Intel® QuickAssist Technology Cryptographic API Reference

Automatically generated from sources, June 11, 2014.

Based on API version 1.8

(See Release Notes to map API version to software package version.)
By using this document, in addition to any agreements you have with Intel, you accept the terms set forth below. You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request. Contact your local Intel sales office or your distributor to obtain the latest specifications and before placing your product order.

Copies of documents which have an order number and are referenced in this document, or other Intel literature, may be obtained by calling 1-800-548-4725, or go to: http://www.intel.com/design/literature.htm.

Any software source code reprinted in this document is furnished for informational purposes only and may only be used or copied and no license, express or implied, by estoppel or otherwise, to any of the reprinted source code is granted by this document.

This document contains information on products in the design phase of development.

Intel processor numbers are not a measure of performance. Processor numbers differentiate features within each processor family, not across different processor families. Go to: http://www.intel.com/products/processor_number/.

Code Names are only for use by Intel to identify products, platforms, programs, services, etc. (â€”productsâ€”) in development by Intel that have not been made commercially available to the public, i.e., announced, launched or shipped. They are never to be used as â€” commercialâ€” names for products. Also, they are not intended to function as trademarks.

Intel and the Intel logo are trademarks of Intel Corporation in the U.S. and/or other countries.

## Revision History

<table>
<thead>
<tr>
<th>Date</th>
<th>Revision</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>June 2014</td>
<td>001</td>
<td>First “public” version of the document. Based on “Intel Confidential” document number 410923-1.8 with the revision history of that document retained for reference purposes.</td>
</tr>
<tr>
<td>April 2014</td>
<td>1.8</td>
<td>- Fixing specification of <strong>FreeBSD</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Whitespace clean-up</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- IXA00384099: Adding default ‘None’ entries to CpaCySymOp and CpaCySymHashAlgorithm</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- IXA00384099: Addition of CPA_CY_SYM_HASH_AES_CBC_MAC</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- IXA00384492: Addition of cpaCySymSessionCtxGetDynamicSize() and cpaCySymDpSessionCtxGetDynamicSize()</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- IXA00385073: Added performance guidance notes for source buffer lengths on the crypto API.</td>
</tr>
<tr>
<td>February 2013</td>
<td>1.7</td>
<td>Addition of AES-XTS mode</td>
</tr>
<tr>
<td>November 2012</td>
<td>1.6-RC2</td>
<td>Resolves the following work requests:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TECG000000192: Complete AES-GMAC support</td>
</tr>
<tr>
<td>October 2012</td>
<td>1.5</td>
<td>Resolves the following work requests:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TECG000000186: Add instance notification support for RESTARTING &amp; RESTARTED events and CPA_STATUS_RESTARTING return codes.</td>
</tr>
<tr>
<td>October 2012</td>
<td>1.6-RC1</td>
<td>Resolves the following work requests:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TECG000000187: Add support for AES-F8</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TECG000000189: Add a unique instance identifier to CpaInstanceIdInfo2</td>
</tr>
<tr>
<td>June 2012</td>
<td>1.4</td>
<td>Resolves comments against previous revision.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Resolves the following work requests:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TECG000000178: Removing CPA_CY_KEY_GEN_SSL_TLS_SEED_LEN_IN_BYTES from cpa_cy_key.h</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TECG000000180: Adding detail on GMAC to API comments.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TECG000000181: Update RSA comments to call out no padding.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TECG000000182: DSA FIPS PUB 186-2 with Change Notice 1 updates to supported DSA key lengths.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TECG000000183: Clarifying that the message buffers may not be cleared when using the DP API if digest verification fails for</td>
</tr>
</tbody>
</table>
May 2012 1.3
Resolves the following work requests:
- TECG00000175: Add support partial packets for chained operations and nested hash operations.
- TECG00000162: Removed references to digestVerify and updated description of pDigestResult.
- TECG00000167: cpaDhKeyGenPhase1 does not generate private value (x) on CCK

Apr 2012 1.3-RC15
Resolves the following work requests:
- TECG00000169: Removing CPA_CY_SYM_DP_TMP_WORKAROUND from cpa_cy_sym_dp.h
- TECG00000170: (IXA00372445 ) Updated API comments to say that it is safe to assume that cpaCySymDpSessionCtxGetSize() will always return the same size for a given implementation. Same for cpaCySymSessionCtxGetSize().

Mar 2012 1.3-RC14
Resolves the following work requests:
- TECG00000166: Added ability to query bus address information for a CpaInstance.

Nov 2011 1.3-RC13
Resolved comments against RC12.

Oct 2011 1.3-RC12
Resolves the following work requests:
- TECG00000135: Updated comments on key generation API with references to RFC5246 (TLS v1.2)
- TECG00000147: Added hashAlgorithm parameter to TLS v1.2 PRF function
- TECG00000153: Clarified cases when digest result should point to src vs. dst buffer
- TECG00000154: Documented that verification failure for GCM/CCM will not result in the buffer being zeroised. Also added flag on DP API to indicate whether digestIsEncrypted.
- TECG00000155: Removed parameter (number of requests submitted) from "perform op now" function
- TECG00000156: Documented that some "unused" fields are in fact reserved for internal usage.

Jul 2011 1.3-RC11
Updated DP API per feedback from engineering during implementation

Jun 2011 1.3-RC10
Resolves comments against previous revisions, including the "traditional" and data plane APIs.
Also includes updates for the following work requests:
- TECG00000119: clarified max length for aadLenInBytes
- TECG00000120: added support for 512-bit RSA operations
- TECG00000121: added support for TLS 1.2 PRF/key generation function
- TECG00000082: added support for batch submission of requests (via data plane API)
- TECG00000030: clarified how large numbers are represented on the API

Apr 2011 1.3-RC8
Adds the data plane API for symmetric crypto, specifically file cpa_cy_sym_dp.h. Also adds new types to represent flag buffers and buffer lists with physical addressing.

Apr 2011 1.3-RC9
Resolves the following issues/work requests:
- TECG00000098: drbg: Clarified description of reseed counter.
- TECG00000108: keygen: Updated description of MGF function to refer to PKCS#1 MGF1 function. Also added @ref to some Doxygen comments to prettify the documentation.
- TECG00000101: nrbg: Clarified that length of requested entropy must be >0
- TECG00000097: prime: updated the list of bit-sizes of prime number candidates supported
- TECG00000117: Updated description of various fields for GCM and CCM, specifically to allow these algorithms to be implemented entirely underneath the API and therefore enabling the implementations to be FIPS certified under CAVP

Note: Data Plane API has been removed from this revision, updates based on previous review and this review will be incorporated in the next revision of the API.

Sep 2010 1.3-RC7
Resolves the following issues/work requests:
- TECG00000086, “DH API constraints on exponent need to be clarified” – removed offending sentences
- TECG00000090, “Consider making some CY stats use 64-bit counters” – deprecated 32-bit counters on “legacy” APIs, added 64-bit counter support everywhere
- Added a symmetric-specific “capability” to specify whether partial packets are supported on a given API instance/implementation

Mar 2010 1.3-RC5
Documents version 1.3 Release Candidate #5 of the API, incorporating feedback from the formal review. Key changes:
- Removed point compression API (pending requirement)
- Updated DSA API with support for FIPS 186-3
- Made DRBG reseed function asynchronous and clarified context constraints on this API
- Numerous other minor clean-ups, clarifications, etc.
<table>
<thead>
<tr>
<th>Date</th>
<th>Version</th>
<th>Changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mar 2010</td>
<td>1.3-RC6</td>
<td>- Added CPA_STATUS_UNSUPPORTED return code to the base API, to be returned when an implementation does not support a given capability.</td>
</tr>
<tr>
<td>Dec 2009</td>
<td>1.3-RC4</td>
<td>- Corrected signature of DRBG session init function to include separate callback function pointers for Generate and Reseed functionality. Also tidied up this revision history table.</td>
</tr>
</tbody>
</table>
| Sep 2009   | 1.3-RC3 | - Documents version 1.3 Release Candidate #3 of the API, incorporating feedback from the formal review. Key changes:  
  - On the RBG API, renamed a DRBG “instance” to a “session” (to avoid confusion with other instances and for consistency with symmetric sessions). Also fixed signature of the reseed function, and clarified some comments.  
  - For elliptic curve crypto, clarified some comments.  
  - Made crypto capabilities more granular.  
  - Fixed some @context tags.  
  - Fixed some typos in doxygen @ref tags.  
  - Marked all deprecated functions/types so that they generate warnings when used.  
  - Fixed definitions of TRUE and FALSE.  
  - Added extern “C” linkage to all header files for C++ compilers.  

- TECG00000068: Merged minor changes from EP80579  
- TECG00000069: ECDSA verify – removed input parameter  
- TECG00000047: Updated DSA to support FIPS 186-3  
- TECG00000048: MGF hash function now configurable  
- TECG00000050: Added point decompaction to Elliptic Curve API  
- TECG00000062: Corrected comment re “authenticated cipher” on session setup data structure  
- TECG00000066: Clarified that partial packet is not supported for Kasumi & SNOW3G  
- TECG00000067: Clarified documentation of digestResultLenInBytes  
- TECG00000076: Clarified that for GCM/CCM decrypt, digestVerify is ignored  
- TECG00000081: Updated DRBG and NRBG APIs based on feedback from Hifn  
- TECG00000085: Resolve tech pubs feedback on QA CY API v1.3-RC3 |
<table>
<thead>
<tr>
<th>Year</th>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
</table>
| July 2009 | 1.3-RC2 | Replaced all tabs with spaces for consistent indentation. Documents version 1.3 Release Candidate #2 of the API  
- Base API updated to reflect the decisions around Instances  
- Incorporates feedback from the informal review of v1.3-RC1  
- TECG37: Clarified parameter usage for RSA KeyGen  
- TECG11: Clarified documentation around the enum CpaCyKeyTlsOp |
| June 2009  | 1.3-RC1 | Documents version 1.3 Release Candidate #1 of the API  
- Incorporates the new cipher and authentication algorithms for wireless (Kasumi F8/F9, SNOW3G UEA2/UIA2, AES-CMAC). This was inherited from engineering with minor changes (addition of AES-CMAC, renaming of KGCORE to F8, etc.).  
- TECG17, TECG27: Incorporates the new elliptic curve algorithms. This was inherited from engineering with some minor changes (removed review comments/resolutions, renamed field types, etc.)  
- TECG29: Incorporates the changes to DRBG/NRBG to allow for certification. The old random APIs have been deprecated.  
- TECG25: Adds “capabilities”. Two levels are added: one to indicate which sub-API groups are supported; and for symmetric, one to say which “optional” ciphers are supported.  
- Merged some changes due to IXA WRs: all comment changes (e.g. addition of RETRY return status from QueryStats functions on some APIs, and other minor clarification text. |
| July 2008  | 1.1 | First released version of this document. Documents version 1.1 of the API. |

1 Deprecated List

Class _CpaCyDhStats
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyDhStats64.

Class _CpaCyDsaStats
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyDsaStats64.

Class _CpaCyKeyGenStats
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyKeyGenStats64.

Class _CpaCyLnStats
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyLnStats64.

Class _CpaCyPrimeStats
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyPrimeStats64.

Class _CpaCyRandGenOpData
As of v1.3 of the API, replaced by CpaCyDrbgGenOpData.

Class _CpaCyRandSeedOpData
As of v1.3 of the API, replaced by CpaCyDrbgReseedOpData.

Class _CpaCyRandStats
As of v1.3 of the API, replaced by CpaCyDrbgStats64.

Class _CpaCyRsaStats
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyRsaStats64.

Class _CpaCySymStats
As of v1.3 of the cryptographic API, this structure has been deprecated, replaced by CpaCySymStats64.

Class _CpaInstanceInfo
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaInstanceInfo2.

Global CPA_DEPRECATED
As of v1.3 of the Crypto API, this enum has been deprecated, replaced by CpaAccelerationServiceType.

Global CPA_DEPRECATED
As of v1.3 of the Crypto API, this enum has been deprecated, replaced by CpaOperationalState.
1 Deprecated List

Global `cpaCyInstanceGetInfo`
   As of v1.3 of the Crypto API, this function has been deprecated, replaced by
   `cpaCyInstanceGetInfo2`.

Global `cpaCySymQueryStats`
   As of v1.3 of the cryptographic API, this function has been deprecated, replaced by
   `cpaCySymQueryStats64()`.

Global `cpaCyKeyGenQueryStats`
   As of v1.3 of the Crypto API, this function has been deprecated, replaced by
   `cpaCyKeyGenQueryStats64()`.

Global `cpaCyRsaQueryStats`
   As of v1.3 of the Crypto API, this function has been deprecated, replaced by
   `cpaCyRsaQueryStats64()`.

Global `cpaCyDhQueryStats`
   As of v1.3 of the Crypto API, this function has been deprecated, replaced by
   `cpaCyDhQueryStats64()`.

Global `cpaCyDsaQueryStats`
   As of v1.3 of the Crypto API, this function has been deprecated, replaced by
   `cpaCyDsaQueryStats64()`.

Global `cpaCyLnStatsQuery`
   As of v1.3 of the Crypto API, this function has been deprecated, replaced by
   `cpaCyLnStatsQuery64()`.

Group `cpaCyRand`
   As of v1.3 of the API, this entire API group has been deprecated, replaced by API groups
   Deterministic Random Bit Generation API and Non-Deterministic Random Bit Generation API.

Global `cpaCyRandGen`
   As of v1.3 of the API, replaced by `cpaCyDrbgGen()`.

Global `cpaCyRandSeed`
   As of v1.3 of the API, replaced by `cpaCyDrbgReseed()`.

Global `cpaCyRandQueryStats`
   As of v1.3 of the API, replaced by `cpaCyDrbgQueryStats64()`.

2 CPA API

Collaboration diagram for CPA API:

2.1 Detailed Description

File: cpa.h

This is the top level API definition for Intel(R) QuickAssist Technology. It contains structures, data types and definitions that are common across the interface.

