1 Intel® FPGA SDK for OpenCL™ Intel Arria 10 GX FPGA Development Kit Reference Platform Porting Guide

1.1 Intel Arria 10 GX FPGA Development Kit Reference Platform: Prerequisites
1.2 Features of the Intel Arria 10 GX FPGA Development Kit Reference Platform
1.2.1 Intel Arria 10 GX FPGA Development Kit Reference Platform Board Variants
1.3 Contents of the Intel Arria 10 GX FPGA Development Kit Reference Platform
1.4 Changes in Intel Arria 10 Development Kit Reference Platform from 17.0 to 17.1

2 Developing Your Intel Arria 10 Custom Platform

2.1 Initializing Your Intel Arria 10 Custom Platform
2.2 Modifying the Intel Arria 10 GX FPGA Development Kit Reference Platform Design
2.3 Integrating Your Intel Arria 10 Custom Platform with the Intel FPGA SDK for OpenCL
2.4 Setting up the Intel Arria 10 Custom Platform Software Development Environment
2.5 Establishing Intel Arria 10 Custom Platform Host Communication
2.6 Branding Your Intel Arria 10 Custom Platform
2.7 Changing the Device Part Number
2.8 Connecting the Memory in the Intel Arria 10 Custom Platform
2.9 Modifying the Kernel PLL Reference Clock
2.10 Integrating an OpenCL Kernel in Your Intel Arria 10 Custom Platform
2.11 Guaranteeing Timing Closure in the Intel Arria 10 Custom Platform
2.11.1 Generating the base.qar Post-Fit Netlist for Your Intel Arria 10 Custom Platform
2.12 Troubleshooting Intel Arria 10 GX FPGA Development Kit Reference Platform Porting Issues

3 Intel Arria 10 GX FPGA Development Kit Reference Platform Design Architecture

3.1 Host-to-Intel Arria 10 FPGA Communication over PCIe
3.1.1 Instantiation of Intel Arria 10 PCIe Hard IP with Direct Memory Access
3.1.2 Device Identification Registers for Intel Arria 10 PCIe Hard IP
3.1.3 Instantiation of the version_id Component
3.1.4 Definitions of Intel Arria 10 FPGA Development Kit Reference Platform Hardware Constraints in Software Headers Files
3.1.5 PCIe Kernel Driver for the Intel Arria 10 GX FPGA Development Kit Reference Platform
3.1.6 Direct Memory Access
3.1.7 Message Signaled Interrupt
3.1.8 Partial Reconfiguration
3.1.9 Cable Autodetect
3.1.10 Host Channel
3.2 DDR4 as Global Memory for OpenCL Applications
3.2.1 DDR4 IP Instantiation
3.2.2 DDR4 Connection to PCIe Host
3.2.3 DDR4 Connection to the OpenCL Kernel
3.3 Host Connection to OpenCL Kernels
3.4 Intel Arria 10 FPGA System Design
3.4.1 Clocks
3.4.2 Resets
3.4.3 Floorplan
1 Intel® FPGA SDK for OpenCL™ Intel Arria 10 GX FPGA Development Kit Reference Platform Porting Guide

The Intel® Arria® 10 GX FPGA Development Kit Reference Platform Porting Guide describes the procedures and design considerations for modifying the Intel Arria 10 GX FPGA Development Kit Reference Platform (a10_ref) into your own Custom Platform for use with the Intel FPGA Software Development Kit (SDK) for OpenCL™ (1) (2).

1.1 Intel Arria 10 GX FPGA Development Kit Reference Platform: Prerequisites

The Intel Arria 10 GX FPGA Development Kit Reference Platform Porting Guide assumes that you are an experienced FPGA designer who is familiar with Intel's FPGA design tools and concepts.

Prerequisites for the altera_a10pciedk Reference Platform:
- An Intel Arria 10-based accelerator card with working PCI Express* (PCIe*) and memory interfaces
  Test these interfaces together in the same design using the same version of the Intel Quartus® Prime Pro Edition software that you will use to develop your Custom Platform.
  **Attention:** The native Arria 10 GX FPGA Development Kit does not automatically work with the SDK. Before using the Arria 10 GX FPGA Development Kit with the SDK, you must first contact your field applications engineer or regional support center representative who will configure the development kit for you.
  Alternatively, contact support for assistance.
- Intel Quartus Prime Pro Edition software
- Designing with Logic Lock regions

General prerequisites:
- FPGA architecture, including clocking, global routing, and I/Os
- High-speed design
- Timing analysis
- Platform Designer design and Avalon® interfaces

(1) OpenCL and the OpenCL logo are trademarks of Apple Inc. used by permission of the Khronos Group™.

(2) The Intel FPGA SDK for OpenCL is based on a published Khronos Specification, and has passed the Khronos Conformance Testing Process. Current conformance status can be found at www.khronos.org/conformance.
1.2 Features of the Intel Arria 10 GX FPGA Development Kit Reference Platform

Prior to designing an Intel FPGA SDK for OpenCL Custom Platform, decide on design considerations that allow you to fully utilize the available hardware on your computing card.

The Intel Arria 10 GX FPGA Development Kit Reference Platform targets a subset of the hardware features available in the Intel Arria 10 GX FPGA Development Kit.
Features of the a10_ref Reference Platform:

- **OpenCL Host**
  The a10_ref Reference Platform uses a PCIe-based host that connects to the Intel Arria 10 PCIe Gen3 x8 hard IP core.

- **OpenCL Global Memory**
  The hardware provides one 2-gigabyte (GB) DDR4 SDRAM daughtercard that is mounted on the HiLo connector (J14 in Figure 1 on page 5).

- **FPGA Programming via one of the following methods:**
  - Partial Reconfiguration (PR) over PCIe.
  - External cable and the Intel Arria 10 GX FPGA Development Kit's on-board Intel FPGA Download Cable II interface.
  - External Intel FPGA Download Cable II interface connected to a 10-pin JTAG header.

- **Guaranteed Timing**
  The a10_ref Reference Platform relies on the Intel Quartus Prime Pro Edition compilation flow to provide guaranteed timing closure. The timing-clean a10_ref Reference Platform is preserved in the form of a precompiled post-fit netlist (that is, the base.qdb Intel Quartus Prime Database Export File). The Intel FPGA SDK for OpenCL Offline Compiler imports this preserved post-fit netlist into each OpenCL kernel compilation.

- **OpenCL Host Pipe**
  Using direct memory access (DMA) in Intel Arria 10 PCIe Gen3 x8 hard IP core a10gx_hostch board variant has a direct host to kernel and kernel to host pipe.

1.2.1 Intel Arria 10 GX FPGA Development Kit Reference Platform Board Variants

The Intel Arria 10 GX FPGA Development Kit Reference Platform has two board variants (that is, a10gx and a10gx_hostch) that targets the Intel Arria 10 GX FPGA Development Kit containing the production silicon for Intel Arria 10 FPGA (-1 speed grade) and DDR4-2400 SDRAM.

To compile your OpenCL kernel for a specific board variant, include the `--board=<board_name>` option in your `aoc` command (for example, `aoc --board=a10gx myKernel.cl`).

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>device.tcl</td>
<td>Tcl file that is included in all revisions and contains all device-specific information (for example, device family, ordering part number (OPN), voltage settings, etc.)</td>
</tr>
<tr>
<td>flat.qsf</td>
<td>Intel Quartus Prime Settings File for the flat project revision. This file includes all the common settings, that are used in the other revisions of the project (that is, base, top, and top_synth). The base.qsf, top.qsf, and top_synth.qsf files include, by reference, all the settings in the flat.qsf file. The Intel Quartus Prime software compiles the flat revision with minimal location constraints. The flat revision compilation does not generate a base.qar file that you can use for future import compilations and does not implement the guaranteed timing flow.</td>
</tr>
<tr>
<td>import_compile.tcl</td>
<td>Tcl script for the SDK-user compilation flow (that is, import revision compilation).</td>
</tr>
<tr>
<td>max5_150.pof</td>
<td>Programming file for the MAX® V device on the Intel Arria 10 GX FPGA Development Kit that sets the memory reference clock to 150 MHz by default at power-up. You must program the max5_150.pof file onto your a10gx board.</td>
</tr>
<tr>
<td>opencl_bsp_ip.qsf</td>
<td>Intel Quartus Prime Settings File that collects all the required .ip files in a unique location. During flat and base revision compilations, the board.qsys, mem.qsys and ddr4.qsys Platform Designer files are added to the opencl_bsp_ip.qsf file.</td>
</tr>
<tr>
<td>quartus.ini</td>
<td>Contains any special Intel Quartus Prime software options that you need to compile OpenCL kernels for the a10_ref Reference Platform.</td>
</tr>
<tr>
<td>top.qpf</td>
<td>Intel Quartus Prime Project File for the OpenCL hardware system.</td>
</tr>
<tr>
<td>top.qsf</td>
<td>Intel Quartus Prime Settings File for the SDK-user compilation flow.</td>
</tr>
<tr>
<td>top.sdc</td>
<td>Synopsys Design Constraints File that contains board-specific timing constraints.</td>
</tr>
<tr>
<td>top.v</td>
<td>Top-level Verilog Design File for the OpenCL hardware system.</td>
</tr>
<tr>
<td>top_post.sdc</td>
<td>Platform Designer and Intel FPGA SDK for OpenCL IP-specific timing constraints.</td>
</tr>
<tr>
<td>top_synth.qsf</td>
<td>Intel Quartus Prime Settings File for the Intel Quartus Prime revision in which the OpenCL kernel system is synthesized.</td>
</tr>
<tr>
<td>ip/mem/&lt;file_name&gt;</td>
<td>Directory containing the .ip files that the Intel Quartus Prime Pro Edition software needs to parameterize the mem component. You must provide both the mem.qsys file and the corresponding .ip files in this directory to the Intel Quartus Prime Pro Edition software.</td>
</tr>
<tr>
<td>ip/ddr4/&lt;file_name&gt;</td>
<td>Directory containing the .ip files that the Intel Quartus Prime Pro Edition software needs to parameterize the ddr4 component. You must provide both the ddr4.qsys file and the corresponding .ip files in this directory to the Intel Quartus Prime Pro Edition software.</td>
</tr>
<tr>
<td>ip/board/&lt;file_name&gt;</td>
<td>Directory containing the .ip files that the Intel Quartus Prime Pro Edition software needs to parameterize the board instance. You must provide both the board.qsys file and the corresponding .ip files in this directory to the Intel Quartus Prime Pro Edition software.</td>
</tr>
<tr>
<td>ip/irq_controller/&lt;file_name&gt;</td>
<td>IP that receives interrupts from the OpenCL kernel system and sends message signaled interrupts (MSI) to the host.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
2 Developing Your Intel Arria 10 Custom Platform

Use the tools available in Intel Arria 10 GX FPGA Development Kit Reference Platform (a10_ref) and the Intel FPGA SDK for OpenCL Custom Platform Toolkit together to create your own Custom Platform.

Developing your Custom Platform requires in-depth knowledge of the contents in the following documents and tools:

- Intel FPGA SDK for OpenCL Custom Platform User Guide
- Contents of the SDK Custom Platform Toolkit
- Stratix V Network Reference Platform Porting Guide
- Documentation for all the Intel FPGA IP in your Custom Platform
- Intel FPGA SDK for OpenCL Getting Started Guide
- Intel FPGA SDK for OpenCL Programming Guide

In addition, you must independently verify all IP on your computing card (for example, PCIe controllers and DDR4 external memory).

- Intel FPGA SDK for OpenCL Getting Started Guide
- Intel FPGA SDK for OpenCL Programming Guide

2.1 Initializing Your Intel Arria 10 Custom Platform

To initialize your Intel FPGA SDK for OpenCL Custom Platform, copy the Intel Arria 10 GX FPGA Development Kit Reference Platform to another directory and rename it.
1. Copy the INTELFPGAOCLSDKROOT/board/a10_ref directory, where
INTELFPGAOCLSDKROOT is the location of the SDK installation.

2. Paste the a10_ref directory into a directory that you own (that is, not a system
directory) and then rename it (<your_custom_platform>).

3. Choose the a10gx board variant in the <your_custom_platform>/hardware
directory to match the production silicon for the Intel Arria 10 FPGA as the basis of
your design.

4. Rename a10gx board variant to match the name of your FPGA board
(<your_custom_platform>/hardware/<board_name>).

5. Modify the <your_custom_platform>/board_env.xml file so that the name
and default fields match the changes you made in step 2 on page 12 and step 4
on page 12, respectively.

6. Modify the my_board name in the inside <your_custom_platform>/
hardware/<board_name>/board_spec.xml file to match the change you
made in step 2 on page 12.

> aoc -list-boards
Board list:
my_board

7. In the SDK, invoke the command aoc -list-boards to confirm that the Intel
FPGA SDK for OpenCL Offline Compiler displays the board name in your Custom
Platform.

• Setting the Intel FPGA SDK for OpenCL User Environment Variables for Linux
• Describe the Intel Arria 10 GX FPGA Development Kit Reference Platform to the
Intel FPGA SDK for OpenCL on page 51

2.2 Modifying the Intel Arria 10 GX FPGA Development Kit
Reference Platform Design

Modify the Intel Quartus Prime design for the Intel Arria 10 GX FPGA Development Kit
Reference Platform to fit your design needs.

You can add a component in Platform Designer and connect it to the existing system,
or add a Verilog file to the available system. After adding the custom components,
connect those components in Platform Designer.

1. Instantiate your PCIe controller, as described in Host-to-Intel Arria 10
Communication over PCIe section.

2. Instantiate any memory controllers and I/O channels. You can add the board
interface hardware either as Platform Designer components in the board.qsys
Platform Designer system or as HDL in the top.v file.
The **board.qsys** file and the **top.v** file are in the `<your_custom_platform>/hardware/<board_name>` directory.

3. Modify the **device.tcl** file to match all the correct settings for the device on your board.

4. Modify the `<your_custom_platform>/hardware/<board_name>/flat.qsf` file to use only the pin-outs and settings for your system. The `base.qsf`, `top.qsf`, and `top_synth.qsf` files will include all the settings from the `flat.qsf` file.

