallations. The Intel-Unite_Client_vx.xxx_x86.msi, where X.X.X.X is the version, must be in a known location on the local system or network share. The following command and parameters for uninstallation must be executed as an administrator:

```msiexec /x "<.msi Installer Path>" /l*v "<Log Path>" /q```

5.9.2 Windows Client Software Uninstallation Command Line Parameters

The client command-line uninstallation parameters are case-sensitive. The result of the uninstallation can be determined by parsing the log file. Double quotes are only required for input values that include one or more spaces. When in doubt, use double quotes to surround input values.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>/x</td>
<td>The switch for uninstall.</td>
</tr>
<tr>
<td>&quot;&lt;.msi Installer Path&gt;&quot;</td>
<td>The path and filename of the msi file, with double quotes (for example, &quot;c:\my downloads\installer.msi&quot;).</td>
</tr>
<tr>
<td>Parameter</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------</td>
<td>------------</td>
</tr>
<tr>
<td>/l*v</td>
<td>The switch for generating a log file (for example, &quot;c:\my logs\hubuninstalllog.txt&quot;).</td>
</tr>
<tr>
<td>&quot;&lt;Log Path&gt;&quot;</td>
<td>The path including the log filename, with double quotes.</td>
</tr>
<tr>
<td>/q</td>
<td>The switch for silent, no user interaction.</td>
</tr>
</tbody>
</table>

### 5.10 Linux Client Software Uninstallation

To uninstall the client application on Red Hat™ Enterprise, Fedora™, or Ubuntu™, use the following commands:

- **Red Hat Enterprise and Fedora:**
  - `sudo yum remove intel-unite-client`, `sudo dnf remove intel-unite-client`
- **Ubuntu:**
  - `sudo apt-get remove intel-unite-client`

### 5.11 Client Log File

The client saves a log file in `%temp%\UniteLog<yyymmdd>_log.txt`, where `<yyymmdd>` is the number of the year, month, and day of the log file.

**Note:** Log files are automatically deleted after 7 days.
6 Admin Portal for the Intel Unite® Solution

The admin portal is the administrator web portal for the Intel Unite® solution. It enables organization appointed administrators to view and manage the configuration of the Intel Unite® solution running on hub and client devices within an organization.

Follow the steps below to access the admin portal:

1. Open a browser and enter https://<FQDN of the server>/intelunite/admin, where <FQDN of the server> is the FQDN of the Intel Unite® application's server.
2. On the login page, enter a user name and password, and click Login. Active Directory users should not include domain\ in the user name text box.
   - When the IT administrator runs the server software installer, a default administrator account is created with the following user name and password:
     - User Name: admin
     - Password: Admin@1
   The first time the built-in admin account is used to log in to the admin portal, the admin portal prompts for a change of the admin password. Set a new password and use the new password to log in to the admin portal. Click the i in a gray circle next to password rule to see more information about the password requirements.

If there is no activity for 30 minutes after logging into the admin portal, the user will be automatically logged out. The login page will be displayed with a message indicating that the user has been logged out due to inactivity.

For AD users, Intel recommends using the following format for logging in:

Example: joe@company.com.

6.1 Admin Portal Common Controls

The banner at the top of the portal contains icons that are always available. These icons provide controls for the Configuration Assistant, logging out of the portal, accessing the help center, setting the display language, and displaying the About page.

6.1.1 Log Out

Follow the steps below to log out of the admin portal:

1. Click the user icon from the common controls area of the admin portal.
2. Select Logout from the drop-down menu.

6.1.2 Change the Display Language

To change the display language, click the language globe icon, select a language, then click Apply.

Available languages:
- Chinese (Simplified)
- Chinese (Traditional)
- English
- French
- German
- Italian
- Japanese
- Korean
6.1.3 Help Center

The Help Center provides documentation that assists in the use of the Intel Unite® solution. To access the Help Center, click the Help Center question mark icon at the top-right corner to open the Help Center panel, which contains the following controls:

- Back arrow icon – Click the back arrow icon to scroll up one page.
- Forward arrow icon – Click the forward arrow icon to scroll down one page.
- Home icon – Click the Home icon to display the table of content for help.
- Link to Support – Click the Support link to navigate to the support website for the Intel Unite® solution.
- Link to About – Click the About link to display information about Intel Unite® solution.

6.1.4 Global Notifications

Global notifications appear in the banner at the top of the admin portal with the following color-coding:

- Red (error message)
- Yellow (warning message)
- Green (information message)

To dismiss a notification, click the circle x located at the right edge.

6.1.5 About

The About link in the admin portal displays the version and other information about the Intel Unite® solution. For users that are logged in, the About details will also include the Organization ID. Click About in the upper-right corner of the page to view details.

6.2 Organizations

After login, the Organizations page is displayed. The Organizations page displays a list of organization that the user belongs to. A user with the Edit Server Management permission can create a new organization, edit an existing organization, and delete an existing organization.

6.2.1 Create a New Organization

Follow the steps below to create a new organization:

1. Click the Create New Organization button.
2. Enter the Organization Name. The name must be at least 4 characters long.
3. Enter a Description for the organization. The description must be at least 4 characters long.
4. Click the Save button.

6.2.2 Select an Organization

To manage the configuration for an organization, it first has to be selected. To select an organization, click the name of the organization. After clicking on the name of the organization, the Portal will display the Hubs and Clients page for that organization.

Note: Once an organization has been selected, any changes made will only affect the selected organization.
6.2.2.1 Set Privacy Selection

Upon first selecting an organization that is not created using the setup wizard, the Privacy Selection dialogue will be displayed to configure the data collection policy for the organization. This can be changed by editing the Privacy Mode server property in the admin portal.

The available privacy policies are:
- **Share anonymous data with Intel** – Telemetry data is collected and forwarded to Intel.
- **Do not share anonymous data with Intel** – No telemetry data is collected.
- **Prompt user to potentially share anonymous data with Intel** – Asks the user to opt-in or opt-out of telemetry data collection and the forwarding of the telemetry data to Intel.

6.2.3 Edit an Existing Organization

Follow the steps below to edit an existing organization:
1. Identify the organization that needs to be updated and click the **Edit Organization** button for that organization.
2. Update the organization properties.
3. Click the **Save Changes** button.

6.2.4 Delete an Organization

Follow the steps below to delete an organization:
1. Identify the organization that needs to be deleted and click the **Delete Organization** button for that organization.
2. Confirm the deletion by clicking the **Delete** button in the Confirm Organization Deletion dialog box.

6.2.5 Find an Organization

For a user that belongs to many organizations, use the Search box to find organizations by string:
1. Enter a string in the search box at the top of the page.
2. Click the **Search** button to list all organizations that have the string in the name of the organization.

6.3 Intel Unite® Solution Management

After selecting the organization from the Organizations page, the portal displays three main menus and the default page, which is the Hubs and Clients page. The three menus are:
- Device Management
- Server Management
- User Management

Click **Organizations** at the top of the page to return to the Organizations page.

6.4 Admin Portal Device Management Menu

The Device Management menu contains links to device management pages and Quick Actions, which are described in this section.

The Device Management menu contains links to the following pages:
- **Hubs and Clients** – This is the default page after logging in. This page displays:
  - The hub or client groups.
  - Devices that are paired and registered with this organization.
• **Configurations** – This page provides the ability to create and make changes to hub and client configurations. These configurations will be assigned to device groups or to devices.

• **Features/Apps** – This page provides the ability to manage feature and app packages, allowing packages to be uploaded, approved, and to be deleted. As new version of feature and app packages are uploaded and approved, the old versions can be deleted.

• **Reserved PINs** – By default, the PIN for a hub will change after a period of time. This page allows assigning a static PIN to a hub, meaning the PIN will not change over time. If a hub is assigned a static PIN, this page allows the hub to be reset to use a changing PIN.

• **Custom Metadata** – This page provides the ability to create additional fields for devices. The fields are free form string fields. This is useful for adding more information for each device (for example, creating a field called “location” will allow recording the location of the hub for later reference).

• **Provision Device** – This page provides a URL that contains all the information needed for a hub or client device to contact the Intel Unite® solution to pair or register. This is the same page that is shown when clicking the Show provisioning URL link on the login page.

• **Auto Pairing Management** – This page provides the management of auto pairing tokens. These tokens are valid for a predefined period time, and this page shows when each token will expire. This page also provides the ability to delete expired tokens.

The device management menu contains the following Quick Actions:

• **Pair Hub** – This quick action is used when manually pairing a hub.

• **Auto Pairing** – This quick action displays a dialogue box of a randomly generated pairing token along with information on how to use the pairing token. The token and the time expiration are available on the Auto Pairing Management page.

• **Upload Package** – This quick action is used to upload feature/apps packages.

• **Create Meeting** – This quick action is used to display a page with a meeting URL. Send this URL to other users to allow them to join the same session for the Intel Unite® solution. This is the same page that is shown when clicking the Create Meeting link on the login page.

### 6.4.1 Device Management – Pages

The following subsections provide details for each page link that is available under the Device Management menu.

#### 6.4.1.1 Hubs and Clients Page

The Hubs and Clients page is where hub and client devices are managed and is the page that is displayed after selecting an organization on the Organizations page.

Hub and client devices are organized in groups. A group of devices will be assigned the same configuration. By default, hub groups and devices are displayed. Click **Clients** to display the client groups and devices. To display the hub groups and devices, click **Hubs**.

Admin portal groups that are associated with an Active Directory group are denoted in the AD Organization Unit column by the icon shown below.

Hover over the icon to display the Active Directory group name.

