# 1 Overview

---

## 1.1 Introduction

The *Intel® Xeon® Processor E7-4800/8800 v4 Product Family Datasheet - Volume One* provides DC and AC electrical specifications, signal integrity, differential signaling specifications, land and signal definitions, and an overview of additional processor feature interfaces.

This document is intended to be distributed as a part of the complete datasheet document which consists of two volumes.

The the next generation of 64-bit, multi-core enterprise processors built on 14 -nanometer process technology. Throughout this document, the processor may be referred to as simply the processor. Based on the low-power/high performance Intel® Xeon® E7 v4 processor microarchitecture, the processor is designed for a three-chip platform as opposed to the previous four-chip platform. The three-chip platform consists of a processor, memory buffer, and the Platform Controller Hub (PCH) and enables higher performance, easier validation, and improved x-y footprint. Intel® Scalable Memory Interconnect capable of up to 9.6 GT/s, up to lanes of PCI Express\* 3.0 links capable of 8.0 GT/s, and 4 lanes of DMI2/PCI Express\* 2.0 interface with a peak transfer rate of 5.0 GT/s. The processor supports up to 46 bits of physical address space and 48-bit of virtual address space.

Included in this family of processors is integrated I/O (IIO) (such as PCI Express and DMI2) on a single silicon die. This single die solution is known as a monolithic processor.

### 1.1.1 Processor Feature Details

- Each core supports two threads (Intel® Hyper-Threading Technology), up to **48** threads per socket
- 46-bit physical addressing and 48-bit virtual addressing
- A 32-KB instruction and 32-KB data first-level cache (L1) for each core
- A 256-KB shared instruction/data mid-level (L2) cache for each core
- Up to 60 MB last level cache (LLC): up to 2.5 MB per core instruction/data last level cache (LLC), shared among all cores

### 1.1.2 Supported Technologies

- Intel® Virtualization Technology (Intel® VT)
- Intel® Virtualization Technology for Directed I/O (Intel® VT-d)
- Intel® Trusted Execution Technology (Intel® TXT)
- Intel® 64 Architecture
- Intel® Streaming SIMD Extensions 4.1 (Intel® SSE4.1)
- Intel® Streaming SIMD Extensions 4.2 (Intel® SSE4.2)
- Intel® Advanced Vector Extensions (Intel® AVX)
- Intel® Hyper-Threading Technology

- Execute Disable Bit
- Intel® Turbo Boost Technology
- Intel® Intelligent Power Technology
- Enhanced Intel SpeedStep® Technology

## 1.2 Interfaces

### 1.2.1 System Memory Support

- ®Registered DDR3 and DDR4 DIMMs
- LR DIMM (Load Reduced DIMM) for buffered memory solutions demanding higher capacity memory subsystems
- Independent channel mode or lockstep mode
- Data burst length of eight cycles for independent channel mode and burst length of 4 cycles for lockstep mode
- Memory DDR3 and DDR4 data transfer rates of 1066, 1333, 1600 and 1866 MT/s
- 64-bit wide channels plus 8-bits of ECC support for each channel
- DDR3 standard I/O Voltage of 1.5 V and DDR3 Low Voltage of 1.35 V
- DDR4 standard I/O Voltage of 1.2 V
- 2-Gb, 4-Gb and 8-Gb DDR3 DRAM technologies supported
- Up to 24 DIMMs supported per socket
- RAS Support (including and not limited to):
  - Rank Level Sparing
  - Demand and Patrol Scrubbing
  - DRAM Single Device Data Correction (SDDC) for any single x4 or x8 DRAM device failure in lock step mode, and x4 in independent mode
  - Data scrambling with address to ease detection of write errors to an incorrect address
  - Error reporting via Machine Check Architecture
  - Read Retry during CRC error handling checks by iMC
  - Channel mirroring within a memory controller on a socket
- Improved Thermal Throttling with dynamic Closed Loop Thermal Throttling (CLTT)
- Memory thermal monitoring support for DIMM temperature via two memory pins, MEM\_HOT\_C{1/23}\_N

### 1.2.2 PCI Express\*

- The PCI Express\* port(s) are fully-compliant to the *PCI Express\* Base Specification, Revision 3.0 (PCIe 3.0)*
- Support for PCI Express\* 3.0 (8.0 GT/s), 2.0 (5.0 GT/s), and 1.0 (2.5 GT/s)
- Up to lanes of PCI Express\* interconnect for general purpose PCI Express\* devices at PCIe\* 3.0 speeds that are configurable for up to independent ports
- 4 lanes of PCI Express\* at PCIe\* 2.0 speeds when not using DMI2 port (Port 0), also can be downgraded to x2 or x1

- Negotiating down to narrower widths is supported
  - x16 port (Port 3) may negotiate down to x8, x4, x2, or x1
  - x8 port (Port 1) may negotiate down to x4, x2, or x1
  - x4 port (Port 0) may negotiate down to x2, or x1
  - When negotiating down to narrower widths, there are caveats as to how lane reversal is supported
- Address Translation Services (ATS) 1.0 support
- Hierarchical PCI-compliant configuration mechanism for downstream devices.
- Traditional PCI style traffic (asynchronous snooped, PCI ordering)
- PCI Express\* extended configuration space. The first 256 bytes of configuration space aliases directly to the PCI compatibility configuration space. The remaining portion of the fixed 4-KB block of memory-mapped space above that (starting at 100h) is known as extended configuration space
- PCI Express\* Enhanced Access Mechanism. Accessing the device configuration space in a flat memory mapped fashion
- Automatic discovery, negotiation, and training of link out of reset
- Supports receiving and decoding 64 bits of address from PCI Express\*
  - Memory transactions received from PCI Express\* that go above the top of physical address space (when Intel VT-d is enabled, the check would be against the translated HPA (Host Physical Address) address) are reported as errors by the processor
  - Outbound access to PCI Express\* will always have address bits 63 to 46 cleared
- Re-issues Configuration cycles that have been previously completed with the Configuration Retry status
- Power Management Event (PME) functions
- Message Signaled Interrupt (MSI and MSI-X) messages
- Degraded Mode support and Lane Reversal support
- Static lane numbering reversal and polarity inversion support

### 1.2.3 Direct Media Interface Gen 2 (DMI 2)

- Serves as the chip-to-chip interface to the Intel® C600 Series Chipset PCH
- The DMI2 port supports x4 link width and only operates in a x4 mode when in DMI2
- Operates at PCI Express\* 1.0 or 2.0 speeds
- Transparent to software
- Processor and peer-to-peer writes and reads with 64-bit address support
- APIC and Message Signaled Interrupt (MSI) support. Will send Intel-defined "End of Interrupt" broadcast message when initiated by the processor.
- System Management Interrupt (SMI), SCI, and SERR error indication
- Static lane numbering reversal support
- Supports DMI2 virtual channels VC0, VC1, VCm, and VCp

### 1.2.4 Intel® QuickPath Interconnect (Intel® QPI)

- Compliant with Intel QuickPath Interconnect v1.1 standard packet formats
- Full width port includes 20 data lanes and 1 clock lane
- 64 byte cache-lines
- Home snoop based coherency
- 4-bit Node ID
- 46-bit physical addressing support
- No Intel QuickPath Interconnect bifurcation support
- Differential signaling
- Forwarded clocking
- Up to 9.6 GT/s data rate (up to 16 GB/s per direction peak bandwidth per port)
  - Ports 0 and 1 run at same operational frequency
  - Port 2 may run at a separate operational frequency
  - Reference Clock is 100 MHz
  - Slow boot speed initialization at 50 MT/s
- Common reference clocking (same clock generator for both sender and receiver)
- Intel® Interconnect Built-In-Self-Test (Intel® IBIST) for high-speed testability
- Polarity and Lane reversal

### 1.2.5 Platform Environment Control Interface (PECI)

The PEFI is a one-wire interface that provides a communication channel between a PEFI client (the processor) and a PEFI master.

- Supports operation at up to 2 Mbps data transfers
- Link layer improvements to support additional services and higher efficiency over PEFI 2.0 generation
- Services include CPU thermal and estimated power information, control functions for power limiting, P-state and T-state control, and access for Machine Check Architecture registers and PCI configuration space (both within the processor package and downstream devices)
- PEFI address determined by SOCKET\_ID configuration
- Single domain (Domain 0) is supported

## 1.3 Power Management Support

### 1.3.1 Processor Package and Core States

- ACPI C-states as implemented by the following processor C-states:
  - Package: PC0, PC1/PC1E, PC3, PC6
  - Core: CC0, CC1/CC1E, CC3, CC6
- Enhanced Intel SpeedStep® Technology

### 1.3.2 System States Support

- S0, S1(transitional only),S4, S5

### 1.3.3 Memory Controller

- Memory thermal monitoring via MEM\_HOT\_C1\_N and MEM\_HOT\_C23\_N pins

### 1.3.4 PCI Express\*

- L0s and L1 low power states

### 1.3.5 Intel® QuickPath Interconnect (Intel® QPI)

- L0s, and L1 power management capabilities

## 1.4 Thermal Management Support

- Digital Thermal Sensor with multiple on-die temperature zones
- Adaptive Thermal Monitor
- THERMTRIP\_N and PROCHOT\_N signal support
- On-Demand mode clock modulation
- Closed Loop Thermal Throttling
- Fan speed control with DTS
- Two integrated SMBus masters for accessing thermal data from DIMMs
- New Memory Thermal Throttling features via MEM\_HOT\_C{1/23}\_N pins
- Running Average Power Limit (RAPL), Processor and DRAM Thermal and Power Optimization Capabilities

## 1.5 Package Summary

## 1.6 Terminology

Term	Description
ASPM	Active State Power Management
BMC	Baseboard Management Controllers
Cbo	Cache and Core Box. It is a term used for internal logic providing ring interface to LLC and Core.
DDR3	Third generation Double Data Rate SDRAM memory technology that is the successor to DDR2 SDRAM
DMA	Direct Memory Access
DMI	Direct Media Interface
DMI2	Direct Media Interface Gen 2
DTS	Digital Thermal Sensor
ECC	Error Correction Code

Term	Description
Enhanced Intel SpeedStep® Technology	Allows the operating system to reduce power consumption when performance is not needed.
Execute Disable Bit	The Execute Disable bit allows memory to be marked as executable or non-executable, when combined with a supporting operating system. If code attempts to run in non-executable memory the processor raises an error to the operating system. This feature can prevent some classes of viruses or worms that exploit buffer overrun vulnerabilities and can thus help improve the overall security of the system. See the <i>Intel® 64 and IA-32 Architectures Software Developer's Manuals</i> for more detailed information.
Flit	Flow Control Unit. The Intel QPI Link layer's unit of transfer; 1 Flit = 80-bits.
Functional Operation	Refers to the normal operating conditions in which all processor specifications, including DC, AC, system bus, signal quality, mechanical, and thermal, are satisfied.
IMC	The Integrated Memory Controller. A Memory Controller that is integrated in the processor die.
IIO	The Integrated I/O Controller. An I/O controller that is integrated in the processor die.
Intel® ME	Intel® Management Engine (Intel® ME)
Intel® QuickPath Interconnect (Intel® QPI)	A cache-coherent, link-based Interconnect specification for Intel processors, chipsets, and I/O bridge components.
Intel® 64 Technology	64-bit memory extensions to the IA-32 architecture. Further details on Intel 64 architecture and programming model can be found at <a href="http://developer.intel.com/technology/intel64/">http://developer.intel.com/technology/intel64/</a> .
Intel® Turbo Boost Technology	Intel® Turbo Boost Technology is a way to automatically run the processor core faster than the marked frequency if the part is operating under power, temperature, and current specifications limits of the Thermal Design Power (TDP). This results in increased performance of both single and multi-threaded applications.
Intel® TXT	Intel® Trusted Execution Technology
Intel® Virtualization Technology (Intel® VT)	Processor virtualization which when used in conjunction with Virtual Machine Monitor software enables multiple, robust independent software environments inside a single platform.
Intel® VT-d	Intel® Virtualization Technology (Intel® VT) for Directed I/O. Intel VT-d is a hardware assist for enabling I/O device virtualization. It is under system software (Virtual Machine Manager or OS) control. Intel VT-d also brings robust security by providing protection from errant DMAs by using DMA remapping, a key feature of Intel VT-d.
Integrated Heat Spreader (IHS)	A component of the processor package used to enhance the thermal performance of the package. Component thermal solutions interface with the processor at the IHS surface.
Jitter	Any timing variation of a transition edge or edges from the defined Unit Interval (UI).
IOV	I/O Virtualization
LLC	Last Level Cache
LRDIMM	Load Reduced Dual In-line Memory Module
NCTF	Non-Critical to Function: NCTF locations are typically redundant ground or non-critical reserved, so the loss of the solder joint continuity at end of life conditions will not affect the overall product functionality.
NEBS	Network Equipment Building System. NEBS is the most common set of environmental design guidelines applied to telecommunications equipment in the United States.
PCH	Platform Controller Hub. The next generation chipset with centralized platform capabilities including the main I/O interfaces along with display connectivity, audio features, power management, manageability, security and storage features.
PCU	Power Control Unit

Term	Description
PCI Express* 3.0	The third generation PCI Express* specification that operates 60% faster than PCI Express* 2.0 (8 Gb/s); however, PCI Express* 3.0 is completely backward compatible with PCI Express* 1.0 and 2.0.
PCI Express 3	PCI Express* Generation 3.0
PCI Express 2	PCI Express* Generation 2.0
PCI Express 1	PCI Express* Generation 2.0/3.0
PECI	Platform Environment Control Interface
Phit	Physical Unit. An Intel® QPI terminology defining units of transfer at the physical layer. 1 Phit is equal to 20 bits in 'full width mode' and 10 bits in 'half width mode'
Processor	The 64-bit, single-core or multi-core component (package)
Processor Core	The term "processor core" refers to Si die itself which can contain multiple execution cores. Each execution core has an instruction cache, data cache, and 256-KB L2 cache. All execution cores share the L3 cache.
RDIMM	Registered Dual In-line Module
Rank	A unit of DRAM corresponding to four to eight devices in parallel, ignoring ECC. These devices are usually, but not always, mounted on a single side of a DDR3 DIMM.
Scalable- 4S, 8S	Targeted for scalable designs, including those using third party Node Controller chips. In these designs, Node Controller is used to scale the design beyond two/four/eight sockets.
SCI	System Control Interrupt. Used in ACPI protocol.
SSE	Intel® Streaming SIMD Extensions (Intel® SSE)
SKU	A processor Stock Keeping Unit (SKU) to be installed in either server or workstation platforms. Electrical, power and thermal specifications for these SKU's are based on specific use condition assumptions. Server processors may be further categorized as Efficient Performance server, workstation and HPC SKUs. For further details on use condition assumptions, please refer to the latest Product Release Qualification (PRQ) Report available via your Customer Quality Engineer (CQE) contact.
SMBus	System Management Bus. A two-wire interface through which simple system and power management related devices can communicate with the rest of the system. It is based on the principals of the operation of the I2C* two-wire serial bus from Philips Semiconductor.
Storage Conditions	A non-operational state. The processor may be installed in a platform, in a tray, or loose. Processors may be sealed in packaging or exposed to free air. Under these conditions, processor landings should not be connected to any supply voltages, have any I/Os biased or receive any clocks. Upon exposure to "free air" (i.e., unsealed packaging or a device removed from packaging material) the processor must be handled in accordance with moisture sensitivity labeling (MSL) as indicated on the packaging material.
TAC	Thermal Averaging Constant
TDP	Thermal Design Power
TSOD	Thermal Sensor on DIMM
UDIMM	Unbuffered Dual In-line Module
Uncore	The portion of the processor comprising the shared cache, IMC, HA, PCU, UBox, and Intel QPI link interface.
Unit Interval	Signaling convention that is binary and unidirectional. In this binary signaling, one bit is sent for every edge of the forwarded clock, whether it be a rising edge or a falling edge. If a number of edges are collected at instances $t_1, t_2, t_n, \dots, t_k$ then the UI at instance "n" is defined as: $UI_n = t_n - (t_{n-1})$
V <sub>CC</sub>	Processor core power supply
V <sub>SS</sub>	Processor ground
V <sub>VMSE</sub> V <sub>VMSE</sub>	Variable power supply for the processor system memory interface.

Term	Description
x1	Refers to a Link or Port with one Physical Lane
x4	Refers to a Link or Port with four Physical Lanes
x8	Refers to a Link or Port with eight Physical Lanes
x16	Refers to a Link or Port with sixteen Physical Lanes

## 1.8 State of Data

The data contained within this document is the most accurate information available by the publication date of this document. The information in this revision of the document is based on silicon characterization data. Values may change prior to production.

### §

## 2 Electrical Specifications

---

### 2.1 Processor Signaling

Intel® Xeon® Processor E7-4800/8800 v4 Product Families include 2011 lands, which utilize various signaling technologies. Signals are grouped by electrical characteristics and buffer type into various signal groups. These include Intel® Scalable Memory Interface Gen 2 (Intel SMI2) (Reference Clock, Command, Control, and Data), PCI Express\*, DMI2, Intel® QuickPath Interconnect (Intel® QPI), Platform Environmental Control Interface (PECI), System Reference Clock, SMBus, JTAG and Test Access Port (TAP), SVID Interface, Processor Asynchronous Sideband, Miscellaneous, and Power/Other signals. See [Table 2-5](#).

Intel strongly recommends performing analog simulations of all interfaces. Please refer to [Section 1.7](#) for signal integrity model availability.

#### 2.1.1 System Memory Interface Signal Groups

The system memory interface utilizes Intel SMI2 technology, which consists of numerous signal groups. These include: Reference Clocks, Command Signals, Control Signals, and Data Signals. Each group consists of numerous signals, which may utilize various signaling technologies. See [Table 2-5](#). Throughout this chapter the system memory interface maybe referred to as Intel SMI2.

#### 2.1.2 PCI Express Signals

The PCI Express Signal Group consists of PCI Express\* ports 1 and 2 and PCI Express miscellaneous signals. See [Table 2-5](#).

#### 2.1.3 DMI2/PCI Express Signals

The Direct Media Interface Gen 2 (DMI2) sends and receives packets and commands to the PCH. The DMI2 is an extension of the standard PCI Express specification. The DMI2/PCI Express signals consist of DMI2 receive and transmit input/output signals and a control signal to select DMI2 or PCIe\* 2.0 operation for port 0. See [Table 2-5](#).

#### 2.1.4 Intel® QuickPath Interconnect (Intel® QPI)

The Intel® Xeon® Processor E7-4800/8800 v4 Product Families provides three Intel® QPI ports for high-speed serial transfer between other processors. Each port consists of two unidirectional links (for transmit and receive). A differential signaling scheme is utilized, which consists of opposite-polarity (DP, DN) signal pairs.