    The **top.qsf** file and **top_synth.qsf** file are in the `<your_custom_platform>/hardware/<board_name>` directory.

**Related Links**

- [Host-to-Intel Arria 10 FPGA Communication over PCIe](#) on page 22

### 2.3 Integrating Your Intel Arria 10 Custom Platform with the Intel FPGA SDK for OpenCL

After you modify your Intel Quartus Prime design files, integrate your Custom Platform with the Intel FPGA SDK for OpenCL.

1. **Update the** `<your_custom_platform>/hardware/<board_name>/board_spec.xml` file. Ensure that there is at least one global memory interface, and all the global memory interfaces correspond to the exported interfaces from the `board.qsys` Platform Designer System File.

2. Set the environment variable `ACL_DEFAULT_FLOW` to `flat`.

   Setting this environment variable instructs the SDK to compile the flat revision corresponding to `<your_custom_platform>/hardware/<board_name>/flat.qsf` file without the partitions or Logic Locks.

   **Tip:** Intel recommends to get a timing clean flat revision compiled before proceeding to the base revision compiles. You can also invoke the following command with the `-bsp-flow=<revision_type>` attribute to run different revisions of your project (for example, flat or base compiles).

   ```
   aoc -bsp-flow=flat boardtest.cl -o=bin/boardtest.aocx
   ```

3. Set the environment variable `ACL_DEFAULT_FLOW` to `base`.

   Setting this environment variable instructs the SDK to compile the base revision corresponding to the `<your_custom_platform>/hardware/<board_name>/base.qsf` file.

4. Perform the steps outlined in the `INTELFPGAOCLSDKROOT/board/custom_platform_toolkit/tests/README.txt` file to compile the `INTELFPGAOCLSDKROOT/board/custom_platform_toolkit/tests/boardtest/boardtest.cl` OpenCL kernel source file.
The environment variable `INTELFGAOCLSDKROOT` points to the location of the SDK installation.

5. If compilation fails because of timing failures, fix the errors, or compile `INTELFGAOCLSDKROOT/board/custom_platform_toolkit/tests/boardtest.cl` with different seeds. To compile the kernel with a different seed, include the `-seed=<N>` option in the `aoc` command (for example, `aoc -seed=2 boardtest.cl`).

You might be able to fix minor timing issues by simply compiling your kernel with a different seed.

2.4 Setting up the Intel Arria 10 Custom Platform Software Development Environment

Prior to building the software layer for your Intel FPGA SDK for OpenCL Custom Platform, set up the software development environment.

- To compile the MMD layer for Windows, perform the following tasks:
  a. Install the GNU `make` utility on your development machine.
  b. Install a version of Microsoft Visual Studio that has the ability to compile 64-bit software (for example, Microsoft Visual Studio version 2010 Professional).
  c. Set the development environment so that SDK users can invoke commands and utilities at the command prompt.
  d. Modify the `<your_custom_platform_name>/source/Makefile.common` file so that `TOP_DEST_DIR` points to the top-level directory of your Custom Platform.
  e. In the `Makefile.common` file or the development environment, set the `JUNGO_LICENSE` variable to your Jungo WinDriver license.
  f. To check that you have set up the software development environment properly, invoke the `gmake` or `gmake clean` command.

- To compile the MMD layer for Linux, perform the following tasks:
  a. Ensure that you use a Linux distribution that Intel supports (for example, GNU Compiler Collection (GCC) version 4.47).
  b. Modify the `<your_custom_platform>/source/Makefile.common` file so that `TOP_DEST_DIR` points to the top-level directory of your Custom Platform.
  c. To check that you have set up the software environment properly, invoke the `make` or `make clean` command.

Jungo Connectivity Ltd. website
2.5 Establishing Intel Arria 10 Custom Platform Host Communication

After modifying and rebranding the Intel Arria 10 GX FPGA Development Kit Reference Platform to your own Custom Platform, use the tools and utilities in your Custom Platform to establish communication between your FPGA accelerator board and your host application.

1. Program your FPGA device with the `<your_custom_platform>/hardware/<board_name>/base.sof` file and then reboot your system.
   
   You should have created the `base.sof` file when integrating your Custom Platform with the Intel FPGA SDK for OpenCL. Refer to the Integrating Your Intel Arria 10 Custom Platform with the Intel FPGA SDK for OpenCL section for more information.

2. Confirm that your operating system recognizes a PCIe device with your vendor and device IDs.
   
   For Windows, open the `Device Manager` and verify that the correct device and IDs appear in the listed information.
   
   For Linux, invoke the `lspci` command and verify that the correct device and IDs appear in the listed information.

3. Run the `aocl install <path_to_customplatform>` utility command to install the kernel driver on your machine.

4. For Windows, set the `PATH` environment variable. For Linux, set the `LD_LIBRARY_PATH` environment variable.
   
   For more information about the settings for `PATH` and `LD_LIBRARY_PATH`, refer to Setting the Intel FPGA SDK for OpenCL User Environment Variables in the Intel FPGA SDK for OpenCL Getting Started Guide.

5. Modify the `version_id_test` function in your `<your_custom_platform>/source/host/mmd/acl_pcie_device.cpp` MMD source code file to exit after reading from the version ID register.

6. Run the `aocl diagnose` utility command and confirm that the version ID register reads back the ID successfully. You may set the environment variables `ACL_HAL_DEBUG` and `ACL_PCIE_DEBUG` to a value of 1 to visualize the result of the diagnostic test on your terminal.

2.6 Branding Your Intel Arria 10 Custom Platform

Modify the library, driver and source files in the Intel Arria 10 GX FPGA Development Kit Reference Platform to reference your Intel FPGA SDK for OpenCL Custom Platform.
1. In the software development environment available with the a10_ref Reference Platform, replace all references of "a10_ref" with the name of your Custom Platform.

2. Modify the PACKAGE_NAME and MMD_LIB_NAME fields in the <your_custom_platform>/source/Makefile.common file.

3. Modify the name, linklib, and mmlibs elements in <your_custom_platform>/board_env.xml file to your custom MMD library name.

4. In your Custom Platform, modify the following lines of code in the hw_pcie_constants.h file to include information of your Custom Platform:

   ```
   #define ACL_BOARD_PKG_NAME "a10_ref"
   #define ACL_VENDOR_NAME "Intel Corporation"
   #define ACL_BOARD_NAME "Arria 10 Reference Platform"
   ```

   For Windows, the hw_pcie_constants.h file is in the <your_custom_platform>/source_windows64/include folder. For Linux, the hw_pcie_constants.h file is in the <your_custom_platform>/linux64/driver directory.

   **Note:** The ACL_BOARD_PKG_NAME variable setting must match the name attribute of the board_env element that you specified in the board_env.xml file.

5. Define the Device ID, Subsystem Vendor ID, Subsystem Device ID, and Revision ID, as defined in the Device Identification Registers for Intel Arria 10 PCIe Hard IP section.

   **Note:** The PCIe IDs in the hw_pcie_constants.h file must match the parameters in the PCIe controller hardware.

6. Update your Custom Platform's board.qsys Platform Designer system and the hw_pcie_constants.h file with the IDs defined in 5 on page 16.

7. For Windows, update DeviceList fields in the <your_custom_platform>/windows64/driver/acl_boards_a10_ref.inf file to match your PCIe ID values and then rename the file to acl_board_<your_custom_platform>.inf.

   **Note:** The <your_custom_platform> string in acl_board_<your_custom_platform>.inf must match the string you specify for the name field in the board_env.xml file.

8. Run make in the <your_custom_platform>/source directory to generate the driver.

Device Identification Registers for Intel Arria 10 PCIe Hard IP on page 24

### 2.7 Changing the Device Part Number

When porting the Intel Arria 10 GX FPGA Development Kit Reference Platform to your own board, change the device part number, where applicable, to the part number of the device on your board.
Update the device part number in the following files within the 
<your_custom_platform>/hardware/<board_name> directory:

- In the device.tcl file, change the device part number in the set global assignment -name DEVICE 10AX115S2F45I1SG QSF assignment.
  The updated device number will appear in the base.qsf, top.qsf, and top_synth.qsf files.
- In the board.qsys, mem.qsys, and ddr4.qsys files, change all occurrences of 10AX115S2F45I1SG.

2.8 Connecting the Memory in the Intel Arria 10 Custom Platform

Calibrate the external memory IP and controllers in your Custom Platform, and connect them to the host.

1. In your Custom Platform, instantiate your external memory IP based on the information in the DDR4 as Global Memory for OpenCL Applications section.
   Update the information pertaining to the global_mem element in the
   <your_custom_platform>/hardware/<board_name>/board_spec.xml file.

2. Remove the boardtest hardware configuration file that you created during the integration of your Custom Platform with the Intel FPGA SDK for OpenCL.

   The environment variable INTELFPGAOCLSDKROOT points to the location of the SDK installation.

4. Reprogram the FPGA with the new boardtest hardware configuration file and then reboot your machine.

5. Modify the wait_for_uniphy function in the acl_pcie_device.cpp MMD source code file to exit after checking the UniPHY status register. Rebuild the MMD software.
   For Windows, the acl_pcie_device.cpp file is in the
   <your_custom_platform>/source\host\mmd folder. For Linux, the
   acl_pcie_device.cpp file is in the <your_custom_platform>/source/ host/mmd directory.

6. Run the aocl diagnose SDK utility and confirm that the host reads back both the version ID and the value 0 from the uniphy_status component.
   The utility should return the message Uniphy are calibrated.

7. Consider analyzing your design in the Signal Tap logic analyzer to confirm the successful calibration of all memory controllers.
   Note: For more information on Signal Tap logic analyzer, download the Signal Tap II Logic Analyzer tutorial from the University Program Tutorial page.

2.9 Modifying the Kernel PLL Reference Clock

The Intel Arria 10 GX FPGA Reference Platform uses an external 125 MHz clock as a reference for the I/O PLL. The I/O PLL relies on this reference clock to generate the internal kernel_clk clock, and the kernel_clk2x clock that runs at twice the frequency of kernel_clk. When porting the a10_ref Reference Platform to your own board using a different reference clock, update the board.qsys and top.sdc files with the new reference clock speed.

1. In the `<your_custom_platform>/hardware/<board_name>/board.qsys` file, update the REF_CLK_RATE parameter value on the kernel_clk_gen IP module.
2. In the `<your_custom_platform>/hardware/<board_name>/top.sdc` file, update the create_clock assignment for kernel_pll_refclk.
3. [Optional] In the `<your_custom_platform>/hardware/<board_name>/top.v` file, update the comment for the kernel_pll_refclk input port.

After you update the board.qsys and the top.sdc files, the post_flow_pr.tcl script will automatically determine the I/O PLL reference frequency and compute the correct PLL settings.

2.10 Integrating an OpenCL Kernel in Your Intel Arria 10 Custom Platform

After you establish host communication and connect the external memory, test the FPGA programming process from kernel creation to program execution.

1. Perform the steps outlined in `INTELFPGAOCLSDKROOT/board/custom_platform_toolkit/tests/README.txt` file to build the hardware configuration file from the `INTELFPGAOCLSDKROOT/board/custom_platform_toolkit/tests/boardtest/boardtest.cl` kernel source file.

The environment variable `INTELFPGAOCLSDKROOT` points to the location of the Intel FPGA SDK for OpenCL installation.

2. Program your FPGA device with the hardware configuration file you created in 1 on page 18 and then reboot your machine.

3. Remove the early-exit modification in the version_id_test function in the acl_PCIE_device.cpp file that you implemented when you established communication between the board and the host interface.

For Windows, the acl_PCIE_device.cpp file is in the `<your_custom_platform>\source\host\mmd\folder. For Linux, the `acl_PCIE_device.cpp` file is in the `<your_custom_platform>/source/host/mmd` directory.

4. Invoke the aocl diagnose `<device_name>` command, where `<device_name>` is the string you define in your Custom Platform to identify each board.
By default, <device_name> is the acl number (for example, acl0 to acl31) that corresponds to your FPGA device. In this case, invoke the aocl diagnose acl0 command.

5. Build the boardtest host application using the .sln file (Windows) or Makefile (Linux) in the SDK’s Custom Platform Toolkit.

   For Windows, the .sln file for Windows is in the INTELFPGAOCLSDKROOT\board\custom_platform_toolkit\tests\boardtest\host folder. For Linux, the Makefile is in the INTELFPGAOCLSDKROOT/board/custom_platform_toolkit/tests/boardtest directory.

6. Set the environment variable CL_CONTEXT_COMPILER_MODE_INTELFPGA to a value of 3 and run the boardtest host application.

   For more information on CL_CONTEXT_COMPILER_MODE_INTELFPGA, refer to Troubleshooting Intel Arria 10 GX FPGA Development Kit Reference Platform Porting Issues.

### 2.11 Guaranteeing Timing Closure in the Intel Arria 10 Custom Platform

When modifying the Intel Arria 10 GX FPGA Development Kit Reference Platform into your own Custom Platform, ensure that guaranteed timing closure holds true for your Custom Platform.

1. Establish the floorplan of your design.

   Important: Consider all design criteria outlined in the FPGA System Design section of the Intel FPGA SDK for OpenCL Custom Platform Toolkit User Guide.

2. Compile several seeds of the INTELFPGAOCLSDKROOT/board/custom_platform_toolkit/tests/boardtest/boardtest.cl file until you generate a design that closes timing cleanly.

   To specify the seed number, include the -seed=<N> option in your aoc command.

3. Copy the base.qar file from the INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx directory into your Custom Platform.

4. Use the flat.qsf file in the a10_ref Reference Platform as references to determine the type of information you must include in the flat.qsf file for your Custom Platform.

   The base.qsf, top.qsf, and top_synth.qsf files automatically inherit all the settings in the flat.qsf file. However, if you need to modify Logic Lock Plus region or PR assignments, only make these changes in the base.qsf file.

