The Hybrid Workforce Is Here to Stay

The reason is clear, with nearly 9 out of 10 (86%) IT decision-makers (ITDMs) noting that their employees want a hybrid work environment. An overwhelming 90% of ITDMs recognize that reliable PC devices improve their employee experience. As it turns out, mature organizations are 20% more likely to experience improved employee retention as a benefit of investing in high-performance, stable PCs.

With hybrid work only increasing, employees want—and need—PCs that help them be as productive as possible. But 36% of survey respondents report having a poor PC experience. And 69% agree their employees should be able to easily switch physical locations while working.

Hybrid Work Requires Reliable PCs

To make hybrid a reality, 87% of ITDMs agree that employees must have stable, dependable PCs. ITDMs understand the importance of flexibility for their workforce: 69% indicate that enabling hybrid work for their employees is a top priority.

Survey results reflect a broader trend. While 63% say most of their employees are remote full time or working in a hybrid environment, only 36% say that most of their employees have returned to the office full time. PC performance plays a critical role in the productivity and satisfaction of today’s workers. In fact, 70% of ITDMs agree that poor PC performance erodes employee productivity and 61% say that the ability to support hybrid work is inhibited by poorly performing PCs. To support future hybrid work, 58% say it’s a priority when purchasing PCs the devices allow their employees to do everything they need to, wherever they are.

Find out how Intel® and its partners can provide technology optimized for today’s hybrid workspace with Intel® vPro™, an Intel® Evo™ Design.