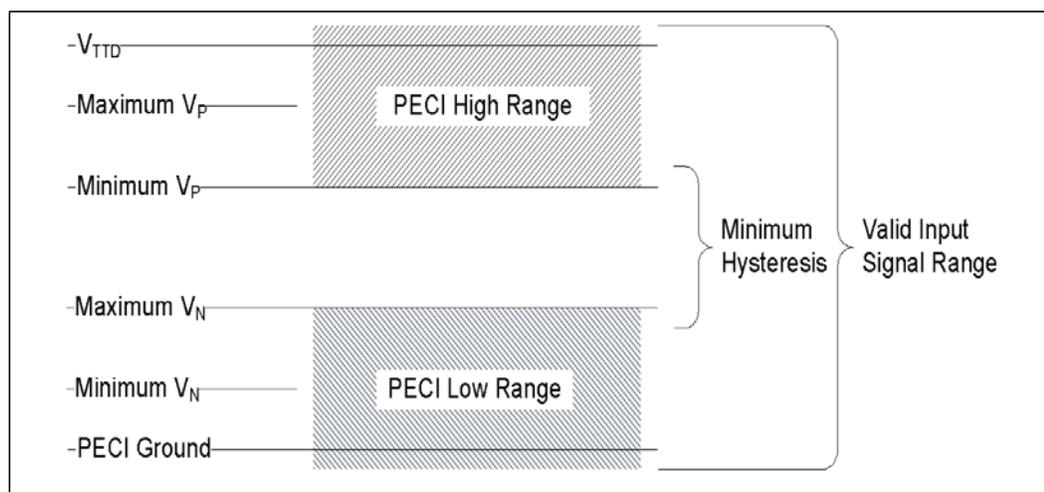

## 2.1.5 Platform Environmental Control Interface (PECI)

PECI is an Intel proprietary interface that provides a communication channel between Intel processors and chipset components to external system management logic and thermal monitoring devices. The Intel® Xeon® Processor E7-4800/8800 v4 Product Families contains a Digital Thermal Sensor (DTS) that reports a relative die temperature as an offset from Thermal Control Circuit (TCC) activation temperature. Temperature sensors located throughout the die are implemented as analog-to-digital converters calibrated at the factory. PECI provides an interface for external devices to read processor temperature, perform processor manageability functions, and manage processor interface tuning and diagnostics.

### 2.1.5.1 Input Device Hysteresis

The PECI client and host input buffers must use a Schmitt-triggered input design for improved noise immunity. Please refer to [Figure 2-1](#) and [Table 2-20](#).

Figure 2-1. Input Device Hysteresis

## 2.1.6 System Reference Clocks (BCLK{0/1}\_DP, BCLK{0/1}\_DN)

The processor core, processor uncore, Intel® QPI link, PCI Express\*, and VMSE memory interface frequencies are generated from BCLK{0/1}\_DP and BCLK{0/1}\_DN signals. There is no direct link between core frequency and Intel® QPI link frequency (for example, there is no core frequency to Intel® QPI multiplier). The processor maximum core frequency, Intel® QPI link frequency, and DDR memory frequency are set during manufacturing. It is possible to override the processor core frequency setting using software. This permits operation at lower core frequencies than the factory set maximum core frequency.

The processor core frequency is configured during reset by using values stored within the device during manufacturing. The stored value sets the lowest core multiplier at which the particular processor can operate. If higher speeds are desired, the appropriate ratio can be configured via the IA32\_PERF\_CTL MSR (MSR 199h); Bits [15:0].

Clock multiplying within the processor is provided by the internal phase locked loop (PLL), which requires a constant frequency BCLK{0/1}\_DP, BCLK{0/1}\_DN input, with exceptions for spread spectrum clocking. DC specifications for the BCLK{0/1}\_DP, BCLK{0/1}\_DN inputs are provided in [Table 2-21](#). These specifications must be met while also meeting the associated signal quality specifications outlined in [Section 2.10](#).

### 2.1.6.1 PLL Power Supply

Disabled for Intel® Xeon® processor E7 v4 product family.

### 2.1.7 JTAG and Test Access Port (TAP) Signals

Due to the voltage levels supported by other components in the JTAG and Test Access Port (TAP) logic, Intel recommends the processor be first in the TAP chain, followed by any other components within the system. A translation buffer should be used to connect to the rest of the chain unless one of the other components is capable of accepting an input of the appropriate voltage. Two copies of each signal may be required with each driving a different voltage level.

### 2.1.8 Processor Sideband Signals

Intel® Xeon® Processor E7-4800/8800 v4 Product Families include asynchronous sideband signals that provide asynchronous input, output, or I/O signals between the processor and the platform or Platform Controller Hub. See [Table 2-5](#) for details.

All Processor Asynchronous Sideband input signals are required to be asserted/deasserted for a defined number of BCLKs in order for the processor to recognize the proper signal state. These are outlined in [Table 2-21](#) (DC specifications). Refer to [Section 2.10](#) for applicable signal integrity specifications.

### 2.1.9 Power/Ground and Sense Signals

Processors also include various other signals including power/ground and sense points. See [Table 2-5](#) for details.

#### 2.1.9.1 Power and Ground Lands

All  $V_{CC}$ ,  $V_{CCPLL}$ ,  $V_{CCIOin}$ ,  $V_{CC33}$ ,  $V_{CCPECI}$ , and  $V_{VMSE}$  lands must be connected to their respective processor power planes, while all  $V_{SS}$  lands must be connected to the system ground plane. For clean on-chip power distribution, processors include lands for all required voltage supplies. See [Table 2-1](#).

**Table 2-1. Power and Ground Lands (Sheet 1 of 2)**

Power and Ground Lands	Number of Lands	Comments
$V_{CC}$	218	Each $V_{CC}$ land must be supplied with the voltage determined by the SVID Bus signals. <a href="#">Table 2-3</a> Defines the voltage level associated with each core SVID pattern. <a href="#">Table 2-12</a> , <a href="#">Figure 2-2</a> , and <a href="#">Figure 2-4</a> represent $V_{CC}$ static and transient limits. $V_{CC}$ has a VBOOT setting of 1.7 V.
$V_{CC33}$	1	$V_{CC33}$ supplies a fixed 3.3 volt stand by voltage to supply PIROM and the OEM scratch ROM.
$V_{CCPECI}$	1	$V_{CCPECI}$ supplies a fixed 1.0 volt voltage to supply Peci for Intel® Xeon® Processor E7 v4 Product Family.
$V_{CCPLL}$	3	Not connected on Intel® Xeon® Processor E7 v4 Product Family

**Table 2-1. Power and Ground Lands (Sheet 2 of 2)**

Power and Ground Lands	Number of Lands	Comments
V <sub>VMSE_01</sub> V <sub>VMSE_23</sub>	16	Provides power to the processor Intel SMI2 interface with fixed 1.35 V supply.
V <sub>ccIOin</sub>	43	V <sub>ccIOin</sub> , must be supplied by a fixed 1.00 V supply.
V <sub>SA</sub>	12	Not connected on Intel® Xeon® Processor E7 v4 Product Family
V <sub>SS</sub>	726	Ground

### 2.1.9.2 Decoupling Guidelines

Due to its large number of transistors and high internal clock speeds, the Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor is capable of generating large current swings between low and full power states. This may cause voltages on power planes to sag below their minimum values if bulk decoupling is not adequate. Large electrolytic bulk capacitors (C<sub>BULK</sub>), help maintain the output voltage during current transients, for example coming out of an idle condition. Care must be taken in the baseboard design to ensure that the voltages provided to the processor remain within the specifications listed in Table 2-12. Failure to do so can result in timing violations or reduced lifetime of the processor.

### 2.1.9.3 Voltage Identification (VID)

The reference voltage or the VID setting is set via the SVID communication bus between the processor and the voltage regulator controller chip. The VID settings are the nominal voltages to be delivered to the processor's V<sub>CC</sub> lands when current draw equals zero. Table 2-3 specifies the reference voltage level corresponding to the VID value transmitted over serial VID. The voltage will change due to temperature and/or current load changes in order to minimize the power and to maximize the performance of the part. The specifications are set so that a voltage regulator can operate with all supported frequencies.

The Intel® Xeon® Processor E7-4800/8800 v4 Product Families uses voltage identification signals to support automatic selection of V<sub>CC</sub> power supply voltages. If the processor socket is empty (SKTOCC\_N high), or a "not supported" response is received from the SVID bus, then the voltage regulation circuit cannot supply the voltage that is requested, the voltage regulator must disable itself or not power on. Vout MAX register (30h) is programmed by the processor to set the maximum supported VID code and if the programmed VID code is higher than the VID supported by the VR, then VR will respond with a "not supported" acknowledgment.

#### 2.1.9.3.1 SVID Commands

The processor supports the following VR commands:

- SetVID\_fast (20 mV/μs),
- SetVID\_slow (5 mV/μs), and
- Slew Rate Decay (downward voltage only and it's a function of the output capacitance's time constant) commands. Table 2-3 includes SVID step sizes and DC shift ranges. Minimum and maximum voltages must be maintained as shown in Table 2-12.

The VRM or EVRD utilized must be capable of regulating its output to the value defined by the new VID.

Power source characteristics must be guaranteed to be stable whenever the supply to the voltage regulator is stable.

#### 2.1.9.3.2 SetVID Fast Command

The SetVID-fast command contains the target VID in the payload byte. The range of voltage is defined in the VID table. The VR should ramp to the new VID setting with a fast slew rate as defined in the slew rate data register typically 20 mV/uS for server platforms.

The SetVID-fast command is preemptive, the VR interrupts its current processes and moves to the new VID. The SetVID-fast command operates on 1 VR address at a time. This command is used in the processor for package C6 fast exit.

#### 2.1.9.3.3 SetVID Slow

The SetVID-slow command contains the target VID in the payload byte. The range of voltage is defined in the VID table. The VR should ramp to the new VID setting with a "slow" slew rate as defined in the slow slew rate data register. Typically the SetVID\_Slow is 4x slower than the SetVID\_fast slew rate.

The SetVID-slow command is preemptive, the VR interrupts its current processes and moves to the new VID. This is the instruction used for normal P-state voltage change. This command is used in the processor for the Intel Enhanced SpeedStep® Technology transitions.

#### 2.1.9.3.4 SetVID Decay

The SetVID-Decay command is the slowest of the DVID transitions. It is normally used for VID down transitions. The VR does not control the slew rate, the output voltage declines with the output load current only.

The SetVID- Decay command is preemptive, the VR interrupts its current processes and moves to the new VID. This command is used in the processor for package C6 entry, allowing capacitor discharge by the leakage, thus saving energy. This command is normally used in VID down direction in the processor package C6 entry.

#### 2.1.9.3.5 SVID Power State Functions: SetPS

The processor has three power state functions and these will be set seamlessly via the SVID bus using the SetPS command. Based on the power state command, the SetPS commands sends information to VR controller to configure the VR to improve efficiency, especially at light loads. For example, typical power states are:

- PS(00h): Represents full power or active mode
- PS(01h): Represents a light load 5 to 20 A
- PS(02h): Represents a very light load <5 A

The VR may change its configuration to meet the processor's power needs with greater efficiency. For example, it may reduce the number of active phases, transition from CCM (Continuous Conduction Mode) to DCM (Discontinuous Conduction Mode) mode, reduce the switching frequency or pulse skip, or change to asynchronous regulation. For example, typical power states are 00h = run in normal mode; a command of 01h= shed phases mode, and an 02h=pulse skip.

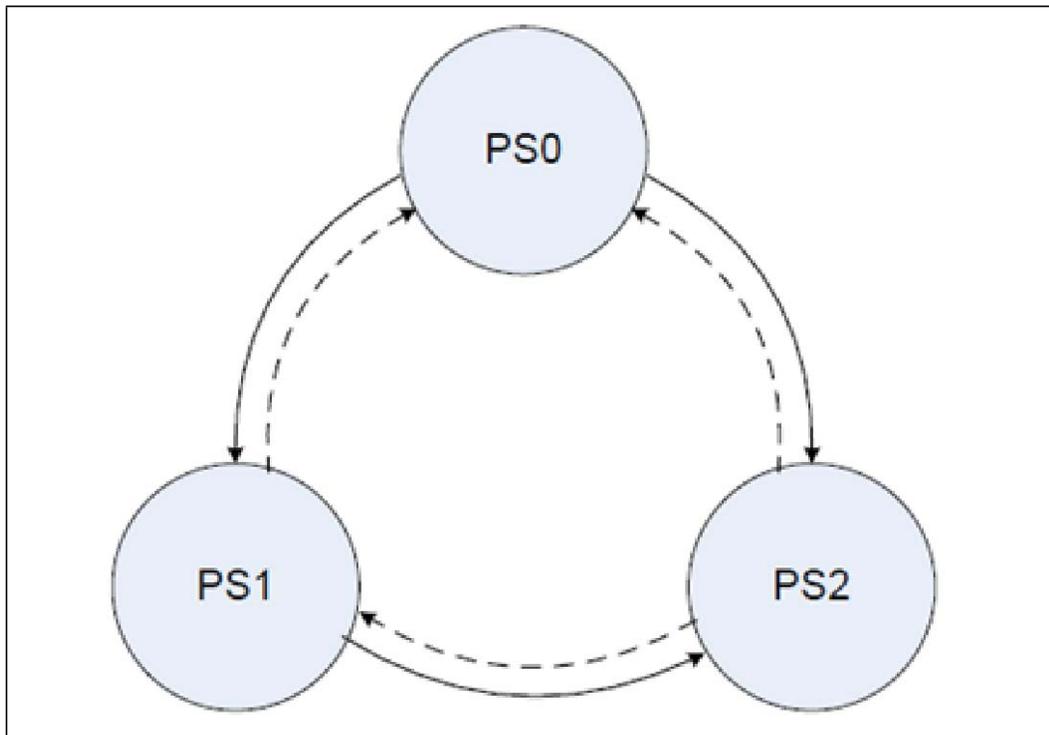

The VR may reduce the number of active phases from PS(00h) to PS(01h) or PS(00h) to PS(02h) for example. There are multiple VR design schemes that can be used to maintain a greater efficiency in these different power states, please work with your VR controller suppliers for optimizations.

The SetPS command sends a byte that is encoded as to which power state the VR should transition.

If a power state is not supported by the controller, the slave should acknowledge with command rejected (11b)

If the VR is in a low power state and receives a SetVID command moving the VID up then the VR exits the low power state to normal mode (PS0) to move the voltage up as fast as possible. The processor must reissue low power state (PS1, PS2, or PS3) command if it is in a low current condition at the new higher voltage. See Figure 2-2 for VR power state transitions.

Figure 2-2. VR Power-State Transitions

#### 2.1.9.3.6 SVID Voltage Rail Addressing

The processor addresses one voltage rail control segments within VR12.5 (VCC). The SVID data packet contains a 4-bit addressing code:

Table 2-2. SVID Address Usage (Sheet 1 of 2)

PWM Address (HEX)	Intel® Xeon® Processor E7-4800/8800 v4 Product Families
00	V <sub>CC</sub>
01	+1 not used
02	VMSE MCO
03	+1 not used

**Table 2-2. SVID Address Usage (Sheet 2 of 2)**

PWM Address (HEX)	Intel® Xeon® Processor E7-4800/8800 v4 Product Families
04	VMSE MC0
05	+1 not used
06	VMSE MC1
07	+1 not used
08	VMSE MC1

**Notes:**

1. Check with VR vendors to determine the physical address assignment method for their controllers.
2. VR addressing is assigned on a per-voltage-rail basis.
3. Dual VR controllers will have two addresses with the lowest order address, always being the higher phase count.
4. For future platform flexibility, the VR controller should include an address offset, as shown with +1 not used.

**Table 2-3. VR12.5 Reference Code Voltage Identification (VID) Table**

HEX	VCC, VSA										
00	0.00	72	1.63	80	1.77	8E	1.91	9C	2.05	AA	2.19
65	1.50	73	1.64	81	1.78	8F	1.92	9D	2.06	AB	2.20
66	1.51	74	1.65	82	1.79	90	1.93	9E	2.07	AC	2.21
67	1.52	75	1.66	83	1.80	91	1.94	9F	2.08	AD	2.22
68	1.53	76	1.67	84	1.81	92	1.95	A0	2.09	AE	2.23
69	1.54	77	1.68	85	1.82	93	1.96	A1	2.10	AF	2.24
6A	1.55	78	1.69	86	1.83	94	1.97	A2	2.11	B0	2.25
6B	1.56	79	1.70	87	1.84	95	1.98	A3	2.12	B1	2.26
6C	1.57	7A	1.71	88	1.85	96	1.99	A4	2.13	B2	2.27
6D	1.58	7B	1.72	89	1.86	97	2.00	A5	2.14	B3	2.28
6E	1.59	7C	1.73	8A	1.87	98	2.01	A6	2.15	B4	2.29
6F	1.60	7D	1.74	8B	1.88	99	2.02	A7	2.16	B5	2.30
70	1.61	7E	1.75	8C	1.89	9A	2.03	A8	2.17		
71	1.62	7F	1.76	8D	1.90	9B	2.04	A9	2.18		

**Notes:**

1. 00h = Off State
2. VID Range HEX 01-65 are not used by the Intel® Xeon® Processor E7-4800/8800 v4 Product Families.
3. VID Range HEX > B5 is not used by the Intel® Xeon® Processor E7 v4 Product Family.
4. For VID Ranges supported see [Table 2-12](#).

### 2.1.10 Reserved or Unused Signals

All Reserved (RSVD) signals must not be connected. Connection of these signals to power, ground or to any other signal (including each other) can result in component malfunction or incompatibility with future processors. See [Chapter 3](#) for a land listing of the processor and the location of all Reserved signals.

For reliable operation, always connect unused inputs or bidirectional signals to an appropriate signal level. Unused active high inputs should be connected through a resistor to ground ( $V_{SS}$ ). Unused outputs maybe left unconnected; however, this may interfere with some Test Access Port (TAP) functions, complicate debug probing, and prevent boundary scan testing. A resistor must be used when tying bidirectional signals

to power or ground. When tying any signal to power or ground, a resistor will also allow for system testability. Resistor values should be within  $\pm 20\%$  of the impedance of the baseboard trace, unless otherwise noted.

## 2.2 Signal Group Summary

Signals are grouped by buffer type and similar characteristics as listed in Table 2-5. The buffer type indicates which signaling technology and specifications apply to the signals.

Table 2-4. Signal Description Buffer Types

Signal	Description
Analog	Analog reference or output. May be used as a threshold voltage or for buffer compensation
Asynchronous <sup>1</sup>	Signal has no timing relationship with any system reference clock.
CMOS	CMOS buffers: 1.05 V or 1.5 V tolerant
DMI2	Direct Media Interface Gen 2 signals. These signals are compatible with PCI Express 2.0 and 1.0 Signaling Environment AC Specifications.
Intel® QPI	Current-mode 6.4 GT/s and 8.0 GT/s forwarded-clock Intel QPI signaling.
Intel SMI2	Intel Scalable Memory Interconnect Gen 2. These signals are the interface between the Intel® Xeon® Processor E7 v4 Product Family and the scalable memory buffer. The pin names start with VMSE.
Open Drain CMOS	Open Drain CMOS (ODCMOS) buffers: 1.05V tolerant
PCI Express*	PCI Express interface signals. These signals are compatible with PCI Express 3.0 Signaling Environment AC Specifications and are AC coupled. The buffers are not 3.3-V tolerant. Refer to the PCIe* specification.
Reference	Voltage reference signal.
SSTL	Source Series Terminated Logic (JEDEC SSTL_15)

**Notes:**

1. Qualifier for a buffer type.

Table 2-5. Signal Groups (Sheet 1 of 3)

Differential/Single-ended	Buffer Type	Signals <sup>1</sup>
<b>Intel SMI2 Reference Clocks<sup>2</sup></b>		
Differential	SSTL Output	VMSE{0/1/2/3}_CLK_D[N/P]
<b>Intel SMI2 Command Signals<sup>2</sup></b>		
Single-ended	SSTL Output	VMSE{0/1/2/3}_CMD[16:0]
<b>Intel SMI2 Data Signals<sup>2</sup></b>		
Differential	SSTL Input/Output	VMSE{0/1/2/3}_DQS_D[N/P][8:0]

TXT_PLTEN	PU	VTT	1K-6K	Ohms	

**Notes:**

1. Please refer to [Table 2-19](#) for details on the  $R_{ON}$  (Buffer on Resistance) value for this signal.

## 2.3 Power-On Configuration (POC) Options

Several configuration options can be configured by hardware. The processor samples its hardware configuration at reset, on the active-to-inactive transition of RESET\_N, or upon assertion of PWRGOOD (inactive-to-active transition). For specifics on these options, please refer to [Table 2-7](#).