2.2 Modules

- Base Data Types
- CPA Type Definition
- Cryptographic API
3 Base Data Types
[ CPA API ]

Collaboration diagram for Base Data Types:

3.1 Detailed Description

File: cpa.h

The base data types for the Intel CPA API.

3.2 Data Structures

- struct _CpaFlatBuffer
- struct _CpaBufferList
- struct _CpaPhysFlatBuffer
- struct _CpaPhysBufferList
- struct _CpaInstanceInfo
- struct _CpaInstanceId
- struct _CpaInstanceId
- struct _CpaInstanceId

3.3 Defines

- #define CPA_INSTANCE_HANDLE_SINGLE
- #define CPA_DP_BUFLIST
- #define CPA_STATUS_SUCCESS
  Success status value.
- #define CPA_STATUS_FAIL
  Fail status value.
- #define CPA_STATUS_RETRY
  Retry status value.
- #define CPA_STATUS_RESOURCE
  The resource that has been requested is unavailable.
- #define CPA_STATUS_INVALID_PARAM
  Invalid parameter has been passed in.
- #define CPA_STATUS_FATAL
  A serious error has occurred.
- #define CPA_STATUS_UNSUPPORTED
  The function is not supported, at least not with the specific parameters supplied.
- #define CPA_STATUS_RESTARTING
  The API implementation is restarting.
- #define CPA_STATUS_MAX_STR_LENGTH_IN_BYTES
  Maximum length of the Overall Status String (including generic and specific strings returned
  by calls to CPA_STATUS_MAX_STR_LENGTH_IN_BYTES).
- #define CPA_STATUS_STR_SUCCESS
  Status string for CPA_STATUS_SUCCESS.
- #define CPA_STATUS_STR_FAIL
3.3 Defines

Status string for CPA_STATUS_FAIL.

- #define CPA_STATUS_STR_RETRY
  Status string for CPA_STATUS_RETRY.
- #define CPA_STATUS_STR_RESOURCE
  Status string for CPA_STATUS_RESOURCE.
- #define CPA_STATUS_STR_INVALID_PARAM
  Status string for CPA_STATUS_INVALID_PARAM.
- #define CPA_STATUS_STR_FATAL
  Status string for CPA_STATUS_FATAL.
- #define CPA_INSTANCE_MAX_NAME_SIZE_IN_BYTES
  Maximum instance info name string length in bytes.
- #define CPA_INSTANCE_MAX_ID_SIZE_IN_BYTES
  Maximum instance info id string length in bytes.
- #define CPA_INSTANCE_MAX_VERSION_SIZE_IN_BYTES
  Maximum instance info version string length in bytes.

3.4 Typedefs

- typedef void * CpaInstanceHandle
- typedef Cpa64U CpaPhysicalAddr
- typedef CpaPhysicalAddr(* CpaVirtualToPhysical )(void *pVirtualAddr)
- typedef _CpaFlatBuffer CpaFlatBuffer
- typedef _CpaBufferList CpaBufferList
- typedef _CpaPhysFlatBuffer CpaPhysFlatBuffer
- typedef _CpaPhysBufferList CpaPhysBufferList
- typedef Cpa32S CpaStatus
- typedef enum _CpaInstanceType CPA_DEPRECATED
- typedef enum _CpaAccelerationServiceType CpaAccelerationServiceType
- typedef enum _CpaInstanceState CPA_DEPRECATED
- typedef _CpaInstanceInfo CPA_DEPRECATED
- typedef _CpaPhysicalInstanceId CPA_DEPRECATED
- typedef _CpaInstanceInfo2 CPA_DEPRECATED
- typedef enum _CpaInstanceEvent CPA_DEPRECATED

3.5 Enumerations

- enum _CpaInstanceType {
  CPA_INSTANCE_TYPE_CRYPTO,
  CPA_INSTANCE_TYPE_DATA_COMPRESSION,
  CPA_INSTANCE_TYPE_RAID,
  CPA_INSTANCE_TYPE_XML,
  CPA_INSTANCE_TYPE_REGEX
}
- enum _CpaAccelerationServiceType {
  CPA_ACC_SVC_TYPE_CRYPTO,
  CPA_ACC_SVC_TYPE_DATA_COMPRESSION,
  CPA_ACC_SVC_TYPE_PATTERN_MATCH,
  CPA_ACC_SVC_TYPE_RAID,
  CPA_ACC_SVC_TYPE_XML,
  CPA_ACC_SVC_TYPE_VIDEO_ANALYTICS
}
- enum _CpaInstanceState {
  CPA_INSTANCE_STATE_INITIALISED,
  CPA_INSTANCE_STATE_SHUTDOWN
}
3.5 Enumerations

```c
enum _CpaOperationalState {
    CPA_OPER_STATE_DOWN,
    CPA_OPER_STATE_UP
}
enum _CpaInstanceEvent {
    CPA_INSTANCE_EVENT_RESTARTING,
    CPA_INSTANCE_EVENT_RESTARTED
}
```

3.6 Data Structure Documentation

3.6.1 _CpaFlatBuffer Struct Reference

3.6.1.1 Detailed Description

File: cpa.h

Flat buffer structure containing a pointer and length member.

A flat buffer structure. The data pointer, pData, is a virtual address. An API instance may require the actual data to be in contiguous physical memory as determined by `CpainstanceInfo2`.

3.6.1.2 Data Fields

- **Cpa32U dataLenInBytes**
  Data length specified in bytes.
- **Cpa8U * pData**
  The data pointer is a virtual address, however the actual data pointed to is required to be in contiguous physical memory unless the field requiresPhysicallyContiguousMemory in CpainstanceInfo2 is false.

3.6.1.3 Field Documentation

**Cpa32U _CpaFlatBuffer::dataLenInBytes**

Data length specified in bytes.

When used as an input parameter to a function, the length specifies the current length of the buffer. When used as an output parameter to a function, the length passed in specifies the maximum length of the buffer on return (i.e. the allocated length). The implementation will not write past this length. On return, the length is always unchanged.

**Cpa8U* _CpaFlatBuffer::pData**

The data pointer is a virtual address, however the actual data pointed to is required to be in contiguous physical memory unless the field requiresPhysicallyContiguousMemory in CpainstanceInfo2 is false.
3.6.2 _CpaBufferList Struct Reference

Collaboration diagram for _CpaBufferList:

```
_CpaFlatBuffer
+ dataLenInBytes
+ pData

pBuffers

_CpaBufferList
+ numBuffers
+ pBuffers
+ pUserData
+ pPrivateMetaData
```

3.6.2.1 Detailed Description

File: cpa.h

Scatter/Gather buffer list containing an array of flat buffers.

A scatter/gather buffer list structure. This buffer structure is typically used to represent a region of memory which is not physically contiguous, by describing it as a collection of buffers, each of which is physically contiguous.

Note:
The memory for the pPrivateMetaData member must be allocated by the client as physically contiguous memory. When allocating memory for pPrivateMetaData, a call to the corresponding BufferListGetMetaSize function (e.g. cpaCyBufferListGetMetaSize) MUST be made to determine the size of the Meta Data Buffer. The returned size (in bytes) may then be passed in a memory allocation routine to allocate the pPrivateMetaData memory.

3.6.2.2 Data Fields

- **Cpa32U numBuffers**
  Number of buffers in the list.
- **CpaFlatBuffer * pBuffers**
  Pointer to an unbounded array containing the number of CpaFlatBuffers defined by numBuffers.
- **void * pUserData**
  This is an opaque field that is not read or modified internally.
- **void * pPrivateMetaData**
  Private representation of this buffer list.
3.6.2 _CpaBufferList Struct Reference

3.6.2.3 Field Documentation

**Cpa32U _CpaBufferList::numBuffers**  
Number of buffers in the list.

**CpaFlatBuffer* _CpaBufferList::pBuffers**  
Pointer to an unbounded array containing the number of CpaFlatBuffers defined by numBuffers.

**void* _CpaBufferList::pUserData**  
This is an opaque field that is not read or modified internally.

**void* _CpaBufferList::pPrivateMetaData**  
Private representation of this buffer list.

The memory for this buffer needs to be allocated by the client as contiguous data. The amount of memory required is returned with a call to the corresponding BufferListGetMetaSize function. If that function returns a size of zero then no memory needs to be allocated, and this parameter can be NULL.

3.6.3 _CpaPhysFlatBuffer Struct Reference

3.6.3.1 Detailed Description

File: cpa.h

Flat buffer structure with physical address.

Functions taking this structure do not need to do any virtual to physical address translation before writing the buffer to hardware.

3.6.3.2 Data Fields

- **Cpa32U dataLenInBytes**  
  Data length specified in bytes.
- **Cpa32U reserved**  
  Reserved for alignment.
- **CpaPhysicalAddr bufferPhysAddr**  
  The physical address at which the data resides.

3.6.3.3 Field Documentation

**Cpa32U _CpaPhysFlatBuffer::dataLenInBytes**  
Data length specified in bytes.

When used as an input parameter to a function, the length specifies the current length of the buffer. When used as an output parameter to a function, the length passed in specifies the maximum length of the buffer on return (i.e. the allocated length). The implementation will not write past this length. On return, the length is always unchanged.

**Cpa32U _CpaPhysFlatBuffer::reserved**  
Reserved for alignment.
**3.6.3 _CpaPhysFlatBuffer Struct Reference**

_CpaPhysicalAddr _CpaPhysFlatBuffer::bufferPhysAddr

The physical address at which the data resides.

The data pointed to is required to be in contiguous physical memory.

---

**3.6.4 _CpaPhysBufferList Struct Reference**

Collaboration diagram for _CpaPhysBufferList:

```
_CpaPhysFlatBuffer
+ dataLenInBytes
+ reserved
+ bufferPhysAddr

flatBuffers

_CpaPhysBufferList
+ reserved0
+ numBuffers
+ reserved1
+ flatBuffers
```

---

**3.6.4.1 Detailed Description**

File: cpa.h

Scatter/gather list containing an array of flat buffers with physical addresses.

Similar to _CpaBufferList, this buffer structure is typically used to represent a region of memory which is not physically contiguous, by describing it as a collection of buffers, each of which is physically contiguous. The difference is that, in this case, the individual "flat" buffers are represented using physical, rather than virtual, addresses.

**3.6.4.2 Data Fields**

- **Cpa64U reserved0**
  Reserved for internal usage.

- **Cpa32U numBuffers**
  Number of buffers in the list.

- **Cpa32U reserved1**
  Reserved for alignment.

- **CpaPhysFlatBuffer flatBuffers []**
  Array of flat buffer structures, of size numBuffers.
3.6.4 _CpaPhysBufferList Struct Reference

3.6.5 _CpaInstanceInfo Struct Reference

3.6.5.1 Detailed Description

File: cpa.h

Instance Info Structure

Deprecated:
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaInstanceInfo2.

Structure that contains the information to describe the instance.

3.6.5.2 Data Fields

- enum _CpaInstanceType type
  Type definition for this instance.
- enum _CpaInstanceState state
  Operational state of the instance.
- Cpa8U name [CPA_INSTANCE_MAX_NAME_SIZE_IN_BYTES]
  Simple text string identifier for the instance.
- Cpa8U version [CPA_INSTANCE_MAX_VERSION_SIZE_IN_BYTES]
  Version string.

</tbody>
</table>
3.6.6 _CpaPhysicalInstanceId Struct Reference

3.6.6.1 Detailed Description

File: cpa.h

Physical Instance ID

Identifies the physical instance of an accelerator execution engine.

Accelerators grouped into “packages”. Each accelerator can in turn contain one or more execution engines. Implementations of this API will define the packageId, acceleratorId, executionEngineId and busAddress as appropriate for the implementation. For example, for hardware-based accelerators, the packageId might identify the chip, which might contain multiple accelerators, each of which might contain multiple execution engines. The combination of packageId, acceleratorId and executionEngineId uniquely identifies the instance.

Hardware based accelerators implementing this API may also provide information on the location of the accelerator in the busAddress field. This field will be defined as appropriate for the implementation. For example, for PCIe attached accelerators, the busAddress may contain the PCIe bus, device and function number of the accelerators.

3.6.6.2 Data Fields

- **Cpa16U packageId**
  Identifies the package within which the accelerator is contained.

- **Cpa16U acceleratorId**
  Identifies the specific accelerator within the package.

- **Cpa16U executionEngineId**
  Identifies the specific execution engine within the accelerator.

- **Cpa16U busAddress**
  Identifies the bus address associated with the accelerator execution engine.

3.6.7.1 Detailed Description

File: cpa.h

Instance Info Structure, version 2

Structure that contains the information to describe the instance.

3.6.7.2 Public Member Functions

- **CPA_BITMAP** (coreAffinity, CPA_MAX_CORES)
  A bitmap identifying the core or cores to which the instance is affinitized in an SMP operating system.

3.6.7.3 Data Fields

- **CpaAccelerationServiceType accelerationServiceType**
  Type of service provided by this instance.
- **Cpa8U vendorName [CPA_INST_VENDOR_NAME_SIZE]**
  String identifying the vendor of the accelerator.
- **Cpa8U partName [CPA_INST_PART_NAME_SIZE]**
  String identifying the part (name and/or number).
3.6.7 _CpaInstanceInfo2 Struct Reference

- **Cpa8U swVersion** [CPA_INST_SW_VERSION_SIZE]
  String identifying the version of the software associated with the instance.

- **Cpa8U instName** [CPA_INST_NAME_SIZE]
  String identifying the name of the instance.

- **Cpa8U instID** [CPA_INST_ID_SIZE]
  String containing a unique identifier for the instance.

- **CpaPhysicalInstanceID physInstId**
  Identifies the "physical instance" of the accelerator.

- **Cpa32U nodeAffinity**
  Identifies the processor complex, or node, to which the accelerator is physically connected, to help identify locality in NUMA systems.

- **CpaOperationalState operState**
  Operational state of the instance.

- **CpaBoolean requiresPhysicallyContiguousMemory**
  Specifies whether the data pointed to by flat buffers (CpaFlatBuffer::pData) supplied to this instance must be in physically contiguous memory.