5. Confirm that you can use the .aocx file to reprogram the FPGA by invoking the aoc1 program acl0 boardtest.aocx command.
6. Remove the `ACL_DEFAULT_FLOW` environment variable that you added when integrating your Custom Platform with the Intel FPGA SDK for OpenCL.

7. Ensure that the environment variable `CL_CONTEXT_COMPILER_MODE_INTEL_FPGA` is not set.

8. Run the `boardtest_host` executable.

### 2.11.1 Generating the `base.qar` Post-Fit Netlist for Your Intel Arria 10 Custom Platform

To implement the compilation flow, you must generate a `base.qar` Intel Quartus Prime Archive File for your Intel Arria 10 Custom Platform.

The steps below represent a general procedure for regenerating the `base.qar` file:

1. Port the system design and the `flat.qsf` file to your computing card.

2. Compile the `INTELFPGAOCLSDKROOT/board/custom_platform_toolkit/tests/boardtest/boardtest.cl` kernel source file using the base revision. Fix any timing failures and recompile the kernel until timing is clean. You can add the `-bsp-flow=base` argument to the `aoc` command to generate a `base.qar` file during the kernel compilation.

   `INTELFPGAOCLSDKROOT` points to the location of the Intel FPGA SDK for OpenCL installation.

3. Copy the generated `base.qar` file into your Custom Platform.

4. Using the default compilation flow, test the `base.qar` file across several OpenCL design examples and confirm that the following criteria are satisfied:
   - All compilations close timing.
   - The OpenCL design examples achieve satisfactory $F_{\text{max}}$.
   - The OpenCL design examples function on the accelerator board.

3.1.2 Device Identification Registers for Intel Arria 10 PCIe Hard IP

To build PCIe hardware, you must set PCIe IDs related to the device hardware.

<table>
<thead>
<tr>
<th>ID Register Name</th>
<th>ID Provider</th>
<th>Description</th>
<th>Parameter Name in PCIe IP Core</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vendor ID</td>
<td>PCI-SIG®</td>
<td>Identifies the FPGA manufacturer. Always set this register to 0x1172, which is Intel vendor ID.</td>
<td>vendor_id_hwtcl</td>
</tr>
<tr>
<td>Device ID</td>
<td>Intel</td>
<td>Describes the PCIe configuration on the FPGA according to Intel’s internal guideline. Set the device ID to the device code of the FPGA on your accelerator board. For the Intel Arria 10 GX FPGA Development Kit Reference Platform, set the Device ID register to 0x2494, which signifies Gen 3 speed, 8 lanes, Intel Arria 10 device family, and Avalon-MM interface, respectively. Refer to Table 7 on page 25 for more information.</td>
<td>device_id_hwtcl</td>
</tr>
<tr>
<td>Revision ID</td>
<td></td>
<td>When setting this ID, ensure that it matches the following revision IDs: • For Windows, the revision ID specified for the DeviceList field in the &lt;your_custom_platform&gt;\windows64\driver \acl_boards_&lt;your_custom_platform&gt;.inf file. • For Linux, the revision ID specified for the ACL_PCI_REVISION variable in the &lt;your_custom_platform&gt;/linux64/driver/hw_pcie_constants.h file.</td>
<td>—</td>
</tr>
<tr>
<td>Class Code</td>
<td>Intel</td>
<td>The Intel FPGA SDK for OpenCL utility checks the base class value to verify whether the board is an OpenCL device. Do not modify the class code settings. • Base class: 0x12 for processing accelerator • Sub class: 0x00 • Programming interface: 0x01</td>
<td>—</td>
</tr>
<tr>
<td>Subsystem Vendor ID</td>
<td>Board vendor</td>
<td>Identifies the manufacturer of the accelerator board. Set this register to the vendor ID of manufacturer of your accelerator board. For the a10_ref Reference Platform, the subsystem vendor ID is 0x1172. If you are a board vendor, set this register to your vendor ID.</td>
<td>subsystem_vendor_id_hwtcl</td>
</tr>
<tr>
<td>Subsystem Device ID</td>
<td>Board vendor</td>
<td>Identifies the accelerator board. The SDK uses this ID to identify the board because the software might perform differently on different boards. If you create a Custom Platform that supports multiple boards, use this ID to distinguish between the boards. Alternatively, if you have multiple Custom Platforms, each supporting a single board, you can use this ID to distinguish between the Custom Platforms.</td>
<td>subsystem_device_id_hwtcl</td>
</tr>
</tbody>
</table>
**Important:** Make this ID unique to your Custom Platform. For example, for the a10_ref Reference Platform, the ID is 0xA151.

You can find these PCIe ID definitions in the PCIe controller instantiated in the INTELFPGAOCLSDKROOTboard/a10_ref/hardware/a10gx/board.qsys Platform Designer System File. These IDs are necessary in the driver and the SDK’s programming flow. The kernel driver uses the **Vendor ID**, **Subsystem Vendor ID** and the **Subsystem Device ID** to identify the boards it supports. The SDK’s programming flow checks the **Device ID** to ensure that it programs a device with a .aocx Intel FPGA SDK for OpenCL Offline Compiler executable file targeting that specific device.

### 3.1.3 Instantiation of the version_id Component

Intel specifies an additional version ID and uses it to verify the address map of the system. The host verifies the version ID of the Intel Arria 10 GX FPGA Development Kit Reference Platform when instantiating the version_id component that connects to the PCIe Avalon master.

The version ID for the a10_ref Reference Platform is A0C7C1E6 in 17.1 release.

Before communicating with any part of the FPGA system, the host first reads from this version_id register to confirm the following:

- The PCIe can access the FPGA fabric successfully.
- The address map matches the map in the MMD software.

Update the VERSION_ID parameter in the version_id component to a new value with every slave addition or removal from the PCIe BAR 4 bus, or whenever the address map changes.

### 3.1.4 Definitions of Intel Arria 10 FPGA Development Kit Reference Platform Hardware Constraints in Software Headers Files

After you build the PCIe component in your hardware design, you need a software layer to communicate with the board via PCIe. To enable communication between the board and the host interface, define the hardware constants for the software in header files.

The two header files that describe the hardware design to the software are in the following locations:

- For Windows systems, the header files are in the `INTELFPGAOCLSDKROOT\board\a10_ref\source\include` folder, where `INTELFPGAOCLSDKROOT` is the path to the SDK installation.
- For Linux systems, the header files are in the `INTELFPGAOCLSDKROOT/board/a10_ref/linux64/driver` directory.

| Table 8. Intel Arria 10 GX FPGA Development Kit Reference Platform Header Files |
|---------------------------------|-----------------------------|
| **Header File Name**           | **Description**             |
| hw_pcie_constants.h            | Header file that defines most of the hardware constants for the board design. This file includes constants such as the IDs described in PCIe Device Identification Registers, BAR number, and offset for different components in your design. In addition, this header file also defines the name strings of ACL_BOARD_PKG_NAME, ACL_VENDOR_NAME, and ACL_BOARD_NAME. |

**continued...**
**Update the information in this file whenever you change the board design.**

**hw_pcie_dma.h**  
Header file that defines DMA-related hardware constants.  
- ACL_PCIE_DMA_ONCHIP_RD_FIFO_BASE refers to the Platform Designer address of rd_dts_slave on the PCIe IP's dma_rd_master.  
- ACL_PCIE_DMA_ONCHIP_WR_FIFO_BASE refers to the Platform Designer address of wr_dts_slave on the PCIe IP's dma_rd_master.  
Update these addresses whenever you change the board design. Refer to the Direct Memory Access section for more information.  
- ACL_PCIE_DMA_TABLE_SIZE refers to the DMA descriptor FIFO depth connected to the DMA. When using the internal descriptor controller, refer to the DMA Descriptor Controller Registers section in the Intel Arria 10 Avalon-MM DMA Interface for PCIe Solutions User Guide for the required size.  
- ACL_PCIE_DMA_PAGES_LOCKED specifies the maximum pages you can lock. You may modify this constant to improve performance.  
- ACL_PCIE_DMA_NON_ALIGNED_TRANS_LOG specifies the starting and ending power-of-two values that non-aligned DMA transfers should have. You may modify this constant to improve performance.

**hw_host_channel.h**  
Header file that defines the host channel IP control register address and names of the channels.

### 3.1.5 PCIe Kernel Driver for the Intel Arria 10 GX FPGA Development Kit Reference Platform

A PCIe kernel driver is necessary for the OpenCL runtime library to access your board design via a PCIe bus.

Use the Intel FPGA SDK for OpenCL install utility to install the kernel driver.

**The a10_ref Reference Platform**

- For Windows systems, the driver is in the `<path_to_al0pciedk>\windows64\driver` folder.
  
The kernel driver, the WinDriver application programming interface (API), is a third-party driver from Jungo Connectivity Ltd. For more information about the WinDriver, refer to the Jungo Connectivity Ltd. website or contact a Jungo Connectivity representative.

- For Linux, an open-source MMD-compatible kernel driver is in the `<path_to_al0pciedk>/linux64/driver` directory. The table below highlights some of the files that are available in this directory.

**Table 9. Highlights of the Intel Arria 10 GX FPGA Development Kit Reference Platform’s Linux PCIe Kernel Driver Directory**

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pcie_linux_driver_exports.h</td>
<td>Header file that defines the special commands that the kernel driver supports.</td>
</tr>
</tbody>
</table>

continued...
The installed kernel driver works as a character device. The basic operations to the driver are `open()`, `close()`, `read()`, and `write()`. To execute a complicated command, create a variable as an `acl_cmd` struct type, specify the command with the proper parameters, and then send the command through a `read()` or `write()` operation. This header file defines the interface of the kernel driver, which the MMD layer uses to communicate with the device.

The file `aclpci.c` implements the Linux kernel driver’s basic structures and functions, such as the `init`, `remove`, and `probe` functions, as well as hardware design-specific functions that handle interrupts. For more information on the interrupt handler, refer to the Message Signaled Interrupts section.

The file `aclpci fileio.c` implements the kernel driver’s file I/O operations. The kernel driver that is available with the `a10_ref` Reference Platform supports four file I/O operations: `open()`, `close()`, `read()`, and `write()`. Implementing these file I/O operations allows the OpenCL user program to access the kernel driver through the file I/O system calls (that is, `open`, `read`, `write`, or `close`).

The file `aclpci cmd.c` implements the specific commands defined in the `pcie_linux_driver_exports.h` file. These special commands include `SAVE_PCI_CONTROL_REGS`, `LOAD_PCI_CONTROL_REGS`, `DO_PR`, `GET_PCI_SLOT_INFO`, etc.

The file `aclpci dma.c` implements DMA and host channel-related routines in the kernel driver. Refer to the Direct Memory Access section for more information.

The file `aclpci pr.c` implements PR-related routines in the kernel driver. Refer to the Partial Reconfiguration section for more information.

The file `aclpci queue.c` implements a queue structure for use in the kernel driver to simplify programming.

- Jungo Connectivity Ltd. website

### 3.1.6 Direct Memory Access

The Intel Arria 10 GX FPGA Development Kit Reference Platform relies on the PCIe hard IP core’s soft DMA engine to transfer data. The Intel Arria 10 PCIe hard IP core’s DMA interface is instantiated as a soft IP inside the PCIe hardware when the Avalon-MM with DMA application interface type is selected in the IP parameter editor.

**Note:** The DMA interface is capable of full duplex data transfers. However, the driver handles one read or write transfer at a time.
Hardware Considerations

The instantiation process exports the DMA controller slave ports (that is, rd_dts_slave and wr_dts_slave) and master ports (that is, rd_dcm_master and wr_dcm_master) into the PCIe module. Two additional master ports, dma_rd_master and dma_wr_master, are exported for DMA read and write operations, respectively. For the DMA interface to function properly, all these ports must be connected correctly in the board.qsys Platform Designer system, where the PCIe hard IP is instantiated.

At the start of DMA transfer, the DMA Descriptor Controller reads from the DMA descriptor table in user memory, and stores the status and the descriptor table into a FIFO address. There are two FIFO addresses: Read Descriptor FIFO address and Write Descriptor FIFO address. After storing the descriptor table into a FIFO address, DMA transfer into the FIFO address can occur. The dma_rd_master port, which moves data from user memory to the device, must connect to the rd_dts_slave and wr_dts_slave ports. Because the dma_rd_master port connects to DDR4 memory also, the locations of the rd_dts_slave and wr_dts_slave ports in the address space must be defined in the hw_pcie_dma.h file.

The rd_dcm_master and wr_dcm_master ports must connect to the txs port. At the end of the DMA transfer, the DMA controller writes the MSI data and the done status into the user memory via the txs slave. The txs slave is part of the PCIe hard IP in board.qsys.

All modules that use DMA must connect to the dma_rd_master and dma_wr_master ports. For DDR4 memory connection, Intel recommends implementing an additional pipeline to connect the two 256-bit PCIe DMA ports to the 512-bit memory slave. For more information, refer to the DDR4 Connection to PCIe Host section.

Software Considerations

The MMD layer uses DMA to transfer data if it receives a data transfer request that satisfies both of the following conditions:

- A transfer size that is greater than 1024 bytes.
- The starting addresses for both the host buffer and the device offset are aligned to 64 bytes.

- Implementing a DMA Transfer on page 30
- DDR4 Connection to PCIe Host on page 35
3.1.6.1 Implementing a DMA Transfer

Implement a DMA transfer in the MMD on Windows (INTELFPGAOCLSDKROOT\board\a10_ref\source\host\mmd\acl_pcie_dma_windows.cpp) or in the kernel driver on Linux (INTELFPGAOCLSDKROOT/board/a10_ref/linux64/driver/aclpci_dma).

Note: For Windows, the Jungo WinDriver imposes a 5000 to 10000 limit on the number of interrupts received per second in user mode. This limit translates to a 2.5 gigabytes per second (GBps) to 5 GBps DMA bandwidth when a full 128-entry table of 4 KB page is transferred per interrupt.

On Windows, polling is the default method for maximizing PCIe DMA bandwidth at the expense of CPU run time. To use interrupts instead of polling, assign a non-NULL value to the ACL_PCIE_DMA_USE_MSI environment variable.