The sampled information configures the processor for subsequent operation. These configuration options cannot be changed except by another reset transition of the latching signal (RESET\_N or PWRGOOD).

**Table 2-7. Power-On Configuration Option Lands**

Configuration Option	Land Name	Notes
Output tri state	PROCHOT_N	1
Execute BIST (Built-In Self Test)	BIST_ENABLE	2
Enable Service Processor Boot Mode	BMCINIT	3
Enable Intel® Trusted Execution Technology (Intel® TXT) Platform	TXT_PLTEN	3
Power-up Sequence Halt for Intel® In-Target Probe (Intel® ITP) configuration	EAR_N	3
Enable Bootable Firmware Agent	FRMAGENT	3
Enable Intel Trusted Execution Technology (Intel TXT) Agent	TXT_AGENT	3
Used in conjunction with FRMAGENT	EX_LEGACY_SKT	3
Configure Socket ID	SOCKET_ID[1:0]	3

**Notes:**

1. Output tristate option enables Fault Resilient Booting (FRB), for FRB details see [Section 2.4](#). The signal used to latch PROCHOT\_N for enabling FRB mode is RESET\_N.
2. This signal is sampled at cold reset / PWRGOOD-reset and warm reset. This is setup before PWRGOOD asserts and held after reset deasserts.
3. This signal is sampled at cold reset / PWRGOOD-reset. This is setup before powergood asserts and held after reset deasserts.

## 2.4 Fault Resilient Booting (FRB)

The Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor supports both socket and core level Fault Resilient Booting (FRB), which provides the ability to boot the system as long as there is one processor functional in the system. One limitation to socket level FRB is that the system cannot boot if the legacy socket that connects to an active PCH becomes unavailable since this is the path to the system BIOS. See [Table 2-9](#) for a list of output tristate FRB signals.

Socket level FRB will tristate processor outputs via the PROCHOT\_N signal. Assertion of the PROCHOT\_N signal through RESET\_N assertion will tristate processor outputs. Note, that individual core disabling is also supported for those cases where disabling the entire package is not desired.

The Intel® Xeon® E7 v4 processor extends the FRB capability to the core granularity by maintaining a register in the uncore so that BIOS or another entity can disable one or more specific processor cores.

**Table 2-8. Fault Resilient Booting (Output Tristate) Signals**

Output Tristate Signal Groups	Signals

## 2.5 Mixing Processors

Intel supports and validates two- and four-processor configurations only, in which all processors operate with the same Intel® QuickPath Interconnect frequency, core frequency, and power segment, and all have the same internal cache sizes. Mixing

components operating at different internal clock frequencies is not supported and will not be validated by Intel. Combining processors from different power segments is also not supported.

**Note:** Processors within a system must operate at the same frequency per bits [15:8] of the FLEX\_RATIO MSR (Address: 194h); however this does not apply to frequency transitions initiated due to thermal events, Extended HALT, Enhanced Intel SpeedStep Technology transitions signal.

Mixing processors of different steppings but the same model (as per CPUID instruction) is supported.

## 2.6 Flexible Motherboard Guidelines (FMB)

The Flexible Motherboard (FMB) guidelines are estimates of the maximum values the Intel® Xeon® Processor E7-4800/8800 v4 Product Families will have over certain time periods. The values are only estimates and actual specifications for future processors may differ. Processors may or may not have specifications equal to the FMB value in the foreseeable future. System designers should meet the FMB values to ensure their systems will be compatible with future Intel® Xeon® Processor E7-4800/8800 v4 Product Families.

## 2.7 Absolute Maximum and Minimum Ratings

Table 2-9 specifies absolute maximum and minimum ratings. At conditions outside functional operation condition limits, but within absolute maximum and minimum ratings, neither functionality nor long-term reliability can be expected. If a device is returned to conditions within functional operation limits after having been subjected to conditions outside these limits, but within the absolute maximum and minimum ratings, the device may be functional, but with its lifetime degraded depending on exposure to conditions exceeding the functional operation condition limits.

Although the processor contains protective circuitry to resist damage from Electro-Static Discharge (ESD), precautions should always be taken to avoid high static voltages or electric fields.

**Table 2-9. Processor Absolute Minimum and Maximum Ratings**

Symbol	Parameter	Min	Typical	Max	Unit
V <sub>CC</sub>	Processor core voltage with respect to V <sub>SS</sub>	-0.3		2.0	V
V <sub>CCPECI</sub>	Processor analog voltage with respect to V <sub>SS</sub>	-0.3	1.00	1.4	V
V <sub>VMSE</sub>	Processor VMSE voltage with respect to V <sub>SS</sub>	-.04	1.35	1.6	V
V <sub>CCIO_IN</sub>	Processor analog IO voltage with respect to V <sub>SS</sub>	-0.3	1.00	1.4	V

**Notes:**

1. For functional operation, all processor electrical, signal quality, mechanical, and thermal specifications must be satisfied.
2. Overshoot and undershoot voltage guidelines for input, output, and I/O signals are outlined in [Section 2.10.5](#). Excessive overshoot or undershoot on any signal will likely result in permanent damage to the processor.

## 2.7.1 Storage Conditions Specifications

Environmental storage condition limits define the temperature and relative humidity limits to which the device is exposed to while being stored in a Moisture Barrier Bag. The specified storage conditions are for component level prior to board attach (see notes in [Table 2-10](#) for post board attach limits).

[Table 2-10](#) specifies absolute maximum and minimum storage temperature limits which represent the maximum or minimum device condition beyond which damage, latent or otherwise, may occur. The table also specifies sustained storage temperature, relative humidity, and time-duration limits. These limits specify the maximum or minimum device storage conditions for a sustained period of time. At conditions outside sustained limits, but within absolute maximum and minimum ratings, quality, and reliability may be affected.

**Table 2-10. Storage Condition Ratings**

Symbol	Parameter	Min	Max	Unit
$T_{\text{absolute storage}}$	The minimum/maximum device storage temperature beyond which damage (latent or otherwise) may occur when subjected to for any length of time.	-25	125	°C
$T_{\text{sustained storage}}$	The minimum/maximum device storage temperature for a sustained period of time.	-5	40	°C
$T_{\text{short term storage}}$	The ambient storage temperature (in shipping media) for a short period of time.	-20	85	°C
$RH_{\text{sustained storage}}$	The maximum device storage relative humidity for a sustained period of time.	60% @ 24		°C
$Time_{\text{sustained storage}}$	A prolonged or extended period of time; typically associated with sustained storage conditions Unopened bag, includes 6 months storage time by customer.	0	30	months
$Time_{\text{short term storage}}$	A short period of time (in shipping media).	0	72	hours

**Notes:**

- Storage conditions are applicable to storage environments only. In this scenario, the processor must not receive a clock, and no lands can be connected to a voltage bias. Storage within these limits will not affect the long-term reliability of the device. For functional operation, please refer to the processor case temperature specifications.
- These ratings apply to the Intel component and do not include the tray or packaging.
- Failure to adhere to this specification can affect the long-term reliability of the processor.
- Non-operating storage limits post board attach: Storage condition limits for the component once attached to the application board are not specified. Intel does not conduct component level certification assessments post board attach given the multitude of attach methods, socket types, and board types used by customers. Provided as general guidance only, Intel board products are specified and certified to meet the following temperature and humidity limits: (Non-operating Temperature Limit: -40 to +70°C and Humidity: 50 to 90%, noncondensing with a maximum wet bulb of 28°C).
- Device storage temperature qualification methods follow JEDEC High and Low Temperature Storage Life Standards: *JESD22-A119* (low temperature) and *JESD22-A103* (high temperature).

## 2.8 Power Limit Specifications

The maximum power limits for associated states are listed below.

**Table 2-11. Package C-State Power Specifications**

TDP SKUs	C0 (Pmax)	C1	C3	C6

**Note:**

- SKU's are subject to change. Please contact your Intel Field Representative to obtain the latest SKU information.

- C0 is the performance state of the processor, and includes all P-states, including Intel Turbo Boost Technology.

## 2.9 DC Specifications

**DC specifications are defined at the processor pads, unless otherwise noted.** DC specifications are only valid while meeting specifications for case temperature ( $T_{CASE}$  specified in [Chapter 5](#)), clock frequency, and input voltages. Care should be taken to read all notes associated with each specification.

### 2.9.1 Voltage and Current Specifications

**Table 2-12. Voltage Specification**

Symbol	Parameter	Voltage Plane	Min	Typ	Max	Unit	Notes <sup>1</sup>
V <sub>CC</sub> VID	V <sub>CC</sub> VID Range		1.5		1.85	V	2, 3
V <sub>CC</sub>	Core Voltage (Launch - FMB)	V <sub>CC</sub>	See <a href="#">Table 2-13</a> and <a href="#">Figure 2-3</a>			V	3, 4, 7, 8, 12, 14, 18
V <sub>VID_STEP</sub> (V <sub>CC</sub> )	VID step size during a transition			10.0		mV	10
V <sub>CCPECI</sub>	Uncore Voltage	V <sub>CCPECI</sub>	0.959	1.00	1.036	V	3, 5, 9, 12, 13
V <sub>VMSE</sub> (V <sub>VMSE_01</sub> , V <sub>VMSE_23</sub> )	I/O Voltage for Intel SMI2 (Standard Voltage)	V <sub>VMSE</sub>	1.303	1.35	1.391	V	11, 13, 14, 16, 17
V <sub>ccIO_IN</sub>	Uncore Voltage (Launch - FMB)	V <sub>ccIO_IN</sub>	0.959	1.00	1.036	V	3, 5, 9, 12, 13

**Notes:**

- Unless otherwise noted, all specifications in this table apply to all processors. These specifications are based on presilicon characterization and will be updated as further data becomes available.
- Individual processor VID values may be calibrated during manufacturing such that two devices at the same speed may have different settings.
- These voltages are targets only. A variable voltage source should exist on systems in the event that a different voltage is required.
- The V<sub>CC</sub> voltage specification requirements are measured across the remote sense pin pairs (V<sub>CC\_SENSE</sub> and V<sub>SS\_VCC\_SENSE</sub>) on the processor package. Voltage measurement should be taken with a DC to 100 MHz bandwidth oscilloscope limit (or DC to 20 MHz for older model oscilloscopes), using a 1.5 pF maximum probe capacitance, and 1 Mohm minimum impedance. The maximum length of the ground wire on the probe should be less than 5 mm to ensure external noise from the system is not coupled in the scope probe.
- The V<sub>TT</sub> voltage specification requirements are measured across the remote sense pin pairs (V<sub>TT\_SENSE</sub> and V<sub>SS\_VTT\_SENSE</sub>) on the processor package. Voltage measurement should be taken with a DC to 100 MHz bandwidth oscilloscope limit (or DC to 20 MHz for older model oscilloscopes), using a 1.5 pF maximum probe capacitance, and 1 Mohm minimum impedance. The maximum length of the ground wire on the probe should be less than 5 mm to ensure external noise from the system is not coupled in the scope probe.
- The processor should not be subjected to any static V<sub>CC</sub> level that exceeds the V<sub>CC\_MAX</sub> associated with any particular current. Failure to adhere to this specification can shorten processor lifetime.
- Minimum V<sub>CC</sub> and maximum I<sub>CC</sub> are specified at the maximum processor case temperature ( $T_{CASE}$ ) shown in [Section 5](#), [“Thermal Management Specifications”](#). I<sub>CC\_MAX</sub> is specified at the relative V<sub>CC\_MAX</sub> point on the V<sub>CC</sub> load line. The processor is capable of drawing I<sub>CC\_MAX</sub> for up to ~0.09375x PL1 Tau seconds. Refer to [Figure 2-4](#) for further details on the average processor current draw over various time durations.
- The processor should not be subjected to any static V<sub>TTA</sub>, V<sub>TTD</sub> level that exceeds the V<sub>TT\_MAX</sub> associated with any particular current. Failure to adhere to this specification can shorten processor lifetime.
- This specification represents the V<sub>CC</sub> reduction or V<sub>CC</sub> increase due to each VID transition, see [Section 2.1.9.3](#), [“Voltage Identification \(VID\)”](#).
- Baseboard bandwidth is limited to 20 MHz.
- FMB is the flexible motherboard guidelines. See [Section 2.6](#) for FMB details.
- DC + AC + Ripple = Total Tolerance
- For Power State Functions see [Section 2.1.9.3.5](#).
- V<sub>VMSE</sub> tolerance at processor pins. Tolerance for VR at remote sense is ±3.0%\*V<sub>VMSE</sub>.
- The V<sub>CCPLL</sub>, V<sub>VMSE01</sub>, V<sub>VMSE23</sub> voltage specification requirements are measured across vias on the platform. Choose V<sub>CCPLL</sub>, V<sub>VMSE01</sub>, or V<sub>VMSE23</sub> vias close to the socket and measure with a DC to 100 MHz bandwidth oscilloscope limit (or DC to 20 MHz for older model oscilloscopes), using 1.5 pF maximum probe capacitance, and 1 Mohm minimum impedance. The maximum

length of the ground wire on the probe should be less than 5 mm to ensure external noise from the system is not coupled in the scope probe.

- VCC has a Vboot setting of 1.7V.

**Table 2-13. Current ( $I_{CC\_MAX}$  and  $I_{CC\_TDC}$ ) Specification**

Symbol	Parameter	Voltage Plane	Current	Unit	Notes <sup>1</sup>

			.075	A		
			0.10	A		

- Unless otherwise noted, all specifications in this table apply to all processors. These specifications are based on presilicon characterization and will be updated as further data becomes available.
- FMB is the flexible motherboard guidelines. See [Section 2.6](#) for FMB details.
- $I_{CC\_TDC}$  (Thermal Design Current) is the sustained (DC equivalent) current that the processor is capable of drawing indefinitely and should be used for the voltage regulator thermal assessment. The voltage regulator is responsible for monitoring its temperature and asserting the necessary signal to inform the processor of a thermal excursion. Please refer to the *Voltage Regulator Module (VRM) and Enterprise Voltage Regulator-Down (EVRD) 12.5 Design Guidelines* for further details.
- Specification is at  $T_{CASE} = 50^{\circ}C$ . Characterized by design (not tested).

5. Minimum  $V_{CC}$  and maximum  $I_{CC}$  are specified at the maximum processor case temperature ( $T_{CASE}$ ) shown in Section 5, "Thermal Management Specifications".  $I_{CC\_MAX}$  is specified at the relative  $V_{CC\_MAX}$  point on the  $V_{CC}$  load line. The processor is capable of drawing  $I_{CC\_MAX}$  for up to  $\sim 0.09375 \times PL1$  Tau seconds. Refer to Figure 2-4 for further details on the average processor current draw over various time durations.
6.  $I_{CC\_MAX}$  is specified at the relative  $V_{CC\_MAX}$  point on the  $V_{CC}$  load line. The processor is capable of drawing  $I_{CC\_MAX}$  for up to  $\sim 0.09375 \times PL1$  Tau seconds. Refer to Figure 2-4 for further details on the average processor current draw over various time durations.

220	VID - 0.154	VID - 0.176	VID - 0.198	1,2,3,4,5,6

**Notes:**

1. The loadline specification includes both static and transient limits.
2. This table is intended to aid in reading discrete points on graph in Figure 2-3.
3. The loadlines specify voltage limits at the die measured at the VCC\_SENSE and VSS\_VCC\_SENSE lands.
4. The V<sub>cc\_min</sub> and V<sub>cc\_max</sub> loadlines represent static and transient limits. Please see Section 4 for V<sub>cc</sub> Overshoot specifications.
5. The Adaptive Loadline Positioning slope is 0.8 mohm, and the tolerance is ±22 mV.
6. The core I<sub>cc</sub> ranges are as follows:
  - 0 to 220 A for Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor (165 W)
  - 0 to 201 A for Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor (140 W)
  - 0 to 165 A for Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor (115 W)

**Figure 2-3. V<sub>CC</sub> Static and Transient Tolerance Loadlines – Intel® Xeon® Processor E7-4800/8800 v4 Product Families Processor**

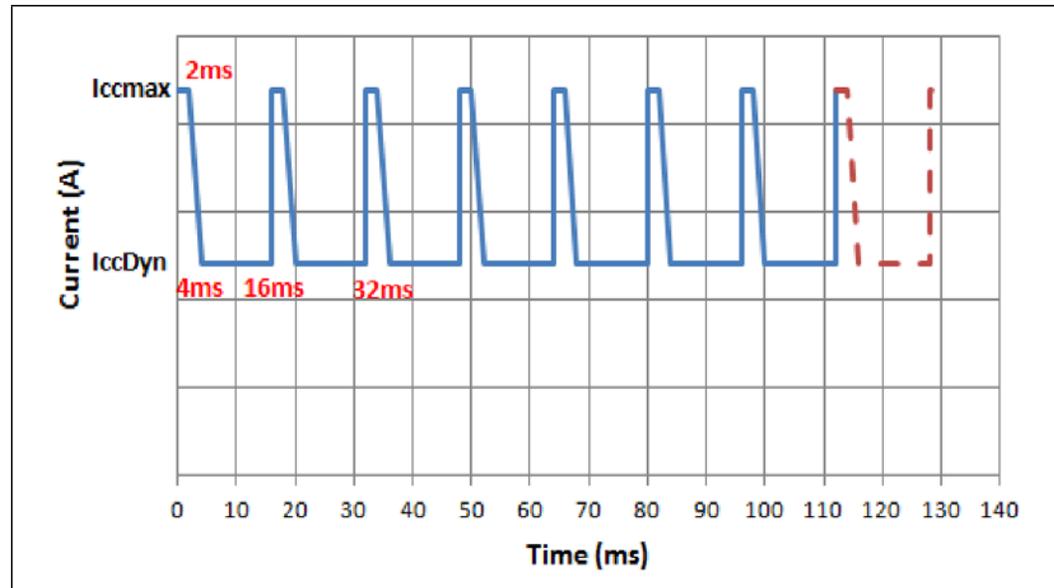

## 2.9.2 Die Voltage Validation

Core voltage ( $V_{CC}$ ) overshoot events at the processor must meet the specifications in Table 2-15 when measured across the VCC\_SENSE and VSS\_VCC\_SENSE lands. Overshoot events that are < 10 ns in duration may be ignored. These measurements of processor die level overshoot should be taken with a 100 MHz bandwidth limited oscilloscope.

Figure 2-4. Load Current Versus Time

**Notes:**

1. In an IccMax condition, the CPU will respond to reduce the current within 2 ms. It will then respond in a step wise fashion to bring the current down to the Icc dynamic condition.
2. Icc dynamic is not expected to last longer than 10 seconds with a heat sink which meets but does not significantly exceed the specifications set forth in this document. Current suggested value is 1.2x TDP.
3. Turbo performance may be impacted by failing to meet durations specified in this graph. Ensure that the platform design can handle peak and average current based on the specification.
4. Processor or voltage regulator thermal protection circuitry should not trip for load currents greater than  $I_{CC\_TDC}$ .
5. Not 100% tested. Specified by design characterization.