Admin portal groups that have a configuration assigned are denoted by a gear icon in the configuration column. Hover over the icon to display the configuration name. In order for a device to function, it must be assigned to a group that has a configuration. A configuration is container that holds packages which are features, apps, and settings for devices.
Use the search box at the top of the page to quickly find devices. Enter a string in the search box and click the Search button to find devices that contains the string in the name. Use the Clear button to clear the search results.

6.4.1.1.1 Select Action Menu

The Select Action menu on the Groups page provides actions that can be applied to a selected group. The list below describes the available actions:

- **Group Details** – View and modify a group’s details. To access a group’s details page, select a group by clicking the group name, open the Select Action menu, and select Group Details. The group details page displays the group name and the Active Directory OU associated with the group. Available actions:
  - **Rename group**: To rename a group, click Edit Group next to the group name. The root group cannot be renamed.
  - **Add/Update AD OU association**: To add or update an AD OU association, click the Assign button, enter the distinguished name of the OU that contains the devices that will receive settings from the configuration that is assigned to this group, and click Assign. The distinguished name of an OU can be obtained by looking at the Attribute Editor tab of the OU property.
  - **Remove AD OU association**: To remove an association with an Active Directory OU, click the Unassign button.
    - If an Active Directory OU contains subgroups, the computers in a subgroup will not be recognized and will not receive settings from the configuration assigned to the group.
    - Some devices may belong to two admin portal groups – a group without an Active Directory OU association, and a group with an Active Directory group association. The configuration assigned to the admin portal group with the Active Directory group association is applied to the device.
- **Assign Devices** – Assign devices to a selected group. To assign devices to a group, select a group, open the Select Action menu, select Assign Devices, select devices to add to the group by placing a check next to each device to be added to the selected group, and click the Assign Device button at the top of the page to assign devices to the selected group.
- **Assign Configuration** – Assign a configuration to the selected group. To assign a configuration to a group, select a group, open the Select Action menu, select Assign Configuration, select a configuration, and click the Assign button to assign the configuration to the selected group.
- **Remove Configuration** – Remove a configuration from a selected group. To remove a configuration from a group, select the group, open the Select Action menu, select Remove Configuration, and click Remove to confirm removal of the configuration from the selected group.
- **Create Group** – Create a new group under the selected group. The new group will become the child, and the selected group will become the parent. Child groups inherit the configuration assigned to the parent group by default. The configuration of a child can be different than the one assigned to the parent. Use the Assign Configuration action to assign a configuration to a child group. To create group, select a group, open the Select Action menu, select Create Group, enter a name for the new group, and click the Create button to create the group.
- **Delete Group** – Delete a selected group. When this action is selected, a Confirm Delete Group(s) dialog box opens to confirm the deletion of the selected group and all child groups. The root group cannot be deleted.
- **Move Group** – Move a group. To move a group, select a group, open the Select Action menu, select Move Group, select a parent group, and click Move to confirm moving the selected group to the new parent group.

6.4.1.1.2 Move and Delete Devices

Follow the steps below to move a device from one group to another group:
1. Select a device by placing a check in the checkbox next to the device name.
2. Click the move group arrow icon.
3. Select a group.
4. Click Move in the Confirm Move dialogue box.

Follow the steps below to delete a device:
1. Select a device by placing a check in the checkbox next to the device name.
2. Click the trash can icon.
3. Click the Delete button in the Confirm Device Deletion dialogue box.

### 6.4.1.1.3 Configure Group Properties

To assist in the configuration of hubs and clients that have the same settings and features, hubs and clients can be put into groups. Each device in a group inherits the settings and features from the configuration assigned to the group.

#### Edit Hub Group Properties

1. Hub group properties can be edited by following these steps.
2. On the Groups page, click the Hubs tab.
3. Select a hub group by clicking the group name.
4. Select Group Details from the drop-down menu at the top.
5. On the group details page, click the Edit Properties button.
6. Modify the properties.
7. Click Save Changes to apply the modifications.

Changes made using the steps above will apply to all devices in the group.

#### Override Hub Group Configuration

At times, a hub device in a hub group requires a different set of configurations than those inherited from the group. Follow the steps below to override the group configuration for a device:
1. On the Groups page, click the Hubs tab.
2. Select the hub group that contains the hub device by clicking the group name.
3. Click the device name to display the detail page.
4. Click the Edit Device button.
5. Modify the properties.
6. Click Save Changes to apply the modifications.

Changes made using the steps above will apply to all devices in the group.

#### Hub Group Properties

Table 11 describes the hub properties that are in the hub packages. A dynamic value of "Yes" means the property value will be applied without restarting the device's Intel Unite® application. A dynamic value of "No" means the property value will be applied the next time the device's Intel Unite® application is restarted.

<table>
<thead>
<tr>

</table>
6.4.1.1.5 Edit Client Group Properties

Follow the steps below to edit client group properties:

1. On the Groups page, click the Client tab.
2. Select a client group by clicking the group name.
3. Select Group Details from the drop-down menu at the top.
4. On the group details page, click the Edit Properties button.
5. Modify the properties as desired.
6. Click Save Changes to apply the modifications.

Changes made using the steps above will apply to all devices in the group.

6.4.1.1.6 Override Client Group Configuration

At times, a client device in a client group requires a different set of configurations than those inherited from the group. Follow the steps below to override the group configuration for a device.

1. On the Groups page, click the Client tab.
2. Select the client group that contains the client device by clicking the group name.
3. Click the device name to display the detail page for that device.
4. On the device details page, click the Edit Device button.
5. Modify the properties.
6. Click Save Changes to apply the modifications.

Changes made using the steps above will only apply to the device.

6.4.1.1.7 Client Group Properties

The tables in this section describe the client properties that are in the client packages.

6.4.1.1.8 Client Plugin Moderation Mode

Some plugins/apps can be configured to only show on moderator clients and be hidden for viewers and presenters in a moderated session. Only plugins that have Disable plugin for non-moderators module property set to True will be hidden. The module property can be found in the Group Details of a configuration.

For non-moderated sessions, all participants will have access to plugins/apps, even when the Disable plugin for non-moderators is set to True for the plugins/apps.
Older plugins may not support moderation mode and will require the use of a newer version of those plugins. Follow these steps to install the new version.

Download the new plugin version before starting the steps below.

1. Remove the old plugin version from client configurations.
   a. Select Configurations from the Device Management menu.
   b. Click Client Configurations to display all client configurations.
   c. Click the Edit button associated with the configuration that has the old plugin version.
   d. Remove the plugin by clicking the minus sign (-) next to the old plugin.
   e. Click Save Changes.
   f. Repeat these steps for all configurations that has the old plugin version.

2. Delete the old plugin version.
   a. Select Features/Apps from the Device Management menu.
   b. Click Client Features/Apps to display all the client plugins.
   c. Click the Delete button associated with the old plugin version.
   d. Confirm the deletion by clicking Delete when the Confirm Delete Feature/App window pops up.

   a. Click Package Approval on the Features/Apps page.
   b. Click Upload Package in the upper right corner.
   c. Browse to the location of the new plugin version and select the .cab file.
   d. Click Open to upload the plugin.
   e. Confirm a Success message pops up and the plugin version is listed in the Package Approval tab.
   f. Click the Approve button associated with the new plugin version.
   g. Confirm a Success message pops up and the new plugin version is listed in the Client Features/Apps tab.

4. Add new plugin version to client configuration.
   a. Select Configurations from the Device Management menu.
   b. Click the Client Configurations to display all client configurations.
   c. Click the Edit button associated with the configuration that will have the new plugin version added.
   d. Add the plugin by clicking the plus sign (+) next to the new plugin version.
   e. Click Save Changes.
   f. Repeat these steps for all configurations that needs the new plugin version.

### 6.4.1.2 Configurations Page

Configurations are containers that holds packages which are features, apps, and settings for hub and client devices. On the Device Management menu, click Configurations to navigate to the Configurations page. The Configurations page lists the hub and client configurations. A configuration is a container that holds packages which are features, apps, and settings for a device. Each configuration consists of packages. Most packages have properties that can be changed to alter the behavior of the device.

When a hub is paired or a client is registered, the assigned configuration determines how the device is configured, and what features and apps are loaded on the device.

The Configurations page displays a list of configurations. By default, the list displays hub configurations. To display a list of client configurations, click Client Configurations. To switch to a list of hub configurations, click Hub Configurations. Click the right-pointing chevron icon to see a package's details. Click the down-pointing chevron icon to hide a package's details.

Use the Search boxes at the top of the Configurations page to find configurations. Enter a string and click Search to display a list of configurations that have the string in its name. Use the Clear button to clear the search results.
6.4.1.2.1 Create Configuration

Follow the steps below to create a new configuration:

1. On the Configurations page, click **Create Configuration**. The Create Configuration view will be displayed.
2. Replace configuration name with the name of the new configuration.
3. Select either **Hub** or **Client** next to the configuration name.
4. From the Intel Unite® Software drop-down menu, select a **version**.
5. To add features or an app, click the **white plus sign (+)** with the blue background associated with the feature or app under Available Features/Apps. Use the Filter field to find features and apps. Once feature or app is added, it's moved under Selected Features/Apps.
6. To remove features or an app, click the **white minus sign (-)** with the blue background associated with the feature or app under Selected Features/Apps. After removing a feature or an app, the feature or app moves under Available Features/Apps.
7. After adding the desired features and apps to the package, click the **Create Configuration** button.

   **Note:** Clicking Cancel before clicking Create Configuration terminates the configuration creation process without saving the changes and returns to the Configurations page.

