MAX<sup>®</sup> II, MAX V, and MAX 10 devices have a user flash memory (UFM) block. You can use the UFM block to replace on-board flash and EEPROM memory devices to store ASSP or processor configuration bits, or electronic identification (ID) information for a board during manufacturing. The logic capacity of MAX II, MAX V, and MAX 10 devices allows integration of system power-on reset (POR), interface bridging, and I/O expansion designs in addition to these serial flash capabilities.

## UFM Array Size

**Table 1: UFM Array Size for MAX II and MAX V Devices**

This table lists the capacity for the UFM block for all MAX II and MAX V devices.

Device Family	Device	Total Bits	Sectors
MAX II Devices	EPM240	8,192	2 (4,096 bits per sector)
	EPM570	8,192	2 (4,096 bits per sector)
	EPM1270	8,192	2 (4,096 bits per sector)
	EPM2210	8,192	2 (4,096 bits per sector)
MAX V Devices	5M40Z	8,192	2 (4,096 bits per sector)
	5M80Z	8,192	2 (4,096 bits per sector)
	5M160Z	8,192	2 (4,096 bits per sector)
	5M240Z	8,192	2 (4,096 bits per sector)
	5M570Z	8,192	2 (4,096 bits per sector)
	5M1270Z	8,192	2 (4,096 bits per sector)
	5M2210Z	8,192	2 (4,096 bits per sector)

**Table 2: UFM and CFM Array Size for MAX 10 Devices**

This table lists the dimensions of the UFM and CFM arrays for MAX 10 devices. The Altera On-Chip Flash IP core also gives you access to configuration flash memory (CFM) when you turn on the dual image configuration mode option.

## Design Considerations

To successfully replace the serial EEPROMs with the UFM blocks of the supported Altera devices, you must consider the following:

- Logic array interface
- Erase and reprogram sequence
- Size and operating conditions

### Logic Array Interface

You can program, erase, and verify the UFM block through the JTAG port or through connections to and from the logic array in accordance with the following IEEE standards:

- IEEE Std. 1532-2002 for MAX II and MAX V devices
- IEEE Std. 1149.1 for MAX 10 devices

There are 13 interface signals to and from the UFM block and the logic array that allow the logic array to read from or write to the UFM during device user mode for MAX II and MAX V devices only.

**Table 3: Supported IP Cores**

IP Core (Protocol)	Interface	MAX II	MAX V	MAX 10
Altera User Flash Memory for I2C Interface Protocol <sup>(1)</sup>	Serial	Supported	Supported	Not supported
Altera User Flash Memory for SPI Interface Protocol <sup>(2)</sup>	Serial	Supported	Supported	Not supported

<sup>(1)</sup> Beginning from the Quartus II software version 14.0, the name of this IP core has been changed from ALTUFM\_I2C to the Altera User Flash Memory for I2C Interface Protocol IP core.

<sup>(2)</sup> Beginning from the Quartus II software version 14.0, the name of this IP core has been changed from ALTUFM\_SPI to the Altera User Flash Memory for SPI Interface Protocol IP core.

IP Core (Protocol)	Interface	MAX II	MAX V	MAX 10
Altera User Flash Memory for Parallel Interface Protocol <sup>(3)</sup>	Parallel	Supported	Supported	Not supported
ALTUFM_NONE	Serial	Supported	Supported	Not supported
Altera On-Chip Flash	Parallel/Serial	Not supported	Not supported	Supported

For MAX II and MAX V devices, the Altera User Flash Memory for I<sup>2</sup>C Interface Protocol, Altera User Flash Memory for SPI Interface Protocol, Altera User Flash Memory for Parallel Interface Protocol and ALTUFM\_NONE IP cores provide interface logic for a subset of these interfaces. For interfaces not provided by the IP core or design examples, you must create user logic to bridge the UFM block to your desired interface protocol.

The Altera On-Chip Flash IP core provides Avalon-MM interface. Use the SPI or I<sup>2</sup>C interface protocol to avalon MM interface logic to communicate with the UFM.

## Erase and Reprogram Sequence

The differences between the UFM block and serial EEPROMs that you should consider in your integration of serial EEPROM applications are the sector-based erase and erase/reprogram cycles. Serial EEPROMs support byte-wide erase, which is automatically implemented during a byte write sequence. The UFM block supports byte writes, but does not support byte erase, requiring a sector-based erase sequence prior to any programming or writing. If the data content of a specific byte location needs to be overwritten in the UFM, the entire sector that the byte resides in must be erased unless the byte location was already erased (all 1s). For programming endurance, the UFM erase/reprogram cycles do not meet the 107 and greater cycles seen in serial EEPROMs.

## Size and Operating Conditions

The memory size that can be replaced using the UFM must not exceed the devices UFM size. The operating conditions for the on-board flash and EEPROM memory devices you intend to replace must be within the range of the Altera devices.

This list provides a non-exhaustive list of vendors for 2-Kbit, 4-Kbit, and 8-Kbit non-volatile memory devices that could be potentially replaced by the UFM blocks of supported Altera devices.