### 2.9.2.1 $V_{CC}$ Overshoot Specifications

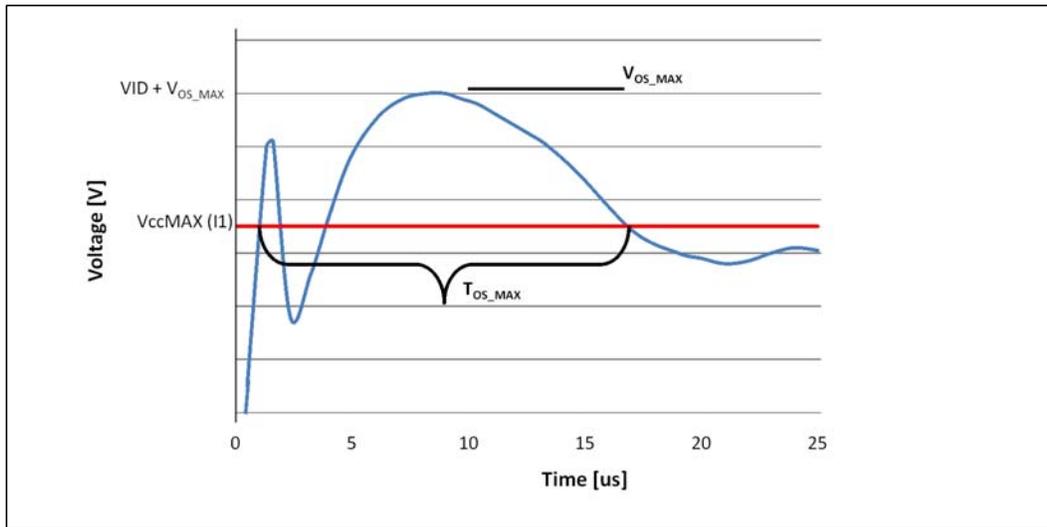

The Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor can tolerate short transient overshoot events where  $V_{CC}$  exceeds the VID voltage when transitioning from a high-to-low current load condition. This overshoot cannot exceed  $VID + V_{OS\_MAX}$  ( $V_{OS\_MAX}$  is the maximum allowable overshoot above VID). These specifications apply to the processor die voltage as measured across the VCC\_SENSE and VSS\_VCC\_SENSE lands.

Table 2-15.  $V_{CC}$  Overshoot Specifications

Symbol	Parameter	Min	Max	Units	Figure	Notes
$V_{OS\_MAX}$	Magnitude of $V_{CC}$ overshoot above VID		72	mV	2-5	
$T_{OS\_MAX}$	Time duration of $V_{CC}$ overshoot above VccMAX value at the new lighter load		25	$\mu$ s	2-5	

Figure 2-5. V<sub>CC</sub> Overshoot Example Waveform

**Notes:**

1. V<sub>OS\_MAX</sub> is the measured overshoot voltage.
2. T<sub>OS\_MAX</sub> is the measured time duration above V<sub>ccMAX</sub>(I1).
3. Istep: Load Release Current Step, for example, I<sub>2</sub> to I<sub>1</sub>, where I<sub>2</sub> > I<sub>1</sub>.
4. V<sub>ccMAX</sub>(I1) = VID - I1 \* RLL + 22 mV.

## 2.9.3 Signal DC Specifications

Table 2-16. PECl DC Specifications

Symbol	Definition and Conditions	Min	Max	Units	Figure	Notes <sup>1</sup>
V <sub>In</sub>	Input Voltage Range	-0.150	V <sub>ccPECl</sub>	V		
V <sub>Hysteresis</sub>	Hysteresis	0.1 * V <sub>ccPECl</sub>		V		
V <sub>N</sub>	Negative-edge threshold voltage	0.275 * V <sub>ccPECl</sub>	0.50 * V <sub>ccPECl</sub>	V	2-1	2
V <sub>P</sub>	Positive-edge threshold voltage	0.55 * V <sub>ccPECl</sub>	0.725 * V <sub>ccPECl</sub>	V	2-1	2
R <sub>Pullup</sub> Resistance	Pullup Resistance V <sub>OH</sub> = 0.75 * V <sub>PECl</sub>	N/A	50	ohm		
I <sub>Leak+</sub>	High impedance state leakage to V <sub>PECl</sub> (V <sub>leak</sub> = V <sub>OL</sub> )	N/A	50	μA		3
I <sub>Leak-</sub>	High impedance leakage to GND (V <sub>leak</sub> = V <sub>OH</sub> )	N/A	25	μA		3
C <sub>Bus</sub>	Bus capacitance per node	N/A	10	pF		4,5
V <sub>Noise</sub>	Signal noise immunity above 300 MHz	0.1 * V <sub>ccPECl</sub>	N/A	V <sub>p-p</sub>		

**Notes:**

1. V<sub>ccPECl</sub> supplies the PECl interface for Intel® Xeon® Processor E7-4800/8800 v4 Product Families.
2. It is expected that the PECl driver will take into account the variance in the receiver input thresholds and consequently, be able to drive its output within safe limits.
3. The leakage specification applies to powered devices on the PECl bus.
4. One node is counted for each client and one node for the system host. Extended trace lengths might appear as additional nodes.
5. Excessive capacitive loading on the PECl line may slow down the signal rise/fall times and consequently limit the maximum bit rate at which the interface can operate.

**Table 2-17. System Reference Clock (BCLK{0/1}) DC Specifications**

Symbol	Parameter	Signal	Min	Max	Unit	Figure	Notes <sup>1</sup>
V <sub>BCLK_diff_ih</sub>	Differential Input High Voltage	Differential	0.150	N/A	V	2-7	
V <sub>BCLK_diff_il</sub>	Differential Input Low Voltage	Differential		-0.150	V	2-7	
V <sub>cross (abs)</sub>	Absolute Crossing Point	Single-ended	0.250	0.550	V	2-6 2-8	2, 4, 7
V <sub>cross(rel)</sub>	Relative Crossing Point	Single-ended	0.250 + 0.5*(V <sub>Havg</sub> - 0.700)	0.550 + 0.5*(V <sub>Havg</sub> - 0.700)	V	2-6	3, 4, 5
ΔV <sub>cross</sub>	Range of Crossing Points	Single-ended	N/A	0.140	V	2-9	6
V <sub>TH</sub>	Threshold Voltage	Single-ended	V <sub>cross</sub> - 0.1	V <sub>cross</sub> + 0.1	V		
I <sub>IL</sub>	Input Leakage Current	N/A		1.50	μA		8
C <sub>pad</sub>	Pad Capacitance	N/A	0.9	1.1	pF		

**Notes:**

1. Unless otherwise noted, all specifications in this table apply to all processor frequencies.
2. Crossing Voltage is defined as the instantaneous voltage value when the rising edge of BCLK{0/1}\_DN is equal to the falling edge of BCLK{0/1}\_DP.
3. V<sub>Havg</sub> is the statistical average of the V<sub>H</sub> measured by the oscilloscope.
4. The crossing point must meet the absolute and relative crossing point specifications simultaneously.
5. V<sub>Havg</sub> can be measured directly using "Vtop" on Agilent\* and "High" on Tektronix oscilloscopes.
6. V<sub>CROSS</sub> is defined as the total variation of all crossing voltages as defined in Note 3.
7. The rising edge of BCLK{0/1}\_DN is equal to the falling edge of BCLK{0/1}\_DP.
8. For Vin between 0 and Vih.

**Table 2-18. SMBus DC Specifications**

Symbol	Parameter	Min	Max	Unit	Notes
V <sub>IL</sub>	Input Low Voltage		0.3*V <sub>TT</sub>	V	
V <sub>IH</sub>	Input High Voltage	0.7*V <sub>TT</sub>		V	
V <sub>OL</sub>	Output Low Voltage		0.2*V <sub>TT</sub>	V	
V <sub>OH</sub>	Output High Voltage		V <sub>TT(max)</sub>	V	
R <sub>ON</sub>	Buffer On Resistance		14	W	
I <sub>L</sub>	Leakage Current Signals MEM_SCL_C[3:0], MEM_SDA_C[3:0]	-100	+100	μA	
I <sub>L</sub>	Leakage Current Signals VPP_SCL, VPP_SDA (R <sub>TEST</sub> = 50 ohm)		+900	μA	

**Table 2-19. JTAG and TAP Signals DC Specifications (Sheet 1 of 2)**

Symbol	Parameter	Min	Max	Unit	Notes
V <sub>IL</sub>	Input Low Voltage		0.3*V <sub>TT</sub>	V	
V <sub>IH</sub>	Input High Voltage	0.7*V <sub>TT</sub>		V	
V <sub>OL</sub>	Output Low Voltage (R <sub>TEST</sub> = 500 ohm)		0.12*V <sub>TT</sub>	V	
V <sub>OH</sub>	Output High Voltage (R <sub>TEST</sub> = 500 ohm)	0.88*V <sub>TT</sub>		V	
R <sub>ON</sub>	Buffer On Resistance Signals BPM_N[7:0], TDO, EAR_N		14	W	
I <sub>IL</sub>	Input Leakage Current Signals PREQ_N, TCK, TDI, TMS, TRST_N	-50	+50	μA	

**Table 2-19. JTAG and TAP Signals DC Specifications (Sheet 2 of 2)**

Symbol	Parameter	Min	Max	Unit	Notes
$I_{IL}$	Input Leakage Current Signals BPM_N[7:0], TDO, EAR_N ( $R_{TEST} = 50$ ohm)		+900	$\mu A$	
$I_O$	Output Current Signal PRDY_N ( $R_{TEST} = 500$ ohm)	-1.50	+1.50	$\mu A$	
	Input Edge Rate Signals: BPM_N[7:0], EAR_N, PREQ_N, TCK, TDI, TMS, TRST_N	0.05		V/ns	1

**Note:**

1. These are measured between VIL and VIH.

**Table 2-20. Serial VID Interface (SVID) DC Specifications**

Symbol	Parameter	Min	Typ	Max	Unit	Notes
$V_{TT}$	CPU I/O Voltage	$V_{TT} - 3\%$	1.05	$V_{TT} + 3\%$	V	
$V_{IL}$	Input Low Voltage Signals SVIDDATA, SVIDALERT_N			$0.3 * V_{TT}$	V	1
$V_{IH}$	Input High Voltage Signals SVIDDATA, SVIDALERT_N	$0.7 * V_{TT}$			V	1
$V_{OH}$	Output High Voltage Signals SVIDCLK, SVIDDATA			$V_{TT(max)}$	V	1
$R_{ON}$	Buffer On Resistance Signals SVIDCLK, SVIDDATA			14	ohm	2
$I_{IL}$	Input Leakage Current Signals SVIDCLK, SVIDDATA			+900	$\mu A$	3
$I_{IL}$	Input Leakage Current Signal SVIDALERT_N	-500		+500	$\mu A$	3

**Notes:**

1.  $V_{TT}$  refers to instantaneous  $V_{TT}$
2. Measured at  $0.31 * V_{TT}$
3. Vin between 0 V and  $V_{TT}$

**Table 2-21. Processor Asynchronous Sideband DC Specifications (Sheet 1 of 2)**

Symbol	Parameter	Min	Max	Unit	Notes

<b>Open Drain CMOS (ODCMOS) Signals</b>					
$V_{IL\_ODCMOS}$	Input Low Voltage		$0.3 * V_{TT}$	V	1,2
$V_{IH\_ODCMOS}$	Input High Voltage	$0.7 * V_{TT}$		V	1,2
$V_{OH\_ODCMOS}$	Output High Voltage Signals: CAT_ERR_N, ERROR_N[2:0], THERMTRIP_N, PROCHOT_N, CPU_ONLY_RESET		$V_{TT(max)}$	V	1,2
$I_{OL}$	Output Leakage Current, Signal MEM_HOT_C{01/23}_N	-100	+100	$\mu\text{A}$	3
$I_{OL}$	Output Leakage Current ( $R_{TEST} = 50 \text{ ohm}$ )		+900	$\mu\text{A}$	3
$R_{ON}$	Buffer On Resistance Signals: CAT_ERR_N, CPU_ONLY_RESET, ERROR_N[2:0], MEM_HOT_C{01/23}_N, PROCHOT_N, THERMTRIP_N		14	ohm	1,2

**Note:**

1. This table applies to the processor sideband and miscellaneous signals specified in Table 2-5.
2. Unless otherwise noted, all specifications in this table apply to all processor frequencies.
3. For  $V_{in}$  between 0 and  $V_{oh}$ .
4. PWRGOOD Non Monotonicity duration ( $T_{NM}$ ) time is maximum 1.3 ns. See Figure 2-10 "PWRGOOD Signal Waveform".
5. These are measured between  $V_{IL}$  and  $V_{IH}$ .

**Table 2-22. Miscellaneous Signals DC Specifications**

Symbol	Parameter	Min	Typical	Max	Unit	Notes
<b>SKTOCC_N Signal</b>						
$V_{O\_ABS\_MAX}$	Output Absolute Max Voltage		3.30	3.50	V	
$I_{OMAX}$	Output Max Current			1	mA	

**2.9.3.1 PCI Express\* DC Specifications**

Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor DC specifications for the PCI Express\* are available in the *PCI Express® Base Specification - Revision 3.0 DRAFT*, which provides only the processor exceptions to the specification.

**2.9.3.2 DMI2/PCI Express DC Specifications**

Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor DC specifications for the DMI2/PCI Express\* are available in the *PCI Express® Base Specification 2.0 and 1.0* document, which provides only the processor exceptions to the specification.

**2.9.3.3 Intel QuickPath Interconnect DC Specifications**

Intel® QuickPath Interconnect specifications are defined at the processor lands. In most cases, termination resistors are not required as these are integrated into the processor silicon.

### 2.9.3.4 Reset and Miscellaneous Signal DC Specifications

For a power-on Reset, RESET\_N must stay active for at least 3.5 millisecond after  $V_{CC}$  and BCLK{0/1} have reached their proper specifications. RESET\_N must not be kept asserted for more than 100 ms while PWRGOOD is asserted. RESET\_N must be held asserted for at least 3.5 millisecond before it is deasserted again. RESET\_N must be held asserted before PWRGOOD is asserted. This signal does not have on-die termination and must be terminated on the system board.

## 2.10 Signal Quality

Data transfer requires the clean reception of data signals and clock signals. Ringing below receiver thresholds, non-monotonic signal edges, and excessive voltage swings will adversely affect system timings. Ringback and signal nonmonotonicity cannot be

tolerated since these phenomena may inadvertently advance receiver state machines. Excessive signal swings (overshoot and undershoot) are detrimental to silicon gate oxide integrity and can cause device failure if absolute voltage limits are exceeded. Overshoot and undershoot can also cause timing degradation due to the build up of intersymbol interference (ISI) effects.

For these reasons, it is crucial that the designer work towards a solution that provides acceptable signal quality across all systematic variations encountered in volume manufacturing.

This section documents signal quality metrics used to derive topology and routing guidelines through simulation. All specifications are specified at the processor die (pad measurements).

Specifications for signal quality are for measurements at the processor core only and are only observable through simulation. Therefore, proper simulation is the only way to verify proper timing and signal quality.

### 2.10.1 Intel® Scalable Memory Interconnect Gen 2 (Intel® SMI 2) Signal Quality Specifications

Overshoot (or undershoot) is the absolute value of the maximum voltage above or below  $V_{SS}$ . The overshoot/undershoot specifications limit transitions beyond specified maximum voltages or  $V_{SS}$  due to the fast signal edge rates. The processor can be damaged by single and/or repeated overshoot or undershoot events on any input, output, or I/O buffer if the charge is large enough (that is, if the over/undershoot is great enough). Baseboard designs which meet signal integrity and timing requirements and which do not exceed the maximum overshoot or undershoot limits listed in [Table 2-23](#) will insure reliable IO performance for the lifetime of the processor.

### 2.10.2 I/O Signal Quality Specifications

Signal Quality specifications for PCIe Signals are included as part of the PCIe DC specifications.

### 2.10.3 Intel® QuickPath Interconnect Signal Quality Specifications

Signal Quality specifications for Differential Intel® QuickPath Interconnect Signals are included as part of the Intel QuickPath Interconnect defined in the *Intel® QuickPath Interconnect V1.1 Base Electrical Specification and Validation Methodologies*.

### 2.10.4 Input Reference Clock Signal Quality Specifications

Overshoot/Undershoot and Ringback specifications for  $BCLK\{0/1\}_D[N/P]$  are found in [Table 2-23](#). Overshoot/Undershoot and Ringback specifications for the DDR3 Reference Clocks are specified by the DIMM.

### 2.10.5 Overshoot/Undershoot Tolerance

Overshoot (or undershoot) is the absolute value of the maximum voltage above or below  $V_{SS}$ , see [Figure 2-11](#). The overshoot/undershoot specifications limit transitions beyond  $V_{VMSE}$  or  $V_{SS}$  due to the fast signal edge rates. The processor can be damaged by single and/or repeated overshoot or undershoot events on any input, output, or I/O buffer if the charge is large enough (i.e., if the over/undershoot is great enough).

Baseboard designs which meet signal integrity and timing requirements and which do not exceed the maximum overshoot or undershoot limits listed in Table 2-23 will insure reliable IO performance for the lifetime of the processor.

### 2.10.5.1 Overshoot/Undershoot Magnitude

Magnitude describes the maximum potential difference between a signal and its voltage reference level. For the processor, both are referenced to  $V_{SS}$ . It is important to note that the overshoot and undershoot conditions are separate and their impact must be determined independently.

The pulse magnitude and duration must be used to determine if the overshoot/undershoot pulse is within specifications.

### 2.10.5.2 Overshoot/Undershoot Pulse Duration

Pulse duration describes the total amount of time that an overshoot/undershoot event exceeds the overshoot/undershoot reference voltage. The total time could encompass several oscillations above the reference voltage. Multiple overshoot/undershoot pulses within a single overshoot/undershoot event may need to be measured to determine the total pulse duration.

**Note:** Oscillations below the reference voltage cannot be subtracted from the total overshoot/undershoot pulse duration.

**Table 2-23. Processor I/O Overshoot/Undershoot Specifications**

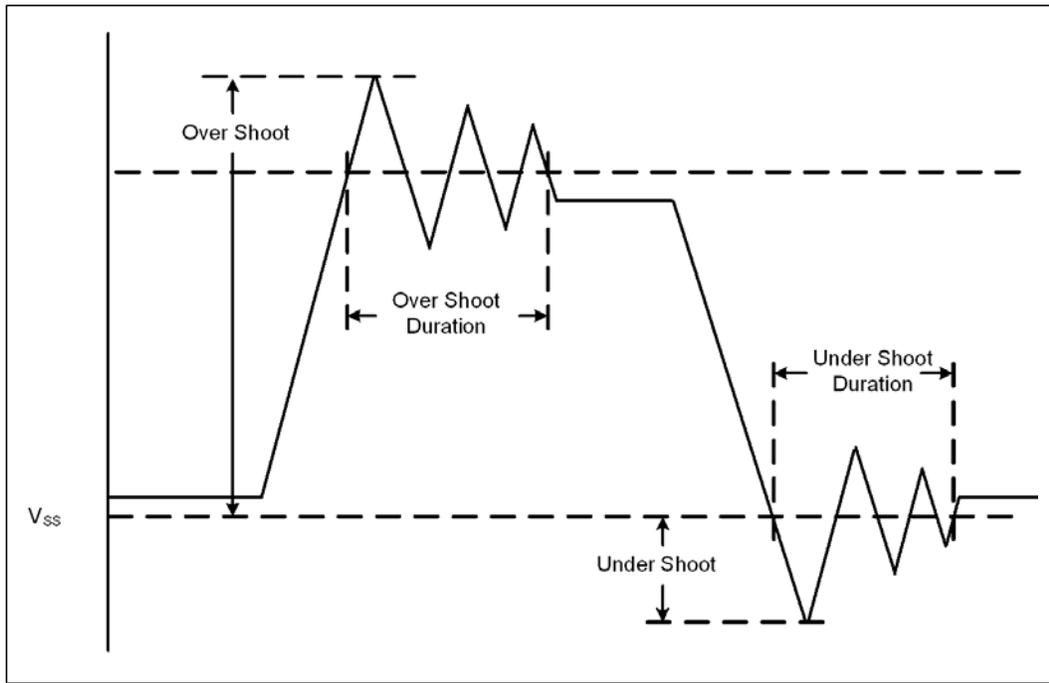

Signal Group	Minimum Undershoot	Maximum Overshoot	Overshoot Duration	Undershoot Duration	Notes
Intel® QuickPath Interconnect	-0.2	1.2	39 ps	15 ps	1, 2
Intel SMI2	0	400			1, 2, 3
Processor Asynchronous Sideband Signals	-0.35	1.35	1.25 ns	0.5 ns	1, 2
Miscellaneous Signals	-.35	1.35			
System Reference Clock (BCLK{0/1})	-0.3V	1.15V	N/A	N/A	1, 2
PWRGOOD Signal	-0.420V	1.28	N/A	N/A	4

**Notes:**

1. These specifications are measured at the processor pad.
2. Refer to Figure 2-11 for description of allowable overshoot/undershoot magnitude and duration.
3. For PWRGOOD DC specifications see Table 2-21 and Figure 2-10 "PWRGOOD Signal Waveform".