6.4.1.2.2 Edit Configuration

Follow the steps below to edit a configuration:

1. On the Configurations page, click the **Edit** button associated with a configuration to bring up the Edit Configuration page. On this page, features and apps can be added or removed.
2. To change the name of the configuration, highlight the name in the **Edit Configuration** text box, and type the new name.
3. To select a new version, open the Intel Unite® Software menu by clicking the **white down arrow** with the blue background icon, then select the desired version.
4. To add a features or an app, click the **white plus sign (+)** with the blue background associated with the feature or app under Available Features/Apps. Use the Filter field to help find features or apps.
5. To remove features or apps, click the **white minus sign (-)** with the blue background associated with the feature or app under Selected Features/Apps. Use the Filter field to help find features or apps.
6. Click the **Save Changes** button to save changes.

   **Note:** Clicking Cancel before clicking Save Changes terminates the process without saving changes and returns to the Configurations page.

6.4.1.2.3 Delete a Configuration

Follow the steps below to delete a configuration:

1. On the Configurations page, identify the configuration to be deleted.
2. For the configuration to be deleted, click the **Delete** button to open the Confirm Delete Configuration dialog box.
3. In the confirmation dialog box, click **Yes** to delete the configuration, or click **No** to cancel the deletion.

   **Note:** Only configurations that are not in use can be deleted. When a configuration is not assigned to any group, it is not in use. If a configuration is in use, the Delete button is not available.
6.4.1.3 Features/Apps Page

To access the Features/Apps page, click Features/Apps on the Device Management menu. The Package Approval page shows the uploaded packages that have not been approved. The contents of the package will not be available for use in a configuration until the package is approved. After a package is approved, the contents are listed under either Hub Features/Apps or Client Features/Apps. Click the Hub Features/Apps tab to display a list of hub modules. Click the Client Features/Apps tab to display a list of client modules.

Features/App are modules that provide core functionality or enhanced capabilities for the hub and/or client. An example of a core functionality is the ability to view presentations remotely. An example of an enhanced capability is the ability to set a customized background. To create modules and packages, refer to the SDK documentation.

6.4.1.3.1 Upload a Package

Features and apps for the Intel Unite® solution are distributed using Packages in cab file format. These apps packages can be downloaded from the Intel showcase website while feature packages are downloaded from the admin portal.

Follow the steps below to upload a package:

1. Click the Upload Package button in the upper right corner.
2. Browse to the location of the manifests or Apps directory.
3. Select the cab file and click the Open button.
4. A successful upload will be indicated by a green pop up box with the word Success.

6.4.1.3.2 Approve a Package

To approve a package on the Features/Apps page, click the Approve button associated with the package. Clicking the Reject button results in the package being unavailable.

6.4.1.3.3 View Hub/Client Features/Apps

To view a list of hub or client apps and features on the Features/Apps page, click the Hub Features/Apps tab or the Client Features/Apps tab. From that page, click the right-pointing chevron icon to see a module's details. Click the down-pointing chevron icon to hide a module's details.

To delete a module, click Delete. The Confirm Delete Module dialog box will open. Click Yes to delete the module. Click No to cancel the deletion. Only modules not in use can be deleted.

6.4.1.4 Reserved PINs Page

Selecting the Reserved PINs menu item on the Device Management menu opens the Reserved PIN page. On the Reserved PIN page, a list of hubs is displayed, and a static PIN can be assigned to a hub.

Use the Search boxes at the top of the Hubs with Reserved PIN and the Hubs section to find hubs. Enter a string and click Search to display a list of hubs that have the string in its device name. Use the Clear button to clear the search results.

6.4.1.4.1 Assign a Static PIN to a Hub

A static PIN can be assigned to a hub in two ways:

Method 1 – Manually set each hub PIN:

1. Find the hub in the list that is to be assigned a static PIN and enter a six-digit number in the PIN field. The six-digit number can be randomly generated or defined specifically by the person entering the static PIN.
2. Click Save.
Method 2 – Assign PINs to one or more hubs using a .csv file:
1. Download the .csv template by clicking the Download Template link in the upper-right corner of the page.
2. Fill in the .csv template with the hub FQDN and PIN.
3. Save the .csv file.
4. Click the Import Reserved PINs button at the top of the page.
5. In the Open dialog box, browse to the location of the .csv file, select it, and click Open.

6.4.1.4.2 Unassign a Static PIN for a Hub

A static PIN can be unassigned for a hub in two ways:
Method 1 – Manually unassign each hub PIN
1. Find the hub with the static PIN assigned in the list of hubs on the Reserved PIN page.
2. Click Unreserve.
Method 2 – Unassign PINs to one or more hubs using a .csv file
1. Download the .csv template by clicking the Download Template link in the upper-right corner of the page.
2. Fill in the .csv template with the hub FQDN and set the value for PIN to *.
3. Save the .csv file.
4. Click the Import Reserved PINs from CSV button at the top of the page.
5. In the Open dialog box, browse to the location of the .csv file select the .csv file, and click Open.

6.4.1.4.3 Use a Random PIN as a Static PIN

To assign a randomly generated PIN as a static PIN for a hub:
1. On the Reserved PIN page, find the hub in the list that is to be assigned the static PIN, and click the Auto Generate button.
2. Click Save.

6.4.1.5 Custom Metadata Page

The Metadata Page displays a list of user-defined metadata. The properties defined on this page become properties of all hub and client devices, allowing each device to be assigned a different value for each property. Use the Search box at the top of the Custom Metadata page to find defined metadata properties. Enter a string and click Search to display a list of metadata properties that have the string in its name. Use the Clear button to clear the search results.

6.4.1.5.1 Create or Delete Metadata

Follow the steps below to create metadata:
1. Click the Add Item button at the top of the page.
2. Enter a name for the metadata.
3. Click the Save button at the top of the page.
Follow the steps below to delete metadata:
1. Place a check in the checkbox next to the metadata to be deleted.
2. Click the Delete button at the top of the page.
3. Click Delete to confirm deletion.

6.4.1.5.2 Edit Metadata Value

Follow the steps below to edit a metadata property:
1. Navigate to the **Hubs and Clients** page by selecting Hubs and Clients on the Device Management menu.
2. Click a device name to open the device details.
3. Click the **Edit Device** button at the top of the page.
4. Enter a string value into the text box for the metadata property.
5. Click **Save Changes** at the top of the page.

### 6.4.1.6 Provision Device Page

The Provision Device page displays a URL. The URL can be used to pair hubs and register clients. The URL contains three important pieces of information – the server URL, the organization ID, and the organization name. These values are needed to pair hubs and register clients. The organization ID and organization name are set during the creation of the organization. The URL string is not case-sensitive.

### 6.4.1.7 Auto Pairing Management Page

The Auto Pairing Management page displays a list of auto pairing tokens and their time of expiration. From this page, tokens can be generated and deleted. Follow the steps below to generate a token:
1. Enter the number of hours that the token will be valid into the duration (hours) text box in the upper-right corner.
2. Click the **Generate Token** button. The Generate Auto Pairing Token window will open with instructions on how to use the token.
3. Click the **Close** button to dismiss the window. The new token is added to the token list.

Follow the steps below to delete a token:
1. Place a check in the checkbox next to the token. More than one token can be selected.
2. Click the **Delete Tokens** button in the upper-right corner. The Confirm Delete Token window will open.
3. Click the **Delete** button to delete the token or the **Cancel** button to keep the token.

### 6.4.2 Device Management – Quick Actions

This section provides information about the Pair Hub, Auto Pairing, Upload Package, and Create Meeting Link Quick Actions located on the Device Management menu.

#### 6.4.2.1 Pair Hub

The Pair Hub Quick Action is used during the hub setup procedures. A hub must be paired with the admin portal before it can be used. Refer to **Section 4.6** for more information about hub pairing.

#### 6.4.2.2 Auto Pairing

The Auto Pairing Quick Action enables the generation of a token that can be used to pair multiple hub devices and register multiple client devices. Follow the steps below to pair devices using the auto pairing token:
1. On the Device Management menu, click in the **duration (hours)** text box and enter the number of hours the token will be valid.
2. Click the **Generate Token** button to display the Generate Auto Pairing Token dialog box, which contains the pairing token and instructions on how to use the token.
3. On the hub device, open a web browser, and browse to the URL `intelunite4://localhost/pair?otp=<token>`, where `<token>` is the value from Step 2.
4. Click **Close** to close the Generate Auto Pairing Token dialog box.
Follow the steps below to register client devices using the auto pair token:

1. On the Device Management menu, click in the duration (hours) text box and enter the number of hours the token will be valid.
2. Click the Generate Token button to display the Generate Auto Pairing Token dialog box, which contains the pairing token and instructions on how to use the token.
3. On the client device, open a web browser, browse to the URL intelunite4://localhost/pair?otp=<token>&email=<email address>&machineName=<machine name>, where <token> is the value from Step 2, <email address> is the email address that will receive the registration email, and <machine name> is the name of the client system.
4. Click the Close button to close the Generate Auto Pairing Token dialog box.

6.4.2.3 Upload Package

Follow the steps below to use the Upload Package Quick Action:

1. On the Device Management menu, click the Upload Package button. An Open dialog box will be displayed.
2. Use the Open dialog box to select the file to upload, then click Open. The package file must be in .cab format.

Once a package is uploaded, the package contents are not available. The package requires approval before the package contents can be used in a configuration.

6.4.2.4 Create Meeting

The Create Meeting Quick Access tool on the Device Management menu displays the Join dialog box. This tool creates a meeting URL for participants who are unable to install or use the existing Intel Unite® solution add-in for Microsoft® Outlook.