The steps below describe the general procedure for implementing a DMA transfer:
1. Verify that the previous DMA transfer sent all the requested bytes of data.
2. Map the virtual memories that are requested for DMA transfer to physical addresses.

   Note: The amount of virtual memory that can be mapped at a time is system dependent. Large DMA transfers will require multiple mapping or unmapping operations. For a higher bandwidth, map the virtual memory ahead in a separate thread that is in parallel to the transfer.
3. Set up the DMA descriptor table on local memory.
4. Write the location of the DMA descriptor table, which is in user memory, to the DMA control registers (that is, RC Read Status and Descriptor Base and RC Write Status and Descriptor Base).
5. Write the Platform Designer address of descriptor FIFOs to the DMA control registers (that is EP Read Descriptor FIFO Base and EP Write Status and Descriptor FIFO Base).
6. Write the start signal to the RD_DMA_LAST_PTR and WR_DMA_LAST_PTR DMA control registers.
7. After the current DMA transfer finishes, repeat the procedure to implement the next DMA transfer.

Direct Memory Access on page 28

3.1.7 Message Signaled Interrupt

The Intel Arria 10 GX FPGA Development Kit Reference Platform uses one MSI line for both DMA and the kernel interface.

Two different modules generate the signal for the MSI line. The DMA controller in the PCIe hard IP core generates the DMA's MSI. The PCI Express interrupt request (IRQ) module (that is, the INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/ip/irq_controller directory) generates the kernel interface's MSI.

For more information on the PCI Express IRQ module, refer to Handling PCIe Interrupts webpage.
Hardware Considerations

In INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/board.qsys, the DMA MSI is connected internally; however, you must connect the kernel interface interrupt manually. For the kernel interface interrupt, the PCI Express IRQ module is instantiated as pcie_irq_0 in board.qsys. The kernel interface interrupts connections are as follows:

- The kernel_irq_to_host port from the OpenCL Kernel Interface (kernel_interface) connects to the interrupt receiver, which allows the OpenCL kernels to signal the PCI Express IRQ module to send an MSI.
- The PCIe hard IP's msi_intfc port connects to the MSI_Interface port in the PCI Express IRQ module. The kernel interface interrupt receives the MSI address and the data necessary to generate the interrupt via msi_intfc.
- The IRQ_GEN_Master port on the PCI Express IRQ module, which is used to write the MSI, connects to the txs port on the PCIe hard IP.
- The IRQ_Read_Slave and IRQ_Mask_Slave ports connect to the pipe_stage_host_ctrl module on Bar 4. After receiving an MSI, the user driver can read the IRQ_Read_Slave port to check the status of the kernel interface interrupt, and read the IRQ_Mask_Slave port to mask the interrupt.

Software Considerations

The interrupt service routine in the Linux driver checks which module generates the interrupt. For the DMA's MSI, the driver reads the DMA descriptor table's status bit in local memory, as specified in the Read DMA Example section of the Intel Arria 10 Avalon-MM DMA Interface for PCIe Solutions User Guide. For kernel interface's MSI, the driver reads the interrupt line sent by the kernel interface.

The interrupt service routine involves the following tasks:

1. Check DMA status on the DMA descriptor table.
2. Read the kernel status from the IRQ_READ_SLAVE port on the PCI Express IRQ module.
3. If a kernel interrupt was triggered, mask the interrupt by writing to the IRQ_MASK_SLAVE port on the PCI Express IRQ module. Then, execute the kernel interrupt service routine.
4. If a DMA interrupt was triggered, reset the DMA descriptor table and execute the DMA interrupt service routine.
5. If applicable, unmask a masked kernel interrupt.

3.1.8 Partial Reconfiguration

The Intel Arria 10 GX FPGA Development Kit Reference Platform uses partial reconfiguration (PR) as a default mechanism to reconfigure the OpenCL kernel-related partition of the design without altering the static board interface that is in a running state.
You can only use PR when the static board interface, generated during base compilations, matches the static region of the design that is used to compile the OpenCL kernel's PR region.

For Windows MMD implementation, the `INTELFPGAOCLSDKROOT\board\a10_ref\source\host\mmd\acl_pcie_config.cpp` file contains the MMD code that communicates with the PR configuration controller within the static region of the design. The `program_core_with_PR_file` function within the `acl_pcie_config.cpp` file requires a handle to the PR bitstream and the length of the PR bitstream in order to perform the PR operation.

For Linux driver implementation, the `INTELFPGAOCLSDKROOT/board/a10_ref/linux64/driver/aclpci_pr.c` file includes the main host driver routine that communicates with the PR configuration controller within the static region of the design. The `aclpci_pr` function within the `acl_pci_pr.c` file requires the following information in order to perform the PR operation:

- A handle to the board
- A handle to the PR bitstream
- The length of the PR bitstream

After verifying that the device is opened, the bitstream is of adequate length, and the PCIe endpoint of the device is reachable, the `aclpci_pr` function writes 0x1 to the PR IP status register. Then, the `aclpci_pr` function writes the complete bitstream, 32 bits at a time, to the PR IP. After the bitstream transfer is complete, the `aclpci_pr` function performs a read operation to the PR IP status register to verify whether PR is successful. A return value of 0x14 indicates a successful PR operation; any other return value indicates an error.

To override the default reconfiguration mechanism, set the `ACL_PCIE_USE_JTAG_PROGRAMMING` environment variable, as shown below:

- For Windows, type `set ACL_PCIE_USE_JTAG_PROGRAMMING=1` at the command prompt.
- For Linux, type `export ACL_PCIE_USE_JTAG_PROGRAMMING=1` at the command prompt.

Setting `ACL_PCIE_USE_JTAG_PROGRAMMING` specifies that JTAG full-chip configuration is the default mechanism for reconfiguring the device.

**Related Links**

**Partial Reconfiguration IP Core**

### 3.1.9 Cable Autodetect

If partial reconfiguration (PR) cannot be used or fails to reconfigure the OpenCL kernel-related partition of the design, an attempt is made to do a full JTAG programming over the Intel FPGA Download Cable (formerly USB-Blaster).

The Intel Arria 10 GX FPGA Development Kit Reference Platform automatically tries to detect the cable by default when programming the FPGA via the Intel FPGA Download Cable.
You can set the ACL_PCIE_JTAG_CABLE or ACL_PCIE_JTAG_DEVICE_INDEX environment variables to disable the auto-detect feature and use values that you define.

Cable autodetect is useful when you have multiple devices connected to a single host and PR cannot be used to program the FPGA.

The memory-mapped device (MMD) uses in-system sources and probes to identify the cable connected to the target board. You must instantiate the cade_id register block and connect it to Bar 4 with the correct address map. You must also instantiate board_in_system_sources_probes_cade_id, which is an in-system sources and probe component, and connect it to cade_id register.

The MMD must be updated to take in the relevant changes. Add the scripts/find_jtag_cable.tcl script to be added to your custom platform.

When the FPGA is being programmed via the Intel FPGA Download Cable, the MMD invokes quartus_stp to execute the find_jtag_cable.tcl script. The script identifies the cable and index number which is then used to program the FPGA through the quartus_pgm command.

3.1.10 Host Channel

The a10gx_hostch board variant of Intel Arria 10 GX FPGA Development Kit Reference Platform uses host channel to provide direct streaming interface between OpenCL host and kernel by using DMA.

The streaming interface makes use of DMA.

3.1.10.1 Host Channel IP Instantiation

In Platform Designer, the host channel IP can be instantiated from Intel Arria 10 board support package components in the IP catalog. The name of the IP is acl_hostchannel_top.

Table 10. Host Channel Top Configuration Setting

<table>
<thead>
<tr>
<th>IP Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOST_CHANNEL_DEPTH = 2048</td>
<td>Depth of the internal buffer that DMA transfers data to and from.</td>
</tr>
<tr>
<td></td>
<td>There are two buffers, and both of their depths are set by this parameter.</td>
</tr>
<tr>
<td>HOST_CHANNEL_VALID_BUFFER_USE_LAB = 0</td>
<td>Set to 1 to use LABs to instantiate the internal buffer, and 0 to use block RAMs.</td>
</tr>
</tbody>
</table>

3.1.10.2 Host Channel Top Connection to PCIe DMA

In addition to the ports connected in DMA section, by disabling Instantiate internal descriptor controller setting on Intel Arria 10 Hard IP for PCI Express, ReadDCS, WrDCS, rd_ast_rx, wr_ast_rx, RdDmaRx and WrDmaRx ports are exposed on the IP.

These ports must be connected to the DMA descriptor controller in the host channel IP.
Base address offset must match the address mentioned in the `board.qsys` file, since these addresses are used by the internal descriptor controller of a10gx board variant.

You need to make the following connections:

- On `acl_hostchannel_top` IP, `rd_dma` and `wr_dma` ports are used to receive and send data to DMA. These ports must be connected to the corresponding ports on PCIe IP with base address offset matching in the `hw_host_channel.h` header file.
- The `cra` port must be connected to the `host_ctrl`.
- The `msi_interface` port must be connected to Intel Arria 10 Hard IP for PCI Express, and the `msi_interface_out` must be connected to the `msi_interface` port of the `pcie_irq`.

### 3.1.10.3 Host Channel Top Connection to OpenCL Kernel

To stream data to kernel, Avalon-Streaming `stin` and `stout` ports are used. To clock cross into kernel clock, two Avalon-ST dual clock FIFO should be instantiated.

For one FIFO, the `in` port should be connected to the `stout` port of the host channel top, while the `out` port is exported. For the second FIFO, `out` port should be connected to the `stin` port of the host channel top, while the `in` port is exported.

In the `board_spec.xml`, the host channel ports are IO ports.

### 3.2 DDR4 as Global Memory for OpenCL Applications

The Intel Arria 10 GX FPGA Development Kit has one bank of 2GB x72 DDR4-2400 SDRAM. The DDR4 SDRAM is a daughtercard that is mounted to the development kit's HiLo connector.

In the current version of the a10_ref Reference Platform, all Platform Designer components related to the DDR4 global memory are now part of the `INTELFPGAOCLESDKROOT/board/a10_ref/hardware/a10gx/acl_ddr4_a10.qsys` Platform Designer subsystem within `board.qsys`. In addition, the location of the clock domain crossings has changed to increase the number of blocks operating in the slower PCIe domain. With this modified structure, you can add multiple memories with different clock domains to the system.

If you have a Custom Platform that is ported from a previous version of the a10_ref Reference Platform, you have the option to modify your Custom Platform as described above. This modification is not mandatory.

#### Dependencies

DDR4 external memory interfaces

For more information on the DDR4 external memory interface IP, refer to the `DDR2, DDR3, and DDR4 SDRAM Board Design Guidelines` section in [External Memory Interface Handbook Volume 2: Design Guidelines](#).

To use the DDR4 SDRAM as global memory for Intel FPGA SDK for OpenCL designs, you must instantiate the memory controller IP, connect the memory IP to the host, and connect the memory IP to the kernel.
3.2.1 DDR4 IP Instantiation

The Intel Arria 10 GX FPGA Development Kit Reference Platform uses one DDR4 Controller IP to communicate with the physical memory.

Table 11. DDR4 SDRAM Controller IP Configuration Settings

<table>
<thead>
<tr>
<th>IP Parameter</th>
<th>Configuration Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timing Parameters</td>
<td>As per the computing card’s data specifications.</td>

<td>Disabled for production.</td>
</tr>
</tbody>
</table>

3.2.2 DDR4 Connection to PCIe Host

Connect all global memory systems in the Intel Arria 10 GX FPGA Development Kit Reference Platform to the host via the OpenCL Memory Bank Divider component.

The DDR4 IP core has one bank where its width and address configurations match those of the DDR4 SDRAM. Intel tunes the other parameters such as burst size, pending reads, and pipelining. These parameters are customizable for an end application or board design.

The Avalon master interfaces from the OpenCL Memory Bank Divider component connect to their respective memory controllers. The Avalon slave connects to the PCIe and DMA IP core. Implementations of appropriate clock crossing and pipelining are based on the design floorplan and the clock domains specific to the computing card. The OpenCL Memory Bank Divider section in the Intel FPGA SDK for OpenCL Custom Platform Toolkit User Guide specifies the connection details of the snoop and memorg ports.

**Important:** Instruct the host to verify the successful calibration of the memory controller.

The INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/board.qsys Platform Designer system uses a custom UniPHY Status to AVS IP component to aggregate different UniPHY status conduits into a single Avalon slave port named s. This slave port connects to the pipe_stage_host_ctrl component so that the PCIe host can access it.
3.2.3 DDR4 Connection to the OpenCL Kernel

The OpenCL kernel needs to connect directly to the memory controller in the Intel Arria 10 GX FPGA Development Kit Reference Platform via a FIFO-based clock crosser.

A clock crosser is necessary because the kernel interface for the compiler must be clocked in the kernel clock domain. In addition, the width, address width, and burst size characteristics of the kernel interface must match those specified in the OpenCL Memory Bank Divider connecting to the host. Appropriate pipelining also exists between the clock crosser and the memory controller.

3.3 Host Connection to OpenCL Kernels

The PCIe host needs to pass commands and arguments to the OpenCL kernels via the control register access (CRA) Avalon slave port that each OpenCL kernel generates. The OpenCL Kernel Interface component exports an Avalon master interface (kernel_cra) that connects to this slave port. The OpenCL Kernel Interface component also generates the kernel reset (kernel_reset) that resets all logic in the kernel clock domain.

The Intel Arria 10 FPGA Development Kit Reference Platform has one DDR4 memory bank. As a result, the Reference Platform instantiates the OpenCL Kernel Interface component and sets the Number of global memory systems parameter to 1.

3.4 Intel Arria 10 FPGA System Design

To integrate all components, close timing, and deliver a post-fit netlist that functions in the hardware, you must first address several additional FPGA design complexities.

Examples of design complexities:
- Designing a robust reset sequence
- Establishing a design floorplan
- Managing global routing
- Pipelining

Optimizations of these design complexities occur in tandem with one another in order to meet timing and board hardware optimization requirements.