Figure 2-11. Maximum Acceptable Overshoot/Undershoot Waveform

## 3 Processor Land Listing

This chapter provides sorted land list in [Section 3.1](#) and [Section 3.2](#). [Table 3-1](#) is a listing of all Datasheet Volume 1: EMTS lands ordered alphabetically by land name. [Table 3-2](#) is a listing of all processor lands ordered by land number.

### 3.1 Listing by Land Name

**Table 3-1. Land Name (Sheet 1 of 50)**

Land Name	Land No.	Buffer Type	Direction
BCLK0_DN	AF46	CMOS	I
BCLK0_DP	AH46	CMOS	I
BCLK1_DN	AE9	CMOS	I
BCLK1_DP	AF10	CMOS	I
BIST_ENABLE	AY50	CMOS	I
BMCINIT	AP50	CMOS	I
BPM_N[0]	K58	CMOS	I/O
BPM_N[1]	L57	CMOS	I/O
BPM_N[2]	E57	CMOS	I/O
BPM_N[3]	C55	CMOS	I/O
BPM_N[4]	B54	CMOS	I/O
BPM_N[5]	A53	CMOS	I/O
BPM_N[6]	D54	CMOS	I/O
BPM_N[7]	D56	CMOS	I/O
CATERR_N	AG35	CMOS	I/O
DEBUG_EN_N	BD10		
DMI_RX_N[0]	AY8	CMOS	I
DMI_RX_N[1]	BB8	CMOS	I
DMI_RX_N[2]	BD8	CMOS	I
DMI_RX_N[3]	BF8	CMOS	I
DMI_RX_P[0]	BA7	CMOS	I
DMI_RX_P[1]	BC7	CMOS	I
DMI_RX_P[2]	BE7	CMOS	I
DMI_RX_P[3]	BG7	CMOS	I
DMI_TX_N[0]	AK8	CMOS	O
DMI_TX_N[1]	AM8	CMOS	O
DMI_TX_N[2]	AP8	CMOS	O
DMI_TX_N[3]	AT8	CMOS	O
DMI_TX_P[0]	AL7	CMOS	O
DMI_TX_P[1]	AN7	CMOS	O
DMI_TX_P[2]	AR7	CMOS	O
DMI_TX_P[3]	AU7	CMOS	O

**Table 3-1. Land Name (Sheet 2 of 50)**

Land Name	Land No.	Buffer Type	Direction
EAR_N	CY58	CMOS	I/O

§

## 4 Signal Descriptions

This chapter describes the Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor signals. They are arranged in functional groups according to their associated interface or category.

### 4.1 System Memory Interface

Table 4-1. Memory Channel Signals

Signal Name	Description
MEM_SCL_C[3:0] MEM_SDA_C[3:0]	SMBus clock for the dedicated interface to the serial presence detect (SPD) and thermal sensors (TSoD) on the DIMMs.
VMSE{0/1/2/3}_CLK_N VMSE{0/1/2/3}_CLK_P	Clocks to the memory buffer. This clock is used to capture the VCMD# signals.
VMSE{0/1/2/3}_CMD[16:0]	Command signals.
VMSE{0/1/2/3}_DQ[63:0]	Data Bus. DDR3 Data bits.
VMSE{0/1/2/3}_DQS_P[8:0] VMSE{0/1/2/3}_DQS_N[8:0]	Data strobes. Driven with edges in center of data, receive edges are aligned with data edges.
VMSE{0/1/2/3}_ECC[7:0]	Check bits. An error correction code is driven along with data on these lines for DIMMs that support that capability
VMSE{0/1/2/3}_ERR_N	Parity Error detected by Registered DIMM (one for each channel).
VMSE_PWR_OK	Power good input signal used to indicate that the power supply is stable for memory channels.

### 4.2 PCI Express Based Interface Signals

**Note:** PCI Express Ports 0 and 1 signals are receive and transmit differential pairs.

Table 4-2. PCI Express\* Port Signals

Signal Name	Description
PE{1:0}_RX_N[15:0] PE{1:0}_RX_P[15:0]	Intel SMI2 Receive Data Input
PE{1:0}_TX_N[15:0] PE{1:0}_TX_P[15:0]	Intel SMI2 Receive Data Output

### 4.3 DMI 2/PCI Express Port Signals

Table 4-3. DMI2 to Port 0 Signals

Signal Name	Description
DMI_RX_DN[3:0] DMI_RX_DP[3:0]	DMI2 Receive Data Input
DMI_TX_DP[3:0] DMI_TX_DN[3:0]	DMI2 Transmit Data Output

## 4.4 Intel® QuickPath Interconnect Signals

Table 4-4. Intel® QPI Port 0, 1, and 2 Signals

Signal Name	Description
QPI{2:0}_CLKRX_DN/DP	Reference Clock Differential Input. These pins provide the PLL reference clock differential input. 100 MHz typ.
QPI{2:0}_CLKTX_DN/DP	Reference Clock Differential Output. These pins provide the PLL reference clock differential input. 100 MHz typ.
QPI{2:0}_DRX_DN/DP[19:00]	Intel® QPI Receive data input.
QPI{2:0}_DTX_DN/DP[19:00]	Intel® QPI Transmit data output.

## 4.5 PECCI Signal

Table 4-5. PECCI Signals

Signal Name	Description
PECCI	PECCI (Platform Environment Control Interface) is the serial sideband interface to the processor and is used primarily for thermal, power and error management. Details regarding the PECCI electrical specifications, protocols and functions can be found in the Platform Environment Control Interface Specification.

## 4.6 System Reference Clock Signals

Table 4-6. System Reference Clock (BCLK{0/1}) Signals

Signal Name	Description
BCLK{0/1}_D[N/P]	Reference Clock Differential input. These pins provide the PLL reference clock differential input into the processor. 100 MHz typical BCLK0 is the Intel® QPI reference clock (system clock) and BCLK1 is the PCI Express* reference clock.

## 4.7 JTAG and TAP Signals

Table 4-7. JTAG and TAP Signals (Sheet 1 of 2)

Signal Name	Description
BPM_N[7:0]	Breakpoint and Performance Monitor Signals: I/O signals from the processor that indicate the status of breakpoints and programmable counters used for monitoring processor performance. These are 100 MHz signals.
EAR_N	External Alignment of Reset, used to bring the processor up into a deterministic state. This signal is pulled up on the die.
PRDY_N	Probe Mode Ready is a processor output used by debug tools to determine processor debug readiness.
PREQ_N	Probe Mode Request is used by debug tools to request debug operation of the processor.
TCK	TCK (Test Clock) provides the clock input for the processor Test Bus (also known as the Test Access Port).
TDI	TDI (Test Data In) transfers serial test data into the processor. TDI provides the serial input needed for JTAG specification support.

Table 4-7. JTAG and TAP Signals (Sheet 2 of 2)

Signal Name	Description
TDO	TDO (Test Data Out) transfers serial test data out of the processor. TDO provides the serial output needed for JTAG specification support.
TMS	TMS (Test Mode Select) is a JTAG specification support signal used by debug tools.
TRST_N	TRST_N (Test Reset) resets the Test Access Port (TAP) logic. TRST_N must be driven low during power on Reset.

## 4.8 Serial VID Interface (SVID) Signals

Table 4-8. SVID Signals

Signal Name	Description
SVIDALERT_N	Serial VID alert.
SVIDCLK	Serial VID clock.
SVIDDATA	Serial VID data out.
SVID_IDLE_N	Output pin used to indicate when the SVID bus is IDLE. When asserted true (low), it will assert for two SVID clock cycles. It guarantees that the SVID bus will remain idle for two SVID clocks after it deasserts.

## 4.9 PIROM Signals

Table 4-9. PIROM Signals

Signal Name	Description
PIROM_ADDR[2:0]	Address for PIROM (Processor Information ROM/OEM scratchpad).
SM_WP	WP (Write Protect) can be used to write protect the Scratch EEPROM. The Scratch EEPROM is write-protected when this input is pulled high to VCCSTBY33.
SMBCLK	The SMBus Clock (SMBCLK) signal is an input clock which is required for operation of PIROM. This clock is driven by the SMBus controller and is asynchronous to other clocks in the processor.
SMBDAT	The SMBus Data (SMBDAT) signal is the data signal for the SMBus. This signal provides the single-bit mechanism for transferring data between SMBus devices.

## 4.10 Processor Asynchronous Sideband and Miscellaneous Signals

Table 4-10. Processor Asynchronous Sideband Signals (Sheet 1 of 2)

Signal Name	Description
CAT_ERR_N	<p>Indicates that the system has experienced a fatal or catastrophic error and cannot continue to operate. The processor will assert CAT_ERR_N for nonrecoverable machine check errors and other internal unrecoverable errors. It is expected that every processor in the system will wire-OR CAT_ERR_N for all processors. Since this is an I/O land, external agents are allowed to assert this land which will cause the processor to take a machine check exception.</p> <p>On Intel® Xeon® Processor E7-4800/8800 v4 Product Families processors, CAT_ERR_N is used for signaling the following types of errors:</p> <ul style="list-style-type: none"> <li>Legacy MCERRs, CAT_ERR_N is asserted for 16 BCLKs, and samples it for 28 BCLKs to determine if it is driven by an external agent indicating a fatal or uncorrected error.</li> <li>Legacy IERRs, CAT_ERR_N remains asserted until warm or cold reset.</li> </ul>
ERROR_N[2:0]	<p>Error status signals for integrated I/O (IIO) unit:</p> <ul style="list-style-type: none"> <li>0 = Hardware correctable error (no operating system or firmware action necessary)</li> <li>1 = Nonfatal error (operating system or firmware action required to contain and recover)</li> <li>2 = Fatal error (system reset likely required to recover)</li> </ul>
MEM_HOT_C01_N MEM_HOT_C23_N	<p>Memory throttle control. MEM_HOT_C01_N and MEM_HOT_C23_N signals have two modes of operation – input and output mode.</p> <p>Input mode is externally asserted and is used to detect external events such as VR_HOT# from the memory voltage regulator and causes the processor to throttle the appropriate memory channels.</p> <p>Output mode is asserted by the processor and has two modes - level mode and duty cycle mode. In level mode, the output indicates that a particular DIMM branch of memory subsystem is hot. In duty cycle mode, the output indicates the hottest DIMM's temperature by altering the percentage of assertion (duty cycle).</p> <p>MEM_HOT_C01_N is used for memory channels 0 &amp; 1 while MEM_HOT_C23_N is used for memory channels 2 &amp; 3.</p>
PMSYNC	<p>Power Management Sync. A sideband signal to communicate power management status from the Platform Controller Hub (PCH) to the processor.</p>
PROCHOT_N	<p>PROCHOT_N will go active when the processor temperature monitoring sensor detects that the processor has reached its maximum safe operating temperature. This indicates that the processor Thermal Control Circuit has been activated, if enabled. This signal can also be driven to the processor to activate the Thermal Control Circuit.</p> <p>If PROCHOT_N is asserted at the assertion of RESET_N, the processor will tristate its outputs.</p>
PWRGOOD	<p>Power good input signal used to indicate that the VCC power supply is stable. The processor requires this signal to be a clean indication that all processor clocks and power supplies are stable and within their specifications.</p> <p>“Clean” implies that the signal will remain low (capable of sinking leakage current), without glitches, from the time that the power supplies are turned on until they come within specification. The signal must then transition monotonically to a high state. PWRGOOD can be driven inactive at any time, but clocks and power must again be stable before a subsequent rising edge of PWRGOOD. The signal must be supplied to the processor; it is used to protect internal circuits against voltage sequencing issues. It should be driven high throughout boundary scan operation.</p>
RESET_N	<p>Asserting the RESET_N signal resets the processor to a known state and invalidates its internal caches without writing back any of their contents. Note some PLL, Intel QuickPath Interconnect and error states are not effected by reset and only PWRGOOD forces them to a known state.</p>
SAFE_MODE_BOOT	<p>NC on production system. Pullup on die.</p>

**Table 4-10. Processor Asynchronous Sideband Signals (Sheet 2 of 2)**

Signal Name	Description
THERMTRIP_N	Assertion of THERMTRIP_N (Thermal Trip) indicates one of two possible critical over-temperature conditions: One, the processor junction temperature has reached a level beyond which permanent silicon damage may occur and Two, the system memory interface has exceeded a critical temperature limit set by BIOS. Measurement of the processor junction temperature is accomplished through multiple internal thermal sensors that are monitored by the Digital Thermal Sensor (DTS). Simultaneously, the Power Control Unit (PCU) monitors external memory temperatures via the dedicated SMBus interface to the DIMMs. If any of the DIMMs exceed the BIOS defined limits, the PCU will signal THERMTRIP_N to prevent damage to the DIMMs. Once activated, the processor will stop all execution and shut down all PLLs. To further protect the processor, its core voltage (VCC), VccIO_IN, VSA, VCCPLL, VVMSE supplies must be removed following the assertion of THERMTRIP_N. Once activated, THERMTRIP_N remains latched until RESET_N is asserted. While the assertion of the RESET_N signal may deassert THERMTRIP_N, if the processor's junction temperature remains at or above the trip level, THERMTRIP_N will again be asserted after RESET_N is deasserted. This signal can also be asserted if the system memory interface has exceeded a critical temperature limit set by BIOS.
TSC_SYNC	Time stamp counter sync. Used to help align the time stamp counters of a newly onlined socket to the time stamp counters of existing sockets.

**Table 4-11. Miscellaneous Signals (Sheet 1 of 2)**

Signal Name	Description
BIST_ENABLE	Input which allows the platform to enable or disable built-in self test (BIST) on the processor. This signal is pulled up on the die. This strap is latched during all reset modes.
BMCINIT	Indicates whether Service Processor Boot Mode should be used. Used in conjunction with FRMAGENT and SOCKET_ID inputs. <ul style="list-style-type: none"> <li>0: No Service Processor boot. Example boot modes: Local PCH (this processor hosts a legacy PCH with firmware behind it), Intel® QPI Link Boot (for processors one hop away from the FW agent), or Intel® QPI Link Init (for processors more than one hop away from the firmware agent).</li> <li>1: Service Processor boot. In this mode of operation, the processor performs the absolute minimum internal configuration and then waits for the Service Processor to complete its initialization. The socket boots after receiving a "GO" handshake signal via a firmware scratchpad register.</li> </ul> Needs 240 Ohm pull up/pull down (see boot mode).
DEBUG_EN_N	This pin is used to enable certain features used by Intel ITP (e.g. probe mode). This pin should be connected to the Intel ITP XDP_PRESENT_N# signal as a security measure to validate user had physical access to the target platform Intel® Xeon® E7 v4 processors only. Needs 240 Ohm pull up.
EX_LEGACY_SKT	BMCINIT, FRMAGENT, LEGACY_SKT together determine the boot mode (SSP, Intel® QPI Link boot modes, DCF boot), whether local or remote, whether the boot PCH is attached, whether the socket is legacy and whether port0 is DMI or Intel SMI2 (Gen1/2). With one exception, this input configuration strap indicates to the processor that it is the legacy socket. The legacy SKT must be strapped for NODE ID 0, via the SKIT-ID pins. There is only 1 legacy SKT in a partition. Needs 240 Ohm pull up/pull down (see boot mode).
FIVR_FAULT	Intel® Xeon® E7 v3 and Intel® Xeon® E7 v4 processors only. Indicates IVR-failure. Accompanied by THERMTRIP # assertion. See the for proper connectivity.
FRMAGENT	This input configuration strap indicates to the processor that it is a bootable firmware agent, i.e. that the firmware flash ROM is located behind the local PCH attached to the processor via the DMI2 interface. This signal is pulled down on the die, refer to Table 2-6 for details. Needs 240 Ohm pull up/pull down (see boot mode).
MSMI_N	MSMI_N is supported by the Intel® Xeon® E7 v3 and Intel® Xeon® E7 v4 processors and not supported by the Intel® Xeon® E7 v2 family processor. When eMCA2 is not enabled, the MSMI_N pin is not used. When eMCA2 is enabled in Intel® Xeon® E7 v3 or Intel® Xeon® E7 v4 processor, CATERR_N will no longer be driven. The processor will instead drive MSMI_N. Platforms that enable eMCA2, should monitor MSMI_N for uncorrectable and fatal events, and at a minimum, reset the system on fatal events as is the case for CATERR_N.

Table 4-11. Miscellaneous Signals (Sheet 2 of 2)

Signal Name	Description
PROC_ID[1:0]	These outputs can be used by the platform to determine if the installed processor is an Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor or a future processor planned for the platform. In the order of PROC_ID1, PROC_ID0, 00 refers to a Intel® Xeon® Processor E7 v2 Family processor. 11 refers to a Intel® Xeon® E7 v3 processor. 10 refers to a Intel® Xeon® E7 v4 processor. There is no connection to the processor silicon for this signal.
NMI	Interrupt input. Active high. Indicates Non-Maskable Interrupt.
PM_FAST_WAKE_N	Intel® Xeon® E7 v3 and Intel® Xeon® E7 v4 processors only
PWR_DEBUG_N	This is a debug signal for power debug using Intel ITP on Intel® Xeon® E7 v4 processor.
RSVD	RESERVED. All signals that are RSVD must be left unconnected on the board.
SKTOCC_N	SKTOCC_N (Socket occupied) will be pulled to ground in the processor package to indicate that the processor is present. There is no connection to the processor silicon for this signal. 4.7 kW pull-up to 3.3V
SOCKET_ID[2:0]	Socket identification configuration straps for establishing the PECE address, Intel® QPI Node ID, and other settings. Each processor socket consumes one Node ID, and there are 128 Home Agent tracker entries..
TEST[13:0]	Test[13:0] must be individually connected to an appropriate power source or ground through a resistor for proper processor operation.
TXT_AGENT	Indicates the Intel® Trusted Execution Technology (Intel® TXT) Agent. This feature is disabled by default via internal pull-down resistor. Strap to VCCIO on the legacy socket only via 240 Ohm resistor to enable the feature.
TXT_PLTEN	Intel® TXT disable. This feature is enabled by default via an internal pull-up resistor. Strap to 0 on all sockets to disable the feature. Use a zero ohm resistor if future flexibility is desirable.

