

Intel has committed to restore 100% of the company's global water use through support of collaborative community-based projects that restore water in quantities equivalent to the water that Intel consumes. To achieve this ambitious goal, Intel engages local community groups, nonprofits and conservation organizations to identify and fund projects that aim to address local water issues and support the well-being of communities and the environment.

Through the end of 2019, Intel achieved the following:

- **Funded 10 new projects**, bringing the total number of funded projects to 21. These projects are estimated to restore more than 1.5 billion gallons of water each year for Arizona, California, New Mexico and Oregon, once complete.
- **Supported restoration of 730 million gallons of water** during 2019, bringing the total restored volume to approximately 1 billion gallons over the last two years.
- **Project activities** during 2019 include: crop conversion, fallowing and irrigation efficiency improvement to reduce the volume withdrawn and consumed; wet meadow restoration and floodplain reconnection to increase groundwater storage; and wetland creation, winter flow release and water rights leasing to create and sustain aquatic and wetland habitats. Volumetric restore benefits are calculated based on established quantification methodologies.