3.4.1 Clocks

Several clock domains affect the Platform Designer hardware system of the Intel Arria 10 GX FPGA Development Kit Reference Platform.
These clock domains include:

- 250 MHz PCIe clock
- 300 MHz DDR4 clock
- 50 MHz general clock (config_clk)
- 125 MHz kernel reference clock
- Kernel clock that can have any clock frequency

With the exception of the kernel clock, the a10_ref Reference Platform is responsible for the timing closure of these clocks. However, because the board design must clock cross all interfaces in the kernel clock domain, the board design also has logic in the kernel clock domain. It is crucial that this logic is minimal and achieves an \( F_{\text{max}} \) higher than typical kernel performance.

**Related Links**

Guaranteed Timing Closure of the Intel Arria 10 GX FPGA Development Kit Reference Platform Design on page 43

### 3.4.2 Resets

The Intel Arria 10 GX FPGA Development Kit Reference Platform design includes the implementation of reset drivers.

These reset drivers include:

- The por_reset_counter in the `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/board.qsys` Platform Designer system implements the power-on-reset. The power-on-reset resets all the hardware on the device by issuing a reset for a number of cycles after the FPGA completes configuration.

- The PCIe bus issues a perst reset that resets all hardware on the device.

- The OpenCL Kernel Interface component issues the kernel_reset that resets all logic in the kernel clock domain.

The power-on-reset and the perst reset are combined into a single global_reset; therefore, there are only two reset sources in the system (that is, global_reset and kernel_reset). However, these resets are explicitly synchronized across the various clock domains, resulting in several reset interfaces.
Important Considerations Regarding Resets

- Synchronizing resets to different clock domains might cause several high fan-out resets.

Platform Designer automatically synchronizes resets to the clock domain of each connected component. In doing so, Platform Designer instantiates new reset controllers with derived names that might change when the design changes. This name change makes it difficult to make and maintain global clock assignments to some of the resets. As a result, for each clock domain, there are explicit reset controllers. For example, `global_reset` drives `reset_controller_pcie` and `reset_controller_ddr4`; however, they are synchronized to the PCIe and DDR4 clock domains, respectively.

- Resets and clocks must work together to propagate reset to all logic.

Resetting a circuit in a given clock domain involves asserting the reset over a number of clock cycles. However, your design may apply resets to the PLLs that generate the clocks for a given clock domain. This means a clock domain can hold in reset without receiving the clock edge that is necessary for synchronous resets. In addition, a clock holding in reset might prevent the propagation of a reset signal because it is synchronized to and from that clock domain. Avoid such situations by ensuring that your design satisfies the following criteria:
  - Generate the `global_reset` signal off the free-running `config_clk`.
  - The `ddr4_calibrate` IP resets the External Memory Interface controller separately.

- Apply resets to both reset interfaces of a clock-crossing bridge or FIFO component.

FIFO content corruption might occur if only part of a clock-crossing bridge or a dual-clock FIFO component is reset. These components typically provide a reset input for each clock domain; therefore, reset both interfaces or none at all. For example, in the `a10_ref` Reference Platform, `kernel_reset` resets all the kernel clock-crossing bridges between DDR on both the `m0_reset` and `s0_reset` interfaces.

3.4.3 Floorplan

Intel establishes the floorplan of the Intel Arria 10 GX FPGA Development Kit Reference Platform by iterating on the design and IP placements.

Dependencies

- Partial Reconfiguration
- Chip Planner
- Logic Lock Plus regions

Intel performed the following tasks iteratively to derive the floorplan of the `a10_ref` Reference Platform:

1. Compile a design without any region or floorplanning constraints.
Intel recommends that you compile the design with several seeds.

2. Examine the placement of the IP cores (for example, PCIe, DDR4, Avalon interconnect pipeline stages and adapters) for candidate locations, as determined by the Intel Quartus Prime Pro Edition software’s Fitter. In particular, Intel recommends examining the seeds that meet or almost meet the timing constraints.

For the a10_ref Reference Platform, the PCIe I/O is located in the lower left corner of the Intel Arria 10 FPGA. The DDR4 I/O is located on the top part of the left I/O column of the device. Because the placements of the PCIe and DDR4 IP components tend to be close to the locations of their respective I/Os, you can apply Logic Lock Plus regions to constrain the IP components to those candidate regions.
Figure 2. **Floorplan of the Intel Arria 10 FPGA Development Kit Reference Platform**

As shown in this Chip Planner view of the floorplan, the two Logic Lock Plus regions spread out between the PCIe I/O and the top region of the left I/O column (that is, the DDR4 I/O area).

- The largest Logic Lock Plus region (Region 1) covers the PCIe I/O and contains most of the static board interface logic.
- Regions 2 contains an Avalon interconnect pipeline stage that bridges the PCIe I/O and DDR4 I/O regions. The Avalon interconnect pipeline stages also help improve the timing closure rate of the static board interface part of the design.
You must create a dedicated Logic Lock Plus region for the OpenCL kernel system. Furthermore, do not place kernel logic in the board's Logic Lock Plus regions (that is, static region). The static region and the OpenCL kernel system region (that is, PR region) do not overlap each other. As shown in Figure 2 on page 40, the logic for the boardtest.cl OpenCL kernel, that is, the scatter area, can be placed anywhere except within the seven Logic Lock Plus regions.

Intel recommends the following strategies to maximize the available FPGA resources for the OpenCL kernel system to improve kernel routability:

- The OpenCL kernel system PR region should cover the entire device except the Logic Lock Plus regions of the board.
- The size of a Logic Lock Plus region should be just large enough to contain the board logic and to meet timing constraints of the board clocks. Oversized Logic Lock Plus regions consume FPGA resources unnecessarily.
- Avoid creating tightly-packed Logic Lock Plus regions that cause very high logic utilization and high routing congestion.

High routing congestion within the Logic Lock Plus regions might decrease the Fitter's ability to route OpenCL kernel signals through the regions.

In the case where the board clocks are not meeting timing and the critical path is between the Logic Lock Plus regions (that is, across region-to-region gap), insert back-to-back pipeline stages on paths that cross the gap. For example, if the critical path is between Region 1 and Region 2, lock down the first pipeline stage (an Avalon-MM Pipeline Bridge component) to Region 1, lock down the second pipeline stage to Region 2, and connect the two pipeline stages directly. This technique ensures that pipeline registers are on both sides of the region-to-region gap, thereby minimizing the delay of paths crossing the gap.

Refer to the Pipelining section for more information.

**Related Links**

- Pipelining on page 42
- Creating Logic Lock Plus Regions

**3.4.4 Global Routing**

FPGAs have dedicated clock trees that distribute high fan-out signals to various sections of the devices. In the FPGA system that the Intel Arria 10 FPGA Development Kit Reference Platform targets, global routing can distribute high fan-out signals regionally or globally.

- Regional distribution applies across any quadrant of the device.
- Global distribution applies across the entire device.

There is no restriction on the placement location of the OpenCL kernel on the device. As a result, the kernel clocks and kernel reset must distribute high fan-out signals globally.

**Note:** To support PR, global routing for the Kernel Reset signal that drives logic inside a PR region requires special handling. Refer to the Partial Reconfiguration section for more information.
3.4.5 Pipelining

You must manually insert pipelines throughout the FPGA system.

In Platform Designer, you can implement pipelines via an Avalon-MM Pipeline Bridge component by setting the following pipelining parameters within the Avalon-MM Pipeline Bridge dialog box:

- Select Pipeline command signals
- Select Pipeline response signals
- Select both Pipeline command signals and Pipeline response signals

Examples of Pipeline Implementation

- Signals that traverse long distances because of the floorplan’s shape or the region-to-region gaps require additional pipelines.

  The DMA at the bottom of the FPGA must connect to the DDR4 memory at the top of the FPGA. To achieve timing closure of the board interface logic at a DDR4 clock speed of 300 MHz, additional pipeline stages between the OpenCL Memory Bank Divider component and the DDR4 controller IP are necessary. In the Intel Arria 10 GX FPGA Development Kit Reference Platform's board.qsys Platform Designer system, the pipeline stages are named pipe_stage_ddr4a_dimm_*.

  The middle pipeline stage, pipe_stage_ddr4a_dimm, combines both the direct kernel DDR4 accesses and the accesses through the OpenCL Memory Bank Divider. The multistage pipeline approach ensures that the kernel entry point to the pipeline is geared towards neither the OpenCL Memory Bank Divider, which is close to the PCIe IP core, nor the DDR4 IP core, which is at the very top of the FPGA.

3.4.6 DDR4 Calibration

The Intel Arria 10 GX FPGA Development Kit Reference Platform includes special mechanisms to ensure the functional stability of the Intel Arria 10 silicon. For example, the DDR4 memory might not calibrate successfully after FPGA reconfiguration. The driver within the a10_ref Reference Platform can detect a failed calibration via the Uniphy Status to AVS IP, and retrigger calibration through the ddr4_calibrate IP block.

3.4.7 Kernel Reprogramming via Partial Reconfiguration

The Intel Arria 10 GX FPGA Development Kit Reference Platform provides the ability to modify the OpenCL kernel and reprograms it onto the FPGA. The a10_ref Reference Platform places the OpenCL kernel in a PR region of the device. Doing so allows you to reprogram the kernel-specific portion of the FPGA across the PCIe bus without affecting the board interface region (that is, static region) of the device.

Dependencies

Intel Quartus Prime Pro Edition software's Partial Reconfiguration feature
To ensure that the device functions properly during and after PR reprogramming, following these rules:

- Place a freeze wrapper around the PR region. The freeze wrapper holds the critical control outputs from the PR region in a known, inactive state during the reprogramming of the logic inside the PR region.

  The `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/ip/freeze_wrapper.v` file implements the freeze wrapper, where `INTELFPGAOCLSDKROOT` is the path to the SDK installation.

- Hold the `kernel_reset_n` signal, which is routed using Global Clock resources, in a logic 1 (deasserted) state during reprogramming of the PR region. When programming completes, assert the `kernel_reset_n` signal (that is, set it to the low state) before disabling the freeze wrapper. Asserting the `kernel_reset_n` signal resets all logic in the PR region to a known state. This assertion step is necessary because the state of all flipflops in the PR region is undefined after PR programming. The logic in the `freeze_wrapper.v` file implements the required behavior for the reset and freeze signals.

### 3.5 Dynamic PLL Reconfiguration

PLL that is used to generate the OpenCL kernel clocks resides in the static region of the design's floorplan. As a result, reprogramming of the kernel partition via PR does not modify the PLL settings. The Intel FPGA SDK for OpenCL relies on the post_flow_pr.tcl Tcl script and the instantiation of the `acl_kernel_clk_a10` Platform Designer component to modify kernel PLL.

In both PR reprogramming and full-chip JTAG programming, the PLL is dynamically reconfigured by default after FPGA configuration completes. This default dynamic PLL reconfiguration step is unnecessary after full-chip programming because the correct PLL settings are already part of the .sof file programmed onto the FPGA over JTAG.

### 3.6 Guaranteed Timing Closure of the Intel Arria 10 GX FPGA Development Kit Reference Platform Design

One of the key features of the Intel FPGA SDK for OpenCL is that it abstracts away hardware details, such as timing closure, for software developers. Both the SDK and the Custom Platform contribute to the implementation of the SDK’s guaranteed timing closure feature.

The SDK provides the IP to generate the kernel clock, and a post-flow script that ensures this clock is configured with a safe operating frequency confirmed by timing analysis. The Custom Platform developer imports a post-fit netlist that has already achieved timing closure on all non-kernel clocks.

#### 3.6.1 Supply the Kernel Clock

In the Intel Arria 10 GX FPGA Development Kit Reference Platform, the OpenCL Kernel Clock Generator component provides the kernel clock and its 2x variant.

The `REF_CLK_RATE` parameter specifies the frequency of the reference clock that connects to the kernel PLL (pll_refclk). For the a10_ref Reference Platform, the `REF_CLK_RATE` frequency is 125 MHz.
The `KERNEL_TARGET_CLOCK_RATE` parameter specifies the frequency that the Intel Quartus Prime Pro Edition software attempts to achieve during compilation. The board hardware contains some logic that the kernel clock clocks. At a minimum, the board hardware includes the clock crossing hardware. To prevent this logic from limiting the Fmax achievable by a kernel, the `KERNEL_TARGET_CLOCK_RATE` must be higher than the frequency that a simple kernel can achieve on your device. For the Intel Arria 10 GX FPGA Development Kit that the a10_ref Reference Platform targets, the `KERNEL_TARGET_CLOCK_RATE` is 400 MHz.

**Caution:** When developing a Custom Platform, setting a high target F_{max} might cause difficulty in achieving timing closure.

When developing your Custom Platform and attempting to close timing, add an overriding SDC definition to relax the timing of the kernel. The following code example from the `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/top_post.sdc` file applies a 5 ns (200 MHz) maximum delay constraint on the OpenCL kernel during base revision compilations:

```tcl
if {! [string equal $::TimeQuestInfo(nameofexecutable) "quartus_map"]}
    if { [get_current_revision] eq "base" }
        post_message -type critical_warning "Compiling with slowed OpenCL Kernel clock.
        This is to help achieve timing closure for board bringup."
    if {! [string equal $::TimeQuestInfo(nameofexecutable) "quartus_sta"]}
        set kernel_keepers [get_keepers system_inst\|kernel_system\|*]
        set_max_delay 5 -from $kernel_keepers -to $kernel_keepers
    }
}
```

### 3.6.2 Guarantee Kernel Clock Timing

The Intel Quartus Prime database interface executable (`quartus_cdb`) runs a script after every Intel Quartus Prime Pro Edition software compilation as a post-flow script. In the Intel Arria 10 GX FPGA Development Kit Reference Platform, the OpenCL Kernel Clock Generator component works together with the post-flow script to guarantee kernel clock timing.

In the import revision compilation, the compilation script `import_compile.tcl` invokes the `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/scripts/post_flow.tcl` Tcl script in the a10_ref Reference Platform after every Intel Quartus Prime Pro Edition software compilation using `quartus_cdb`.