## 4.11 Processor Power and Ground Supplies

Table 4-12. Power and Ground Signals (Sheet 1 of 2)

Signal Name	Description
VCC	Variable power supply for the processor cores, last level caches (LLC), ring interface, and home agent. It is provided by a VRM/EVRD12.5 compliant regulator for each CPU socket. The valid voltage of this supply is indicated by the processor using the serial voltage ID (SVID) interface.
VCC_SENSE VSS_VCC_SENSE	VCC_SENSE and VSS_VCC_SENSE provide an isolated, low impedance connection to the processor core power and ground. These signals must be connected to the voltage regulator feedback circuit, which insures the output voltage (that is, processor voltage) remains within specification.
VCC33	VCC33 supplies 3.3 V to PIROM/OEM Scratch ROM. This supply is required for PIROM usage.
VCCIO_IN	Intel® Xeon® E7 v3 and Intel® Xeon® E7 v4 processors only power supply.
VCCPLL	Fixed power supply (1.8 V) for the processor phased lock loop (PLL). Also known as VCCsfr.
VTTA and VTTQ	Combined fixed analog and quiet analog supply for VMSE, Power Control Unit (PCU), miscellaneous IO, Direct Media Interface Gen 2 (DMI2) interface, Intel® QPI interface and PCI Express* interface at VTT voltage (1.0 V). Not connected for Intel® Xeon® E7 v3 or Intel® Xeon® E7 v4 processors.
VTT_SENSE VSS_VTT_SENSE	VTT_SENSE and VSS_VTT_SENSE provide an isolated, low impedance connection to the processor I/O power plane. These signals must be connected to the voltage regulator feedback circuit, which insures the output voltage (that is, processor voltage) remains within specification.
VCCPECE	Power supply for PECE. Intel® Xeon® E7 v3 and Intel® Xeon® E7 v4 processors only.
VSA	Variable power supply for the processor system agent units. These include logic (non-I/O) for the integrated I/O controller, the integrated memory controller (iMC), and the Intel® QPI agent.

Table 4-12. Power and Ground Signals (Sheet 2 of 2)

Signal Name	Description
VSA_SENSE VSS_VSA_SENSE	VSA_SENSE and VSS_VSA_SENSE provide an isolated, low impedance connection to the processor system agent (VSA) power plane. These signals must be connected to the voltage regulator feedback circuit, which insures the output voltage (that is, processor voltage) remains within specification.
VSS	Processor ground node.
VVMSE01 and VVMSE23	1.35 V power supply for the processor system memory interface. VVMSE is generic for VVMSE01, VVMSE23. <i>Note:</i> The processor must be provided VVMSE011 and VVMSE23 for proper operation, even in configurations where no memory is populated.

§

# 5 Thermal Management Specifications

---

## 5.1 Package Thermal Specifications

The Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor requires a thermal solution to maintain temperatures within operating limits. Any attempt to operate the processor outside these limits may result in permanent damage to the processor and potentially other components within the system. Maintaining the proper thermal environment is key to reliable, long-term system operation.

A complete solution includes both component and system level thermal management features. Component level thermal solutions can include active or passive heatsinks attached to the processor integrated heat spreader (IHS). Typical system level thermal solutions may consist of system fans combined with ducting and venting.

This section provides data necessary for developing a complete thermal solution. For more information on designing a component level thermal solution, refer to the *Intel® Xeon® Processor E7 v4 Product Family Thermal/Mechanical Specifications and Design Guide*.

### 5.1.1 Thermal Specifications

To allow optimal operation and long-term reliability of Intel processor-based systems, the processor must remain within the minimum and maximum case temperature ( $T_{CASE}$ ) specifications as defined by the applicable thermal profile. Thermal solutions not designed to provide sufficient thermal capability may affect the long-term reliability of the processor and system. For more details on thermal solution design, please refer to the *Intel® Xeon® Processor E7 v4 Product Family Thermal/Mechanical Specifications and Design Guide*.

The Intel® Xeon® Processor E7-4800/8800 v4 Product Families processors implement a methodology for managing processor temperatures which is intended to support acoustic noise reduction through fan speed control and to assure processor reliability. Selection of the appropriate fan speed is based on the relative temperature data reported by the processor's Platform Environment Control Interface (PECI).

If the DTS value is less than  $T_{CONTROL}$ , then the case temperature is permitted to exceed the Thermal Profile, but the DTS value must remain at or below  $T_{CONTROL}$ .

For  $T_{CASE}$  implementations, if DTS is greater than  $T_{CONTROL}$ , then the case temperature must meet the  $T_{CASE}$  based Thermal Profiles.

For DTS implementations:

- $T_{CASE}$  thermal profile can be ignored during processor run time.
- If DTS is greater than  $T_{CONTROL}$  then follow DTS thermal profile specifications for fan speed optimization.

The temperature reported over PECI is always a negative value and represents a delta below the onset of thermal control circuit (TCC) activation, as indicated by PROCHOT\_N. Systems that implement fan speed control must be designed to use this data. Systems that do not alter the fan speed need to guarantee the case temperature meets the thermal profile specifications.

With single thermal profile, it is expected that the Thermal Control Circuit (TCC) would be activated for very brief periods of time when running the most power intensive applications. Utilization of a thermal solution that does not meet the thermal profile will violate the thermal specifications and may result in permanent damage to the processor. Refer to the *Intel® Xeon® Processor E7 v4 Product Family Thermal/Mechanical Specifications and Design Guide* for details on system thermal solution design, thermal profiles and environmental considerations. The upper point of the thermal profile consists of the Thermal Design Power (TDP) and the associated  $T_{CASE}$  value.

( $x = TDP$  and  $y = T_{CASE\_MAX} @ TDP$ ) represents a thermal solution design point. In actuality the processor case temperature will not reach this value due to TCC activation.

Intel recommends that complete thermal solution designs target the Thermal Design Power (TDP). The Adaptive Thermal Monitor feature is intended to help protect the processor in the event that an application exceeds the TDP recommendation for a sustained time period. To ensure maximum flexibility for future requirements, systems should be designed to the Flexible Motherboard (FMB) guidelines, even if a processor with lower power dissipation is currently planned. The Adaptive Thermal Monitor feature must be enabled for the processor to remain within its specifications.

### 5.1.2 $T_{CASE}$ and DTS Based Thermal Specifications

To simplify compliance to thermal specifications at processor run time, the Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor has added a Digital Thermal Sensor (DTS) based thermal specification. Digital Thermal Sensor reports a relative die temperature as an offset from TCC activation temperature.  $T_{CASE}$  thermal based specifications are used for heat sink sizing and DTS based specs are used for acoustic and fan speed optimizations. For the Intel® Xeon® E7 v4 processor family, firmware (for example, BMC or other platform management devices) will have DTS based specifications for all SKUs programmed by the customer. SKUs may share  $T_{CASE}$  thermal profiles but they will have separate  $T_{DTS}$  based thermal profiles.

The processor fan speed control is managed by comparing DTS thermal readings via PECI against the processor-specific fan speed control reference point, or  $T_{control}$ . Both  $T_{control}$  and DTS thermal readings are accessible via the processor PECI client. At a one time readout only, the Fan Speed Control firmware will read the following:

- IA32\_TEMPERATURE\_TARGET MSR
- $T_{control}$  via PECI - RdPkgConfig()
- TDP via PECI - RdPkgConfig()
- Core Count - RdPCICongfigLocal()

DTS PECI commands will also support DTS temperature data readings.

Also, refer to the *Intel® Xeon® Processor E7 v4 Product Family Thermal/Mechanical Specifications and Design Guide* for details on DTS based thermal solution design considerations.

## 5.1.3 Intel® Xeon® Processor E7-4800/8800 v4 Product Families Thermal Profiles

### 5.1.3.1 Thermal Specifications

Table 5-1. Thermal Specifications

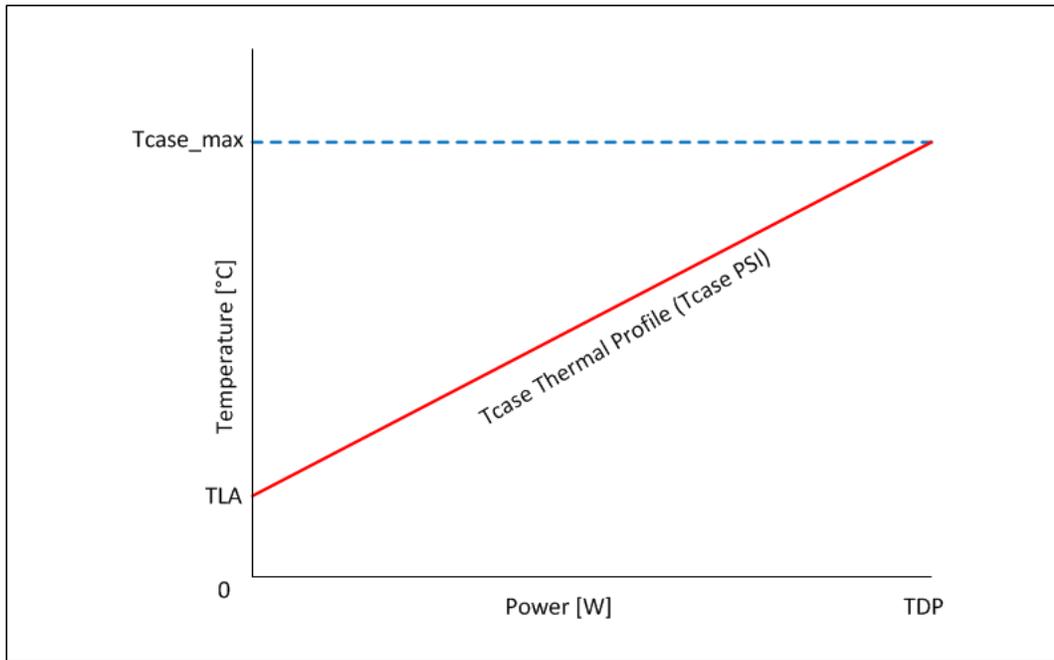

TDP	Core Count	TLA	Tcase Min	Tcase Max	Tcase PSI	DTS Max	DTS PSI	Notes
165	24	49	0	79	0.182	95	165	1,2,3,4,5
165	18	49	0	80	0.188	101	165	1,2,3,4,5
165	10	49	0	79	0.182	98	165	1,2,3,4,5
150	22	49	0	77	0.187	92	150	1,2,3,4,5
140	20	49	0	76	0.193	92	140	1,2,3,4,5
140	18	49	0	75	0.186	92	140	1,2,3,4,5
140	14	49	0	73	0.171	96	140	1,2,3,4,5
140	4	49	0	77	0.200	93	140	1,2,3,4,5
115	16	49	0	69	0.174	85	115	1,2,3,4,5
115	14	49	0	68	0.165	87	115	1,2,3,4,5
115	10	49	0	67	0.157	88	115	1,2,3,4,5
115	8	49	0	69	0.174	85	115	1, 2, 3, 4, 5

**Notes:**

1. These values are specified at  $V_{CC\_MAX}$  for all processor frequencies. Systems must be designed to ensure the processor is not to be subjected to any static  $V_{CC}$  and  $I_{CC}$  combination wherein  $V_{CC}$  exceeds  $V_{CC\_MAX}$  at specified ICC.
2. Thermal Design Power (TDP) should be used for processor thermal solution design targets. TDP is not the maximum power that the processor can dissipate. TDP is measured at maximum  $T_{CASE}$ .
3. These specifications are based on post silicon measurements, which will be updated as further characterization data becomes available.
4. Power specifications are defined at all VIDs. The Intel® Xeon® Processor E7-4800/8800 v4 Product Families processor may be delivered under multiple VIDs for each frequency.
5. FMB (flexible motherboard) guidelines provide a design target for meeting all planned processor frequency requirements.

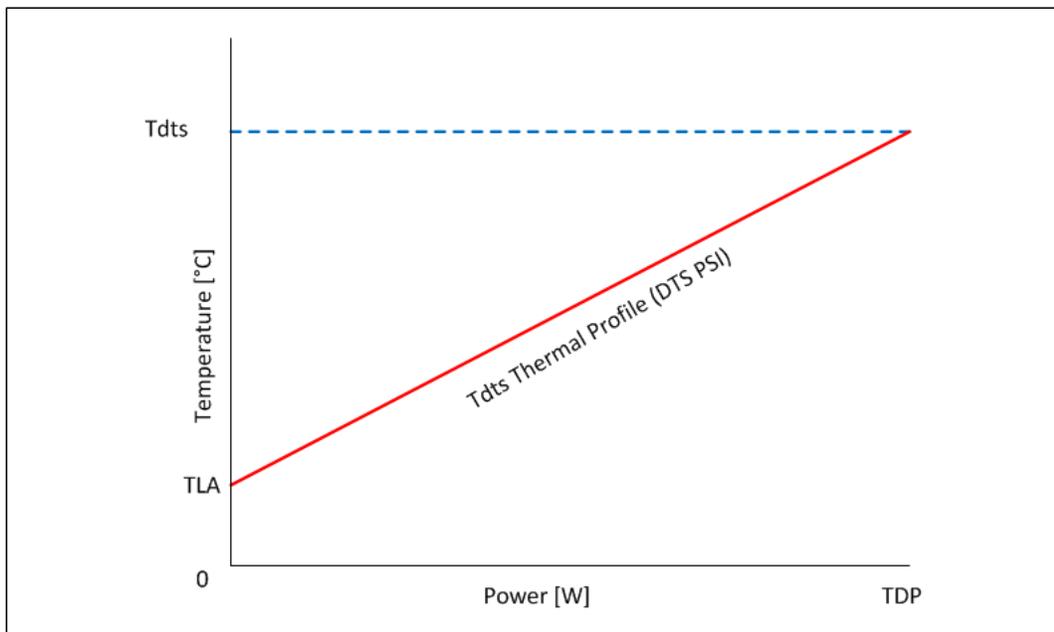

Figure 5-1. Tcase Thermal Profile Example

**Notes:**

4. Refer to the *Intel® Xeon® Processor E7 v4 Product Family Thermal/Mechanical Specifications and Design Guide* for system and environmental implementation details.

Figure 5-2. DTS: Thermal Profile Example

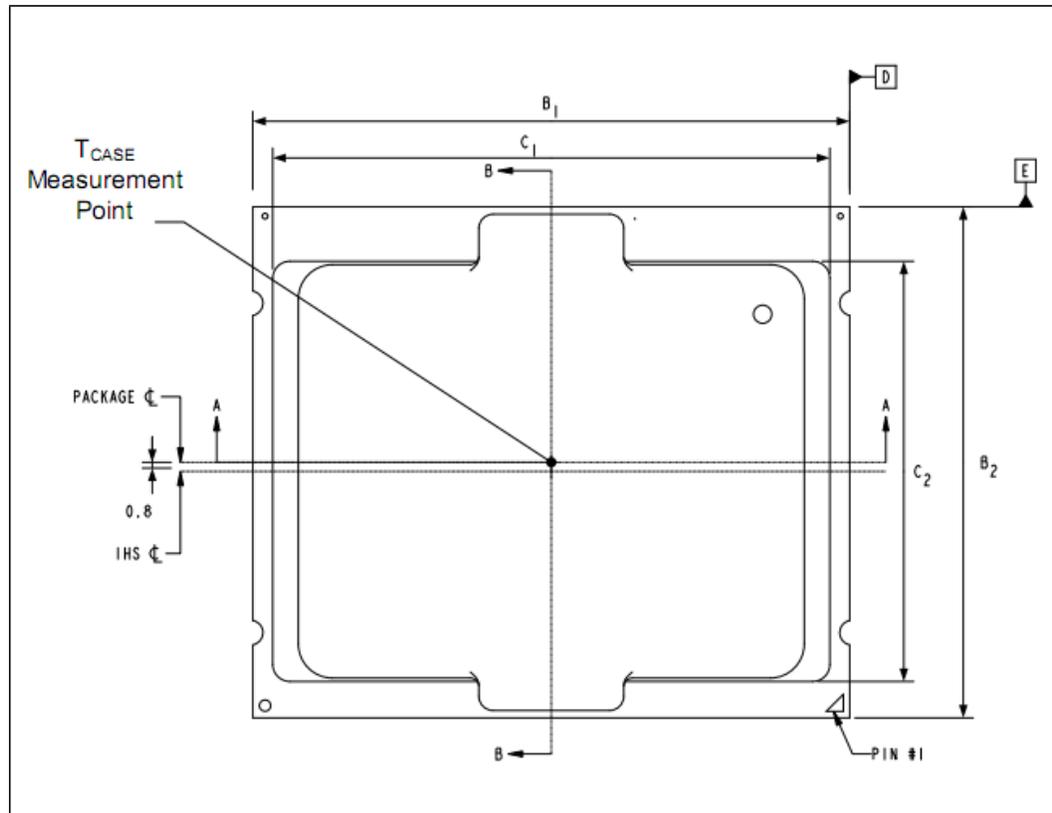

**Notes:**

1. Some processor units may be tested to lower TDP and the IA32\_TEMPERATURE\_TARGET MSR will be aligned to that lower TDP.
2. Refer to the *Intel® Xeon® Processor E7 v4 Product Family Thermal/Mechanical Specifications and Design Guide* for system and environmental implementation details.

### 5.1.4 Thermal Metrology

The minimum and maximum case temperatures ( $T_{CASE}$ ) specified in Figure 5-1 are measured at the geometric top center of the processor integrated heat spreader (IHS). Figure 5-3 illustrates the location where  $T_{CASE}$  temperature measurements should be made. For detailed guidelines on temperature measurement methodology, refer to the *Intel® Xeon® Processor E7 v4 Product Family Thermal/Mechanical Specifications and Design Guide*.

Figure 5-3. Case Temperature ( $T_{CASE}$ ) Measurement Location

**Notes:**

1. Figure is not to scale and is for reference only.
2. See the processor package mechanical drawing for the dimensions of the features.

# 6 PIROM

## 6.1 Processor Information ROM

The Processor Information ROM (PIROM) is a memory device located on the processor and is accessible via the System Management Bus (SMBus) which contains information regarding the processor's features. These features are listed in [Table 6-1](#).

The PIROM resides in the lower half of the memory component (addresses 00 to 7Fh), which is permanently write-protected by Intel. The upper half comprises the Scratch EEPROM (addresses 80 to FFh).