The meeting URL can be sent to users who will join a session using the Intel Unite® solution. Recipients can join a meeting by using the Run command window (Windows*, macOS*, and iOS* clients) or a web browser (Windows*, macOS*, and iOS* clients).

Follow the steps below to join a meeting using the Run command window on a Windows* device:

1. Copy the meeting URL.
2. Open a Run command window or terminal window.
3. Paste the URL in the Run command text box or terminal window and press Enter.

Follow the steps below to join a meeting using a web browser on a Windows* or macOS* device:

1. Copy the URL.
2. Open a web browser.
3. Paste the URL in the address bar and press Enter.

6.5 Admin Portal Server Management Menu

The Server Management menu includes the following menu items:

- Telemetry – This page displays telemetry data that are collected.
- Logs – This page displays the logs that have been generated, which can be used to debug unexpected behaviors.
- Server Properties – This page displays server properties and allows to edit them.
- Organizations – This page displays a list of organizations the user belongs to. A user with the Edit Server Management permission can create a new organization and edit existing organizations.
### 6.5.1 Telemetry Page

The Telemetry page includes graphs showing telemetry information. The following information types are displayed as telemetry data:

- Connections and presentations Per Day (All Rooms) – Connection events per day.
- Seconds in Use Per Day (All Rooms) – Usage time per day.
- Participant Count per Session – The number of participants per session.
- Participant Connected Duration (Seconds) – Participant connection time per session.
- CPU Information (Hub) – CPUs running in hubs associated with the server and the count of each CPU.
- Hubs Per OS – Operating systems running on the hubs associated with the server and the count of each operating system.
- Clients Per OS – Operating systems running on the clients paired with the server and the count of each operating system.
- Plugin Launches (Hub) – Names of the apps used on hubs, and the count of each app.

The range can be modified by changing the Start Date and/or the End Date fields. This range applies to all telemetry data.

**Telemetry data controls:**

- Click the **Reset** button to reset the telemetry data and clear the graphs.
- Click the **Refresh** button to get the latest information and update the graphs.
- Click the **Export** button to export a .csv file of the telemetry data to the user's download directory.

### 6.5.2 Logs Page

The Logs page displays a list of logs. Each log entry includes the following information:

- **Device Name** – The fully qualified domain name of the device that generated the log entry.
- **Level** – The severity of the log entry. The following table describes the severity levels.
- **Source** – The originator of a log entry.
- **Timestamp** – The time a log entry was generated.
- **Message** – Information specific to the log entry.

<table>
<thead>
<tr>
<th>Log Severity Level</th>
<th>Severity Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Critical</td>
<td>Critical errors that cannot be recovered. This results in program crash, data loss, and so forth.</td>
</tr>
<tr>
<td>2</td>
<td>Error</td>
<td>Major error that is still recoverable.</td>
</tr>
<tr>
<td>3</td>
<td>Warning</td>
<td>Event that is handled but should still have some type of review for ongoing occurrences.</td>
</tr>
<tr>
<td>4</td>
<td>Info</td>
<td>Informational status.</td>
</tr>
<tr>
<td>5</td>
<td>Debug</td>
<td>Lower-level debug messages that can help diagnose an issue.</td>
</tr>
<tr>
<td>6</td>
<td>Trace</td>
<td>Lowest-level logging, may include all function enter/exit as well as internal states for various modules.</td>
</tr>
</tbody>
</table>

- The **Reset** button clears the logs.
- Use the Search box at the top of the Logs page to find log entries. Enter a string and click **Search** to display a list of logs that have the string associated with the device name.
- Use the **Clear** button to clear the search results.
- Change the **Start Date** and **End Date** to widen or narrow the list of logs generated between the two dates inclusive.
6.5.3 Server Properties Page

The Server Properties page displays a list of server properties, the organization name, and the organization description. To edit and change the server properties, organization name, or organization description, click the Edit Properties button. After a change is made, click Save Changes to apply the change. Table 18 describes the server properties.

Table 18: Server Properties

<table>

<td>Boolean</td>
<td>True</td>
</tr>
</tbody>
</table>

In addition to the server properties, a button is available at the top the Server Properties page:

- Test AD connection – Click to verify AD FS settings are correctly set.
6.6 Admin Portal User Management Menu

The User Management menu groups all the pages that relates to user management.

The User Management menu includes the following pages:

- Users – This page provides the management of users in the organization that uses the Intel Unite® solution, allowing changing user properties, and deleting users.
- Moderators – This page provides the management of moderators. A moderator is a user that controls a moderated session. From this page, a user can be assigned to be a moderator or a user's moderator status can be revoked.
- Roles – This page provides the management of roles. Roles are a collection of specific permissions. Custom roles can be created or deleted.

6.6.1 Users Page

The Users page of the admin portal displays a list of all admin portal users. The Users page enables administrators to add, edit, delete, and reassign user roles, as described in the next sections. Use the Search boxes at the top of the Users page to find users. Enter a string and click Search to display a list of users that have the string in its name. Use the Clear button to clear the search results.

6.6.1.1 Add a User

Follow the steps below to add a new user:

1. On the Users page of the admin portal, click the Add User button. The Add User page opens.
2. Complete the following options on the Add User page:
   - User Name – The user ID or the email address of the user to be added. The user to be added must have an account with Intel and have signed into the admin portal at least once.
   - Select Role – The user's role which determines the permissions for the user. The user can be assigned a role that is linked to an Active Directory user group. Linking an Active Directory user group to a role does not restrict which user can be assigned to that role.
3. After filling in the user information click Save to add the user.

For Active Directory users, add the AD user to the appropriate AD OU that has the desired permissions defined by the corresponding role created for that AD OU. Refer to Section 6.6.3.1 for details about creating a role for an AD OU. AD users are not added to the admin portal for Intel Unite® solution and are managed through Active Directory.

6.6.1.2 User Actions

Users with User Management permissions can use the Users page to delete users and assign users to different roles:

- Delete User – Place a check in the box next to the username. On the Select Action menu at the top of the page, click Delete. A confirmation dialog box opens. Click Yes to delete the user or click No to close the confirmation dialog box without deleting the user.
- Assign Different Role – Place a check in the box next to the username. On the Select Action menu at the top of the page, select Assign Different Role. The Select Role dialog box opens. Choose the new role and click Assign.

6.6.2 Moderators Page

The Moderators page displays a list of users who have moderator privileges. This page enables users with Moderator Management permissions to add, manage, and remove users from the moderator list. Use the Search
boxes at the top of the page to find users in the moderator list. Enter a string and click **Search** to display a list of users who have the entered string in the user’s name. Use the **Clear** button to clear the search results.

### 6.6.2.1 Add a Moderator

On the Moderators page, moderators can be added in two ways – individually or as a group:

Follow the steps below to add a moderator individually:

1. Click **Add Moderator**.
2. Enter the moderator's name and email address.
3. Click **Save**.

Follow the steps below to add moderators as a group:

1. Click **Import Moderators from CSV**
2. Select the .csv file that contains the list of moderators.
3. Click **Open**.

### 6.6.2.2 Delete a Moderator

Follow the steps below to delete a moderator:

1. On the Moderators page, place a check in the box next to the username and select **Delete**. A confirmation dialog box will open.
2. Click **Yes** to delete the user or click **No** to close the confirmation dialog box without deleting the moderator.

### 6.6.2.3 Moderated Sessions

For a session to be moderated, the moderator functionality mode needs to be set for the hub device. To set the moderator functionality mode, modify the configuration hub properties Moderator Mode. Refer to Section 6.4.1.1.3 for more information about hub properties. The available Moderator Modes are:

**0 – No Moderation**

Default mode. No moderators are in the session, and all participants have equal rights to view and present.

**1 – Self Promote**

The session is unmanaged until someone promotes themselves to be the moderator. The moderator designates who presents during the session and have the ability to promote other participants to be moderators. Becoming a moderator during the session does not result in the user being added to the moderator allowlist.

**2 – Strict**

The session is managed only by the users that are on the moderator allowlist. When the moderator joins the session, they are automatically promoted to the moderator role. A participant can request to become a moderator, which results in an email to the administrator, who can add the participant to the moderator allowlist from the admin portal.

### 6.6.2.4 Enhanced Moderation

Enhanced Moderation is a feature that provides the ability for session moderators to preview a participant's screen and invite them to start presenting. To use Enhanced Moderation, the following properties must be configured

**Hub properties:**

- Moderator Mode must be set to 2 (preview in strict moderation).
- Moderator Mode - Screen Preview must be set to 1 (preview in strict moderation).

**Client properties:**

- Enable Client Screen Preview must be set to **True**. This setting will apply to all devices in the group, but it can be overridden per device if required.
6.6.3 Roles Page

Clicking Roles on the User Management menu opens the All Roles Page. The All Roles page displays a list of roles and the number of users who are assigned to each role. By default, five roles are listed:

- Admin
- Pairing
- Role Management
- User Management
- Device Management

If a role is assigned with an AD OU, a URL will be shown at the top of the page. This URL is used to sign in to the admin portal.

Each built-in role has a specific set of permissions. Permissions are allowed actions/access to the admin portal. To show permissions for a role, click the right-pointing chevron. Click the down-pointing chevron to hide the permissions. Table 19 shows the built-in permissions for each role. Write permissions have all the permissions of read with additional capabilities. The subsequent tables show the allowed actions and access for the defined permissions.

### 6.6.3.1 Create a New Role

For users that require permissions that are not provided by the built-in roles, a new role with custom permissions can be created. When creating a new role, the following are defined:

- **Role Name** – The name of the new role.
- **Active Directory Group** – Links the role to an Active Directory OU, meaning all domain users directly assigned to the Active Directory OU will have the same permissions. If an Active Directory OU contains subgroups, the users in the subgroups will not be recognized and will not have any permissions.