- **CpaBoolean isPolled**
  Specifies whether the instance must be polled, or is event driven.

- **CpaBoolean isOffloaded**
  Identifies whether the instance uses hardware offload, or is a software-only implementation.

3.6.7.4 Member Function Documentation

```cpp
_CpaInstanceInfo2::CPA_BITMAP( coreAffinity , CPA_MAX_CORES )
```

A bitmap identifying the core or cores to which the instance is affinitized in an SMP operating system.

The term core here is used to mean a "logical" core - for example, in a dual-processor, quad-core system with hyperthreading (two threads per core), there would be 16 such cores (2 processors x 4 cores/processor x 2 threads/core). The numbering of these cores and the corresponding bit positions is OS-specific. Note that Linux refers to this as "processor affinity" or "CPU affinity", and refers to the bitmap as a "cpumask".

The term "affinity" is used to mean that this is the core on which the callback function will be invoked when using the asynchronous mode of the API. In a hardware-based implementation of the API, this might be the core to which the interrupt is affinitized. In a software-based implementation, this might be the core to which the process running the algorithm is affinitized. Where there is no affinity, the bitmap can be set to all zeroes.

This bitmap should be manipulated using the macros CPA_BITMAP_BIT_SET, CPA_BITMAP_BIT_CLEAR and CPA_BITMAP_BIT_TEST.

3.6.7.5 Field Documentation

- **CpaAccelerationServiceType _CpaInstanceInfo2::accelerationServiceType**
  Type of service provided by this instance.

- **Cpa8U _CpaInstanceInfo2::vendorName[CPA_INST_VENDOR_NAME_SIZE]**
  String identifying the vendor of the accelerator.

- **Cpa8U _CpaInstanceInfo2::partName[CPA_INST_PART_NAME_SIZE]**
  String identifying the part (name and/or number).
3.7 Define Documentation

**Cpa8U_CpaInstanceInfo2::swVersion** [CPA_INST_SW_VERSION_SIZE]

String identifying the version of the software associated with the instance.

For hardware-based implementations of the API, this should be the driver version. For software-based implementations of the API, this should be the version of the library.

Note that this should NOT be used to store the version of the API, nor should it be used to report the hardware revision (which can be captured as part of the `partName`, if required).

**Cpa8U_CpaInstanceInfo2::instName** [CPA_INST_NAME_SIZE]

String identifying the name of the instance.

**Cpa8U_CpaInstanceInfo2::instID** [CPA_INST_ID_SIZE]

String containing a unique identifier for the instance.

**CpaPhysicalInstanceId_CpaInstanceInfo2::physInstId**

Identifies the "physical instance" of the accelerator.

**Cpa32U_CpaInstanceInfo2::nodeAffinity**

Identifies the processor complex, or node, to which the accelerator is physically connected, to help identify locality in NUMA systems.

The values taken by this attribute will typically be in the range 0..n-1, where n is the number of nodes (processor complexes) in the system. For example, in a dual-processor configuration, n=2. The precise values and their interpretation are OS-specific.

**CpaOperationalState_CpaInstanceInfo2::operState**

Operational state of the instance.

**CpaBoolean_CpaInstanceInfo2::requiresPhysicallyContiguousMemory**

Specifies whether the data pointed to by flat buffers (CpaFlatBuffer::pData) supplied to this instance must be in physically contiguous memory.

**CpaBoolean_CpaInstanceInfo2::isPolled**

Specifies whether the instance must be polled, or is event driven.

For hardware accelerators, the alternative to polling would be interrupts.

**CpaBoolean_CpaInstanceInfo2::isOffloaded**

Identifies whether the instance uses hardware offload, or is a software-only implementation.

---

### 3.7 Define Documentation

```c
#define CPA_INSTANCE_HANDLE_SINGLE
```

**File: cpa.h**

Default instantiation handle value where there is only a single instance

Used as an instance handle value where only one instance exists.

Reference Number: 330685-001
3.7 Define Documentation

#define CPA_DP_BUFLIST
   
   **File: cpa.h**

   Special value which can be taken by length fields on some of the “data plane” APIs to indicate that the
   buffer in question is of type CpaPhysBufferList, rather than simply an array of bytes.

#define CPA_STATUS_SUCCESS
   Success status value.

#define CPA_STATUS_FAIL
   Fail status value.

#define CPA_STATUS_RETRY
   Retry status value.

#define CPA_STATUS_RESOURCE
   The resource that has been requested is unavailable.

   Refer to relevant sections of the API for specifics on what the suggested course of action is.

#define CPA_STATUS_INVALID_PARAM
   Invalid parameter has been passed in.

#define CPA_STATUS_FATAL
   A serious error has occurred.

   Recommended course of action is to shutdown and restart the component.

#define CPA_STATUS_UNSUPPORTED
   The function is not supported, at least not with the specific parameters supplied.

   This may be because a particular capability is not supported by the current implementation.

#define CPA_STATUS_RESTARTING
   The API implementation is restarting.

   This may be reported if, for example, a hardware implementation is undergoing a reset. Recommended
   course of action is to retry the request.

#define CPA_STATUS_MAX_STR_LENGTH_IN_BYTES
   Maximum length of the Overall Status String (including generic and specific strings returned by calls to
   cpaXxGetStatusText).

   **File: cpa.h**

   API status string type definition

   This type definition is used for the generic status text strings provided by cpaXxGetStatusText API
   functions. Common values are defined, for example see CPA_STATUS_STR_SUCCESS,
   CPA_STATUS_FAIL, etc., as well as the maximum size CPA_STATUS_MAX_STR_LENGTH_IN_BYTES.
#define CPA_STATUS_STR_SUCCESS
Status string for CPA_STATUS_SUCCESS.

#define CPA_STATUS_STR_FAIL
Status string for CPA_STATUS_FAIL.

#define CPA_STATUS_STR_RETRY
Status string for CPA_STATUS_RETRY.

#define CPA_STATUS_STR_RESOURCE
Status string for CPA_STATUS_RESOURCE.

#define CPA_STATUS_STR_INVALID_PARAM
Status string for CPA_STATUS_INVALID_PARAM.

#define CPA_STATUS_STR_FATAL
Status string for CPA_STATUS_FATAL.

#define CPA_INSTANCE_MAX_NAME_SIZE_IN_BYTES
Maximum instance info name string length in bytes.

#define CPA_INSTANCE_MAX_ID_SIZE_IN_BYTES
Maximum instance info id string length in bytes.

#define CPA_INSTANCE_MAX_VERSION_SIZE_IN_BYTES
Maximum instance info version string length in bytes.

3.8 Typedef Documentation

typedef void* CpaInstanceHandle

File: cpa.h

Instance handle type.

Handle used to uniquely identify an instance.

Note: Where only a single instantiation exists this field may be set to CPA_INSTANCE_HANDLE_SINGLE.

typedef Cpa64UCpaPhysicalAddr

File: cpa.h

Physical memory address.

Type for physical memory addresses.

typedef CpaPhysicalAddr(* CpaVirtualToPhysical)(void *pVirtualAddr)
Virtual to physical address conversion routine.

This function is used to convert virtual addresses to physical addresses.

Context:
The function shall not be called in an interrupt context.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.

Reentrant:
No

Thread-safe:
Yes

Parameters:

[in] `pVirtualAddr` Virtual address to be converted.

Returns:
Returns the corresponding physical address. On error, the value NULL is returned.

Postcondition:
None

See also:
None

typedef struct _CpaFlatBuffer CpaFlatBuffer

File: cpa.h

Flat buffer structure containing a pointer and length member.

A flat buffer structure. The data pointer, pData, is a virtual address. An API instance may require the actual data to be in contiguous physical memory as determined by `CpaInstanceInfo2`.

typedef struct _CpaBufferList CpaBufferList

File: cpa.h

Scatter/Gather buffer list containing an array of flat buffers.

A scatter/gather buffer list structure. This buffer structure is typically used to represent a region of memory which is not physically contiguous, by describing it as a collection of buffers, each of which is physically contiguous.
### 3.8 Typedef Documentation

**Note:**

The memory for the pPrivateMetaData member must be allocated by the client as physically contiguous memory. When allocating memory for pPrivateMetaData, a call to the corresponding BufferListGetMetaSize function (e.g. cpaCyBufferListGetMetaSize) MUST be made to determine the size of the Meta Data Buffer. The returned size (in bytes) may then be passed in a memory allocation routine to allocate the pPrivateMetaData memory.

```c
typedef struct _CpaPhysFlatBuffer CpaPhysFlatBuffer
```

**File: cpa.h**

Flat buffer structure with physical address.

Functions taking this structure do not need to do any virtual to physical address translation before writing the buffer to hardware.

```c
typedef struct _CpaPhysBufferList CpaPhysBufferList
```

**File: cpa.h**

Scatter/gather list containing an array of flat buffers with physical addresses.

Similar to **CpaBufferList**, this buffer structure is typically used to represent a region of memory which is not physically contiguous, by describing it as a collection of buffers, each of which is physically contiguous. The difference is that, in this case, the individual "flat" buffers are represented using physical, rather than virtual, addresses.

```c
typedef Cpa32S CpaStatus
```

**File: cpa.h**

API status value type definition

This type definition is used for the return values used in all the API functions. Common values are defined, for example see **CPA_STATUS_SUCCESS, CPA_STATUS_FAIL**, etc.

```c
typedef enum _CpaInstanceType CPA_DEPRECATED
```

**File: cpa.h**

Instance Types

**Deprecated:**

As of v1.3 of the Crypto API, this enum has been deprecated, replaced by **CpaAccelerationServiceType**.

Enumeration of the different instance types.

```c
typedef enum _CpaAccelerationServiceType CpaAccelerationServiceType
```

**File: cpa.h**

Service Type
3.8 Typedef Documentation

Enumeration of the different service types.

typedef enum _CPAInstanceState CPA_DEPRECATED

File: cpa.h

Instance State

Deprecated:
As of v1.3 of the Crypto API, this enum has been deprecated, replaced by CpaOperationalState.

Enumeration of the different instance states that are possible.

typedef enum _CpaOperationalState CpaOperationalState

File: cpa.h

Instance operational state

Enumeration of the different operational states that are possible.

typedef struct _CPAInstanceStateInfo CPA_DEPRECATED

File: cpa.h

Instance Info Structure

Deprecated:
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaInstanceInfo2.

Structure that contains the information to describe the instance.

typedef struct _CPAPhysicalInstanceId CpaPhysicalInstanceId

File: cpa.h

Physical Instance ID

Identifies the physical instance of an accelerator execution engine.

Accelerators grouped into "packages". Each accelerator can in turn contain one or more execution engines. Implementations of this API will define the packageId, acceleratorId, executionEngineId and busAddress as appropriate for the implementation. For example, for hardware-based accelerators, the packageId might identify the chip, which might contain multiple accelerators, each of which might contain multiple execution engines. The combination of packageId, acceleratorId and executionEngineId uniquely identifies the instance.

Hardware based accelerators implementing this API may also provide information on the location of the accelerator in the busAddress field. This field will be defined as appropriate for the implementation. For example, for PCIe attached accelerators, the busAddress may contain the PCIe bus, device and function number of the accelerators.
typedef struct _CpaInstanceInfo2 CpInstanceInfo2

File: cpa.h

Instance Info Structure, version 2
Structure that contains the information to describe the instance.

typedef enum _CpaInstanceEvent CpInstanceEvent

File: cpa.h

Instance Events
Enumeration of the different events that will cause the registered Instance notification callback function to be invoked.

3.9 Enumeration Type Documentation

enum _CpaInstanceType

File: cpa.h

Instance Types

Deprecated:
As of v1.3 of the Crypto API, this enum has been deprecated, replaced by CpaAccelerationServiceType.

Enumeration of the different instance types.

Enumerator:

- CPA_INSTANCE_TYPE_CRYPTO: Cryptographic instance type.
- CPA_INSTANCE_TYPE_DATA_COMPRESSION: Data compression instance type.
- CPA_INSTANCE_TYPE_RAID: RAID instance type.
- CPA_INSTANCE_TYPE_XML: XML instance type.
- CPA_INSTANCE_TYPE_REGEX: Regular Expression instance type.

enum _CpaAccelerationServiceType

File: cpa.h

Service Type
Enumeration of the different service types.

Enumerator:

- CPA_ACC_SVC_TYPE_CRYPTO: Cryptography.
- CPA_ACC_SVC_TYPE_DATA_COMPRESSION: Data Compression.
- CPA_ACC_SVC_TYPE_PATTERN_MATCH: Pattern Match.
- CPA_ACC_SVC_TYPE_RAID: RAID.
3.9 Enumeration Type Documentation

<table>
<thead>
<tr>
<th>CPA_ACC_SVC_TYPE_XML</th>
<th>XML.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPA_ACC_SVC_TYPE_VIDEO_ANALYTICS</td>
<td>Video Analytics.</td>
</tr>
</tbody>
</table>

enum _CpaInstanceState

File: cpa.h

Instance State

**Deprecated:**
As of v1.3 of the Crypto API, this enum has been deprecated, replaced by CpaOperationalState.

Enumeration of the different instance states that are possible.

**Enumerator:**
- CPA_INSTANCE_STATE_INITIALIZED: Instance is in the initialized state and ready for use.
- CPA_INSTANCE_STATE_SHUTDOWN: Instance is in the shutdown state and not available for use.

enum _CpaOperationalState

File: cpa.h

Instance operational state

Enumeration of the different operational states that are possible.

**Enumerator:**
- CPA_OPER_STATE_DOWN: Instance is not available for use. May not yet be initialized, or stopped.
- CPA_OPER_STATE_UP: Instance is available for use. Has been initialized and started.

enum _CpaInstanceEvent

File: cpa.h

Instance Events

Enumeration of the different events that will cause the registered Instance notification callback function to be invoked.

**Enumerator:**
- CPA_INSTANCE_EVENT_RESTARTING: Event type that triggers the registered instance notification callback function when and instance is restarting.

The reason why an instance is restarting is implementation specific. For example a hardware
implementation may send this event if the hardware device is about to be reset.