**Table 6-1. Processor Information ROM Table (Sheet 1 of 3)**

Offset/Section	# of Bits	Function	Notes	Examples
<b>Header</b>				
00h	8	Data Format Revision	Two 4-bit hex digits	Start with 00h
01-02h	16	PIROM Size	Size in bytes (MSB first)	Use a decimal to hex transfer; 128 bytes = 0080h:
03h	8	Processor Data Address	Byte pointer, 00h if not present	0Eh
04h	8	Processor Core Data Address	Byte pointer, 00h if not present	1Bh
05h	8	Processor Uncore Data Address	Byte pointer, 00h if not present	2A
06h	8	Package Data Address	Byte pointer, 00h if not present	4Ch
07h	8	Part Number Data Address	Byte pointer, 00h if not present	54h
08h	8	Thermal Reference Data Address	Byte pointer, 00h if not present	66h
09h	8	Feature Data Address	Byte pointer, 00h if not present	6Ch
0Ah	8	Other Data Address	Byte pointer, 00h if not present	77h
0B-0Dh	16	Reserved	Reserved for future use	000000h
<b>Processor Data</b>				
0E to 13h	48	S-spec Number	Six 8-bit ASCII characters	
14h	7/1	Sample/Production	First seven bits reserved	0b = Sample, 1b = Production 00000001 = production
15	6 2	Number of Cores Number of Threads	[7:2] = Number of cores [1:0] = Threads per core	00111110 = 15 cores with 2 threads each
16 to 17h	16	System Clock Speed	Four 4-bit hex digits (Mhz)	0100h = 100MHz <sup>1</sup>
18 to 1Ah	24	Reserved	Reserved for future use	000000h
<b>Processor Core Data</b>				
1B to 1Ch	16	CPUID	Four 4-bit hex digits	
1D to 1Eh	16	Reserved	Reserved for future use	0000h
1F to 20h	16	Maximum P1 Core Frequency	Non-Intel Turbo Boost Technology (Mhz) Four 4-bit hex digits (Mhz)	2500h = 2500 MHz <sup>1</sup>
21 to 22h	16	Maximum P0 Core Frequency	Intel Turbo Boost Technology (Mhz) Four 4-bit hex digits (Mhz)	2800h = 2800 MHz <sup>1</sup>
23 to 24h	16	Maximum Core Voltage ID	Four 4-bit hex digits (mV)	1350h = 1350 mV <sup>1</sup>

**Table 6-1. Processor Information ROM Table (Sheet 2 of 3)**

Offset/ Section	# of Bits	Function	Notes	Examples
25 to 26h	16	Minimum Core Voltage ID	Four 4-bit hex digits (mV)	0800h = 800 mV <sup>1</sup>
27h	8	Core Voltage Tolerance, High	Allowable positive DC shift Two 4-bit hex digits (mV)	15h = 15mV <sup>1</sup>
28h	8	Core Voltage Tolerance, Low	Allowable negative DC shift Two 4-bit hex digits (mV)	15h = 15mV <sup>1</sup>
29h	8	Reserved	Reserved for future use	00h
<b>Processor Uncore Data</b>				
2A to 2Bh	16	Maximum Intel® QPI Link Transfer Rate	Four 4-bit hex digits (in MT/s)	8000h = 8.000 GT/s <sup>1</sup>
2C to 2Dh	16	Maximum Intel SMI2 Link Transfer Rate	Four 4-bit hex digits (in MT/s)	8000h = 8.000 GT/s <sup>1</sup>
2E to 31h	32	Intel® QPI Version Number	Four 8-bit ASCII Characters	01.1
32h	7/1	Intel TXT	First seven bits reserved	00000001 = supported 00000000 = unsupported
33 to 34h	16	Maximum Intel SMI2 Performance Transfer Rate	Four 4-bit hex digits (in MT/s)	2666h = 2.666GT/s <sup>1</sup>
35 to 36h	16	Maximum Intel SMI2 Lock Step Transfer Rate	Four 4-bit hex digits (in MT/s)	1600h = 1.600GT/s <sup>1</sup>
37 to 38h	16	Maximum VSA VID	Four 4-bit hex digits (mV)	1200h = 1200 mV <sup>1</sup>
39 to 3Ah	16	Minimum VSA VID	Four 4-bit hex digits (mV)	0600h = 600 mV <sup>1</sup>
3B to 3Eh	32	Reserved	Reserved for future use	00000000h
3F to 40h	16	L2 Cache Size	Decimal (Kb) Per CPU Core	0100h = 256Kb
41 to 42h	16	L3 Cache Size	Decimal (Kb)	6000h = 24576Kb, 4800h = 18432Kb, 3000h = 12288Kb
43 to 44	16	VVMSE Nominal Voltage	Four 4-bit hex digits (mV)	1350h = 1350 mV <sup>1</sup>
45 to 46h	16	VccIO_IN Nominal Voltage	Four 4-bit hex digits (mV)	1000h = 1000 mV <sup>1</sup>
47 to 4Bh	40	Reserved	Reserved for future use	0000000000h
<b>Package</b>				
4C to 4Fh	32	Package Revision	Four 8-bit ASCII characters	01.0
50h	6/2	Substrate Revision Software ID	First 6 bits reserved	000000**
51 to 53h	24	Reserved	Reserved for future use	000000h
<b>Part Numbers</b>				
54 to 5Ah	56	Processor Family Number	Seven 8-bit ASCII characters	CM80636
5B to 62h	64	Processor SKU Number	Seven 8-bit ASCII characters	1272834
63 to 65h	24	Reserved	Reserved for future use	000000h
<b>Thermal Reference</b>				
66h	8	Recommended THERMALERT_N assertion threshold value	MSB is Reserved	0h = 0C <sup>1</sup>
67h	8	Thermal calibration offset value	MSB is Reserved	0h = 0C <sup>1</sup>
68h	8	T <sub>CASE</sub> Maximum	Maximum case temperature Two 4-bit hex digits (mV)	69h = 69°C <sup>1</sup>
69 to 6Ah	16	Thermal Design Power	Four 4-bit hex digits (in Watts)	0130h = 130 Watts <sup>1</sup>
6Bh	8	Reserved	Reserved for future use	00h

**Table 6-1. Processor Information ROM Table (Sheet 3 of 3)**

Offset/Section	# of Bits	Function	Notes	Examples
<b>Features</b>				
6C to 6Fh	32	Processor Core Feature Flags	From CPUID function 1, EDX contents	4387FBFFh
70h	8	Processor Feature Flags	Eight features - Binary 1 indicates functional feature	10001101
71h	8	Additional Processor Feature Flags	Eight additional features - Binary 1 indicates functional feature	01110101
72	6/2	Multiprocessor Support	00b = UP, 01b = DP, 10b = S2S, 11b = MP/SMS	00000011 = MP/SMS
73h	4/4	Number of Devices in TAP Chain	First four bits reserved One 4-bit hex digit - Bits	*0h <sup>1</sup>
74 to 75h	16	Reserved	Reserved for future use	0000h
76h	8	Static Checksum	1 byte checksum	Add up by byte and take 2's complement.
<b>Other</b>				
77 to 7Eh	64	Electronic Signature	Coded binary	N/A
7Fh	8	Electronic Signature Checksum	1 byte checksum	Add up by byte and take 2's complement.

**Notes:**

1. Uses Binary Coded Decimal (BCD) translation.

## 6.2 Scratch EEPROM

Also available in the memory component on the processor SMBus is an EEPROM which may be used for other data at the system or processor vendor's discretion. The data in this EEPROM, once programmed, can be write-protected by asserting the active-high SM\_WP signal. This signal has a weak pull-down (10 kohm) to allow the EEPROM to be programmed in systems with no implementation of this signal. The Scratch EEPROM resides in the upper half of the memory component (addresses 80 - FFh). The lower half comprises the Processor Information ROM (addresses 00 - 7Fh), which is permanently write-protected by Intel.

## 6.3 PIROM and Scratch EEPROM Supported SMBus Transactions

The PIROM responds to two SMBus packet types: Read Byte and Write Byte. However, since the PIROM is write-protected, it will acknowledge a Write Byte command but ignore the data. The Scratch EEPROM responds to Read Byte and Write Byte commands. [Table 6-2](#) illustrates the Read Byte command. [Table 6-3](#) illustrates the Write Byte command.

In the tables, 'S' represents a SMBus start bit, 'P' represents a stop bit, 'A' represents an acknowledge (ACK), and 'N' represents a negative acknowledge (NACK). The shaded bits are transmitted by the PIROM or Scratch EEPROM, and the bits that aren't shaded are transmitted by the SMBus host controller. In the tables, the data addresses indicate 8 bits.

The SMBus host controller should transmit 8 bits with the most significant bit indicating which section of the EEPROM is to be addressed: the PIROM (MSB = 0) or the Scratch EEPROM (MSB = 1).

**Table 6-2. Read Byte SMBus Packet**

S	Slave Address	Write	A	Command Code	A	S	Slave Address	Read	A	Data	///	P
1	7-bits	1	1	8-bits	1	1	7-bits	1	1	8-bits	1	1

**Table 6-3. Write Byte SMBus Packet**

S	Slave Address	Write	A	Command Code	A	Data	A	P
1	7-bits	1	1	8-bits	1	8-bits	1	1

## 6.4 SMBus Memory Component Addressing

Of the addresses broadcast across the SMBus, the memory component claims those of the form "10100XXZb". The "XX" bits are defined by pull-up and pull-down of the SKTID[1:0] pins. Note that SKTID[2] does not affect the SMBus address for the memory component. These address pins are pulled down weakly (10 k) on the processor substrate to ensure that the memory components are in a known state in systems which do not support the SMBus (or only support a partial implementation). The "Z" bit is the read/write bit for the serial bus transaction.

Note that addresses of the form "0000XXXXb" are Reserved and should not be generated by an SMBus master.

Table 6-4 describes the address pin connections and how they affect the addressing of the memory component.

**Table 6-4. Memory Device SMBus Addressing**

Address (Hex)	Upper Address <sup>1</sup>	Device Select			R/W
	Bits 7-4	SKTID[2]	SKTID[1] Bit 2	SKTID[0] Bit 1	Bit 0
A0h/A1h	10100	10100	0	0	X
A2h/A3h	10100	10100	0	1	X
A4h/A5h	10100	10100	1	0	X
A6h/A7h	10100	10100	1	1	X

**Notes:**

1. This addressing scheme will support up to four processors on a single SMBus.

## 6.5 Managing Data in the PIROM

The PIROM consists of the following sections:

- Header
- Processor Data
- Processor Core Data
- Processor Uncore Data
- Cache Data
- Package Data
- Part Number Data
- Thermal Reference Data
- Feature Data
- Other Data

Details on each of these sections are described below.

**Note:** Reserved fields or bits SHOULD be programmed to zeros. However, OEMs should not rely on this model.

### 6.5.1 Header

To maintain backward compatibility, the Header defines the starting address for each subsequent section of the PIROM. Software should check for the offset before reading data from a particular section of the ROM.

Example: Code looking for the processor uncore data of a processor would read offset 05h to find a value of 29. 29 is the first address within the 'Processor Uncore Data' section of the PIROM.

#### 6.5.1.1 DFR: Data Format Revision

This location identifies the data format revision of the PIROM data structure. Writes to this register have no effect.

Offset: 00h	
Bit	Description
7:0	<b>Data Format Revision</b> The data format revision is used whenever fields within the PIROM are redefined. The initial definition will begin at a value of 1. If a field, or bit assignment within a field, is changed such that software needs to discern between the old and new definition, then the data format revision field will be incremented.  00h: Reserved 01h: Initial definition 02h: Second revision 03h: Third revision 04h: Fourth revision 05h: Fifth revision <i>(Defined by this document)</i> 06h-FFh: Reserved

### 6.5.1.2 PISIZE: PIROM Size

This location identifies the PIROM size. Writes to this register have no effect.

Offset: 01h-02h	
Bit	Description
15:0	<p><b>PIROM Size</b> The PIROM size provides the size of the device in hex bytes. The MSB is at location 01h; the LSB is at location 02h.</p> <p>0000h - 007Fh: Reserved 0080h: 128 byte PIROM size 0081- FFFFh: Reserved</p>

### 6.5.1.3 PDA: Processor Data Address

This location provides the offset to the Processor Data Section. Writes to this register have no effect.

Offset: 03h	
Bit	Description
7:0	<p><b>Processor Data Address</b> Byte pointer to the Processor Data section</p> <p>00h: Processor Data section not present 01h - 0Dh: Reserved 0Eh: Processor Data section pointer value 0Fh-FFh: Reserved</p>

### 6.5.1.4 PCDA: Processor Core Data Address

This location provides the offset to the Processor Core Data Section. Writes to this register have no effect.

Offset: 04h	
Bit	Description
7:0	<p><b>Processor Core Data Address</b> Byte pointer to the Processor Core Data section</p> <p>00h: Processor Core Data section not present 01h - 09h: Reserved 1Ah: Processor Core Data section pointer value 1Bh-FFh: Reserved</p>

### 6.5.1.5 PUDA: Processor Uncore Data Address

This location provides the offset to the Processor Uncore Data Section. Writes to this register have no effect.

Offset: 05h	
Bit	Description
7:0	<b>Processor Uncore Data Address</b> Byte pointer to the Processor Uncore Data section 00h: Processor Uncore Data section not present 01h - 28h: Reserved 29h: Processor Uncore Data section pointer value 2Ah-FFh: Reserved

### 6.5.1.6 PDA: Package Data Address

This location provides the offset to the Package Data Section. Writes to this register have no effect.

Offset: 06h	
Bit	Description
7:0	<b>Package Data Address</b> Byte pointer to the Package Data section 00h: Package Data section not present 01h - 4Ah: Reserved 4Bh: Package Data section pointer value 4Ch-FFh: Reserved

### 6.5.1.7 PNDA: Part Number Data Address

This location provides the offset to the Part Number Data Section. Writes to this register have no effect.

Offset: 07h	
Bit	Description
7:0	<b>Part Number Data Address</b> Byte pointer to the Part Number Data section 00h: Part Number Data section not present 01h - 52h: Reserved 53h: Part Number Data section pointer value 54h-FFh: Reserved

### 6.5.1.8 TRDA: Thermal Reference Data Address

This location provides the offset to the Thermal Reference Data Section. Writes to this register have no effect.

<b>Offset:</b> 08h	
Bit	Description
7:0	<b>Thermal Reference Data Address</b> Byte pointer to the Thermal Reference Data section 00h: Thermal Reference Data section not present 01h - 64h: Reserved 65h: Thermal Reference Data section pointer value 66h-FFh: Reserved

### 6.5.1.9 FDA: Feature Data Address

This location provides the offset to the Feature Data Section. Writes to this register have no effect.

<b>Offset:</b> 09h	
Bit	Description
7:0	<b>Feature Data Address</b> Byte pointer to the Feature Data section 00h: Feature Data section not present 01h - 6Ah: Reserved 6Bh: Feature Data section pointer value 6Ch-FFh: Reserved

### 6.5.1.10 ODA: Other Data Address

This location provides the offset to the Other Data Section. Writes to this register have no effect.

<b>Offset:</b> 0Ah	
Bit	Description
7:0	<b>Other Data Address</b> Byte pointer to the Other Data section 00h: Other Data section not present 01h - 78h: Reserved 79h: Other Data section pointer value 7Ah- FFh: Reserved

### 6.5.1.11 RES1: Reserved 1

This location is reserved. Writes to this register have no effect.

<b>Offset:</b> 0Bh-0Dh	
Bit	Description
23:0	<b>RESERVED</b> 000000h-FFFFFFh: Reserved

## 6.5.2 Processor Data

This section contains three pieces of data:

- The S-spec of the part in ASCII format.
- (1) 2-bit field to declare if the part is a preproduction sample or a production unit.
- The system bus speed in BCD format

### 6.5.2.1 SQNUM: S-Spec Number

This location provides the S-Spec number of the processor. The S-spec field is six ASCII characters wide and is programmed with the same S-spec value as marked on the processor. If the value is less than six characters in length, leading spaces (20h) are programmed in this field. Writes to this register have no effect.

For example, a processor with a S-spec mark of QWFZ contains the following in field 0E-13h: 20h, 20h, 51h, 57h, 46h, 5Ah. This data consists of two blanks at 0Eh and 0Fh followed by the ASCII codes for QEU5 in locations 10 - 13h.

Offset: 0Eh-13h	
Bit	Description
47:40	<b>Character 6</b> S-spec character or 20h 00h-0FFh: ASCII character
39:32	<b>Character 5</b> S-spec character or 20h 00h-0FFh: ASCII character
31:24	<b>Character 4</b> S-spec character 00h-0FFh: ASCII character
23:16	<b>Character 3</b> S-spec character 00h-0FFh: ASCII character
15:8	<b>Character 2</b> S-spec character 00h-0FFh: ASCII character
7:0	<b>Character 1</b> S-spec character 00h-0FFh: ASCII character

### 6.5.2.2 SAMPROD: Sample/Production

This location contains the sample/production field, which is a two-bit field and is LSB aligned. All Q-spec material will use a value of 00b. All S-spec material will use a value of 01b. All other values are reserved. Writes to this register have no effect.

For example, a processor with a Qxxx mark (engineering sample) will have offset 14h set to 00h. A processor with an Sxxxx mark (production unit) will use 01h at offset 14h.

Offset: 14h	
Bit	Description
7:2	<b>RESERVED</b> 000000b-111111b: Reserved
1:0	<b>Sample/Production</b> Sample or Production indicator 00b: Sample 01b: Production 10b-11b: Reserved

### 6.5.2.3 Processor Thread and Core Information

This location contains information regarding the number of cores and threads on the processor. Writes to this register have no effect. Data format is binary.

For example, the Intel® Xeon® E7 v4 processor has up to 24 cores and two threads per core.

Offset: 15h	
Bit	Description
7:2	Number of cores
1:0	Number of threads per core

### 6.5.2.4 SCS: System Clock Speed

This location contains the system clock frequency information. Systems may need to read this offset to decide if all installed processors support the same system clock speed. The data provided is the speed, rounded to a whole number, and reflected in binary coded decimal. Writes to this register have no effect.

For example, a processor with system bus speed of 100 MHz will have a value of 0100h.

Offset: 16h-17h	
Bit	Description
15:0	<b>System Bus Speed</b> 0000h-FFFFh: MHz

### 6.5.2.5 RES2: Reserved 2

This location is reserved. Writes to this register have no effect.

Offset: 18h-2Ah	
Bit	Description
23:0	<b>RESERVED</b> 000000h-FFFFFFh: Reserved

## 6.5.3 Processor Core Data

This section contains silicon-related data relevant to the processor cores.

### 6.5.3.1 CPUID: CPUID

This location contains the CPUID, Processor Type, Family, Model and Stepping. The CPUID field is a copy of the results in EAX[15:0] from Function 1 of the CPUID instruction. Writes to this register have no effect. Data format is hexadecimal.

Offset: 1Bh-1Ch	
Bit	Description
15:13	<b>Reserved</b> 00b-11b: Reserved
12:12	<b>Processor Type</b> 0b-1b: Processor Type
11:8	<b>Processor Family</b> 0h-Fh: Processor Family
7:4	<b>Processor Model</b> 0h-Fh: Processor Model
3:0	<b>Processor Stepping</b> 0h-Fh: Processor Stepping

### 6.5.3.2 RES3: Reserved 3

This locations are reserved. Writes to this register have no effect.

Offset: 1Dh-1Eh	
Bit	Description
15:0	<b>RESERVED</b> 0000h-FFFFh: Reserved

### 6.5.3.3 MP1CF: Maximum P1 Core Frequency

This location contains the maximum non-Intel Turbo Boost Technology core frequency for the processor. The frequency should equate to the markings on the processor and/or the QDF/S-spec speed even if the parts are not limited or locked to the intended speed. Format of this field is in megahertz, rounded to a whole number, and encoded in binary coded decimal. Writes to this register have no effect.

**Example:** A 2.666 GHz processor will have a value of 2666h.

Offset: 1F-20h	
Bit	Description
15:0	<b>Maximum P1 Core Frequency</b> 0000h-FFFFh: MHz

#### 6.5.3.4 MPOCF: Maximum P0 Core Frequency

This location contains the maximum Intel Turbo Boost Technology core frequency for the processor. This is the maximum intended speed for the part under any functional conditions. Format of this field is in megahertz, rounded to a whole number, and encoded in binary coded decimal. Writes to this register have no effect.

**Example:** A processor with a maximum Intel Turbo Boost Technology frequency of 2.666 GHz will have a value of 2666h.

Offset: 21h-22h	
Bit	Description
15:0	Maximum P0 Core Frequency 0000h-FFFFh: MHz

#### 6.5.3.5 MAXVID: Maximum Core VID

This location contains the maximum Core VID (Voltage Identification) voltage that may be requested via the VID pins. This field, rounded to the next thousandth, is in millivolts and is reflected in binary coded decimal. Writes to this register have no effect.

**Example:** A voltage of 1.350 V maximum core VID would contain 1350h.

Offset: 23h-24h	
Bit	Description
15:0	Maximum Core VID 0000h-FFFFh: mV

#### 6.5.3.6 MINVID: Minimum Core VID

This location contains the Minimum Core VID (Voltage Identification) voltage that may be requested via the VID pins. This field, rounded to the next thousandth, is in mV and is reflected in binary coded decimal. Writes to this register have no effect.