- **Permissions** – Permissions applied to a new role. Multiple or all permissions can be applied.

The following steps describe how to create a new role:

1. On the Roles page, click the **Create New Role** button.
2. Replace the Role Name with the name of the new role.
3. If creating a new role for an AD OU, click the **Assign** button next to the Active Directory Group text box. Enter the distinguished name of the OU that contains the users and click **Assign**. The Distinguished name of an OU can be obtained by looking at the Attribute Editor tab of the OU property. For example, enter `OU=unite_admin,CN=Users,DC=vprodemo,DC=com` as the distinguished name.

   **Important Note:** When an AD OU is assigned to a role, a URL will be shown at the top of the All Roles page. This URL is used to sign in to the admin portal for the Intel Unite® solution using AD FS.

4. Add and remove permissions as needed:
   - **Add permissions** – Click the **white plus sign (+)** with blue background associated with the permission under Available Permissions. After adding, the permission is displayed under Applied Permissions. To add all available permissions, click the **blue plus sign (+)** with the white background next to Available Permissions. Use the **Filter** field to help find permissions.
   - **Remove permissions** – Click the **white minus sign (-)** with blue background associated with the permission under Selected Permissions. After removing, the permission is displayed under Available Permissions. To remove all available permissions, click the **blue minus sign (-)** with the white background next to Selected Permissions. Use the **Filter** field to help find permissions.
5. After adding the desired permissions, click **Create New Role**. The newly created role is listed under All Roles on the Roles page.

Multiple roles can be created that are linked to the same Active Directory OU and have different permissions. Users who are members of the Active Directory OU have a union of all the permissions from all roles linked to the Active Directory OU.
7 Maintenance Service

The Maintenance service is a Windows service responsible for supporting, cleaning, and maintaining server information. This section explains the functions and how to configure the various features of the maintenance service. The maintenance service is responsible for the following tasks:

- Cleaning expired data:
  - Pairing codes
  - PINs
  - OTP tokens
  - Meetings
  - Telemetry
  - Logging
- Updating device OUs
- Monitoring hub device health

7.1 Clean Expired Pairing Codes

This service is used to clean all rows in the pairing code table with expired pairing codes. It is configured using the properties listed in the table below.

**Table 27: Clean Expired Pairing Codes Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Value Type</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expired Paring Code Removal</td>
<td>This property sets the interval at which the Clean Expired Pairing Codes service is executed.</td>
<td>Minutes</td>
<td>1440</td>
</tr>
</tbody>
</table>

Follow the steps below to set up the Clean Expired Pairing Codes service:

1. Log in to the admin portal.
2. Click Server Management from the navigation bar at the top of the screen and select Server Properties.
3. Click Edit Properties.
4. Enter a value for the Expired Paring Code Removal property.
5. Click Save Changes.

7.2 Clean Expired PINs

This service is used to clean all expired device PINs. It is configured using the properties listed in the table below.

**Table 28: Clean Expired PINs Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Value Type</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expired PIN Removal</td>
<td>This property sets the interval (in minutes) at which the Clean Expired PINs service is executed.</td>
<td>Minutes</td>
<td>5</td>
</tr>
<tr>
<td>PIN Expiration Time</td>
<td>This property sets the time (in minutes) before a PIN is considered expired.</td>
<td>N/A</td>
<td>None</td>
</tr>
</tbody>
</table>

Follow the steps below to set up the Clean Expired Pins service:

1. Log in to the admin portal.
2. Click Server Management from the navigation bar at the top of the screen and select Server Properties.
3. Click Edit Properties.
4. Enter a value for the Expired PIN Removal property.
5. Enter a value for the PIN Expiration Time property.
6. Click Save Changes.

### 7.3 Clean Expired OTP Tokens

This service is used to clean all rows in the OTP token table with expired OTP tokens. It is configured using the properties listed in the table below.

**Table 29: Clean Expired OTP Tokens Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Value Type</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expired Auto Pairing Token Removal</td>
<td>This property sets the interval at which the Clean Expired OTP Tokens service is executed.</td>
<td>Minutes</td>
<td>1440</td>
</tr>
</tbody>
</table>

Follow the steps below to set up the Clean Expired OTP Tokens service:

1. Log in to the admin portal.
2. Click Server Management from the navigation bar at the top of the screen and select Server Properties.
3. Click Edit Properties.
4. Enter a value for the Expired Auto Pairing Token Removal property.
5. Click Save Changes.

### 7.4 Clean Expired Meetings

The Clean Expired Meetings service is used to clean all rows in meeting and meeting device tables with expired meetings. It is configured using the properties listed in the table below.

**Table 30: Clean Expired Meetings Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Value Type</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expired Meeting Removal</td>
<td>This property sets the interval (in minutes) at which the Clean Expired Meetings service is executed.</td>
<td>Minutes</td>
<td>1440</td>
</tr>
<tr>
<td>Meeting Expiration</td>
<td>This property sets the time (in days) before a meeting is considered expired.</td>
<td>Days</td>
<td>1</td>
</tr>
</tbody>
</table>

Follow the steps below to set up the Clean Expired Meetings service:

1. Log in to the admin portal.
2. Click Server Management from the navigation bar at the top of the screen and select Server Properties.
3. Click Edit Properties.
4. Enter a value for the Expired Meeting Removal property.
5. Enter a value for the Meeting Expiration property.
6. Click Save Changes.

### 7.5 Clean Telemetry Data

The Clean Telemetry Data service is used to clean all rows with expired telemetry data in the device metadata and device event tables. It is configured using the properties listed in the table below.
### Table 31: Clean Telemetry Data Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Value Type</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expired Telemetry Data Removal</td>
<td>This property sets the interval at which the Clean Telemetry Data service is executed.</td>
<td>Minutes</td>
<td>1449</td>
</tr>
<tr>
<td>Metrics Retention Policy</td>
<td>This property sets the time to retain telemetry data.</td>
<td>Days</td>
<td>365</td>
</tr>
</tbody>
</table>

Follow the steps below to set up the Clean Telemetry Data service:

1. Log in to the admin portal.
2. Click **Server Management** from the navigation bar at the top of the screen and select **Server Properties**.
3. Click **Edit Properties**.
4. Enter a value for the **Expired Telemetry Data Removal** property.
5. Enter a value for the **Metrics Retention Policy** property.
6. Click **Save Changes**.

### 7.6 Clean Logging Data

The Clean Logging Data service is used to clean all rows in the logging table with expired telemetry data. It is configured using the properties listed in the table below.

### Table 32: Clean Logging Data Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Value Type</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expired Log Removal</td>
<td>This property sets the interval at which the Clean Logging Data service is executed.</td>
<td>Minutes</td>
<td>1440</td>
</tr>
<tr>
<td>Logs Retention Policy</td>
<td>This property sets the time to retain log data.</td>
<td>Days</td>
<td>30</td>
</tr>
</tbody>
</table>

Follow the steps below to set up the Clean Logging Data service:

1. Log in to the admin portal.
2. Click **Server Management** from the navigation bar at the top of the screen and select **Server Properties**.
3. Click **Edit Properties**.
4. Enter a value for the **Expired Log Removal** property.
5. Enter a value for the **Logs Retention Policy** property.
6. Click **Save Changes**.

### 7.7 Update Device OU

The Update Device OU service is used to update the device table. It is configured using the properties listed in the table below.

### Table 33: Update Device OU Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Value Type</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maintenance Service AD OU Cache Generation</td>
<td>This property sets the interval at which the Update Device OU service is executed.</td>
<td>Minutes</td>
<td>1440</td>
</tr>
</tbody>
</table>

In addition to this property, configuring the Update Device OU service requires changes to the following Active Directory properties in the configuration file:
1. To set up the Update Device OU service, follow the steps below:
2. Log in to the admin portal.
3. Click **Server Management** from the navigation bar at the top of the screen and select **Server Properties**.
4. Click **Edit Properties**.
5. Enter a value for the **Maintenance Service AD OU Cache Generation** property.
6. Click **Save Changes**.
7. Go to the server where the Maintenance Service is running.
8. Using Task Manager, right-click **Intel Unite Maintenance Service** and select **Properties**.
9. Copy the path to the executable.
10. Open the **Intel.Unite.Server.Maintenance.exe.config** file in Notepad and set the following properties:
   - **ActiveDirectoryServer**
   - **ActiveDirectoryGlobalCatalog**
   - **ActiveDirectoryServerUsername**
   - **ActiveDirectoryServerPassword**
   - **ActiveDirectoryServerUseSSL**
   
   For example:
   
   `<add key="ActiveDirectoryServer" value="1440"/> <!-- In Minutes -->
   <add key="ActiveDirectoryGlobalCatalog" value=""/>
   <add key="ActiveDirectoryServerUsername" value=""/>
   <add key="ActiveDirectoryServerPassword" value=""/>
   <add key="ActiveDirectoryServerUseSSL" value=""/>
   <add key="ActiveDirectoryServerGroupsCacheLifespan" value="1"/>
   <add key="ActiveDirectoryServerUnitInterval" value="5"/>

### 7.8 Health Monitor Service

The Health Monitor service watches to see if a set of hub devices becomes inactive (as determined by enabling a flag in reporting). If inactive, it will send an alert to admins listed in the admin portal. It is configured using the properties listed in the table below.