*CPA_INSTANCE_EVENT_RESTARTED*  
Event type that triggers the registered instance notification callback function when an instance has restarted.

The reason why an instance has restarted is implementation specific. For example, a hardware implementation may send this event after the hardware device has been reset.
4 CPA Type Definition

[CPA API]

Collaboration diagram for CPA Type Definition:

4.1 Detailed Description

File: cpa_types.h

This is the CPA Type Definitions.

4.2 Defines

- #define NULL
- #define TRUE
- #define FALSE
- #define CPA_BITMAP(name, sizeInBits)
- #define CPA_BITMAP_BIT_TEST(bitmask, bit)
  Test a specified bit in the specified bitmap.
- #define CPA_BITMAP_BIT_SET(bitmask, bit)
- #define CPA_BITMAP_BIT_CLEAR(bitmask, bit)
  Clear a specified bit in the specified bitmap.
- #define CPA_DEPRECATED
  Declare a function or type and mark it as deprecated so that usages get flagged with a warning.

4.3 Typedefs

- typedef uint8_t Cpa8U
- typedef int8_t Cpa8S
- typedef uint16_t Cpa16U
- typedef int16_t Cpa16S
- typedef uint32_t Cpa32U
- typedef int32_t Cpa32S

  CPA_FALSE,
  CPA_TRUE
}
4.5 Define Documentation

#define NULL

File: cpa_types.h

NULL definition.

#define TRUE

File: cpa_types.h

True value definition.

#define FALSE

File: cpa_types.h

False value definition.

#define CPA_BITMAP( name,
               sizeInBits  )

File: cpa_types.h

Declare a bitmap of specified size (in bits).

This macro is used to declare a bitmap of arbitrary size.

To test whether a bit in the bitmap is set, use CPA_BITMAP_BIT_TEST.

While most uses of bitmaps on the API are read-only, macros are also provided to set (see CPA_BITMAP_BIT_SET) and clear (see CPA_BITMAP_BIT_CLEAR) bits in the bitmap.

#define CPA_BITMAP_BIT_TEST( bitmask,
                     bit  )

Test a specified bit in the specified bitmap.

The bitmap may have been declared using CPA_BITMAP. Returns a Boolean (true if the bit is set, false otherwise).

#define CPA_BITMAP_BIT_SET( bitmask,
                   bit  )

Set a specified bit in the specified bitmap. The bitmap may have been declared using CPA_BITMAP.

#define CPA_BITMAP_BIT_CLEAR( bitmask,
                  bit  )

Clear a specified bit in the specified bitmap.
4.6 Typedef Documentation

The bitmap may have been declared using CPA_BITMAP.

#define CPA_DEPRECATED
Declare a function or type and mark it as deprecated so that usages get flagged with a warning.

4.6 Typedef Documentation

typedef uint8_t Cpa8U

- CpaStatus cpacyInstanceGetInfo2 (const CpalInstanceHandle instanceHandle, CpalInstanceInfo2 *pInstanceInfo2)
  Function to get information on a particular instance.
- CpaStatus cpacyInstanceSetNotificationCb (const CpalInstanceHandle instanceHandle, const CpaCyInstanceNotificationCbFunc pInstanceNotificationCb, void *pCallbackTag)
### Typedef Documentation

#### _CpaCyPriority

typedef enum _CpaCyPriority CpaCyPriority

File: cpa_cy_common.h

Request priority

Enumeration of priority of the request to be given to the API. Currently two levels - HIGH and NORMAL are supported. HIGH priority requests will be prioritized on a "best-effort" basis over requests that are marked with a NORMAL priority.

#### CpaCyGenericCbFunc

typedef void(* CpaCyGenericCbFunc)(void *pCallbackTag, CpaStatus status, void *pOpData)

File: cpa_cy_common.h

Definition of the crypto generic callback function

This data structure specifies the prototype for a generic callback function

**Context:**
This callback function can be executed in a context that DOES NOT permit sleeping to occur.

**Assumptions:**
None

**Side-Effects:**
None

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

- [in] `pCallbackTag` Opaque value provided by user while making individual function call.
- [in] `status` Status of the operation. Valid values are CPA_STATUS_SUCCESS and CPA_STATUS_FAIL.
- [in] `pOpData` Opaque Pointer to the operation data that was submitted in the request

**Return values:**
None

**Precondition:**
Component has been initialized.

**Postcondition:**
None

**Note:**
None

**See also:**

Reference Number: 330685-001
typedef void(* CpaCyGenFlatBufCbFunc)(void *pCallbackTag, CpaStatus status, void *pOpdata, CpaFlatBuffer *pOut)

File: cpa_cy_common.h

Definition of generic callback function with an additional output CpaFlatBuffer parameter.

This data structure specifies the prototype for a generic callback function which provides an output buffer (of type CpaFlatBuffer).

Context:
This callback function can be executed in a context that DOES NOT permit sleeping to occur.

Assumptions:
None

Side-Effects:
None

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in] pCallbackTag Opaque value provided by user while making individual function call.
[in] status Status of the operation. Valid values are CPA_STATUS_SUCCESS and CPA_STATUS_FAIL.
[in] pOpData Opaque Pointer to the operation data that was submitted in the request
[in] pOut Pointer to the output buffer provided in the request invoking this callback.

Return values:
None

Precondition:
Component has been initialized.

Postcondition:
None

Note:
None

See also:
None

typedef void(* CpaCyInstanceNotificationCbFunc)(const CpaInstanceHandle instanceHandle, void *pCallbackTag, const CpaInstanceEvent instanceEvent)

File: cpa_cy_common.h

Callback function for instance notification support.
This is the prototype for the instance notification callback function. The callback function is passed in as a parameter to the `cpaCyInstanceSetNotificationCb` function.

**Context:**
This function will be executed in a context that requires that sleeping MUST NOT be permitted.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
No

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

- `[in]` `instanceHandle` Instance handle.
- `[in]` `pCallbackTag` Opaque value provided by user while making individual function calls.
- `[in]` `instanceEvent` The event that will trigger this function to get invoked.

**Return values:**
None

**Precondition:**
Component has been initialized and the notification function has been set via the `cpaCyInstanceSetNotificationCb` function.

**Postcondition:**
None

**Note:**
None

**See also:**
`cpaCyInstanceSetNotificationCb()`.

---

### 6.6 Enumeration Type Documentation

```c
enum _CpaCyPriority
```

**File:** `cpa_cy_common.h`

Request priority

Enumeration of priority of the request to be given to the API. Currently two levels - HIGH and NORMAL are supported. HIGH priority requests will be prioritized on a "best-effort" basis over requests that are marked with a NORMAL priority.
6.7 Function Documentation

Enumerator:

- **CPA_CY_PRIORITY_NORMAL** Normal priority.
- **CPA_CY_PRIORITY_HIGH** High priority.

---

## 6.7 Function Documentation

**CpaStatus** cpaCyBufferListGetMetaSize (const *CpaInstanceHandle* instanceHandle, *Cpa32U* numBuffers, *Cpa32U* *pSizeInBytes)

**File:** cpa_cy_common.h

Function to return the size of the memory which must be allocated for the pPrivateMetaData member of CpaBufferList.

This function is used to obtain the size (in bytes) required to allocate a buffer descriptor for the pPrivateMetaData member in the CpaBufferList structure. Should the function return zero then no metadata is required for the buffer list.

**Context:**
This function may be called from any context.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
No

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

- **[in]** *instanceHandle* Handle to an instance of this API.
- **[in]** *numBuffers* The number of pointers in the CpaBufferList. This is the maximum number of CpaFlatBuffers which may be contained in this CpaBufferList.
- **[out]** *pSizeInBytes* Pointer to the size in bytes of memory to be allocated when the client wishes to allocate a cpaFlatBuffer

**Return values:**

- **CPA_STATUS_SUCCESS** Function executed successfully.
- **CPA_STATUS_FAIL** Function failed.
- **CPA_STATUS_INVALID_PARAM** Invalid parameter passed in.

**Precondition:**
None.

**Postcondition:**

Reference Number: 330685-001
Function to return a string indicating the specific error that occurred for a particular instance.

When a function invocation on a particular instance returns an error, the client can invoke this function to query the instance for a null terminated string which describes the general error condition, and if available additional text on the specific error. The Client MUST allocate \texttt{CPA\_STATUS\_MAX\_STR\_LENGTH\_IN\_BYTES} bytes for the buffer string.

\textbf{Context:} This function may be called from any context.

\textbf{Assumptions:} None

\textbf{Side-Effects:} None

\textbf{Blocking:} No

\textbf{Reentrant:} No

\textbf{Thread-safe:} Yes

\textbf{Parameters:}

\begin{itemize}
  \item \texttt{instanceHandle} [in] Handle to an instance of this API.
  \item \texttt{errStatus} [in] The error condition that occurred
  \item \texttt{pStatusText} [out] Pointer to the string buffer that will be updated with a null terminated status text string. The invoking application MUST allocate this buffer to be \texttt{CPA\_STATUS\_MAX\_STR\_LENGTH\_IN\_BYTES}.
\end{itemize}

\textbf{Return values:}

\begin{itemize}
  \item \texttt{CPA\_STATUS\_SUCCESS} Function executed successfully.
  \item \texttt{CPA\_STATUS\_FAIL} Function failed. Note, In this scenario it is INVALID to call this function a further time.
  \item \texttt{CPA\_STATUS\_INVALID\_PARAM} Invalid parameter passed in.
\end{itemize}

\textbf{Precondition:} None.
Postcondition:
None

Note:
None

See also:
CpaStatus

CpaStatus cpaCyGetNumInstances ( Cpa16U * pNumInstances )

File: cpa_cy_common.h

Get the number of instances that are supported by the API implementation.

This function will get the number of instances that are supported by an implementation of the Cryptographic API. This number is then used to determine the size of the array that must be passed to cpaCyGetInstances().

Context:
This function MUST NOT be called from an interrupt context as it MAY sleep.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.

Reentrant:
No

Thread-safe:
Yes

Parameters:
[out] pNumInstances Pointer to where the number of instances will be written.

Return values:
CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.

Precondition:
None

Postcondition:
None

Note:
This function operates in a synchronous manner and no asynchronous callback will be generated

See also:
cpaCyGetInstances
CpaStatus cpaCyGetInstances ( Cpa16U numInstances, 
  CpainstanceHandle * cyInstances )

File: cpa_cy_common.h

Get the handles to the instances that are supported by the API implementation.

This function will return handles to the instances that are supported by an implementation of the 
Cryptographic API. These instance handles can then be used as input parameters with other Cryptographic 
API functions.

This function will populate an array that has been allocated by the caller. The size of this API will have been 
determined by the cpaCyGetNumInstances() function.

Context:
This function MUST NOT be called from an interrupt context as it MAY sleep.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in] numInstances Size of the array. If the value is not the same as the number of 
instances supported, then an error (CPA_STATUS_INVALID_PARAM) 
is returned.

[in,out] cyInstances Pointer to where the instance handles will be written.

Return values:
CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.

Precondition:
None

Postcondition:
None

Note:
This function operates in a synchronous manner and no asynchronous callback will be generated

See also:

Reference Number: 330685-001

**cpaCyGetNumInstances**

```c
CpaStatus CPA_DEPRECATED cpaCyInstanceGetInfo ( const CpaInstanceHandle instanceHandle,
                                                struct _CpaInstanceInfo * pInstanceInfo
                                            )
```

- **File:** cpa_cy_common.h
- **Function:** to get information on a particular instance.
- **Deprecated:**
  - As of v1.3 of the Crypto API, this function has been deprecated, replaced by `cpaCyInstanceGetInfo2`.
- **Context:**
  - This function may be called from any context.
- **Assumptions:**
  - None
- **Side-Effects:**
  - None
- **Blocking:**
  - No
- **Reentrant:**
  - No
- **Thread-safe:**
  - Yes
- **Parameters:**
  - `[in]` `instanceHandle` Handle to an instance of this API to be initialized.
  - `[out]` `pInstanceInfo` Pointer to the memory location allocated by the client into which the CpaInstanceInfo structure will be written.
- **Return values:**
  - `CPA_STATUS_SUCCESS` Function executed successfully.
  - `CPA_STATUS_FAIL` Function failed.
  - `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- **Precondition:**
  - The client has retrieved an instanceHandle from successive calls to `cpaCyGetNumInstances` and `cpaCyGetInstances`.
- **Postcondition:**
  - None
- **Note:**
  - None
- **See also:**

Reference Number: 330685-001
### cpaCyInstanceGetInfo2

**Function to get information on a particular instance.**

This function will provide instance specific information through a `CpaInstanceInfo2` structure. Supersedes `cpaCyInstanceGetInfo`.

#### Context:
This function may be called from any context.

#### Assumptions:
None

#### Side-Effects:
None

#### Blocking:
No

#### Reentrant:
No

#### Thread-safe:
Yes

#### Parameters:
- `instanceHandle` [in] Handle to an instance of this API to be initialized.
- `pInstanceInfo2` [out] Pointer to the memory location allocated by the client into which the `CpaInstanceInfo2` structure will be written.

#### Return values:
- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.

#### Precondition:
The client has retrieved an instanceHandle from successive calls to `cpaCyGetNumInstances` and `cpaCyGetInstances`.

#### Postcondition:
None

#### Note:
None

#### See also:
- `cpaCyGetNumInstances`, `cpaCyGetInstances`, `CpaInstanceInfo`
File: cpa_cy_common.h

Subscribe for instance notifications.

Clients of the CpaCy interface can subscribe for instance notifications by registering a CpaCylInstanceNotificationCbFunc function.

Context:
This function may be called from any context.

Assumptions:
None

Side-Effects:
None

Blocking:
No

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in] instanceHandle Instance handle.
[in] pInstanceNotificationCb Instance notification callback function pointer.
[in] pCallbackTag Opaque value provided by user while making individual function calls.

Return values:
CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.

Precondition:
Instance has been initialized.