**Example:** A voltage of 1.000 V maximum core VID would contain 1000h.

Offset: 25h-26h	
Bit	Description
15:0	Maximum Core VID 0000h-FFFFh: mV

### 6.5.3.7 VTH: Core Voltage Tolerance, High

This location contains the maximum Core Voltage Tolerance DC offset high. This field, rounded to the next thousandth, is in millivolts and is reflected in binary coded decimal. Writes to this register have no effect. A value of FF indicates that this value is undetermined. Writes to this register have no effect.

**Example:** 15 mV tolerance would be saved as 15h.

Offset: 27h	
Bit	Description
7:0	<b>Core Voltage Tolerance, High</b> 00h-FFh: mV

### 6.5.3.8 VTL: Core Voltage Tolerance, Low

This location contains the maximum Core Voltage Tolerance DC offset low. This field, rounded to the next thousandth, is in millivolts and is reflected in binary coded decimal. Writes to this register have no effect. A value of FF indicates that this value is undetermined. Writes to this register have no effect.

**Example:** 15 mV tolerance would be saved as 15h.

Offset: 28h	
Bit	Description
7:0	<b>Core Voltage Tolerance, Low</b> 00h-FFh: mV

### 6.5.3.9 RES3: Reserved 3a

This locations are reserved. Writes to this register have no effect.

Offset: 29h	
Bit	Description
7:0	<b>RESERVED</b> 00h-FFh: Reserved

## 6.5.4 Processor Uncore Data

This section contains silicon-related data relevant to the processor Uncore.

### 6.5.4.1 MAXQPI: Maximum Intel® QPI Transfer Rate

Systems may need to read this offset to decide if all installed processors support the same Intel® QPI Link Transfer Rate. The data provided is the transfer rate, rounded to a whole number, and reflected in binary coded decimal. Writes to this register have no effect.

**Example:** The Intel® Xeon® E7 v4 processor supports a maximum Intel® QPI link transfer rate of 9.6 GT/s. Therefore, offset 2Ah-2Bh has a value of 9600.

Offset: 2Ah-2Bh	
Bit	Description
15:0	Maximum Intel® QPI Transfer Rate 0000h-FFFFh: MHz

### 6.5.4.2 MAXPCI: Maximum Intel PCIe Transfer Rate

Systems may need to read this offset to decide if all installed processors support the same Intel SMI2 Link Transfer Rate. The data provided is the transfer rate, rounded to a whole number, and reflected in binary coded decimal. Writes to this register have no effect.

For example, the Intel® Xeon® E7 v4 processor supports a maximum Intel SMI2 link transfer rate of 8.0 GT/s. Therefore, offset 2Ah-2Bh has a value of 8000.

Offset: 2Ch-2Dh	
Bit	Description
15:0	Minimum Intel® QPI Transfer Rate 0000h-FFFFh: MHz

### 6.5.4.3 QPIVN: Intel® QPI Version Number

The Intel® QPI Version Number is provided as four 8-bit ASCII characters. Writes to this register have no effect.

For example, the Intel® Xeon® E7 v4 processor supports Intel® QPI Version Number 1.1. Therefore, offset 2Eh-31h has an ASCII value of "01.1", which is 30, 31, 2E, 31.

Offset: 2Eh-31h	
Bit	Description
31:0	Intel® QPI Version Number 00000000h-FFFFFFFFh: MHz

#### 6.5.4.4 TXT: TXT

This location contains the Intel TXT location, which is a two-bit field and is LSB aligned. A value of 00b indicates Intel TXT is not supported. A value of 01b indicates Intel TXT is supported. Writes to this register have no effect.

**Example:** A processor supporting Intel TXT will have offset 32h set to 01h.

Offset: 32h	
Bit	Description
7:2	<b>RESERVED</b> 000000b-111111b: Reserved
1:0	<b>TXT</b> TXT support indicator 00b: Not supported 01b: Supported 10b-11b: Reserved

#### 6.5.4.5 MAXSMP: Maximum Intel SMI2 Performance Transfer Rate

Systems may need to read this offset to decide on compatible processors and Jordan Creek capabilities. The data provided is the transfer rate, rounded to a whole number, and reflected in binary coded decimal. Writes to this register have no effect.

**Example:** The Intel® Xeon® E7 v4 processor supports a maximum Intel SMI2 performance transfer rate of 3.2 GT/s. Therefore, offset 33h-34h has a value of 3200h.

Offset: 33h-34h	
Bit	Description
15:0	<b>Maximum Intel SMI Transfer Rate</b> 0000h-FFFFh: MHz

#### 6.5.4.6 MAXSML: Maximum Intel SMI2 Lock Step Transfer Rate

Systems may need to read this offset to decide on compatible processors and Jordan Creek scalable memory buffer capabilities. The data provided is the transfer rate, rounded to a whole number, and reflected in binary coded decimal. Writes to this register have no effect.

**Example:** The Haswell-EX processor supports a maximum Intel SMI 2 lock step transfer rate of 1.600 GT/s. Therefore, offset 33h-34h has a value of 1600h.

Offset: 35h-36h	
Bit	Description
15:0	<b>Minimum Intel SMI Transfer Rate</b> 0000h-FFFFh: MHz

#### 6.5.4.7 MXSAVD: MAX VSA VID

Offset 37h-38h is the Processor Vsa maximum VID (Voltage Identification) field and contains the maximum voltage requested via the VID pins. This field, rounded to the next thousandth, is in mV and is reflected in binary coded decimal. Some systems read this offset to determine if all processors support the same default VID setting. Writes to this register have no effect.

**Example:** A voltage of 1.200 V maximum core VID would contain 1200h in Offset 36-37h.

Offset: 37h-38h	
Bit	Description
15:0	<b>MAX VSA VID</b> 0000h-FFFFh: mV

#### 6.5.4.8 MNSAVD: MIN VSA VID

Offset 39h-4Ah is the Processor Vsa minimum VID (Voltage Identification) field and contains the minimum voltage requested via the VID pins. This field, rounded to the next thousandth, is in mV and is reflected in binary coded decimal. Some systems read this offset to determine if all processors support the same default VID setting. Writes to this register have no effect.

**Example:** A voltage of 0.600 V maximum core VID would contain 600h in Offset 39- 4Ah.

Offset: 39-4Ah	
Bit	Description
15:0	<b>MIN VSA VID</b> 0000h-FFFFh: mV

#### 6.5.4.9 RES4: Reserved 4

This location is reserved. Writes to this register have no effect.

Offset: 3Bh-3Eh	
Bit	Description
31:0	<b>RESERVED</b> 00000000h-FFFFFFFFh: Reserved

#### 6.5.4.10 L2SIZE: L2 Cache Size

This location contains the size of the level-two cache in kilobytes. Writes to this register have no effect. Data format is decimal.

**Example:** The Intel® Xeon® Processor E7-4800/8800 v4 Product Families have a 2.5 MB L2 cache. Thus, offset 3Fh-40h will contain a value of 1400.

Offset: 3Fh-40h	
Bit	Description
15:0	<b>L2 Cache Size</b> 0000h-FFFFh: KB

#### 6.5.4.11 L3SIZE: L3 Cache Size

This location contains the size of the level-three cache in kilobytes. Writes to this register have no effect. Data format is decimal.

**Example:** The Intel® Xeon® Processor E7-4800/8800 v4 Product Families has up to a 60 MB L3 cache. Thus, offset 41h-42h will contain a value of F000.

Offset: 41h-42h	
Bit	Description
15:0	<b>L3 Cache Size</b> 0000h-FFFFh: KB

#### 6.5.4.12 VVMSE: VVMSE

This field contains the voltage requested for the VVMSE pins. This field is in mV and is reflected in hex. Some systems read this offset to determine if all processors support the same default VMSE settings. Writes to this register have no effect.

**Example:** A voltage of 1.350 VVMSE would contain an Offset 43-44h value of 1350h.

Offset: 43h-44h	
Bit	Description
15:0	<b>Cache Voltage ID</b> 0000h-FFFFh: mV

#### 6.5.4.13 VccIO\_IN: VIO

This field contains the voltage requested for the Vccio\_in pins. This field is in mV and is reflected in hex. Some systems read this offset to determine if all processors support the same default Vccio\_in settings. Writes to this register have no effect.

**Example:** A voltage of 0.95  $V_{CCIO\_IN}$  would contain an Offset 43-44h value of 0950h.

Offset: 45-46h	
Bit	Description
15:0	<b>Cache Voltage Tolerance, High</b> 0000h-FFFFh: mV

#### 6.5.4.14 RES5: Reserved 5

This location is reserved. Writes to this register have no effect.

Offset: 47h-4Bh	
Bit	Description
39:0	<b>RESERVED</b> 0000000000h-FFFFFFFFFh: Reserved

### 6.5.5 Package Data

This section contains substrate and other package related data.

#### 6.5.5.1 PREV: Package Revision

This location tracks the highest level package revision. It is provided in an ASCII format of four characters (8 bits x 4 characters = 32 bits). The package is documented as 1.0, 2.0, etc. If only three ASCII characters are consumed, a leading space is provided in the data field. Writes to this register have no effect.

For example, the Intel® Xeon® E7 v4 processor utilizes the second revision of the LGA-2011 package. Thus, at offset 4C-4F-35h, the data is a space followed by 2.0. In hex, this would be 20h, 32h, 2Eh, 30h.

Offset: 4Ch-4Fh	
Bit	Description
31:24	<b>Character 4</b> ASCII character or 20h 00h-0FFh: ASCII character
23:16	<b>Character 3</b> ASCII character 00h-0FFh: ASCII character
15:8	<b>Character 2</b> ASCII character 00h-0FFh: ASCII character
7:0	<b>Character 1</b> ASCII character 00h-0FFh: ASCII character

#### 6.5.5.2 Substrate Revision Software ID

This location is a place holder for the Substrate Revision Software ID. Writes to this register have no effect.

Offset: 50h	
Bit	Description
7:0	<b>Substrate Revision Software ID</b> 00h-FFh: Reserved

### 6.5.5.3 RES6: Reserved 6

This location is reserved. Writes to this register have no effect.

Offset: 51h-53h	
Bit	Description
23:0	<b>RESERVED</b> 000000h-FFFFFFh: Reserved

## 6.5.6 Part Number Data

This section provides device traceability.

### 6.5.6.1 PFN: Processor Family Number

This location contains seven ASCII characters reflecting the Intel® family number for the processor. This number is the same on all Intel® Xeon® E7 v4 processors. Combined with the Processor SKU Number below, this is the complete processor part number. This information is typically marked on the outside of the processor. If the part number is less than 15 total characters, a leading space is inserted into the value. The part number should match the information found in the marking specification. Writes to this register have no effect.

For example, a processor with a part number of AT80604\*\*\*\*\* will have the following data found at offset 38-3Eh: 41h, 54h, 38h, 30h, 36h, 30h, 34h.

Offset: 54h-5Ah	
Bit	Description
55:48	<b>Character 7</b> ASCII character or 20h 00h-0FFh: ASCII character
47:40	<b>Character 6</b> ASCII character or 20h 00h-0FFh: ASCII character
39:32	<b>Character 5</b> ASCII character or 20h 00h-0FFh: ASCII character
31:24	<b>Character 4</b> ASCII character 00h-0FFh: ASCII character
23:16	<b>Character 3</b> ASCII character 00h-0FFh: ASCII character
15:8	<b>Character 2</b> ASCII character 00h-0FFh: ASCII character
7:0	<b>Character 1</b> ASCII character 00h-0FFh: ASCII character

### 6.5.6.2 PSN: Processor SKU Number

This location contains eight ASCII characters reflecting the SKU number for the processor. Added to the end of the Processor Family Number above, this is the complete processor part number. This information is typically marked on the outside of the processor. If the part number is less than 15 total characters, a leading space is inserted into the value. The part number should match the information found in the marking specification. Writes to this register have no effect.

**Example:** A processor with a part number of \*\*\*\*\*003771AA will have the following data found at offset 58-62h: 30h, 30h, 33h, 37h, 37h, 31h, 41h, 41h.

Offset: 58h=62h	
Bit	Description
63:56	<b>Character 8</b> 00h-0FFh: ASCII character
55:48	<b>Character 7</b> ASCII character or 20h 00h-0FFh: ASCII character
47:40	<b>Character 6</b> ASCII character or 20h 00h-0FFh: ASCII character
39:32	<b>Character 5</b> ASCII character or 20h 00h-0FFh: ASCII character
31:24	<b>Character 4</b> ASCII character 00h-0FFh: ASCII character
23:16	<b>Character 3</b> ASCII character 00h-0FFh: ASCII character
15:8	<b>Character 2</b> ASCII character 00h-0FFh: ASCII character
7:0	<b>Character 1</b> ASCII character 00h-0FFh: ASCII character

### 6.5.6.3 RES7: Reserved 7

This location is reserved. Writes to this register have no effect.

Offset: 63h-65h	
Bit	Description
23:0	<b>RESERVED</b> 000000h-FFFFFFh: Reserved

## 6.5.7 Thermal Reference Data

### 6.5.7.1 TUT: Thermalert Upper Threshold

This location is a place holder for the Thermalert Upper Threshold Byte. Writes to this register have no effect.

Offset: 66h	
Bit	Description
7:0	<b>Thermalert Upper Threshold</b> 0000h-FFFFh: Reserved

### 6.5.7.2 TCO: Thermal Calibration Offset

This location is a place holder for the Thermal Calibration Offset Byte. Writes to this register have no effect.

Offset: 67h	
Bit	Description
7:0	<b>Thermal Calibration Offset</b> 0000h-FFFFh: Reserved

### 6.5.7.3 TCASE: $T_{CASE}$ Maximum

This location provides the maximum  $T_{CASE}$  for the processor. The field reflects temperature in degrees Celsius in binary coded decimal format. The thermal specifications are specified at the case Integrated Heat Spreader (IHS). Writes to this register have no effect.

**Example:** A temperature of 66°C would contain a value of 66h.

Offset: 68h	
Bit	Description
7:0	<b><math>T_{CASE}</math> Maximum</b> 00h-FFh: Degrees Celsius

### 6.5.7.4 TDP: Thermal Design Power

This location contains the maximum Thermal Design Power for the part. The field reflects power in watts in binary coded decimal format. Writes to this register have no effect. A zero value means that the value was not programmed.

**Example:** A 130 W TDP would be saved as 0130h.

Offset: 69h-6Ah	
Bit	Description
15:0	<b>Thermal Design Power</b> 0000h-FFFFh: Watts

### 6.5.7.5 RES7: Reserved 8

This location is reserved. Writes to this register have no effect.

Offset: 6Bh	
Bit	Description
7:0	<b>RESERVED</b> 00h-FFh: Reserved

## 6.5.8 Feature Data

This section provides information on key features that the platform may need to understand without powering on the processor.

### 6.5.8.1 PCFF: Processor Core Feature Flags

This location contains a copy of results in EDX[31:0] from Function 1 of the CPUID instruction. These details provide instruction and feature support by product family. Writes to this register have no effect.

**Example:** A value of BFEBFBFFh can be found at offset 6C - 6Fh.

Offset: 6Ch-6Fh	
Bit	Description
31:0	<b>Processor Core Feature Flags</b> 00000000h-FFFFFFFF: Feature Flags

### 6.5.8.2 PFF: Processor Feature Flags

This location contains additional feature information from the processor. Writes to this register have no effect.

**Note:** Bit 5 and Bit 6 are mutually exclusive (only one bit will be set).

Offset: 70h	
Bit	Description
7	Multi-Core (set if the processor is a multicore processor)
6	Serial signature (set if there is a serial signature at offset 5B- 62h)
5	Electronic signature present (set if there is a electronic signature at 5B- 62h)
4	Thermal Sense Device present (set if an SMBus thermal sensor is on package)
3	Reserved
2	OEM EEPROM present (set if there is a scratch ROM at offset 80 - FFh)
1	Core VID present (set if there is a VID provided by the processor)
0	L3 Cache present (set if there is a level-3 cache on the processor)

Bits are set when a feature is present, and cleared when they are not.

### 6.5.8.3 APFF: Additional Processor Feature Flags

This location contains additional feature information from the processor. Writes to this register have no effect.

Offset: 71h	
Bit	Description
7	Reserved
6	Intel® Cache Safe Technology
5	Extended Halt State (C1E)
4	Intel Virtualization Technology
3	Execute Disable
2	Intel® 64
1	Intel® Thermal Monitor 2
0	Enhanced Intel SpeedStep® Technology

Bits are set when a feature is present, and cleared when they are not.

### 6.5.8.4 MPSUP: Multiprocessor Support

This location contains 2 bits for representing the supported number of physical processors on the bus. These two bits are LSB aligned where 00b equates to nonscalable 2 socket (2S) operation, 01b to scalable 2 socket (S2S), 10 to scalable 4 socket (S4S), and 11b to scalable 8 socket (S8S). Intel® Xeon® E7 v4 processor is a S2S, S4S, or S8S processor. The first six bits in this field are reserved for future use. Writes to this register have no effect.

**Example:** A scalable 8-socket processor will have a value of 03h at offset 71h.

Offset: 72h	
Bit	Description
7:2	<b>RESERVED</b> 000000b-111111b: Reserved
1:0	<b>Multiprocessor Support</b> 2S, S2S, S4S or S8S indicator 00b: Nonscalable 2 Socket 01b: Scalable 2 Socket 10b: Scalable 4 Socket 11b: Scalable 8 Socket

### 6.5.8.5 TCDC: Tap Chain Device Count

At offset 73, a 4-bit hex digit is used to tell how many devices are in the TAP Chain. A Intel® Xeon® E7 v4 processor with ten cores, this field would be set to Ah.

Offset: 73h	
Bit	Description
7:0	<b>TAP Chain Device Count</b> 0000h-FFFFh: Reserved

#### 6.5.8.6 RES9: Reserved 9

This location is reserved. Writes to this register have no effect.

Offset: 74h-75h	
Bit	Description
15:0	<b>RESERVED</b> 0000h-FFFFh: Reserved

#### 6.5.8.7 STTCKS: Static Checksum

This location provides the checksum of the static values per SKU. Writes to this register have no effect.

Offset: 76h	
Bit	Description
7:0	<b>Static Checksum</b> One-byte checksum of the Static Checksum 00h- FFh: See <a href="#">Section 6.5.10</a> for calculation of this value.

### 6.5.9 Electronic Signature

This section contains a large reserved area, and items added after the original format for the Intel® Xeon® E7 v4 processor PIROM was set.

#### 6.5.9.1 ESIG: Electronic Signature

This location contains a 64-bit identification number. The value in this field is either an electronic signature. Writes to this register have no effect.

Offset: 77h-7Eh	
Bit	Description
63:0	<b>Electronic Signature</b> 0000000000000000h-FFFFFFFFFFFFFFFFh: Electronic Signature

#### 6.5.9.2 ESCKS: Electronic Signature Checksum

This location provides the checksum for the Other Data Section. Writes to this register have no effect.

Offset: 7Fh	
Bit	Description
7:0	<b>Other Data Checksum</b> One-byte checksum of the Other Data Checksum 00h- FFh: See <a href="#">Section 6.5.10</a> for calculation of this value.

## 6.5.10 Checksums

The PIROM includes multiple checksums. Table 6-5 includes the checksum values for each section defined in the 128-byte ROM.

Table 6-5. 128-Byte ROM Checksum Values

Section	Checksum Address
Static Features	76h
Electronic Signature	7Fh

Checksums are automatically calculated and programmed by Intel. The first step in calculating the checksum is to add each byte from the field to the next subsequent byte. This result is then negated to provide the checksum.

**Example:** For a byte string of AA445Ch, the resulting checksum will be B6h.

$$AA = 10101010 \quad 44 = 01000100 \quad 5C = 01011100$$

$$AA + 44 + 5C = 01001010$$

Negate the sum:  $10110101 + 1 = \mathbf{10110110 (B6h)}$

§