The `post_flow.tcl` script also determines the kernel clock and configures it to a functional frequency.

**Important:** Execute this post flow script for every Intel Quartus Prime compilation.
3.6.3 Provide a Timing-Closed Post-Fit Netlist

Each Intel FPGA SDK for OpenCL-compatible Reference and Custom Platform, such as the Intel Arria 10 GX FPGA Development Kit Reference Platform, provides a timing-closed post-fit netlist that imports placement and routing information for all nodes clocked by non-kernel clocks.

Dependencies

Intel Quartus Prime Pro Edition compiler

Intel Quartus Prime software provides several mechanisms for preserving the placement and routing of some previously compiled logic and importing this logic into a new compilation. For Intel Arria 10 devices, the previously compiled logic is imported into the compilation flow.

Figure 3. Custom Platform Development Flow and Hand-Off between Board Developer and End User

This figure illustrates the hand-off between the board vendor and the SDK end user. The board developer is responsible for porting the a10_ref Reference Platform to their own board, closing timing, and locking down the static part of the board.
**Figure 4. Structure of the Hierarchy for the OpenCL Hardware System on the Intel Arria 10 Device**

This figure illustrates that the placement and routing for everything outside the `kernel_system` partition are preserved and are imported in the top revision compilations. The `kernel_system` partition itself is not preserved and is compiled from source.

The Intel Quartus Prime Pro Edition compilation flow can preserve the placement and routing of the board interface partition via the exported Intel Quartus Prime Archive File. The `base.qdb` file contains all the database files for the base compilation of `root_partition`. The a10_ref Reference Platform is configured with the project revisions and partitioning that are necessary to implement the compilation flow. By default, the SDK invokes the Intel Quartus Prime Pro Edition software on the top revision. This revision is configured to import and restore the `base.qdb` file, which has been precompiled and exported from a base revision compilation.

When developing your Custom Platform from the a10_ref Reference Platform, it is essential to maintain the `flat.qsf`, `base.qsf`, `top.qsf`, and `top_synth.qsf` Intel Quartus Prime Settings Files.

The a10_ref Reference Platform includes two additional partitions: the `Top` partition and the `kernel_system` partition. The `Top` partition contains all logic, and the `kernel_system` partition contains the logic in the PR region. The PR region is specified by the following assignments:

```tcl
set_instance_assignment -name PARTIAL_RECONFIGURATION_PARTITION ON -to freeze_wrapper_inst|kernel_system_inst
```

*Generating the base.qar Post-Fit Netlist for Your Intel Arria 10 Custom Platform* on page 20

### 3.7 Intel Quartus Prime Compilation Flow and Scripts

The `import_compile.tcl` Tcl Script File in the Intel Arria 10 GX FPGA Development Kit Reference Platform controls the Intel Quartus Prime compilation flow.
Invoke the Intel Quartus Prime compilation flow by calling the following `quartus_sh` executables:

- The board developer runs the `quartus_sh --flow compile top --c base` command to execute the base revision compilation. This compilation closes timing, locks down the static region, and generates the `base.qdb` file.
- The user of the Intel Arria 10 FPGA Development Kit Reference Platform or a Custom Platform runs the `quartus_sh -t import_compile.tcl` command to execute the import revision compilation. This compilation generates programming files that are guaranteed to be timing closed and PR-compatible with each other.

### 3.7.1 Enabling the Intel Quartus Prime Forward-Compatibility Flow

The forward-compatibility flow allows you to use `base.qdb` files that are forward compatible with future versions of the Intel Quartus Prime Pro Edition software.

Enabling the forward-compatibility flow allows you to use board vendor-generated precompiled post-fit netlists, in the form of the `base.qdb` file, in a future Intel Quartus Prime Pro Edition software version. The forward-compatibility flow eliminates the need to match the Intel Quartus Prime Pro Edition software version used to develop the Custom Platform and the version used to run the Custom Platform.

**Warning:** Intel does not guarantee that the compilation of your board design in a future version of the Intel Quartus Prime Pro Edition software will be successful. It is possible that your `base.qdb` file implements a configuration that will become illegal in future Intel Quartus Prime Pro Edition software versions.

If you are migrating a previous version of the Intel Arria 10 GX FPGA Development Kit Reference Platform to the current version and you want to incorporate the forward-compatibility flow, perform the following tasks:

1. Add the following command in the `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/scripts/post_flow_pr.tcl` script to generate a forward-compatible `base.qdb` file:
   ```
   quartus_cdb top --c base --export_design --snapshot final --file base.qdb
   ```
   For information on the function of the `post_flow_pr.tcl` script, refer to *Quartus Prime Compilation Flow for Board Developers*.

2. In the `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/import_compile.tcl` script, add the `quartus_fit` and then the `quartus_asm` commands after importing the `base.qdb` file.
   Running these commands verifies that the imported `base.qdb` file is usable in the Intel Quartus Prime Pro Edition software version that Custom Platform users work with.
   For more information on the function of the `import_compile.tcl` script, refer to the *Intel Quartus Prime Compilation Flow for Custom Platform Users*.

3.7.2 Intel Quartus Prime Compilation Flow for Board Developers

The `quartus_sh --flow compile top -c base` command executes the Intel Quartus Prime compilation flow that generates a `base.sof` full-chip JTAG programming file within the `.aocx` file.

The script performs the necessary tasks to ensure that the import revision compilations using the timing-closed and locked-down static region are PR-compatible with each other.

Running the `quartus_sh --flow compile top -c base` command executes the following tasks:

- **Runs** `quartus_syn` to execute the Analysis and Synthesis stage of the Intel Quartus Prime compilation flow.
- **Runs** `quartus_fit` to execute the Place and Route stage of the Intel Quartus Prime compilation flow.
- **Runs** `quartus_sta` to execute the Static Timing Analysis stage of the Intel Quartus Prime compilation flow.
- **Runs** the `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/scripts/post_flow_pr.tcl` file.

The `post_flow_pr.tcl` script determines the maximum frequency at which the OpenCL kernel can run and generates the corresponding PLL settings. The script then reruns static timing analysis. The script also exports the compilation database of the base revision compilation results as a forward-compatible Partition Database File (`.qdb`). Refer to the QDB File Generation section for more information.

- **Runs** `quartus_asm` to generate the `.sof` file with updated embedded PLL settings. Updating the `.sof` file allows it to run safely on the board with the maximum kernel frequency.
- **Generates** the `fpga.bin` file, which contains the full-chip programming file. The full-chip programming file (`base.sof`) is in the `.acl.sof` section of the `fpga.bin` file.

The `.aocx` file that the base revision compilation flow generates only contains the `.sof` full-chip programming file. It does not contain a programming file that can be used with PR because this `.aocx` file is only intended to be written to Flash memory as the default FPGA image. The Intel FPGA SDK for OpenCL program utility automatically uses JTAG programming when it programs with a `.aocx` file from the base revision compilation. Only the import revision compilation flow, executed by the SDK user, generates a `.aocx` file that can be used with PR.

- Hash Checking on page 50
- Platform Designer System Generation on page 50
- QDB File Generation on page 50
3.7.3 Intel Quartus Prime Compilation Flow for Custom Platform Users

The `import_compile.tcl` script executes the Intel Quartus Prime compilation flow that generates a `top.sof` full-chip JTAG programming file and a `top.rbf` PR bitstream file within the `.aocx` file.

The `import_compile.tcl` script executes the following tasks:

- Runs the `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/scripts/pre_flow_pr.tcl` file. The `pre_flow_pr.tcl` script generates the `board.qsys` and the `kernel_system.qsys` Platform Designer System Files. Refer to the Platform Designer System Generation section for more information.
- Imports the base revision compilation results as a `.qdb` file. Refer to the QDB File Generation section for more information.
- Runs `quartus_fit` and `quartus_asm` to verify that the `.qdb` file is forward compatible.
- Runs `quartus_syn` to execute the Analysis and Synthesis stage of the Intel Quartus Prime compilation flow for the kernel partition only.
- Runs `quartus_fit` to execute the Place and Route stage of the Intel Quartus Prime compilation flow for the entire design.
- Runs `quartus_sta` to execute the Static Timing Analysis stage of the Intel Quartus Prime compilation flow.
- Runs the `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/scripts/post_flow_pr.tcl` file. The `post_flow_pr.tcl` script determines the maximum frequency at which the OpenCL kernel can run and generates the corresponding PLL settings. The script then reruns the static timing analysis.
- Runs `quartus_asm` to generate the full-chip programming files for the base revision.
- Runs `quartus_asm` to generate the full-chip programming files for the import revision.
- Generates the `fpga.bin` file, which contains the following files and IDs:
  - The `top.sof` full-chip programming file.
  - The `top.rbf` PR programming file.
  - The `pr_base.id` unique ID for PR base revision.

Before `quartus_asm` generates the `.sof` file in an import revision compilation, the static region of the import revision compilation is compared to the static region of the base revision compilation to check for errors. To prevent a mismatch error in the I/O configuration shift register (IOCSR) bits, the PLL settings in the `base.sof` and `top.sof` files must be identical. When designing the Intel Arria 10 FPGA Development Kit Reference Platform, Intel ensured in the `import_compile.tcl` Tcl script that the PLL settings in both the `base.sof` file and the `top.sof` file are identical, resulting in an additional `quartus_asm` execution step to regenerate the `base.sof` file.

- QDB File Generation on page 50
3.7.4 Platform Designer System Generation

The Intel FPGA SDK for OpenCL Offline Compiler generates the board.qsys and kernel_system.qsys Platform Designer systems in the `INTELFPGAOCLSDKROOT/board/<custom_platform>/hardware/<board_name>` directory after successfully completing a first-stage compilation. The `INTELFPGAOCLSDKROOT` environment variable points to the location of the Intel FPGA SDK for OpenCL installation directory.

The board.qsys Platform Designer system represents the bulk of the static region. The kernel_system.qsys Platform Designer system is the top-level of the PR region. The `pre_flow_pr.tcl` script generates both Platform Designer systems on the fly before the beginning of the Intel Quartus Prime compilation flow in both the base and import revision compilations.

3.7.5 QDB File Generation

The base.qdb Intel Quartus Prime Compilation Database File contains all the necessary compilation database information for importing a timing-closed and placed-and-routed netlist of the static region.

The `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/scripts/post_flow_pr.tcl` script creates the base.qdb file. The .tcl file invokes the export_design command to export the entire base revision compilation database to the base.qar file that also contains the base.sdc and pr_base.id files. For your Custom Platform, you do not need to add the base.sdc and pr_base.id files to the board directory (that is, `INTELFPGAOCLSDKROOT/board/<custom_platform>/hardware/<board_name>`) separately.

3.7.6 Hash Checking

Intel assigns a unique ID to each base revision compilation to ensure a safe way of only partially reconfiguring a PR region on top of a design that has a matching static region.

The unique ID is generated at the beginning of a base revision compilation using the MD5 message-digest algorithm. The MD5 algorithm generates a hash of a text file that contains the current working directory and a high-resolution timer value. The MD5 algorithm then truncates the hash to a 32-bit value. The `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/scripts/pre_flow_pr.tcl` script stores this 32-bit value in the pr_base_id register IP within the board.qsys Platform Designer system by overwriting the default value of 0xdeadbeef.

The unique ID for the base revision compilation is added to the pr_base.id file. The ID becomes part of the import revision compilation directory after the pr_base.id file is copied from the `INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx` directory. During the fpga.bin generation step of the import revision compilation, the unique ID is added as the .acl.hash section of the fpga.bin file.

When the Intel FPGA SDK for OpenCL user invokes the aocl program utility to reconfigure the FPGA, the software first checks that the pr_base_id value in the currently programmed static region matches the hash value in the fpga.bin section.
within the .aocx file. If the two 32-bit values match, it is safe to execute partial reconfiguration. If the 32-bit values do not match, the aocl program utility performs full-chip JTAG programming via Intel FPGA Download Cable.

### 3.8 Addition of Timing Constraints

A Custom Platform must apply the correct timing constraints to the Intel Quartus Prime project. In the Intel Arria 10 FPGA Development Kit Reference Platform, the top.sdc file contains all timing constraints applicable before IP instantiation in Platform Designer. The top_post.sdc file contains timing constraints applicable after Platform Designer.

The order of the application of time constraints is based on the order of appearance of the top.sdc and top_post.sdc in the top.qsf file.

One noteworthy constraint in the a10_ref Reference Platform is the multicycle constraint for the kernel reset in the top_post.sdc file. Using global routing saves routing resources and provides more balanced skew. However, the delay across the global route might cause recovery timing issues that limit kernel clock speed. Therefore, it is necessary to include a multicycle path on the global reset signal.

### 3.9 Connection of the Intel Arria 10 GX FPGA Development Kit Reference Platform to the Intel FPGA SDK for OpenCL

A Custom Platform must include a board_env.xml file to describe its general contents to the Intel FPGA SDK for OpenCL Offline Compiler. For each hardware design, your Custom Platform also requires a board_spec.xml file for each hardware design that describes the hardware.

The following sections describe the implementation of these files for the Intel Arria 10 GX FPGA Development Kit Reference Platform.

#### 3.9.1 Describe the Intel Arria 10 GX FPGA Development Kit Reference Platform to the Intel FPGA SDK for OpenCL

The INTELFPGAOCLSDKROOT/board/a10_ref/board_env.xml file describes the Intel Arria 10 GX FPGA Development Kit Reference Platform to the Intel FPGA SDK for OpenCL. Details of each field in the board_env.xml file are available in the *Creating the board_env.xml File* section of the *Intel FPGA SDK for OpenCL Custom Platform Toolkit User Guide*.

In the a10_ref Reference Platform, Intel uses the bin folder for Windows dynamic link libraries (DLLs), the lib directory for delivering libraries, and the libexec directory for delivering the SDK utility executables. This directory structure allows the PATH environment variable to point to the location of the DLLs (that is, bin) in isolation of the SDK utility executables.
3.9.2 Describe the Intel Arria 10 GX FPGA Development Kit Reference Platform Hardware to the Intel FPGA SDK for OpenCL

The Intel Arria 10 GX FPGA Development Kit Reference Platform includes an INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/board_spec.xml file that describes the hardware to the Intel FPGA SDK for OpenCL.