Postcondition:
None

Note:
None

7 Cryptographic Instance Management API

[Cryptographic API]

Collaboration diagram for Cryptographic Instance Management API:

7.1 Detailed Description

File: cpa_cy_im.h

These functions specify the Instance Management API for available Cryptographic Instances. It is expected that these functions will only be called via a single system maintenance entity, rather than individual clients.

7.2 Data Structures

- struct _CpaCyCapabilitiesInfo

7.3 Typedefs

- typedef _CpaCyCapabilitiesInfo CpaCyCapabilitiesInfo

7.4 Functions

- CpaStatus cpaCyStartInstance (CpaInstanceHandle instanceHandle)
- CpaStatus cpaCyStopInstance (CpaInstanceHandle instanceHandle)
- CpaStatus cpaCyQueryCapabilities (const CpaInstanceHandle instanceHandle, CpaCyCapabilitiesInfo *pCapInfo)
- CpaStatus cpaCySetAddressTranslation (const CpaInstanceHandle instanceHandle, CpaVirtualToPhysical virtual2Physical)

7.5 Data Structure Documentation

7.5.1 _CpaCyCapabilitiesInfo Struct Reference

7.5.1.1 Detailed Description

File: cpa_cy_im.h

Cryptographic Capabilities Info

This structure contains the capabilities that vary across API implementations. This structure is used in conjunction with cpaCyQueryCapabilities() to determine the capabilities supported by a particular API implementation.

The client MUST allocate memory for this structure and any members that require memory. When the structure is passed into the function ownership of the memory passes to the function. Ownership of the
7.5.1 _CpaCyCapabilitiesInfo Struct Reference

memory returns to the client when the function returns.

7.5.1.2 Data Fields

- **CpaBoolean symSupported**
  CPA_TRUE if instance supports the symmetric cryptography API.

- **CpaBoolean symDpSupported**
  CPA_TRUE if instance supports the symmetric cryptography data plane API.

- **CpaBoolean dhSupported**
  CPA_TRUE if instance supports the Diffie Hellman API.

- **CpaBoolean dsaSupported**
  CPA_TRUE if instance supports the DSA API.

- **CpaBoolean rsaSupported**
  CPA_TRUE if instance supports the RSA API.

- **CpaBoolean ecSupported**
  CPA_TRUE if instance supports the Elliptic Curve API.

- **CpaBoolean ecdhSupported**
  CPA_TRUE if instance supports the Elliptic Curve Diffie Hellman API.

- **CpaBoolean ecdsaSupported**
  CPA_TRUE if instance supports the Elliptic Curve DSA API.

- **CpaBoolean keySupported**
  CPA_TRUE if instance supports the Key Generation API.

- **CpaBoolean lnSupported**
  CPA_TRUE if instance supports the Large Number API.

- **CpaBoolean primeSupported**
  CPA_TRUE if instance supports the prime number testing API.

- **CpaBoolean drbgSupported**
  CPA_TRUE if instance supports the DRBG API.

- **CpaBoolean nrbgSupported**
  CPA_TRUE if instance supports the NRBG API.

- **CpaBoolean randSupported**
  CPA_TRUE if instance supports the random bit/number generation API.

7.5.1.3 Field Documentation

- **CpaBoolean _CpaCyCapabilitiesInfo::symSupported**
  CPA_TRUE if instance supports the symmetric cryptography API.

  See Symmetric Cipher and Hash Cryptographic API.

- **CpaBoolean _CpaCyCapabilitiesInfo::symDpSupported**
  CPA_TRUE if instance supports the symmetric cryptography data plane API.

  See Symmetric cryptographic Data Plane API.

- **CpaBoolean _CpaCyCapabilitiesInfo::dhSupported**
  CPA_TRUE if instance supports the Diffie Hellman API.

  See Diffie-Hellman (DH) API.

- **CpaBoolean _CpaCyCapabilitiesInfo::dsaSupported**
  CPA_TRUE if instance supports the DSA API.

  See Digital Signature Algorithm (DSA) API.
CpaBoolean _CpaCyCapabilitiesInfo::rsaSupported
CPA_TRUE if instance supports the RSA API.

See RSA API.

CpaBoolean _CpaCyCapabilitiesInfo::ecSupported
CPA_TRUE if instance supports the Elliptic Curve API.

See Elliptic Curve (EC) API.

CpaBoolean _CpaCyCapabilitiesInfo::ecdhSupported
CPA_TRUE if instance supports the Elliptic Curve Diffie-Hellman API.

See Elliptic Curve Diffie-Hellman (ECDH) API.

CpaBoolean _CpaCyCapabilitiesInfo::ecdsaSupported
CPA_TRUE if instance supports the Elliptic Curve DSA API.

See Elliptic Curve Digital Signature Algorithm (ECDSA) API.

CpaBoolean _CpaCyCapabilitiesInfo::keySupported
CPA_TRUE if instance supports the Key Generation API.

See Cryptographic Key and Mask Generation API.

CpaBoolean _CpaCyCapabilitiesInfo::lnSupported
CPA_TRUE if instance supports the Large Number API.

See Cryptographic Large Number API.

CpaBoolean _CpaCyCapabilitiesInfo::primeSupported
CPA_TRUE if instance supports the prime number testing API.

See Prime Number Test API.

CpaBoolean _CpaCyCapabilitiesInfo::drbgSupported
CPA_TRUE if instance supports the DRBG API.

See Deterministic Random Bit Generation API.

CpaBoolean _CpaCyCapabilitiesInfo::nrbgSupported
CPA_TRUE if instance supports the NRBG API.

See Non-Deterministic Random Bit Generation API.

CpaBoolean _CpaCyCapabilitiesInfo::randSupported
CPA_TRUE if instance supports the random bit/number generation API.

See Random Bit/Number Generation API.
7.6 Typedef Documentation

Typedef Documentation

```c
typedef struct _CpaCyCapabilitiesInfo CpaCyCapabilitiesInfo
```

File: cpa_cy_im.h

Cryptographic Capabilities Info

This structure contains the capabilities that vary across API implementations. This structure is used in conjunction with `cpaCyQueryCapabilities()` to determine the capabilities supported by a particular API implementation.

The client MUST allocate memory for this structure and any members that require memory. When the structure is passed into the function ownership of the memory passes to the function. Ownership of the memory returns to the client when the function returns.

7.7 Function Documentation

```c
CpaStatus cpaCyStartInstance ( CpalInstanceHandle instanceHandle )
```

File: cpa_cy_im.h

Cryptographic Component Initialization and Start function.

This function will initialize and start the Cryptographic component. It MUST be called before any other crypto function is called. This function SHOULD be called only once (either for the very first time, or after an `cpaCyStopInstance` call which succeeded) per instance. Subsequent calls will have no effect.

**Context:**
This function may sleep, and MUST NOT be called in interrupt context.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
This function is synchronous and blocking.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

```c
[ out ] instanceHandle Handle to an instance of this API to be initialized.
```

**Return values:**

- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed. Suggested course of action is to shutdown and restart.
7.7 Function Documentation

Precondition:
None.

Postcondition:
None

Note:
Note that this is a synchronous function and has no completion callback associated with it.

See also:
cpaCyStopInstance()

CpaStatus cpaCyStopInstance ( CpaInstanceHandle instanceHandle )

File: cpa_cy_im.h

Cryptographic Component Stop function.

This function will stop the Cryptographic component and free all system resources associated with it. The client MUST ensure that all outstanding operations have completed before calling this function. The recommended approach to ensure this is to deregister all session or callback handles before calling this function. If outstanding operations still exist when this function is invoked, the callback function for each of those operations will NOT be invoked and the shutdown will continue. If the component is to be restarted, then a call to cpaCyStartInstance is required.

Context:
This function may sleep, and so MUST NOT be called in interrupt context.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in] instanceHandle Handle to an instance of this API to be shutdown.

Return values:
CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed. Suggested course of action is to ensure requests are not still being submitted and that all sessions are deregistered. If this does not help, then forcefully remove the component from the system.

Precondition:
The component has been initialized via cpaCyStartInstance.

Postcondition:
Note:
Note that this is a synchronous function and has no completion callback associated with it.

See also:
cpaCyStartInstance()

CpaStatus cpaCyQueryCapabilities ( const CpaInstanceHandle instanceHandle, CpaCyCapabilitiesInfo * pCapInfo )

File: cpa_cy_im.h

Returns capabilities of a Cryptographic API instance

This function is used to query the instance capabilities.

Context:
The function shall not be called in an interrupt context.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in] instanceHandle Handle to an instance of this API.
[out] pCapInfo Pointer to capabilities info structure. All fields in the structure are populated by the API instance.

Return values:
CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.

Precondition:
The instance has been initialized via the cpaCyStartInstance function.

Postcondition:
None
7.7 Function Documentation

File: cpa_cy_im.h

Sets the address translation function

This function is used to set the virtual to physical address translation routine for the instance. The specified routine is used by the instance to perform any required translation of a virtual address to a physical address. If the application does not invoke this function, then the instance will use its default method, such as virt2phys, for address translation.

Context:
The function shall not be called in an interrupt context.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in] instanceHandle  Pattern Matching API instance handle.
[in] virtual2Physical  Routine that performs virtual to physical address translation.

Return values:
  CPA_STATUS_SUCCESS Function executed successfully.
  CPA_STATUS_FAIL Function failed.
  CPA_STATUS_INVALID_PARAM Invalid parameter passed in.

Precondition:
None

Postcondition:
None

See also:
None
8 Symmetric Cipher and Hash Cryptographic API

[Cryptographic API]

Collaboration diagram for Symmetric Cipher and Hash Cryptographic API:

8.1 Detailed Description

8.8 Data Structure Documentation

8.8.1 _CpaCySymCipherSetupData Struct Reference

8.8.1.1 Detailed Description

File: cpa_cy_sym.h

Symmetric Cipher Setup Data.

This structure contains data relating to Cipher (Encryption and Decryption) to set up a session.

8.8.1.2 Data Fields

- `CpaCySymCipherAlgorithm cipherAlgorithm`
  Cipher algorithm and mode.
- `Cpa32U cipherKeyLenInBytes`
8.8.1 _CpaCySymCipherSetupData Struct Reference

Cipher key length in bytes.

- **Cpa8U * pCipherKey**
  Cipher key. For the CPA_CY_SYM_CIPHER_AES_F8 mode of operation, pCipherKey will point to a concatenation of the AES encryption key followed by a keymask.

- **CpaCySymCipherDirection cipherDirection**
  This parameter determines if the cipher operation is an encrypt or a decrypt operation.

8.8.1.3 Field Documentation

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CpaCySymCipherAlgorithm _CpaCySymCipherSetupData::cipherAlgorithm</td>
<td>Cipher algorithm and mode.</td>
</tr>
</tbody>
</table>
| Cpa32U _CpaCySymCipherSetupData::cipherKeyLenInBytes | Cipher key length in bytes. For AES it can be 128 bits (16 bytes), 192 bits (24 bytes) or 256 bits (32 bytes). For the CCM mode of operation, the only supported key length is 128 bits (16 bytes). For the CPA_CY_SYM_CIPHER_AES_F8 mode of operation, cipherKeyLenInBytes should be set to the combined length of the encryption key and the keymask. Since the keymask and the encryption key are the same size, cipherKeyLenInBytes should be set to 2 x the AES encryption key length. For the AES-XTS mode of operation:
  - Two keys must be provided and cipherKeyLenInBytes refers to total length of the two keys.
  - Each key can be either 128 bits (16 bytes) or 256 bits (32 bytes).
  - Both keys must have the same size. |
| Cpa8U* _CpaCySymCipherSetupData::pCipherKey | Cipher key. For the CPA_CY_SYM_CIPHER_AES_F8 mode of operation, pCipherKey will point to a concatenation of the AES encryption key followed by a keymask. As per RFC3711, the keymask should be padded with trailing bytes to match the length of the encryption key used. For AES-XTS mode of operation, two keys must be provided and pCipherKey must point to the two keys concatenated together (Key1 || Key2). cipherKeyLenInBytes will contain the total size of both keys. |
| CpaCySymCipherDirection _CpaCySymCipherSetupData::cipherDirection | This parameter determines if the cipher operation is an encrypt or a decrypt operation. For the RC4 algorithm and the F8/CTR modes, only encrypt operations are valid. |

8.8.2 _CpaCySymHashNestedModeSetupData Struct Reference

8.8.2.1 Detailed Description

File: cpa_cy_sym.h

Hash Mode Nested Setup Data.

This structure contains data relating to a hash session in CPA_CY_SYM_HASH_MODE_NESTED mode.
### 8.8.2.2 Data Fields

- **Cpa8U * pInnerPrefixData**
  A pointer to a buffer holding the Inner Prefix data.

- **Cpa32U innerPrefixLenInBytes**
  The inner prefix length in bytes.

- **CpaCySymHashAlgorithm outerHashAlgorithm**
  The hash algorithm used for the outer hash.

- **Cpa8U * pOuterPrefixData**
  A pointer to a buffer holding the Outer Prefix data.

- **Cpa32U outerPrefixLenInBytes**
  The outer prefix length in bytes.

### 8.8.2.3 Field Documentation

**Cpa8U* _CpaCySymHashNestedModeSetupData::pInnerPrefixData**

A pointer to a buffer holding the Inner Prefix data.

For optimal performance the prefix data SHOULD be 8-byte aligned. This data is prepended to the data being hashed before the inner hash operation is performed.

**Cpa32U _CpaCySymHashNestedModeSetupData::innerPrefixLenInBytes**

The inner prefix length in bytes.

The maximum size the prefix data can be is 255 bytes.

**CpaCySymHashAlgorithm _CpaCySymHashNestedModeSetupData::outerHashAlgorithm**

The hash algorithm used for the outer hash.

Note: The inner hash algorithm is provided in the hash context.

**Cpa8U* _CpaCySymHashNestedModeSetupData::pOuterPrefixData**

A pointer to a buffer holding the Outer Prefix data.

For optimal performance the prefix data SHOULD be 8-byte aligned. This data is prepended to the output from the inner hash operation before the outer hash operation is performed.

**Cpa32U _CpaCySymHashNestedModeSetupData::outerPrefixLenInBytes**

The outer prefix length in bytes.