**Table 34: Health Monitor Service Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Value Type</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maintenance Service Interval</td>
<td>This property sets the interval at which the Health Monitor service is executed.</td>
<td>Minutes</td>
<td>1440</td>
</tr>
<tr>
<td>Inactive Hub Threshold</td>
<td>This property sets minimum number of inactive devices before a Health monitoring report is sent to all admins.</td>
<td>Number of inactive devices</td>
<td>1</td>
</tr>
</tbody>
</table>
The Health Monitor service scans the hubs and clients database where all the devices are stored and checks all the devices that have the configuration core property Enable Reporting set to True. Once all the clients with Enable Reporting set to True have been identified, the Health Monitor service checks the timestamp field. It then looks for devices where the difference in minutes between the actual time and the last update time is greater than the Inactive Duration key (as set in the Server Properties section of the admin portal).

After the Health Monitor service gets the number of devices that meet these criteria, it compares that number against the Inactive Hub Threshold key. If the number of devices that exceed the Inactive Duration is greater than the number of devices set in the Inactive Hub Threshold, an email will be sent to all the users registered in the admin portal that have the Admin role. If the Health Monitor Service finds that the number of inactive devices is greater than it was in the previous scan, additional emails will be sent.

To set up the Clean Expired Meetings service, follow the steps below:

1. Log in to the admin portal.
2. Click Server Management from the navigation bar at the top of the screen and select Server Properties.
3. Click Edit Properties.
4. Enter a value for the Maintenance Service Interval.
5. Enter a value for the Inactive Hub Threshold property.
6. Enter a value for the Inactive Duration.
7. Click Save Changes.
8. Go to the server where the Maintenance Service is running.
10. Copy the path to the executable.
11. Open the Intel.Unite.Server.Maintenance.exe.config file in Notepad and set the following properties:
    - SMTP FROM
    - SMTP HOST
    - PORT
    - USERNAME
    - PASSWORD

For example:

```xml
<mailSettings>
  <smtp from="noreply@intel.com">
    <network host="smtp.intel.com" port="25" userName="noreply@intel.com" password="pass"/>
  </smtp>
</mailSettings>
```

12. Return to the admin portal.
13. Click User Management from the navigation bar at the top of the screen and select Users.
14. Find the email address of the account that should become the admin and click the Edit button next to it.
15. Set the Role of that user to “Admin”, then click Save.
16. Click Device Management from the navigation bar at the top of the screen, then click Hubs and Clients.
17. Click the hub you want to track, then click Edit Device.
18. Set Enable hub check-in reporting to True, then click Save Changes.
Each organization and the organization administrators determine a regular maintenance program. Refer to Section 9 for recommended maintenance.

### 7.9 Alerts and Monitoring

The admin portal can be configured to notify the IT administrator when a certain number of hubs becomes non-responsive. The server properties listed in Table 35 allow an IT administrator to customize the alert behavior. Refer to Section 6.5.3 for a detailed list of server properties.

**Table 35: Alerts and Monitoring Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Email</td>
<td>The email address where alert messages are sent.</td>
</tr>
<tr>
<td>Maintenance Service Interval</td>
<td>The number of minutes between maintenance service events, which include checking for inactive devices.</td>
</tr>
<tr>
<td>Inactive Hub Threshold</td>
<td>The number of concurrent inactive hubs before an email is sent to the admin email address.</td>
</tr>
<tr>
<td>Inactive Notification Interval</td>
<td>Time interval for sending repeated inactive hub notification emails.</td>
</tr>
<tr>
<td>Inactivity Duration</td>
<td>The number of minutes since the last check-in from a hub before it is considered inactive.</td>
</tr>
</tbody>
</table>
8 Security Controls

8.1 Minimum Security Standards (MSS)

Intel recommends that all devices running the Intel Unite® application meet the default organization Minimum Security Standards (MSS), have an agent installed for patching, and have an antivirus/IPS/IDS and other necessary controls as per the MSS specification (McAfee* suite for Anti Malware, IPS, and IDS were tested for compatibility).

8.2 Machine Hardening

The machine Unified Extensible Firmware Interface (UEFI) could be configured to only boot from the Windows* boot loader, ensuring that starting from a USB or DVD will not work. Other configurations can be set to enable the execute disable bit, enable Intel® Trusted Execution Technology, and require a password to change UEFI configurations.

For Windows* OS hardening, as a baseline, the system runs with non-elevated user rights. Intel also recommends removing unused software from the OS, including unnecessary preinstalled software and Windows* components (PowerShell, Print and Document services, Windows* location provider, XPS services, and so forth). Apply group policies that are reminiscent of kiosks or digital signage.

Regarding GUI subsystem lock, for systems that use non-touch screens without a keyboard or mouse, breaking out of the GUI subsystem is harder. To prevent an attacker from attacking using an HID device (USB keyboard/mouse), Intel recommends to programmatically block usage of Alt + Tab, Ctrl + Shift + Esc, and the Charms bar.

8.3 Other Security Controls

Intel recommends locking the machine user account per specific machine account in Active Directory. If the deployment includes a high number of units, user accounts can be locked per a designated floor of a specific building.

Each machine is recommended to have an identified owner. If a machine goes offline for an extended period, the identified owner is notified.

Beyond the security mechanisms provided by the Intel vPro® platform and the Intel Unite® software, Intel recommends to harden the Microsoft* Windows* OS per Microsoft's guidelines for machine hardening. For reference, consult the Microsoft Security Compliance Manager* (SCM) (includes a wizard-based hardening tool, including hardening best known methods (BKMs) and relevant documentation).
9 Recommended Maintenance

Each organization and the IT administrators determine a regular maintenance program. In addition, the following maintenance tasks are recommended:

- Nightly Reboot – Reboot the hubs on a daily base (preferably at night). Prior to reboot, run maintenance tasks, such as wiping cached temp files and initiating the standard patching procedure.
- Patching Strategy – If available, run the standard patching mechanism in an unattended mode (no GUI prompts), preferably before the nightly reboot.
- Reporting – Logs are captured and can be accessed on the admin portal under on the System Management tab.
- Backend Monitoring – Use standard virtual server monitoring tools to generate and send alerts to second-level support.
Appendix A Provisioning for Google Admin*

A.1 Enforce Automatic Intel Unite® Application Install

Follow the steps below to configure the enforcement of automatic Intel Unite® application installation:

1. Open a browser, navigate to https://admin.google.com, and login to the Google Admin Console.
2. From the menu in the upper left-hand corner of the Admin dashboard, choose Devices > Chrome Management from the slide-out menu.
3. Scroll down and click App Management.
4. Click on the three dots Settings menu just below the header bar in the upper-right corner.
6. Enter the ID and URL of the Intel Unite® app for Chrome OS. These values are currently:
   - cphbmldglfdddfnjgfclpckpbcliai
   - "managedLandingUrl": {"Value": "intelunite4://localhost/register?serverUrl=https://unite4.example.com/intelunit"}
   - "managedEnableWebrtc": {"Value": true},
   - "managedEnterpriseServer": {"Value": "unite.example.com"},
   - "managedLandingUrl": {"Value": "intelunite4://localhost/register?serverUrl=https://unite4.example.com/intelunit"}

Note: Intel Unite® application is hidden on desktop browsers due to Google’s new policies regarding Chrome* browser no longer supporting Chrome applications. You can still access the store page using the link above.

7. You will be sent to the management settings for the app. Click User Settings, then select your organization from the list of options.
8. Toggle Force Installation to Enabled.
9. Click Save when you are finished.

For a Chromebook to use these settings, it may have to be powerwashed. If your fleet is not joined to your enterprise account, then a powerwash may be necessary, except for brand new, out-of-box systems. If your fleet is already joined, powerwashing is not necessary. The first User Account used on the device must be a user from your organization’s user directory. These users can be found by clicking the menu button, then selecting Directory from the drop-down menu, then clicking Users.

A.2 Google Admin* Setup for Client Configuration

Follow the steps below to configure the Intel Unite® software using Google Admin* when Intel Unite® clients are under domain management.

1. Open a browser, navigate to https://admin.google.com, and log in to the Google Admin Console.
2. From Google Admin, click Device Management.
3. Click Chrome Management.
4. Click App Management.
5. Select the Intel Unite® software icon.
7. Select the organization from the Orgs list.
8. Make desired configuration changes, or to upload a configuration file, click Upload Configuration File. The configuration file is in JSON* format. An example of what is in a configuration file is shown below:

```json
{
  "managedEnterpriseServer": {"Value" : "unite.example.com"},
  "managedEnableWebrtc": {"Value" : true},
```
9. The following settings can be set using the configuration file:
   a. managedEnterpriseServer – A text field labeled Enterprise Server. If set to anything other than blank, it is used as the Intel Unite® solution for the app, and it overrides and disables the Intel Unite® solution field in the settings.
   b. managedEnableWebRTC – A Boolean toggle labeled Enable WebRTC. If set to true, the app uses WebRTC (if available on the hub) rather than RFT.
   c. managedLandingUrl – If set, this is used as the Intel Unite® solution and organization ID for the associated Chromebooks*, overriding the local settings. The URL format is as follows: intelunite4://localhost/register?serverUrl=<url>&orgId=<guid>
   d. managedPairingUrl—This sets up the Email Address, Machine Name and Pairing Token for the associated Chromebooks, overriding the local settings.
   e. Note: If not set, the email address will not populate in the app; ensure that the managedPairingUrl is properly set in the configuration file.
   f. The URL format is as follows: intelunite4://localhost/pair?otp=<OTP_GUID>&email=<EMAIL>&machineName=<NAME>, where the <EMAIL> and <NAME> will be filled in automatically, while the <OTP_GUID> is the token created on the admin portal. Follow the steps below to obtain the <OTP_GUID>:
      i. Open a browser and navigate to the admin portal.
      ii. Enter the username and password.
      iii. Click the Sign In button to sign in.
      iv. Select the organization being configured.
      v. Select Auto Pairing Management from the Device Management menu to display a list of token GUIDs.
   g. managedOrganizationSecret — A string value that acts as a unique password that encrypts each client app data stored inside Google’s Sync storage. Any string value will work and there are no requirements for length or complexity.