Device

The device section contains the name of the device model file available in the INTELFPGAOCLSDKROOT/share/models/dm directory of the SDK and in the board spec.xml file. The used_resources element accounts for all logic outside of the kernel partition. The value of used_resources for alms equals the difference between the total number of adaptive logic modules (ALMs) used in final placement and the total number of ALMs available to the kernel partition. You can derive this value from the Partition Statistic section of the Fitter report after a compilation. Consider the following ALM categories within an example Fitter report:

```
+-----------------------------------------------------------------------------
| ; Fitter Partition Statistics                                               |
| +-----------------------------------------+                          |
| ; Statistic ; l freeze_wrapper_inst| |
| kernel_system_inst ;                  |
| +-----------------------------------------+                          |
| ; ALMs needed [=A-B+C] ; 0 / 427200 (0%) ; 0 / 385220 (0%)                 |
```

The value of used_resources equals the total number of ALMs in l minus the total number of ALMs in freeze_wrapper_inst|kernel_system_inst. In the example above, used_resources = 427200 - 385220 = 41980 ALMs.

You can derive used_resources for rams and dsps in the same way using M20Ks and DSP blocks, respectively. The used_resources value for ffs is four times the used_resources value for alms because there are two primary and two secondary logic registers per ALM.

Global Memory

In the board_spec.xml file, there is one global_mem section for DDR memory. Assign the string DDR to the name attribute of the global_mem element. The board instance in Platform Designer provides all of these interfaces. Therefore, the string board is specified in the name attribute of all the interface elements within global_mem.
• DDR

Because DDR memory serves as the default memory for the board that the a10_ref Reference Platform targets, its address attribute begins at zero. Its config_addr is 0x018 to match the memorg conduit used to connect to the corresponding OpenCL Memory Bank Divider for DDR.

**Attention:** The width and burst sizes must match the parameters in the OpenCL Memory Bank Divider for DDR (memory_bank_divider).

**Interfaces**

The interfaces section describes kernel clocks, reset, CRA, and snoop interfaces. The OpenCL Memory Bank Divider for the default memory (in this case, memory_bank_divider) exports the snoop interface described in the interfaces section. The width of the snoop interface should match the width of the corresponding streaming interface.

### 3.10 Intel Arria 10 FPGA Programming Flow

There are three ways to program the Intel Arria 10 FPGA for the Intel Arria 10 GX FPGA Development Kit Reference Platform: Flash, quartus_pgm, and partial reconfiguration (PR).

In the order from the longest to the shortest configuration time, the three FPGA programming methods are as follows:

- To replace both the FPGA periphery and the core while maintaining the programmed state after power cycling, use Flash programming.
- To replace both the FPGA periphery and the core, use the Intel Quartus Prime Programmer command-line executable (quartus_pgm) to program the device via cables such as the Intel FPGA Download Cable (formerly USB-Blaster).
- To replace only the kernel portion of the device, use PR.

The default FPGA programming flow is to use PR over PCIe. The Partial Reconfiguration Controller IP instantiates PR over PCIe using the following IP parameter settings:

<table>
<thead>
<tr>
<th>Parameter Settings for the Partial Reconfiguration Controller IP</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>-----------------</td>
</tr>
<tr>
<td>Use as PR Internal Host</td>
</tr>
<tr>
<td>Enable Avalon-MM slave interface</td>
</tr>
<tr>
<td>Input data width</td>
</tr>
<tr>
<td>Clock-to-Data ratio</td>
</tr>
<tr>
<td>Divide error detection frequency by</td>
</tr>
<tr>
<td>Auto-instantiate PR block</td>
</tr>
<tr>
<td>Auto-instantiate CRC block</td>
</tr>
</tbody>
</table>
The 50 MHz config_clk clocks the Partial Reconfiguration Controller IP. The Avalon-MM interface connects to the host control bus on PCIe BAR4. Using PCIe Gen3x8 under these configuration settings, the duration of partial reconfiguration of the PR region is about 1.6 seconds.

You cannot use PR if there is a mismatch between the hash within the .aocx file and the hash in the static region of the current image on the FPGA. In this case, program the FPGA via Intel FPGA Download Cable by invoking quartus_pgm instead. If the .aocx file is not PR compatible with the current image on the FPGA, the Intel Quartus Prime Programmer displays the following message:

```plaintext
aoc1 program acl0 boardtest.aocx
aoc1 program: Running program from <path_to_a10_ref>/linux64/libexec
Reprogramming device with handle 1
MMD INFO : [acla10_ref0] PR base and import compile IDs do not match
MMD INFO : [acla10_ref0] PR base ID currently configured is 0x7d056bf2
MMD INFO : [acla10_ref0] PR import compile expects ID to be 0x30242eb9
mmd program_device: Board reprogram failed
```

Only use quartus_pgm via Intel FPGA Download Cable if you use a cable to connect the board and the host computer. Cabling is a point of potential failure, and it does not scale well to large deployments. If possible, reserve the quartus_pgm programming approach for development and testing purposes only.

If PR fails, an attempt is automatically made to detect the Intel FPGA Download Cable and do a full JTAG programming.

### 3.10.1 Define the Contents of the fpga.bin File for the Intel Arria 10 GX FPGA Development Kit Reference Platform

You may arbitrarily define the contents of the fpga.bin file in a Custom Platform because it passes from the Intel FPGA SDK for OpenCL to the Custom Platform as a black box. Intel defines the contents of the fpga.bin file in the Intel Arria 10 GX FPGA Development Kit Reference Platform as an Executable and Linkable Format (ELF) binary that organizes the various fields into sections.

#### Table 13. Contents of the Intel Arria 10 GX FPGA Development Reference Platform’s fpga.bin File

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.acl.sof</td>
<td>The full programming bitstream for the compiled design. This section appears in the fpga.bin files generated from both the base revision and the import revision compilations.</td>
</tr>
<tr>
<td>.acl.core.rbf</td>
<td>The PR programming bitstream for the kernel region. This section only appears in the fpga.bin file generated from import revision compilation.</td>
</tr>
<tr>
<td>.acl.hash</td>
<td>The unique ID for the base revision compilation. This section only appears in the fpga.bin file generated from import revision compilation.</td>
</tr>
</tbody>
</table>

### 3.11 Host-to-Device MMD Software Implementation

The Intel Arria 10 GX FPGA Development Kit Reference Platform’s MMD layer is a thin software layer that is essential for communication between the host and the board. A full implementation of the MMD library is necessary for every Custom Platform for the proper functioning of the OpenCL host applications and board utilities. Details of the
API functions, their arguments, and return values for MMD layer are specified in the 
<your_custom_platform>/source/include/aocl_mmd.h file, where 
<your_custom_platform> points to the top-level directory of your Custom Platform.

The source codes of an MMD library that demonstrates good performance are available 
in the INTELFPGAOCLSDKROOT/board/a10_ref/source/host/mmd directory. 
Refer to the Host-to-Device MMD Software Implementation section in the Stratix V 
Network Reference Platform Porting Guide for more information.

For more information on the MMD API functions, refer to the MMD API Descriptions 
section of the Intel FPGA SDK for OpenCL Custom Platform Toolkit User Guide.

3.12 Implementation of Intel FPGA SDK for OpenCL Utilities

The Intel Arria 10 GX FPGA Development Kit Reference Platform includes a set of Intel 
FPGA SDK for OpenCL utilities for managing the FPGA board.

For more information on the implementation requirements of the AOCL utilities, refer 
to the Providing Intel FPGA SDK for OpenCL Utilities Support section of the Intel FPGA 
SDK for OpenCL Custom Platform Toolkit User Guide.

Related Links

Providing Intel FPGA SDK for OpenCL Utilities Support

3.12.1 aocl install

The install <path_to_customplatform> utility in the Intel Arria 10 GX FPGA 
Development Kit Reference Platform installs the kernel driver on the host computer. 
Users of the Intel FPGA SDK for OpenCL only need to install the driver once, after 
which the driver should be automatically loaded each time the machine reboots.

Attention: You must have write privileges to the SDK directory to install the kernel directory.

Windows

The install.bat script is located in the <your_custom_platform> 
\windows64\libexec directory, where <your_custom_platform> points to the top-
level directory of your Custom Platform. This install.bat script triggers the 
install executable from Jungo Connectivity Ltd. to install the WinDriver on the host 
machine.

Linux

The install script is located in the <your_custom_platform>/linux64/ 
libexec directory. This install script first compiles the kernel module in a 
temporary location and then performs the necessary setup to enable automatic driver 
loading after reboot.
3.12.2 aocl uninstall

The uninstall <path_to_customplatform> utility in the Intel Arria 10 GX FPGA Development Kit Reference Platform removes the current host computer drivers used for communicating with the board.

**Windows**

The uninstall.bat script is located in the <your_custom_platform>\windows64\libexec directory, where <your_custom_platform> points to the top-level directory of your Custom Platform. This uninstall.bat script triggers the uninstall executable from Jungo Connectivity Ltd. to uninstall the WinDriver on the host machine.

**Linux**

The uninstall script is located in the <your_custom_platform>/linux64/libexec directory. This uninstall script removes the driver module from the kernel.

3.12.3 aocl program

The program utility in the Intel Arria 10 GX FPGA Development Kit Reference Platform programs the board with the specified .aocx file. Calling the aocl_mmd_reprogram() MMD API function implements the program utility.

3.12.4 aocl flash

The flash utility in the Intel Arria 10 GX FPGA Development Kit Reference Platform configures the power-on image for the FPGA using the specified .aocx file. Calling into the MMD library implements the flash utility.
Figure 5. **JTAG Chain with Intel Arria 10 FPGA, MAX V CPLD, and CFI Flash Memory**
This figure illustrates the JTAG chain and the location of the common flash interface (CFI) relative to the MAX V CPLD on the Intel Arria 10 GX FPGA Development Kit.

3.12.5 *aocl diagnose*

The diagnose utility in the Intel Arria 10 GX FPGA Development Kit Reference Platform reports device information and identifies issues. The diagnose utility first verifies the installation of the kernel driver. Depending on whether an additional argument is specified in the command, the utility then performs different tasks.

Without an argument, the utility returns the overall information of all the devices installed in a host machine. If a specific device name is provided as an argument (that is, *aocl diagnose* `<device_name>`), the diagnose utility runs a memory transfer test and then reports the host-device transfer performance.

You can run the diagnose utility for multiple devices (that is, *aocl diagnose* `<device_name1>` `<device_name2>` `<device_name3>`). If you want to run the diagnose utility for all devices, use the `all` option (that is, *aocl diagnose* `all`).

3.12.5.1 Possible Errors After Running the *diagnose* Utility

This section provides debugging steps to some of the errors you might encounter after implementing the diagnose utility.

**Memory Module Not Plugged-in or a Loose Connection on the Board**

If the memory module is not plugged in or if there is a loose connection on the board, you might see errors similar to the following example:

```
aocl diagnose: Running diagnose from
aocl diagnose: failed 32 times. First error below:
MMD INFO: [acla10_ref0] uniphy(s) did not calibrate. Expected 0 but read 2
MMD INFO: If there are more failures than Uniphy controllers connected,
MMD INFO: ensure the uniphy_status core is correctly parameterized.
```
Solution

Confirm that you have connected the memory board, power cable, and USB cable correctly as shown in Configuring and installing the Intel Arria 10 GX FPGA Development Kit board. If you have confirmed your connections and continue to get this error, the memory board might not be seated correctly in the HiLo connector.

Error While Loading Shared Libraries

When you execute diagnose all utility, you might see errors as shown in the following example:

```
$ aocl diagnose all
hld/board/a10_ref/linux64/libexec/diagnose: error while loading shared libraries:
libaltera_a10_ref_mmd.so: cannot open shared object file: No such file or directory
```

Solution

Ensure that you have set the PATH environment variable correctly.

```
export PATH=$PATH:$INTELFPGAOCLSDKROOT/bin:$QUARTUS_DIR/bin
```

3.12.6 aocl list-devices

The list-devices utility lists all the devices installed in a host machine, grouped by board packages.

The list-devices utility is similar to the diagnose utility. It first verifies the installation of the kernel driver and then lists all the devices.

3.13 Intel Arria 10 FPGA Development Kit Reference Platform Scripts

The Intel Arria 10 FPGA Development Kit Reference Platform includes a number of Tcl scripts in its hardware/<board_name>/scripts directory.

Table 14. Tcl Scripts within the INTELFPGAOCLSDKROOT/board/a10_ref/hardware/a10gx/scripts Directory

<table>
<thead>
<tr>
<th>Script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_write_sdc.tcl</td>
<td>The post_flow_pr.tcl script runs this script during the base revision compilation. The base_write_sdc.tcl script then exports all the SDC constraints to the base.sdc file, which is part of the board directory.</td>
</tr>
<tr>
<td>create_fpga_bin_pr.tcl</td>
<td>Creates the ELF binary file, fpga.bin, from the .sof file, the .rbf file, and the pr_base.id file.</td>
</tr>
<tr>
<td>post_flow_pr.tcl</td>
<td>This script runs after every Intel Quartus Prime Pro Edition software compilation. It facilitates the guaranteed timing flow by setting the kernel clock PLL, generating a small report in the acl_quartus_report.txt file, and rerunning STA with the modified kernel clock settings.</td>
</tr>
<tr>
<td>pre_flow_pr.tcl</td>
<td>This script generates the RTL of the top-level board.qsys Platform Designer system for the static region and the kernel_system.qsys Platform Designer system for the kernel PR region.</td>
</tr>
</tbody>
</table>
### qar_ip_files.tcl
Tcl script that packages up all IP files in the base revision compile to create base.qar.

### create_acds_ver_hex.tcl
Tcl script that creates quartus_version.id and acds_version_rom.mif files. PR can be done only if the programmed AOCX was compiled from the same Quartus version as AOCX being programmed.