The maximum size the prefix data can be is 255 bytes.

### 8.8.3 _CpaCySymHashAuthModeSetupData Struct Reference

#### 8.8.3.1 Detailed Description

**File: cpa_cy_sym.h**

Hash Auth Mode Setup Data.

This structure contains data relating to a hash session in CPA_CY_SYM_HASH_MODE_AUTH mode.
8.8.3.2 Data Fields

- **Cpa8U * authKey**
  Authentication key pointer.

- **Cpa32U authKeyLenInBytes**
  Length of the authentication key in bytes.

- **Cpa32U aadLenInBytes**
  The length of the additional authenticated data (AAD) in bytes.

8.8.3.3 Field Documentation

**Cpa8U* _CpaCySymHashAuthModeSetupData::authKey**

Authentication key pointer.

For the GCM (**CPA_CY_SYM_HASH_AES_GCM**) and CCM (**CPA_CY_SYM_HASH_AES_CCM**) modes of operation, this field is ignored; the authentication key is the same as the cipher key (see the field \texttt{pCipherKey} in struct \texttt{CpaCySymCipherSetupData}).

**Cpa32U _CpaCySymHashAuthModeSetupData::authKeyLenInBytes**

Length of the authentication key in bytes.

The key length MUST be less than or equal to the block size of the algorithm. It is the client's responsibility to ensure that the key length is compliant with the standard being used (for example RFC 2104, FIPS 198a).

For the GCM (**CPA_CY_SYM_HASH_AES_GCM**) and CCM (**CPA_CY_SYM_HASH_AES_CCM**) modes of operation, this field is ignored; the authentication key is the same as the cipher key, and so is its length (see the field \texttt{cipherKeyLenInBytes} in struct \texttt{CpaCySymCipherSetupData}).

**Cpa32U _CpaCySymHashAuthModeSetupData::aadLenInBytes**

The length of the additional authenticated data (AAD) in bytes.

The maximum permitted value is 240 bytes, unless otherwise specified below.

This field must be specified when the hash algorithm is one of the following:

- For SNOW3G (**CPA_CY_SYM_HASH_SNOW3G_UIA2**), this is the length of the IV (which should be 16).
- For GCM (**CPA_CY_SYM_HASH_AES_GCM**). In this case, this is the length of the Additional Authenticated Data (called \texttt{A}, in NIST SP800-38D).
- For CCM (**CPA_CY_SYM_HASH_AES_CCM**). In this case, this is the length of the associated data (called \texttt{A}, in NIST SP800-38C). Note that this does NOT include the length of any padding, or the 18 bytes reserved at the start of the above field to store the block B0 and the encoded length. The maximum permitted value in this case is 222 bytes.

**Note:**

For AES-GMAC (**CPA_CY_SYM_HASH_AES_GMAC**) mode of operation this field is not used and should be set to 0. Instead the length of the AAD data is specified in the \texttt{messageLenToHashInBytes} field of the \texttt{CpaCySymOpData} structure.
8.8.4 _CpaCySymHashSetupData Struct Reference

8.8.4.1 Detailed Description

File: cpa_cy_sym.h

Hash Setup Data.

This structure contains data relating to a hash session. The fields hashAlgorithm, hashMode and digestResultLenInBytes are common to all three hash modes and MUST be set for each mode.

8.8.4.2 Data Fields

- **CpaCySymHashAlgorithm hashAlgorithm**
  Hash algorithm.

- **CpaCySymHashMode hashMode**
  Mode of the hash operation.

- **Cpa32U digestResultLenInBytes**
  Length of the digest to be returned.

- **CpaCySymHashAuthModeSetupData authModeSetupData**
  Authentication Mode Setup Data.

- **CpaCySymHashNestedModeSetupData nestedModeSetupData**
  Nested Hash Mode Setup Data. Only valid for mode CPA_CY_SYM_MODE_HASH_NESTED.

8.8.4.3 Field Documentation

[CpaCySymHashAlgorithm _CpaCySymHashSetupData::hashAlgorithm](#)
Hash algorithm.
For mode CPA_CY_SYM_MODE_HASH_NESTED, this is the inner hash algorithm.

**CpaCySymHashMode**

Mode of the hash operation.

Valid options include plain, auth or nested hash mode.

**Cpa32U**

Length of the digest to be returned.

If the verify option is set, this specifies the length of the digest to be compared for the session.

For CCM (CPA_CY_SYM_HASH_AES_CCM), this is the octet length of the MAC, which can be one of 4, 6, 8, 10, 12, 14 or 16.

For GCM (CPA_CY_SYM_HASH_AES_GCM), this is the length in bytes of the authentication tag.

If the value is less than the maximum length allowed by the hash, the result shall be truncated. If the value is greater than the maximum length allowed by the hash, an error (CPA_STATUS_INVALID_PARAM) is returned from the function `cpaCySymInitSession`.

In the case of nested hash, it is the outer hash which determines the maximum length allowed.

**CpaCySymHashAuthModeSetupData**

Authentication Mode Setup Data.

Only valid for mode CPA_CY_SYM_MODE_HASH_AUTH

**CpaCySymHashNestedModeSetupData**

Nested Hash Mode Setup Data Only valid for mode CPA_CY_SYM_MODE_HASH_NESTED.

### 8.8.5 _CpaCySymSessionSetupData Struct Reference

Collaboration diagram for _CpaCySymSessionSetupData:
8.8.5 Detailed Description

File: cpa_cy_sym.h

Session Setup Data.

This structure contains data relating to setting up a session. The client needs to complete the information in this structure in order to setup a session.

8.8.5.2 Data Fields

- **CpaCyPriority sessionPriority**
  Priority of this session.
- **CpaCySymOp symOperation**
  Operation to perform.
- **CpaCySymCipherSetupData cipherSetupData**
  Cipher Setup Data for the session.
8.8.5 _CpaCySymSessionSetupData Struct Reference

- **CpaCySymHashSetupData hashSetupData**
  Hash Setup Data for a session.

- **CpaCySymAlgChainOrder algChainOrder**
  If this operation data structure relates to an algorithm chaining session then this parameter determines the order in which the chained operations are performed.

- **CpaBoolean digestIsAppended**
  Flag indicating whether the digest is appended immediately following the region over which the digest is computed.

- **CpaBoolean verifyDigest**
  This flag is relevant only for operations which generate a message digest.

- **CpaBoolean partialsNotRequired**
  This flag indicates if partial packet processing is required for this session.

8.8.5.3 Field Documentation

<tr>
<td></td>
<td>This is true for both IPsec packets and SSL/TLS records.</td>
</tr>
<tr>
<td></td>
<td>If this flag is set, then the value of the pDigestResult field of the structure <strong>CpaCySymOpData</strong> is ignored.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The value of this field is ignored for the authenticated cipher AES_CCM as the digest must be appended in this case.</td>
</tr>
</tbody>
</table>
Setting digestIsAppended for hash only operations when verifyDigest is also set is not supported. For hash only operations when verifyDigest is set, digestIsAppended should be set to CPA_FALSE.

**CpaBoolean** CpaCySymSessionSetupData::verifyDigest

This flag is relevant only for operations which generate a message digest.

If set to true, the computed digest will not be written back to the buffer location specified by other parameters, but instead will be verified (i.e. compared to the value passed in at that location). The number of bytes to be written or compared is indicated by the digest output length for the session.

**Note:**
This option is only valid for full packets and for final partial packets when using partials without algorithm chaining.

The value of this field is ignored for the authenticated ciphers (AES_CCM and AES_GCM). Digest verification is always done for these (when the direction is decrypt) and unless the DP API is used, the message buffer will be zeroed if verification fails. When using the DP API, it is the API clients responsibility to clear the message buffer when digest verification fails.

**CpaBoolean** CpaCySymSessionSetupData::partialsNotRequired

This flag indicates if partial packet processing is required for this session.

If set to true, partial packet processing will not be enabled for this session and any calls to cpaCySymPerformOp() with the packetType parameter set to a value other than CPA_CY_SYM_PACKET_TYPE_FULL will fail.

### 8.8.6 _CpaCySymOpData Struct Reference

#### 8.8.6.1 Detailed Description

**File:** cpa_cy_sym.h

Cryptographic Component Operation Data.

This structure contains data relating to performing cryptographic processing on a data buffer. This request is used with cpaCySymPerformOp() call for performing cipher, hash, auth cipher or a combined hash and cipher operation.

**See also:**
CpaCySymPacketType

**Note:**
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCySymPerformOp function, and before it has been returned in the callback, undefined behavior will result.

#### 8.8.6.2 Data Fields

- **CpaCySymSessionCtx** sessionCtx
  Handle for the initialized session context.
- **CpaCySymPacketType** packetType
  Selects the packet type.
- **Cpa8U** * plv
  Initialization Vector or Counter.
8.8.6._CpaCySymOpData Struct Reference

- **Cpa32U ivLenInBytes**
  Length of valid IV data pointed to by the plv parameter.

- **Cpa32U cryptoStartSrcOffsetInBytes**
  Starting point for cipher processing, specified as number of bytes from start of data in the source buffer.

- **Cpa32U messageLenToCipherInBytes**
  The message length, in bytes, of the source buffer on which the cryptographic operation will be computed.

- **Cpa32U hashStartSrcOffsetInBytes**
  Starting point for hash processing, specified as number of bytes from start of packet in source buffer.

- **Cpa32U messageLenToHashInBytes**
  The message length, in bytes, of the source buffer that the hash will be computed on.

- **Cpa8U *pDigestResult**
  If the digestIsAppended member of the **CpaCySymSessionSetupData** structure is NOT set then this is a pointer to the location where the digest result should be inserted (in the case of digest generation) or where the purported digest exists (in the case of digest verification).

- **Cpa8U *pAdditionalAuthData**
  Pointer to Additional Authenticated Data (AAD) needed for authenticated cipher mechanisms (CCM and GCM), and to the IV for SNOW3G authentication (CPA_CY_SYM_HASH_SNOW3G_UIA2).

8.8.6.3 Field Documentation

<table>
<thead>
<tr>
<th>CpaCySymSessionCtx _CpaCySymOpData::sessionCtx</th>
<th>Handle for the initialized session context.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CpaCySymPacketType _CpaCySymOpData::packetType</td>
<td>Selects the packet type.</td>
</tr>
<tr>
<td>Cpa8U* _CpaCySymOpData::plv</td>
<td>Initialization Vector or Counter.</td>
</tr>
</tbody>
</table>
  - For block ciphers in CBC or F8 mode, or for Kasumi in F8 mode, or for SNOW3G in UEA2 mode, this is the Initialization Vector (IV) value.
  - For block ciphers in CTR mode, this is the counter.
  - For GCM mode, this is either the IV (if the length is 96 bits) or J0 (for other sizes), where J0 is as defined by NIST SP800-38D. Regardless of the IV length, a full 16 bytes needs to be allocated.
  - For CCM mode, the first byte is reserved, and the nonce should be written starting at &plv[1] (to allow space for the implementation to write in the flags in the first byte). Note that a full 16 bytes should be allocated, even though the ivLenInBytes field will have a value less than this. The macro **CPA_CY_SYM_CCM_SET_NONCE** may be used here.
  - For AES-XTS, this is the 128bit tweak, i, from IEEE Std 1619-2007.

For optimum performance, the data pointed to SHOULD be 8-byte aligned.

The IV/Counter will be updated after every partial cryptographic operation.

<table>
<thead>
<tr>
<th>Cpa32U _CpaCySymOpData::ivLenInBytes</th>
<th>Length of valid IV data pointed to by the plv parameter.</th>
</tr>
</thead>
</table>
  - For block ciphers in CBC or F8 mode, or for Kasumi in F8 mode, or for SNOW3G in UEA2 mode, this is the length of the IV (which must be the same as the block length of the cipher).|

Reference Number: 330685-001
For block ciphers in CTR mode, this is the length of the counter (which must be the same as the block length of the cipher).

- For GCM mode, this is either 12 (for 96-bit IVs) or 16, in which case plv points to J0.
- For CCM mode, this is the length of the nonce, which can be in the range 7 to 13 inclusive.

**Cpa32U_CpaCySymOpData::cryptoStartSrcOffsetInBytes**
Starting point for cipher processing, specified as number of bytes from start of data in the source buffer.

The result of the cipher operation will be written back into the output buffer starting at this location.

**Cpa32U_CpaCySymOpData::messageLenToCipherInBytes**
The message length, in bytes, of the source buffer on which the cryptographic operation will be computed.

This must be a multiple of the block size if a block cipher is being used. This is also the same as the result length.

**Note:**
In the case of CCM (CPA_CY_SYM_HASH_AES_CCM), this value should not include the length of the padding or the length of the MAC; the driver will compute the actual number of bytes over which the encryption will occur, which will include these values.

There are limitations on this length for partial operations. Refer to the cpaCySymPerformOp function description for details.

On some implementations, this length may be limited to a 16-bit value (65535 bytes).

For AES-GMAC (CPA_CY_SYM_HASH_AES_GMAC), this field should be set to 0.

**Cpa32U_CpaCySymOpData::hashStartSrcOffsetInBytes**
Starting point for hash processing, specified as number of bytes from start of packet in source buffer.

**Note:**
For CCM and GCM modes of operation, this field is ignored. The field pAdditionalAuthData field should be set instead.

For AES-GMAC (CPA_CY_SYM_HASH_AES_GMAC) mode of operation, this field specifies the start of the AAD data in the source buffer.

**Cpa32U_CpaCySymOpData::messageLenToHashInBytes**
The message length, in bytes, of the source buffer that the hash will be computed on.

**Note:**
There are limitations on this length for partial operations. Refer to the cpaCySymPerformOp function description for details.

For CCM and GCM modes of operation, this field is ignored. The field pAdditionalAuthData field should be set instead.

For AES-GMAC (CPA_CY_SYM_HASH_AES_GMAC) mode of operation, this field specifies the length of the AAD data in the source buffer.

On some implementations, this length may be limited to a 16-bit value (65535 bytes).