10. Click Save.

A.3 Grant the Intel Unite® App Trusted User Information Access

Intel Unite® application queries the user’s Google Plus* account for their email, name, and avatar, with no user input required, if the app has been allowlisted in your organizations Google Admin* account. Follow the steps below to grant the Intel Unite® application trusted user information access.

   1. Open a browser, navigate to https://admin.google.com, and login to the Google Admin Console.
   2. From the menu in the upper-left corner of the admin dashboard, choose Security > Settings.
   3. Scroll to the bottom of the Security page and click API Permissions.
   4. Under the API Access subsection you will see a list of Apps. Scroll to the bottom of this list where you will see two links: “Installed Apps” and “Trusted Apps”. Click Trusted Apps.
   5. Click the yellow plus button (+) in the lower-right of this page, which will open the Add App To Trusted List dialog.
   6. From the drop-down, select Web Application. Since the Chrome App uses a Google API key, it is treated as any other website.
   7. Paste the OAuth2 “client_id” into the OAuth2 Client ID input; this value is as follows: 401030424932-jvg1hh0pen7vjd96vr5g2g2dnknpf6.apps.googleusercontent.com
8. Click **Security** in the upper-left corner of the browser to navigate back to the security settings page.

9. Click **Advanced Settings**, then click **Manage API client access**.

10. Paste the OAuth2 ID from above into the "Client Name" field.

11. Paste the following string into the "One or More API Scopes" field:

```plaintext
```

12. Click the **Authorize** button.

The Intel Unite® app will query Google* APIs to retrieve each user's Google Plus profile and receive a unique email address, name, and profile image. These will be used to replace the generate values in the pairing URL, and to configure the user's email, name, initials, and avatar image automatically, without user input.
Appendix B Self-Signed PIN Server Certificate Support

Follow the steps below to configure the PIN server for the Intel Unite® solution to use self-signed certificates.

1. **Using a browser, make a copy of the PIN server self-signed certificate.**
   - If using Chrome®, click on the Secure lock icon that appears next to https URLs. Click Certificate, choose the Details tab, then click the Export button on the lower right.
   - If using Firefox®, click the lock icon next to https URLs. Click the > button to the right of the Secure Connection area of the menu. Click More Information, click the View Certificate button, then switch to the Details tab of the popup window. Click Export to save a copy of the certificate.

2. **Open a browser, navigate to** https://admin.google.com, **and login to the Google Admin Console.**
3. **From the Google Admin Menu in the upper right of the dashboard, choose Device Management and select Networks.**
4. **From the Networks page, choose Certificates.**
5. **Click Add Certificate and choose the certificate saved in Step 1.**
Appendix C Error Codes

C.1 Client Error Codes

This section provides information about error codes that may occur on the client application. To contact Intel Unite® solution support, open a web browser and navigate to the support website for the Intel Unite® solution.

The client saves a log file at \Users\<user>\AppData\Local\Temp\UniteLog, where <user> is the logged in user.

The name of the log file is <yyyymmdd>_log.txt where <yyyymmdd> is the date stamp.

Table 36: Client Error Codes

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
**Error Code: 0x00540**  
**Error Text:** Error downloading client module file.  
**Error Description:** Error downloading/decompressing client module file.  
**Error Remediation:** Delete the module assigned in the admin portal and upload again.

---

**C.2 Hub Error Codes**

This section provides information about error codes that may occur on the hub application. To contact Intel Unite® solution support, open a web browser and navigate to the support website for the Intel Unite® solution. The hub saves a log file at `C:\Users\<user>\AppData\Local\Temp`, where `<user>` is the logged in user. The name of the log file is `<yyyymmdd>_log.txt` where `<yyyymmdd>` is the date stamp.

**Table 37: Hub Error Codes**

</tbody>
</table>
Appendix D Troubleshooting

D.1 Slowness Accessing the Admin Portal or Launching Client/Hub Software When Not Connected to the Internet

Due to timeouts when the operating system attempts to verify certificate revocation, which requires Internet access, users may experience slowness when accessing the admin portal or launching the client/hub software. To prevent this behavior, set the following registry keys on your client/hub:

[HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Internet Settings]
"CertificateRevocation"=dword:00000000

[HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\WinTrust\Trust Providers\Software Publishing]
"State"=dword:00023e00

[HKEY_CURRENT_USER\Software\Microsoft\Internet Explorer\Download]
"CheckExeSignatures"="no"

D.2 Hub Time Drift

Hub time might drift and be different than other hubs, which can cause confusion as to when a session ends or who owns the session. To resolve this, configure the hubs sync time with the domain on a regular basis. Use a search engine in a web browser to search for how to configure a domain system to sync time with the domain controller. After configuring the hub to sync time with the domain controller on a regular basis, follow the steps below to confirm the setting:

1. Open a command-line sync window (press Windows Key + R, type cmd, and press Enter or Return).
2. Type w32tm.exe /query /status and press Enter or Return.
3. Confirm that the source is not set to Local CMOS Clock.

D.3 Client Error 0x00535 – Unable to Connect to Server

Client Error 0x00535 - Unable to connect to Server may result due to not having the SHA-2 certificate installed on the client system.

To resolve this issue, import the SHA-2 certificate from the admin portal to the trusted root of the client system.

D.4 Server Unable to Process Request; Login Failed for User "UniteServiceUser"

This could happen if there is a SQL login mismatch or if the database password gets corrupted because a user tries to install the Enterprise Server multiple times. The workaround/solution is to verify the authentication modes used during Microsoft SQL installation. Follow the steps below to change the login/authentication type:

1. Go to Microsoft SQL Management Studio and connect to the SQL server.
2. Right click the SQL server and select Properties.
3. Select the Security page and make sure SQL Server and Windows authentication mode is selected.

If error continues to occur, follow the steps below to reset the password for the api_user:

1. Use Microsoft SQL Management Studio and connect to your SQL server.
2. Go to Security and select Logins, then right-click on api_user to open a window for Login Properties
3. Enter a new password, then click OK to save changes.
D.5 Users May See Longer than Usual Connection Times or Periodic Plow Screen Updates

This may occur when U-APSD (Unscheduled Automatic Power Save Delivery) is enabled with some wireless access points. Refer to http://www.intel.com/support/wireless/wlan/sb/CS-034875.htm for details. This can potentially be solved with an update to the firmware of the wireless access point. In most enterprises, this is not easy to do; as a last resort, you can disable U-APSD on the Client in the advanced properties of the wireless driver.

D.6 Admin Portal "Invalid API Key" Errors May Occur if the Server is Hosted Behind a Proxy

If you attempt to register an API key and see an error message reading "The API key is invalid.", the root cause may be a result of the server being hosted behind a proxy. For solutions where the server is behind a proxy, the proxy configuration must be added to the Web.config file.
Appendix E Security Checklist

Intel recommends a number of server, hub, and client security settings.

E.1 Server

Intel recommends the following settings to enhance the server security being used with the Intel Unite® solution:

- Ensure SSL is enabled in IIS (https sites should work). This might require working with the organization’s IT department to install an SHA-2 certificate with a valid root of trust. (Strongly Recommended) Note: The hub can pin the certificate hash in the registry to simplify certificate checking.
- Encrypt connection strings. For details refer to the Microsoft Developer Network* (MSDN) documentation.
- Encrypt communication between the web portal and SQL DB.
- If using SQL authentication, protect the SQL credentials. For more information, refer to the MSDN webpage How To: Connect to SQL Server Using SQL Authentication in ASP.NET 2.0.
- Remove Port 80 binding for Default Web Site in IIS.
- Enable rate limiting in IIS: https://docs.microsoft.com/en-us/iis/configuration/system.webserver/security/dynamicipsecurity/denybyrequestrate

E.2 Hub

Intel recommends the following settings to enhance security for hub devices being used with the Intel Unite® solution:

- Pin Intel Unite® solution certificate in registry. Refer to the Microsoft enterprise certificate pinning article.
- Physically secure the hub to prevent unauthorized access or theft.
- Disable unused or unnecessary input/output ports to prevent unauthorized access or alteration of hub behavior.
- Consult with IT security experts for any other security recommendations.

E.3 Client

Intel recommends the following settings to enhance security for hub devices being used with the Intel Unite® solution:

- Pin Intel Unite® solution certificate in registry. Refer to the Microsoft enterprise certificate pinning article.
Appendix F Considerations for Transitioning from a 4.x or 3.x Environment

This section describes some considerations for installing the Intel Unite® solution in an existing 4.x or 3.x environment.

- Intel Unite solution 4.0 server components can be installed on a server that already has Intel Unite solution 3.x server components installed.
  - 4.0 server database components can be installed on the same server that has 3.x server database components installed. This is because 4.0 and 3.x create different database tables.
  - 4.0 Admin Web Portal can be installed on the same server that has a 3.x Admin Web Portal installed. The web resources for the 4.0 Admin Web Portal are installed to a different path than the 3.x Admin Web Portal.
  - The 4.0 server components Admin API, Telemetry Service, and Maintenance Service can be installed on a server that has 3.x server components installed.

- 4.0 clients can connect to both 4.0 and 3.x hubs.

  Note: For the Windows 4.0 client to connect to a 3.x hub, the device must have a 3.x client installed as well as the 4.0 client. The 4.0 Client must be installed after the 3.x client is already installed.

- Intel Unite solution 3.x uses a DNS SRV record for Autodiscover, while Intel Unite solution 4.0 uses a DNS TXT record. This allows both to run within an organization.