- quartus_version.id is stored in AOCX so that at runtime, BSP can determine Quartus version of AOCX being programmed.
- acds_version_rom.mif is used during compilation, to update the contents of on-chip memory in the SOF file.

### regenerate_cache.tcl
Tcl script that regenerates the BAK cache file in your temporary directory.

---

### 3.14 Considerations in Intel Arria 10 GX FPGA Development Kit Reference Platform Implementation

The implementation of the Intel Arria 10 GX FPGA Development Kit Reference Platform includes some workarounds that address certain Intel Quartus Prime Pro Edition software known issues.

- The `quartus_syn` executable reads the SDC files. However, it does not support the Tcl command `get_current_revision`. Therefore, in the `top_post.sdc` file, a check is in place to determine whether `quartus_syn` has read the file before checking the current version.

In addition to these workarounds, take into account the following considerations:

- Intel Quartus Prime compilation is only ever performed after the Intel FPGA SDK for OpenCL Offline Compiler embeds an OpenCL kernel inside the system.
- Perform Intel Quartus Prime compilation after you install the Intel FPGA SDK for OpenCL and set the `INTELFPGAOCLSDKROOT` environment variable to point to the SDK installation.
- The name of the directory where the Intel Quartus Prime project resides must match the `name` field in the `board_spec.xml` file within the Custom Platform. The name must be case sensitive.
- The `PATH` or `LD_LIBRARY_PATH` environment variable must point to the MMD library in the Custom Platform.
## 4 Document Revision History

### Table 15. Document Revision History of the Intel Arria 10 GX FPGA Development Kit Reference Platform Porting Guide

<table>
<thead>

<tr>
<td></td>
<td></td>
<td>— LogicLock as Logic Lock</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In 6 on page 12, added an example code.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Connecting the Memory in the Intel Arria 10 Custom Platform on page 17, added cross references to University program page and Signal Tap II logic analyzer tutorial.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Partial Reconfiguration on page 31, added a related link to Partial Reconfiguration IP Core.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Floorplan on page 38, added a related link to Creating Logic Lock Plus Regions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Features of the Intel Arria 10 GX FPGA Development Kit Reference Platform on page 5, added OpenCL Host Pipe feature.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Intel Arria 10 GX FPGA Development Kit Reference Platform Board Variants on page 6, added the a10gx_hostch variant.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Instantiation of Intel Arria 10 PCIe Hard IP with Direct Memory Access on page 22, updated Instantiate Internal Descriptor Controller Enabled parameter for the disabled setting for a10gx_hostch board variant.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Instantiation of the version_id Component on page 26, updated the version ID for the a10_ref Reference Platform.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Definitions of Intel Arria 10 FPGA Development Kit Reference Platform Hardware Constraints in Software Headers Files on page 26, added hw_host_channel.h header file that defines the host channel IP control register address and names of the channels.</td>
</tr>
</tbody>
</table>

continued...
• Renamed the references of the following:
  — acl_ddr4_a10_core.qsys to ddr4.qsys
  — acl_ddr4_a10.qsys to mem.qsys
  — ip/acl_ddr4_a10/ to ip/mem/
  — ip/acl_ddr4_a10_core/ to ip/ddr4/
• In Intel Quartus Prime Compilation Flow for Custom Platform Users on page 49, removed the bullet point about running `quartus_cpf` to generate the PR programming files since it is done automatically in the flow now.
• In PCIe Kernel Driver for the Intel Arria 10 GX FPGA Development Kit Reference Platform on page 27, updated the description of aclpci_dma.c file to include host channel.
• In Contents of the Intel Arria 10 GX FPGA Development Kit Reference Platform on page 6:
  — Added `ip/host_channel` and `scripts/create_acds_ver_hex.tcl` to the table.
  — Removed `scripts/bak_flow.tcl` and `scripts/helpers.tcl` since both scripts are now moved to Intel FPGA SDK for OpenCL.
  — Corrected `board.Qsys Pro, acl_ddr4_a10.Qsys Pro and acl_ddr4_a10_core.Qsys Pro` as `board.qsys, acl_ddr4_a10.qsys` and `acl_ddr4_a10_core.qsys`.
• Implemented single dash and `-option=<value>` conventions in the following topics:
  — Intel Arria 10 GX FPGA Development Kit Reference Platform Board Variants on page 6
  — Integrating Your Intel Arria 10 Custom Platform with the Intel FPGA SDK for OpenCL on page 13
  — Guaranteeing Timing Closure in the Intel Arria 10 Custom Platform on page 19
  — Initializing Your Intel Arria 10 Custom Platform on page 11
• Updated the topic `aocl diagnose` on page 57 to include options to diagnose multiple devices and all devices.
• Added the following new topics:
  — Changes in Intel Arria 10 Development Kit Reference Platform from 17.0 to 17.1 on page 9
  — `aocl list-devices` on page 58
  — Possible Errors After Running the diagnose Utility on page 57
  — Host Channel on page 33
  — Host Channel IP Instantiation on page 33
  — Host Channel Top Connection to PCIe DMA on page 33
  — Host Channel Top Connection to OpenCL Kernel on page 34
• Updated the topics `aocl install` on page 55 and `aocl uninstall` on page 56 to include the path to custom platform during installation and uninstallation. Added a Attention note in the `aocl install` on page 55 about the need for write privileges for the SDK directory.
• In Initializing Your Intel Arria 10 Custom Platform on page 11 and Establishing Intel Arria 10 Custom Platform Host Communication on page 15, removed reference to the environment variable `AOCL_BOARD_PACKAGE_ROOT` since it is deprecated and and updated instances of `aocl install updated as aocl install <path_to_customplatform>`.
• In Integrating Your Intel Arria 10 Custom Platform with the Intel FPGA SDK for OpenCL on page 13, added a new step 2 about setting the environment variable `ACL_DEFAULT_FLOW` to `flat`.

</tbody>
</table>
| October 2016 | 2016.10.31  | • Rebranded Altera SDK for OpenCL to Intel FPGA SDK for OpenCL.  
• Rebranded Altera Offline Compiler to Intel FPGA SDK for OpenCL Offline Compiler.  
• Changed the short-form name of the Reference Platform from altera_a10pciedk to a10_ref, to match the directory name in the SDK.  
• Added notice that you must contact your field applications engineer or regional support center representative to configure the Arria 10 GX FPGA Development Kit before using it with the SDK.  
• Removed the a10gx_es2 and the a10gx_es3 board variants from the Reference Platform. The a10_ref Reference Platform only supports the a10gx board variant.  
• In Contents of the Arria 10 GX FPGA Development Kit Reference Platform:  
  — For Windows, changed the source_windows64 directory to source.  
  — Updated the list of files available in the a10gx subdirectory.  
  — Removed information for the max5_133.pof file.  
• Removed statement regarding PR being an early-access feature.  
• Updated the location of the acl_ddr4_a10.qsys and acl_ddr4_a10_core.qsys files from the a10gx/ip directory to the top-level a10gx directory. The board.qsys, acl_ddr4_a10.qsys, and acl_ddr4_a10_core.qsys systems were migrated to Qsys Pro.  
• In the ip subdirectory, added .ip files that contain parameters of instantiated external OpenCL IP. Refer to Contents of the Arria 10 GX FPGA Development Kit Reference Platform for more information.  
• Added an opencl_bsp_ip.qsf file so that qsys_archive in Qsys Pro can insert .qsys and .ip files into this revision. All Verilog and Qsys source files from top.sdc and top_post.sdc are now in opencl_bsp_ip.qsf.  
• In Modifying the Arria 10 GX FPGA Development Kit Reference Platform Design, added a step to update the device.tcl file with the correct settings.

<th>Changes</th>
</tr>
</thead>
</table>
|      |         | • In *Changing the Device Part Number*:  
|      |         |   — Noted that the QSF setting for the device part number is now in *device.tcl* instead of *flat.qsf*. The following device-specific assignments are now in *device.tcl*:  
|      |         |     *FAMILY, MIN_CORE_JUNCTION_TEMP, MAX_CORE_JUNCTION_TEMP, DEVICE_FILTER_PACKAGE, DEVICE_FILTER_PIN_COUNT, ERROR_CHECK_FREQUENCY_DIVISOR, STRATIX_DEVICE_IO_STANDARD, RESERVE_ALL_UNUSED_PINS_WEAK_PULLUP, RESERVE_DATA0_AFTER_CONFIGURATION*  
|      |         |   — Noted that the device part number must be updated in *acl_ddr4_a10.qsys* and *acl_ddr4_a10_core.qsys*, in addition to *board.qsys*.  
|      |         | • In *Guaranteeing Timing Closure in the Arria 10 Custom Platform* and *Generating the base.qdb Post-Fit Netlist for Your Arria 10 Custom Platform*, noted that *base.sdc* must be copied along with *base.qdb* and *pr_base_id.txt* into the Custom Platform.  
|      |         | • In *Floorplan*, updated the floorplan of the *a10_ref Reference Platform*.  
|      |         | • In *Provide a Timing-Closed Post-Fit Netlist*, removed the QSF assignments that enabled the Spectra-Q engine compilation flow for base and top revision compilations. The *base.qsf* file no longer needs to be updated in order to enable the flow.  
|      |         | • In *Enabling the Quartus Prime Spectra-Q Forward_Compatibility Flow*:  
|      |         |   — Modified the Quartus Prime software command to be added to the *post_flow_pr.tcl* script to generate the forward-compatible *base.qdb* file.  
|      |         |   — Removed the step of modifying the *quartus.ini* file because it is no longer needed.  
|      |         | • In *Quartus Prime Compilation Flow for Board Developers*, modified the list of tasks that are performed when the *quartus.sh --flow compile top --c base* command was invoked because the process would no longer run the *pre_flow_pr.tcl* script.  
|      |         | • In the *top.qpf* file, reorganized the order of the revisions to *opencl_bsp_ip, flat, base, top_synth, and then top*. In addition, removed old references to Intel Quartus Prime software version 15.1 continued...
<table>
<thead>
<tr>
<th>Date</th>
<th>Version</th>
<th>Changes</th>
</tr>
</thead>
</table>
| July 2016  | 2016.07.29 | • Modified top_post.sdc file to reflect Qsys Pro RTL hierarchy changes  
• To facilitate Partial Reconfiguration:  
  — Added set_global_assignment -name REVISION_TYPE PR_BASE to the base.qsf file  
  — Added set_global_assignment -name REVISION_TYPE PR_BASE to the top_synth.qsf file  
  — Added set_global_assignment -name REVISION_TYPE PR_IMPL to the top.qsf file  
  — In the quartus.ini file, removed the following lines:  
    • qhd_enable_pr_bak_export=on  
    • pr_allow_lims_on_globals_user Guarantee_frozen_high=on  
    • apl_use_advanced_pcl=off  
    • qhd_force_bak_export=on and  
    • hd_force_bak_import=on  
• In the flat.qsf file:  
  — Removed the wildcarded LREGION assignments for pipe_stage_dma* and pipe_stage_PCIE_* and the commented GLOBAL_SIGNAL assignments.  
  — Added the line PR_ALLOWLOBAL LIMS ON -to freeze_wrapper_inst|kernel_system_clock_Reset_Reset_Reset_n  
  — Changed the GLOBAL_SIGNAL assignment to kernel clocks  
| May 2016   | 2016.05.09 | • Maintenance release.  
• In Arria 10 GX FPGA Development Kit Reference Platform Board Variants and Initializing Your Arria 10 Custom Platform, added reminder to match the board variant with the status of the Arria 10 device on your board.  
• Modified content to reflect the creation of the base.qdb file in lieu of the base_qhd.qar file.  
• Modified content to reflect the implementation of the flat.qsf file, which contains all the common QSF assignments shared among the base.qsf, top.qsf, and top_synth.qsf files. Use the flat revision for compilation flows that cannot use PR and do not require guaranteed timing. Because the flat revision is included in both the base and top revisions, use the flat revision to expand your design (for example, to attach extra DDR memory banks on your board).  
• Modified content to reflect the updated functionality of the pre_flow_pr.tcl and post_flow_pr.tcl scripts.  
• Updated the command you run to execute the base revision compilation from quartus_sh -v base_compile.tcl to quartus_sh --flow compile top --c base. This update enables you to compile the design from the Quartus Prime Pro Edition software GUI.  
• Removed the ip/acl_kernel_clk_a10/ acl_kernel_clk_a10.qsys and ip/acl_temperature_a10/ acl_temperature_sensor_a10.qsys files from the Reference Platform because the acl_kernel_clk_a10 and acl_temperature_sensor_a10 IP are now part of the Altera SDK for OpenCL. Use the IPs from AOCL instead of duplicating them in your Custom Platform. A check is in place to verify that these IPs are not duplicated in your Custom Platform. |
The guaranteed timing flow is now part of AOCL. To avoid duplication, removed the following files from the Reference Platform:

- `adjust_pll.tcl`, which creates the PLL configuration file and modifies the PLL atoms
- `pr_checks.tcl`, which checks for initialized MLABs

Removed information on the following legacy files; they are no longer part of the Reference Platform:

- `hardware/<board_name>/base_compile.tcl`
- `hardware/<board_name>/base_qhd.qar`
- `hardware/<board_name>/system.qsys`
- `scripts/call_script_as_function.tcl`
- `scripts/create_pr_base_id.tcl`

Added memory hierarchy in `board.qsys`:

- The DDR4 subsystem is now in a separate IP located in the `ip/acl_ddr4_a10` directory
- The DDR4 core and pipeline stages are not in separate Qsys systems

In *Describe the Arria 10 GX FPGA Development Kit Reference Platform Hardware to the AOCL*, updated the example Fitter Partition Statistics report and the explanation on how to calculate `used_resources` for `alms`.

Under *Quartus Prime Compilation Flow and Scripts*, added the section *Enabling the Quartus Prime Spectra-Q Forward-Compatibility Flow*. Modified the `import_compile.tcl` file and added INI settings to `quartus.ini` and `base.qsf` to enable the Forward Compatibility flow. Support for the Forward Compatibility flow is preliminary. Refer to the Altera SDK for OpenCL version 16.0 Release Notes for more details.