**Cpa8U*_CpaCySymOpData::pDigestResult**
If the digestIsAppended member of the `CpaCySymSessionSetupData` structure is NOT set then this is a pointer to the location where the digest result should be inserted (in the case of digest generation) or where the purported digest exists (in the case of digest verification).

At session registration time, the client specified the digest result length with the `digestResultLenInBytes` member of the `CpaCySymHashSetupData` structure. The client must allocate at least `digestResultLenInBytes` of physically contiguous memory at this location.

For partial packet processing without algorithm chaining, this pointer will be ignored for all but the final partial operation.

For digest generation, the digest result will overwrite any data at this location.

**Note:**
For GCM (CPA_CY_SYM_HASH_AES_GCM), for "digest result" read "authentication tag T".

If the digestIsAppended member of the `CpaCySymSessionSetupData` structure is set then this value is ignored and the digest result is understood to be in the destination buffer for digest generation, and in the source buffer for digest verification. The location of the digest result in this case is immediately following the region over which the digest is computed.

### `Cpa8U*_CpaCySymOpData::pAdditionalAuthData`

Pointer to Additional Authenticated Data (AAD) needed for authenticated cipher mechanisms (CCM and GCM), and to the IV for SNOW3G authentication (CPA_CY_SYM_HASH_SNOW3G_UIA2).

For other authentication mechanisms this pointer is ignored.

The length of the data pointed to by this field is set up for the session in the `CpaCySymHashAuthModeSetupData` structure as part of the `cpaCySymInitSession` function call. This length must not exceed 240 bytes.

Specifically for CCM (CPA_CY_SYM_HASH_AES_CCM), the caller should setup this field as follows:

- the nonce should be written starting at an offset of one byte into the array, leaving room for the implementation to write in the flags to the first byte. For example, `memcpy(&(pOpData->pAdditionalAuthData[1]), pNonce, nonceLen);`
- The macro `CPA_CY_SYM_CCM_SET_NONCE` may be used here.

- the additional authentication data itself should be written starting at an offset of 18 bytes into the array, leaving room for the length encoding in the first two bytes of the second block. For example, `memcpy(&(pOpData->pAdditionalAuthData[18]), pAad, aadLen);`
- The macro `CPA_CY_SYM_CCM_SET_AAD` may be used here.

- the array should be big enough to hold the above fields, plus any padding to round this up to the nearest multiple of the block size (16 bytes). Padding will be added by the implementation.

Finally, for GCM (CPA_CY_SYM_HASH_AES_GCM), the caller should setup this field as follows:

- the AAD is written in starting at byte 0
- the array must be big enough to hold the AAD, plus any padding to round this up to the nearest multiple of the block size (16 bytes). Padding will be added by the implementation.

**Note:**
For AES-GMAC (CPA_CY_SYM_HASH_AES_GMAC) mode of operation, this field is not used and should be set to 0. Instead the AAD data should be placed in the source buffer.
8.8.7 _CpaCySymStats Struct Reference

8.8.7 _CpaCySymStats Struct Reference

8.8.7.1 Detailed Description

File: cpa_cy_sym.h

Cryptographic Component Statistics.

Deprecated:
As of v1.3 of the cryptographic API, this structure has been deprecated, replaced by 
CpaCySymStats64.

This structure contains statistics on the Symmetric Cryptographic operations. Statistics are set to zero when 
the component is initialized.

8.8.7.2 Data Fields

- **Cpa32UnumSessionsInitialized**
  Number of session initialized.
- **Cpa32UnumSessionsRemoved**
  Number of sessions removed.
- **Cpa32UnumSessionErrors**
  Number of session initialized and removed errors.
- **Cpa32UnumSymOpRequests**
  Number of successful symmetric operation requests.
- **Cpa32UnumSymOpRequestErrors**
  Number of operation requests that had an error and could not be processed.
- **Cpa32UnumSymOpCompleted**
  Number of operations that completed successfully.
- **Cpa32UnumSymOpCompletedErrors**
  Number of operations that could not be completed successfully due to errors.
- **Cpa32UnumSymOpVerifyFailures**
  Number of operations that completed successfully, but the result of the digest verification test 
  was that it failed.

8.8.9 _CpaCySymCapabilitiesInfo Struct Reference

8.8.9.1 Detailed Description

File: cpa_cy_sym.h

Symmetric Capabilities Info

This structure contains the capabilities that vary across implementations of the symmetric sub-API of the cryptographic API. This structure is used in conjunction with cpaCySymQueryCapabilities() to determine the capabilities supported by a particular API implementation.

For example, to see if an implementation supports cipher CPA_CY_SYM_CIPHER_AES_CBC, use the code

```c
if (CPA_BITMAP_BIT_TEST(capInfo.ciphers, CPA_CY_SYM_CIPHER_AES_CBC))
{
    // algo is supported
}
else
{
    // algo is not supported
}
```

The client MUST allocate memory for this structure and any members that require memory. When the structure is passed into the function ownership of the memory passes to the function. Ownership of the memory returns to the client when the function returns.

8.8.9.2 Public Member Functions

- **CPA_BITMAP** (ciphers, CPA_CY_SYM_CIPHER_CAP_BITMAP_SIZE)
  Bitmap representing which cipher algorithms (and modes) are supported by the instance.
- **CPA_BITMAP** (hashes, CPA_CY_SYM_HASH_CAP_BITMAP_SIZE)
  Bitmap representing which hash/authentication algorithms are supported by the instance.
8.8.9.3 Data Fields

- **CpaBoolean partialPacketSupported**
  CPA_TRUE if instance supports partial packets.

8.8.9.4 Member Function Documentation

```cpp
_CpaCySymCapabilitiesInfo::CPA_BITMAP( ciphers,
   CPA_CY_SYM_CIPHER_CAP_BITMAP_SIZE
)
```

Bitmap representing which cipher algorithms (and modes) are supported by the instance.

Bits can be tested using the macro **CPA_BITMAP_BIT_TEST**. The bit positions are those specified in the enumerated type **CpaCySymCipherAlgorithm**.

```cpp
_CpaCySymCapabilitiesInfo::CPA_BITMAP( hashes,
   CPA_CY_SYM_HASH_CAP_BITMAP_SIZE
)
```

Bitmap representing which hash/authentication algorithms are supported by the instance.

Bits can be tested using the macro **CPA_BITMAP_BIT_TEST**. The bit positions are those specified in the enumerated type **CpaCySymHashAlgorithm**.

8.8.9.5 Field Documentation

**CpaBoolean _CpaCySymCapabilitiesInfo::partialPacketSupported**

CPA_TRUE if instance supports partial packets.

See **CpaCySymPacketType**.

8.9 Define Documentation

```cpp
#define CPA_CY_SYM_CIPHER_CAP_BITMAP_SIZE
```

**File: cpa_cy_sym.h**

Size of bitmap needed for cipher "capabilities" type.

Defines the number of bits in the bitmap to represent supported ciphers in the type **CpaCySymCapabilitiesInfo**. Should be set to at least one greater than the largest value in the enumerated type **CpaCySymHashAlgorithm**, so that the value of the enum constant can also be used as the bit position in the bitmap.

A larger value was chosen to allow for extensibility without the need to change the size of the bitmap (to ease backwards compatibility in future versions of the API).

```cpp
#define CPA_CY_SYM_HASH_CAP_BITMAP_SIZE
```

**File: cpa_cy_sym.h**

Size of bitmap needed for hash "capabilities" type.
8.9 Define Documentation

Defines the number of bits in the bitmap to represent supported hashes in the type CpaCySymCapabilitiesInfo. Should be set to at least one greater than the largest value in the enumerated type CpaCySymHashAlgorithm, so that the value of the enum constant can also be used as the bit position in the bitmap.

A larger value was chosen to allow for extensibility without the need to change the size of the bitmap (to ease backwards compatibility in future versions of the API).

#define CPA_CY_SYM_CCM_SET_NONCE ( pOpData, pNonce, nonceLen )

File: cpa_cy_sym.h

Setup the nonce for CCM.

This macro sets the nonce in the appropriate locations of the CpaCySymOpData struct for the authenticated encryption algorithm CPA_CY_SYM_HASH_AES_CCM.

#define CPA_CY_SYM_CCM_SET_AAD ( pOpData, pAad, aadLen )

File: cpa_cy_sym.h

Setup the additional authentication data for CCM.

This macro sets the additional authentication data in the appropriate location of the CpaCySymOpData struct for the authenticated encryption algorithm CPA_CY_SYM_HASH_AES_CCM.

8.10 Typedef Documentation

typedef void* CpaCySymSessionCtx

File: cpa_cy_sym.h

Cryptographic component symmetric session context handle.

Handle to a cryptographic session context. The memory for this handle is allocated by the client. The size of the memory that the client needs to allocate is determined by a call to the cpaCySymSessionCtxGetSize or cpaCySymSessionCtxGetDynamicSize functions. The session context memory is initialized with a call to the cpaCySymInitSession function. This memory MUST not be freed until a call to cpaCySymRemoveSession has completed successfully.

typedef enum _CpaCySymPacketType CpaCySymPacketType

File: cpa_cy_sym.h

Packet type for the cpaCySymPerformOp function

Enumeration which is used to indicate to the symmetric cryptographic perform function on which type of packet the operation is required to be invoked. Multi-part cipher and hash operations are useful when processing needs to be performed on a message which is available to the client in multiple parts (for
8.10 Typedef Documentation

example due to network fragmentation of the packet).

**Note:**
There are some restrictions regarding the operations on which partial packet processing is supported. For details, see the function `cpaCySymPerformOp`.

**See also:**
`cpaCySymPerformOp()`

```c
typedef enum _CpaCySymOp CpaCySymOp
```

**File:** `cpa_cy_sym.h`

Types of operations supported by the `cpaCySymPerformOp` function.

This enumeration lists different types of operations supported by the `cpaCySymPerformOp` function. The operation type is defined during session registration and cannot be changed for a session once it has been setup.

**See also:**
`cpaCySymPerformOp`

```c
typedef enum _CpaCySymCipherAlgorithm CpaCySymCipherAlgorithm
```

**File:** `cpa_cy_sym.h`

Cipher algorithms.

This enumeration lists supported cipher algorithms and modes.

```c
typedef enum _CpaCySymCipherDirection CpaCySymCipherDirection
```

**File:** `cpa_cy_sym.h`

Symmetric Cipher Direction

This enum indicates the cipher direction (encryption or decryption).

```c
typedef struct _CpaCySymCipherSetupData CpaCySymCipherSetupData
```

**File:** `cpa_cy_sym.h`

Symmetric Cipher Setup Data.

This structure contains data relating to Cipher (Encryption and Decryption) to set up a session.

```c
typedef enum _CpaCySymHashMode CpaCySymHashMode
```

**File:** `cpa_cy_sym.h`

Symmetric Hash mode

This enum indicates the Hash Mode.
typedef enum _CpaCySymHashAlgorithm CpaCySymHashAlgorithm

File: cpa_cy_sym.h

Hash algorithms.

This enumeration lists supported hash algorithms.

typedef struct _CpaCySymHashNestedModeSetupData CpaCySymHashNestedModeSetupData

File: cpa_cy_sym.h

Hash Mode Nested Setup Data.

This structure contains data relating to a hash session in CPA_CY_SYM_HASH_MODE_NESTED mode.

typedef struct _CpaCySymHashAuthModeSetupData CpaCySymHashAuthModeSetupData

File: cpa_cy_sym.h

Hash Auth Mode Setup Data.

This structure contains data relating to a hash session in CPA_CY_SYM_HASH_MODE_AUTH mode.

typedef struct _CpaCySymHashSetupData CpaCySymHashSetupData

File: cpa_cy_sym.h

Hash Setup Data.

This structure contains data relating to a hash session. The fields hashAlgorithm, hashMode and digestResultLenInBytes are common to all three hash modes and MUST be set for each mode.

typedef enum _CpaCySymAlgChainOrder CpaCySymAlgChainOrder

File: cpa_cy_sym.h

Algorithm Chaining Operation Ordering

This enum defines the ordering of operations for algorithm chaining.

typedef struct _CpaCySymSessionSetupData CpaCySymSessionSetupData

File: cpa_cy_sym.h

Session Setup Data.

This structure contains data relating to setting up a session. The client needs to complete the information in this structure in order to setup a session.

typedef struct _CpaCySymOpData CpaCySymOpData

File: cpa_cy_sym.h
Cryptographic Component Operation Data.

This structure contains data relating to performing cryptographic processing on a data buffer. This request is used with `cpaCySymPerformOp()` call for performing cipher, hash, auth cipher or a combined hash and cipher operation.

See also:
- `CpaCySymPacketType`

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the `cpaCySymPerformOp` function, and before it has been returned in the callback, undefined behavior will result.

typedef struct _CpaCySymStats CPA_DEPRECATED

File: `cpa_cy_sym.h`

Cryptographic Component Statistics.

Deprecated:
As of v1.3 of the cryptographic API, this structure has been deprecated, replaced by `CpaCySymStats64`.

This structure contains statistics on the Symmetric Cryptographic operations. Statistics are set to zero when the component is initialized.

typedef struct _CpaCySymStats64 CpaCySymStats64

File: `cpa_cy_sym.h`

Cryptographic Component Statistics (64-bit version).

This structure contains a 64-bit version of the statistics on the Symmetric Cryptographic operations. Statistics are set to zero when the component is initialized.

typedef void(*CpaCySymCbFunc)(void *pCallbackTag, CpaStatus status, const CpaCySymOp operationType, void *pOpData, CpaBufferList *pDstBuffer, CpaBoolean verifyResult)

File: `cpa_cy_sym.h`

Definition of callback function

This is the callback function prototype. The callback function is registered by the application using the `cpaCySymInitSession()` function call.

Context:
This callback function can be executed in a context that DOES NOT permit sleeping to occur.

Assumptions:
None

Side-Effects:
None
8.10 Typedef Documentation

**Reentrant:**

No

**Thread-safe:**

Yes

**Parameters:**

- **pCallbackTag** [in]
  Opaque value provided by user while making individual function call.

