

# EZ6303QI Triple Output Module

2.2A DC-DC Buck Module with 2 x 300mA LDOs

## EVALUATION BOARD OVERVIEW

Figure 1: Evaluation Board (EVB) Features (Top View)

**NOTE A:** The EZ6303QI Evaluation Board is shown in Figure 1 with the important features numbered.

**NOTE B:** The following instructions will directly correlate with the numbers shown in Figure 1.

## EVALUATION BOARD INSTRUCTIONS

**1) Input Voltage (PVIN, L1IN, L2IN)** - Connect 2.7V to 3.6V supply on the DC-DC Regulator input supply (PVIN). Connect 1.8V to 5.5V on the LDO input supplies (LDO1\_IN and LDO2\_IN). The LDO input supplies may be jumpered together with J5. Pay attention to input polarity and do not turn on until everything is connected correctly.

**2) Ground (GND)** - Connect the input and output ground to GND for each rail, respectively.

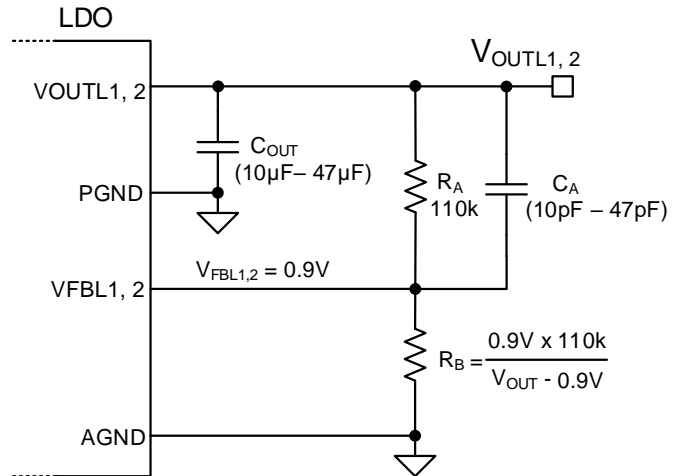

**3) Output Voltage (OUT\_SW, L1OUT, L2OUT)** - Connect the load to the buck output (OUT\_SW), the LDO1 output (L1OUT) and the LDO2 output (L2OUT). If the instructions were followed up to this point, the device may be powered on.

**4) Enable (SWENk, L1EN, L2EN)** - The ENABLE is internally pulled low to ground. The jumpers J1, J2 and J3 may be used to enable or disable each rail, respectively. An external signal may be applied to the J1, J2 or J3 pins to enable or disable each corresponding rail.

**5) Output Voltage Settings** - The output voltage of each rail may be adjusted quickly by placing a jumper on the jumper sets J6, J7 and J9. The voltages available for the buck regulator are 0.6V, 1V, 1.8V, 2.5 and 3.3V. The voltages available for the LDOs are 0.9V, 1V, 1.8V, 2.5V and 3.3V. The compensation CA may be adjusted according to Table 1 for best results. The output voltage may also be adjusted to any voltage as indicated by the equation for RB shown in Figure 2 and Figure 3.

**Figure 2: DC-DC VOUT Resistor Divider & Compensation Capacitor**

**Figure 3: LDO VOUT Resistor Divider & Compensation Capacitor**

**Table 1: External Compensation Recommendations**

Rail	V <sub>OUT</sub>	R <sub>B</sub>	C <sub>A</sub>	R <sub>A</sub>	R <sub>C</sub>	C <sub>OUT</sub>
DC-DC	0.6V	OPEN	33pF	169kΩ	6.65kΩ	47μF or 2 x 22μF
	0.9V	590kΩ	33pF			
	1.0V	374kΩ	33pF			
	1.2V	249kΩ	33pF			
	1.5V	165kΩ	27pF			
	1.8V	124kΩ	27pF			
	2.5V	78.7kΩ	27pF			
	3.3V	37.4kΩ	27pF			
LDO	1.0V	1MΩ	33pF	110kΩ	0	47μF or 2 x 22μF
	1.2V	332kΩ	33pF			
	1.5V	165kΩ	27pF			
	1.8V	110kΩ	27pF			
	2.5V	61.9kΩ	27pF			
	3.3V	41.2kΩ	27pF			

**6) Power OK (SWOK, L1OK, L2OK)** - The power OK is an open drain flag. When output voltage is within ±10% of regulation, the power OK flag will be pulled high to PVIN through a 100k resistance for each rail. Be sure there is a jumper on JP1 to connect the POKs to PVIN.

**7) Soft Start Capacitor (C9)** – The soft start capacitor (C9) is 15nF by default and can be between 10nF to 100nF. The output rise time is controlled by C9. The voltage rise time calculation is shown:

$$\text{Rise Time} \rightarrow t_{\text{RISE}} [\text{ms}] = C_{\text{SS}} [\text{nF}] \times 0.065$$

$$C_{\text{SS}} = 10\text{nF} \rightarrow t_{\text{RISE}} \approx 0.65\text{ms}$$

$$C_{\text{SS}} = 100\text{nF} \rightarrow t_{\text{RISE}} \approx 6.5\text{ms}$$

**8) Bulk Capacitors** – The EZ6303QI DC-DC buck regulator may support up to 150μF on the output, but

the compensation should be adjusted accordingly. Using Table 1 as the reference for  $C_A$ , if  $C_{\text{OUT}}$  is increased, then the  $C_A$  should also be increased. The relationship is linearly shown below:

$$\Delta C_{\text{OUT}} \approx +50\mu\text{F} \rightarrow \Delta C_A \approx +5\text{pF}$$

The recommended maximum output capacitance ( $C_{\text{OUT\_MAX}}$ ) is 150μF and phase-lead capacitance ( $C_{A\_MAX}$ ) is 47pF. The LDO output capacitance range should be between 10μF to 47μF.

## EVALUATION BOARD SCHEMATIC