Install sequence when going from Intel Unite solution 3.x to 4.0:

1. First install 4.0 Intel Unite software on the PIN server and create the DNS TXT record.
2. Throughout transition period, maintain 3.x and 4.0 versions of the server.

  Note: Intel Unite solution 3.x and 4.0 servers can be run simultaneously on the same OS.

3. Begin installing 4.0 client application on all of your Windows based devices while keeping the 3.x client application installed. Everything non-Windows can be upgraded to 4.0. When the application starts up the 4.0 client will attempt to connect to a 4.0 hub and fall back to a 3.x connection as needed.
4. Once all the client devices are on 4.0, hubs can be migrated to 4.0 as well.
Appendix G Backup and Restore of the PIN Server for Intel Unite® Solution Version 4

Follow the steps below to back up and restore a PIN Server for the Intel Unite® solution version 4.

G.1 Minimum Backup Steps:

1. Back up the SQL database ‘unite_server’ using your preferred backup method.
2. Back up the following directories as part of your normal backup routine:
   - C:\Intel\Manifests
   - C:\Intel\TempManifest

G.2 Restore Steps:

1. Rebuild the server or restore the VM and install all prerequisites for server of the Intel Unite solution.
2. Install the server for the Intel Unite solution, let it create the DB. On the Custom Setup page, select Will be installed on local hard drive for the Database.
3. After the server for the Intel Unite solution is installed, stop the following Services in the order listed:
   - Unite Maintenance
   - Unite Telemetry
   - WWW
4. Restore manifest backups to C:\Intel\TempManifests and C:\Intel\Manifests respectively. (The target directory does not exist at this time.)
5. Use your preferred method to restore the ‘unite_server’ database and associate the ‘api_user’ to the ‘unite_server’ database.
   Sample code to associate user:
   USE unite_server
   GO
   sp_change_users_login 'AUTO_FIX', 'api_user'
6. Start the following Services in the order listed:
   - Unite Maintenance
   - Unite Telemetry
   - WWW
7. Confirm that the server is functioning by logging in to the admin portal.
Appendix H Load Balancing Configuration Options

The Intel Unite® solution supports a number of load balancing configurations. An example that would use DNS Round Robin load balancing is depicted below:

Figure 3: Load Balanced Configuration

This example shows multiple IIS front-end servers all connecting to a DB hosted on an existing SQL infrastructure such as a SQL farm, etc.

The installation components will be distributed in an architecture such as this. The section below defines how to select individual components to install using the server for the Intel Unite solution installer.

H.1 Distributing the enterprise server components in a load balancing configuration

For an enterprise server installation in a load balanced configuration, the Database feature should be installed on one server, while the Web API, admin portal, Telemetry Service, and Maintenance Service can be installed on multiple servers:
Figure 4: Server Features

Custom Setup
Select the way you want features to be installed.

Features to be installed
If you are performing an upgrade, it is recommended that you backup the unite_server database.

This feature requires 0KB on your hard drive.

Browse…

Reset  Disk Usage  Back  Next  Cancel
The following steps describe how to configure the installation of the enterprise server software for use with a load balancer.

1. After completing the procedure in Section 3.3.1 through Step 9, configure the following install options for Database, Web API, admin portal, Telemetry Service, and Maintenance Service features to set up the enterprise server with a load balancer:
   - To install the Database on the server, choose **Will be installed on local hard drive** or **Entire feature will be installed on local hard drive**.
   - To not install the Database on the server, choose **Entire feature will be unavailable**.
   - To install the Web API on the server, choose **Will be installed on local hard drive** or **Entire feature will be installed on local hard drive**.
   - To not install the Web API on the server, choose **Entire feature will be unavailable**.
   - To install the admin portal on the server, choose **Will be installed on local hard drive** or **Entire feature will be installed on local hard drive**.
   - To not install the admin portal on the server, choose **Entire feature will be unavailable**.
   - To install the Telemetry Service on the server, choose **Will be installed on local hard drive** or **Entire feature will be installed on local hard drive**.
   - To not install the Telemetry Service on the server, choose **Entire feature will be unavailable**.
   - To install the Maintenance Service on the server, choose **Will be installed on local hard drive** or **Entire feature will be installed on local hard drive**.
   - To not install the Maintenance Service on the server, choose **Entire feature will be unavailable**.

**Note:** Currently, the options **Will be installed to run from network** and **Entire feature will be installed to run from network** are not supported. Choosing these options results in the feature not being installed on the server.
2. After selecting the features to install, click **Next**.

3. In the Organization Name text box, enter an organization name, and in the Organization Description text box, enter a description. The organization name is used to create the root hub group and the root client group.

4. Select either **Enhanced Pairing Mode** or **Standard Pairing Mode**.
   - Enhanced pairing mode requires email confirmation when registering a client device.
   - Standard pairing mode does not require e-mail confirmation when registering a client device.

   **Note:** Pairing mode cannot be changed once it is set. It requires a re-installation of the server to change the pairing mode.

5. Click **Next**.

6. Click **Install** to start the installation. When the installation process completes, the enterprise server is installed.

Additionally, the enterprise server distributes the manifest files and they will need to reside in a common location to all of the front-end IIS servers. The web.config files specify the locations of the Manifest and TempManifest directories that host these files. Re-locate the files from these directories to a central location such as a Windows share and edit the web.config files to reflect the new location. Perform the followings steps to edit the configuration to reflect the new locations:

**Option 1: Manually Edit Web.config**

1. Using a text editor, open web.config located at `c:\Program Files (x86)\Intel\IntelUnite\IntelUnite\Api`.

2. Add the following two lines to the `<AppSettings>` section, replacing `server` and `share` with the appropriate values:

   ```xml
   <add key="ManifestFolder" value="\\server\share\Manifests" />
   <add key="UnapprovedManifestFolder" value="\\server\share\TempManifests" />
   ```

3. Save the modified web.config file.

**Option 2: IIS Manager**

1. Open **IIS Manager**.

2. Browse to **Default Web Site** in the Connection pane.

3. Open **Application Settings** in the middle pane.

4. If ManifestFolder and UnapprovedManifestFolder are not listed, create them using the following steps:
   a. Click Add in the Actions pane.
   b. Enter ManifestFolder for the name.
   c. For the value, enter the UNC path for the manifest files (`\\server\share\Manifests`).
   d. Click OK.
   e. Click Add in the Actions pane.
   f. Enter UnapprovedManifestFolder for the name.
   g. For the value, enter the UNC path for the unapproved manifest files (`\\server\share\TempManifests`).
   h. Click OK.

5. If ManifestFolder and UnapprovedManifestFolder already exists, update the values using the following steps:
   a. Double click on the name ManifestFolder.
   b. Modify the value by entering the UNC path for the manifest files (`\\server\share\Manifests`).
   c. Click OK.
   d. Double click on the name UnapprovedManifestFolder.
e. Modify the value by entering the UNC path for the unapproved manifest files (\\server\share\TempManifests).

f. Click OK.
Appendix I Using Windows Integrated Authentication for the PIN service

By default, the server component of the Intel Unite® solution uses SQL authentication for the database connection. For organizations with security policies requiring Windows Integrated Authentication (WIA), the instructions in this appendix explain how to alter the configuration to use WIA instead. Ensure that the server component is installed and functioning as expected, then follow the instructions in the subsections below.

Note: The subsections in this appendix should be performed in the order they appear. Do not skip any steps.

I.1 IIS Connection Strings

1. Change the connection string for the API web application. (In the IIS management console, navigate to Sites, then Default Web Site, then IntelUnite, then API.)
2. In the right pane, double-click Connection Strings, then double click DBConnection.
3. Select the top option of SQL Server and input the name of the SQL server and the database. (The database will be unite_server, and the SQL server name can be found in the custom connection string in the bottom dialog.)
5. Click OK.

I.2 IIS Application Pools

1. In the IIS management console, navigate to Application Pools.
2. Change the application pool identity for IntelUniteAdminPortalPool and IntelUniteWebApiPool. (Highlight the application pool and click Advanced Settings in the right navigation bar, scroll down to the identity, and click the ellipsis to change the identity.)

Note: Custom application pool identities may already be in use for Active Directory Integration. These identities will need to be granted the same rights and roles that the api_user SQL account is granted.

I.3 Services Configuration Files

1. Navigate to C:\Program Files (x86)\Intel\Intel Unite\Services and edit the following files:
2. Find the following line in both files:
   `<add name="DBConnection" providerName="System.Data.SqlClient" connectionString="server=(local)\SQLEXPRESS;database=unite_server;User Id=api_user;Password=password;"/>
3. Replace it with the following line:
   `<add name="DBConnection" providerName="System.Data.SqlClient" connectionString="server=(local)\SQLEXPRESS;database=unite_server;Integrated Security=True;"/>
4. Navigate to the Services management console and change the logon of the Intel Unite Maintenance Service and Intel Unite Telemetry Service to use the same credentials that were specified in the application pool identities.

Note: This may require a rights assignment, the account must be granted the right to "Logon as a service".
I.4 Change api_user SQL Account Password

Use SQL Server Management Studio or your preferred method to change the api_user SQL account password. Changing the password on the api_user account will assist in verification of the new connection method.

I.5 Restart IIS, Restart Services, and Test

1. Use your preferred method to restart IIS, as well as the Telemetry and Maintenance services.
2. Test the functionality of the Intel Unite® solution. (Log in to the admin portal, launch the Intel Unite® app on a hub and client, and use that client to connect to that hub.)

Note: Rebooting the server is an alternative to restarting services and IIS.