- **status** [in]
  Status of the operation. Valid values are CPA_STATUS_SUCCESS and CPA_STATUS_FAIL.

- **operationType** [in]
  Identifies the operation type that was requested in the cpaCySymPerformOp function.

- **pOpData** [in]
  Pointer to structure with input parameters.

- **pDstBuffer** [in]
  Caller MUST allocate a sufficiently sized destination buffer to hold the data output. For out-of-place processing the data outside the cryptographic regions in the source buffer are copied into the destination buffer. To perform "in-place" processing set the pDstBuffer parameter in cpaCySymPerformOp function to point at the same location as pSrcBuffer. For optimum performance, the data pointed to SHOULD be 8-byte aligned.

- **verifyResult** [in]
  This parameter is valid when the verifyDigest option is set in the CpaCySymSessionSetupData structure. A value of CPA_TRUE indicates that the compare succeeded. A value of CPA_FALSE indicates that the compare failed for an unspecified reason.

**Return values:**

None

**Precondition:**

Component has been initialized.

**Postcondition:**

None

**Note:**

None

**See also:**

cpaCySymInitSession(), cpaCySymRemoveSession()

typedef struct _CpaCySymCapabilitiesInfo CpaCySymCapabilitiesInfo

**File:** cpa_cy_sym.h

Symmetric Capabilities Info

This structure contains the capabilities that vary across implementations of the symmetric sub-API of the cryptographic API. This structure is used in conjunction with cpaCySymQueryCapabilities() to determine the capabilities supported by a particular API implementation.

For example, to see if an implementation supports cipher CPA_CY_SYM_CIPHER_AES_CBC, use the code

```c
if (CPA_BITMAP_BIT_TEST(capInfo.ciphers, CPA_CY_SYM_CIPHER_AES_CBC))
{
    // algo is supported
}
```
8.11 Enumeration Type Documentation

e else
{
   // algo is not supported
}

The client MUST allocate memory for this structure and any members that require memory. When the
structure is passed into the function ownership of the memory passes to the function. Ownership of the
memory returns to the client when the function returns.

8.11 Enumeration Type Documentation

e enum _CpaCySymPacketType

File: cpa_cy_sym.h

Packet type for the cpaCySymPerformOp function

Enumeration which is used to indicate to the symmetric cryptographic perform function on which type of
packet the operation is required to be invoked. Multi-part cipher and hash operations are useful when
processing needs to be performed on a message which is available to the client in multiple parts (for
example due to network fragmentation of the packet).

Note:
There are some restrictions regarding the operations on which partial packet processing is
supported. For details, see the function cpaCySymPerformOp.

See also:
cpaCySymPerformOp()

Enumerator:

CPA_CY_SYM_PACKET_TYPE_FULL Perform an operation on a full packet.
CPA_CY_SYM_PACKET_TYPE_PARTIAL Perform a partial operation and maintain the
state of the partial operation within the session.

This is used for either the first or subsequent
packets within a partial packet flow.

CPA_CY_SYM_PACKET_TYPE_LAST_PARTIAL Complete the last part of a multi-part operation.

e enum _CpaCySymOp

File: cpa_cy_sym.h

Types of operations supported by the cpaCySymPerformOp function.

This enumeration lists different types of operations supported by the cpaCySymPerformOp function. The
operation type is defined during session registration and cannot be changed for a session once it has been
setup.

See also:
cpaCySymPerformOp

Enumerator:

CPA_CY_SYM_OP_NONE No operation.
CPA_CY_SYM_OP_CIPHER Cipher only operation on the data.
8.11 Enumeration Type Documentation

| CPA_CY_SYM_OP_HASH | Hash only operation on the data. |
| CPA_CY_SYM_OP_ALGORITHM_CHAINING | Chain any cipher with any hash operation. |

The order depends on the value in the CpaCySymAlgChainOrder enum.

This value is also used for authenticated ciphers (GCM and CCM), in which case the cipherAlgorithm should take one of the values CPA_CY_SYM_CIPHER_AES_CCM or CPA_CY_SYM_CIPHER_AES_GCM, while the hashAlgorithm should take the corresponding value CPA_CY_SYM_HASH_AES_CCM or CPA_CY_SYM_HASH_AES_GCM.

```cpp
class _CpaCySymCipherAlgorithm
{
public:
    enum CPA_CY_SYM_CIPHER_NULL = 0;
    enum CPA_CY_SYM_CIPHER_ARC4 = 1;
    enum CPA_CY_SYM_CIPHER_AES_ECB = 2;
    enum CPA_CY_SYM_CIPHER_AES_CBC = 3;
    enum CPA_CY_SYM_CIPHER_AES_CCM = 4;
    enum CPA_CY_SYM_CIPHER_AES_GCM = 5;
    enum CPA_CY_SYM_CIPHER_DES_ECB = 6;
    enum CPA_CY_SYM_CIPHER_DES_CBC = 7;
    enum CPA_CY_SYM_CIPHER_3DES_ECB = 8;

    CPA_CY_SYM_CIPHER_NULL NULL cipher algorithm.
    CPA_CY_SYM_CIPHER_ARC4 (A)RC4 cipher algorithm
    CPA_CY_SYM_CIPHER_AES_ECB AES algorithm in ECB mode.
    CPA_CY_SYM_CIPHER_AES_CBC AES algorithm in CBC mode.
    CPA_CY_SYM_CIPHER_AES_CCM AES algorithm in Counter mode.
    CPA_CY_SYM_CIPHER_AES_GCM AES algorithm in CCM mode.
    CPA_CY_SYM_CIPHER_DES_ECB DES algorithm in ECB mode.
    CPA_CY_SYM_CIPHER_DES_CBC DES algorithm in CBC mode.
    CPA_CY_SYM_CIPHER_3DES_ECB Triple DES algorithm in ECB mode.
}
```

File: cpa_cy_sym.h

Cipher algorithms.

This enumeration lists supported cipher algorithms and modes.

**Enumerator:**

- CPA_CY_SYM_CIPHER_NULL: NULL cipher algorithm. No mode applies to the NULL algorithm.
- CPA_CY_SYM_CIPHER_ARC4: (A)RC4 cipher algorithm.
- CPA_CY_SYM_CIPHER_AES_ECB: AES algorithm in ECB mode.
- CPA_CY_SYM_CIPHER_AES_CBC: AES algorithm in CBC mode.
- CPA_CY_SYM_CIPHER_AES_CCM: AES algorithm in Counter mode.
- CPA_CY_SYM_CIPHER_AES_GCM: AES algorithm in CCM mode.
- CPA_CY_SYM_CIPHER_DES_ECB: DES algorithm in ECB mode.
- CPA_CY_SYM_CIPHER_DES_CBC: DES algorithm in CBC mode.
- CPA_CY_SYM_CIPHER_3DES_ECB: Triple DES algorithm in ECB mode.

This authenticated cipher is only supported when the hash mode is also set to CPA_CY_SYM_HASH_MODE_AUTH. When this cipher algorithm is used the CPA_CY_SYM_HASH_AES_CCM element of the CpaCySymHashAlgorithm enum MUST be used to set up the related CpaCySymHashSetupData structure in the session context.

This authenticated cipher is only supported when the hash mode is also set to CPA_CY_SYM_HASH_MODE_AUTH. When this cipher algorithm is used the CPA_CY_SYM_HASH_AES_GCM element of the CpaCySymHashAlgorithm enum MUST be used to set up the related CpaCySymHashSetupData structure in the session context.
8.11 Enumeration Type Documentation

enum _CpaCySymCipherDirection

File: cpa_cy_sym.h

Symmetric Cipher Direction

This enum indicates the cipher direction (encryption or decryption).

Enumerator:

- CPA_CY_SYM_CIPHER_DIRECTION_ENCRYPT: Encrypt Data.
- CPA_CY_SYM_CIPHER_DIRECTION_DECRYPT: Decrypt Data.

enum _CpaCySymHashMode

File: cpa_cy_sym.h

Symmetric Hash mode

This enum indicates the Hash Mode.

Enumerator:

- CPA_CY_SYM_HASH_MODE_PLAIN: Plain hash. Can be specified for MD5 and the SHA family of hash algorithms.
- CPA_CY_SYM_HASH_MODE_AUTH: Authenticated hash. This mode may be used in conjunction with the MD5 and SHA family of algorithms to specify HMAC. It MUST also be specified with all of the remaining algorithms, all of which are in fact authentication algorithms.
- CPA_CY_SYM_HASH_MODE_NESTED: Nested hash. Can be specified for MD5 and the SHA family of hash algorithms.

enum _CpaCySymHashAlgorithm

File: cpa_cy_sym.h

Hash algorithms.

This enumeration lists supported hash algorithms.

Enumerator:
<table>
<thead>
<tr>
<th>Enumeration Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPA_CY_SYM_HASH_NONE</td>
<td>No hash algorithm.</td>
</tr>
<tr>
<td>CPA_CY_SYM_HASH_MD5</td>

<td>Kasumi algorithm in F9 mode.</td>
</tr>
<tr>
<td>CPA_CY_SYM_HASH_SNOW3G_UIA2</td>
<td>SNOW3G algorithm in UIA2 mode.</td>
</tr>
<tr>
<td>CPA_CY_SYM_HASH_AES_CMAC</td>
<td>AES CMAC algorithm.</td>
</tr>
<tr>
<td>CPA_CY_SYM_HASH_AES_GMAC</td>
<td>AES GMAC algorithm.</td>
</tr>
</tbody>
</table>
This is only supported in the hash mode
CPA_CY_SYM_HASH_MODE_AUTH. When this hash
algorithm is used, the
CPA_CY_SYM_CIPHER_AES_GCM element of the
CpaCySymCipherAlgorithm enum MUST be used to set
up the related CpaCySymCipherSetupData structure in
the session context.

*CPA_CY_SYM_HASH_AES_CBC_MAC* AES-CBC-MAC algorithm.

This is only supported in the hash mode
CPA_CY_SYM_HASH_MODE_AUTH. Only 128-bit keys
are supported.

**enum _CpaCySymAlgChainOrder**

**File: cpa_cy_sym.h**

Algorithm Chaining Operation Ordering

This enum defines the ordering of operations for algorithm chaining.

**Enumerator:**

*CPA_CY_SYM_ALG_CHAIN_ORDER_HASH_THEN_CIPHER*
Perform the hash operation followed by the cipher operation.

If it is required that the result of the hash (i.e. the digest) is going to be included in the data to be
ciphered, then:

◊ The digest MUST be placed in the destination buffer at the location corresponding to the
end of the data region to be hashed (hashStartSrcOffsetInBytes +
messageLenToHashInBytes), i.e. there must be no gaps between the start of the digest
and the end of the data region to be hashed.
◊ The messageLenToCipherInBytes member of the CpaCySymOpData structure must be
equal to the overall length of the plain text, the digest length and any (optional) trailing data
that is to be included.
◊ The messageLenToCipherInBytes must be a multiple to the block size if a block cipher is
being used.

The following is an example of the layout of the buffer before the operation, after the hash, and after
the cipher:

```
+-------------------------+---------------+
|         Plaintext       |     Tail      |
+-------------------------+---------------+
<-messageLenToHashInBytes->

+-------------------------+---------------+
|         Plaintext       | Digest        | Tail |
+-------------------------+---------------+
<--------messageLenToCipherInBytes-------->
+-----------------------------------------+
|               Cipher Text               |
+-----------------------------------------+
```

*CPA_CY_SYM_ALG_CHAIN_ORDER_CIPHER_THEN_HASH*
Perform the cipher operation followed by the hash operation.

Reference Number: 330685-001
8.12 Function Documentation

The hash operation will be performed on the ciphertext resulting from the cipher operation.

The following is an example of the layout of the buffer before the operation, after the cipher, and after the hash:

```
+--------+---------------------------+---------------+
|  Head  |         Plaintext         |    Tail       |
+--------+---------------------------+---------------+
    <-messageLenToCipherInBytes->

+--------+---------------------------+---------------+
|  Head  |         Ciphertext        |    Tail       |
+--------+---------------------------+---------------+
    <------messageLenToHashInBytes------>

+--------+---------------------------+--------+------+
|  Head  |         Ciphertext        | Digest | Tail |
+--------+---------------------------+--------+------+
```

### 8.12 Function Documentation

**CpaStatus**

`cpaCySymSessionCxtGetSize (const CpaInstanceHandle instanceHandle, 
const CpaCySymSessionSetupData *pSessionSetupData, 
Cpa32U *pSessionCtxSizeInBytes)`

**File:** cpa_cy_sym.h

Gets the size required to store a session context.

This function is used by the client to determine the size of the memory it must allocate in order to store the session context. This MUST be called before the client allocates the memory for the session context and before the client calls the `cpaCySymInitSession` function.

For a given implementation of this API, it is safe to assume that `cpaCySymSessionCxtGetSize()` will always return the same size and that the size will not be different for different setup data parameters. However, it should be noted that the size may change: (1) between different implementations of the API (e.g. between software and hardware implementations or between different hardware implementations) (2) between different releases of the same API implementation.

The size returned by this function is the smallest size needed to support all possible combinations of setup data parameters. Some setup data parameter combinations may fit within a smaller session context size. The alternate `cpaCySymSessionCxtGetDynamicSize()` function will return the smallest size needed to fit the provided setup data parameters.

**Context:**

This is a synchronous function that cannot sleep. It can be executed in a context that does not permit sleeping.

**Assumptions:**

None

**Side-Effects:**

None

Reference Number: 330685-001
8.12 Function Documentation

**Blocking:**
No.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

- **[in]** `instanceHandle` Instance handle.
- **[in]** `pSessionSetupData` Pointer to session setup data which contains parameters which are static for a given cryptographic session such as operation type, mechanisms, and keys for cipher and/or hash operations.
- **[out]** `pSessionCtxSizeInBytes` The amount of memory in bytes required to hold the Session Context.

**Return values:**

- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.

**Precondition:**
The component has been initialized via `cpaCyStartInstance` function.

**Postcondition:**
None

**Note:**
This is a synchronous function and has no completion callback associated with it.

**See also:**
`CpaCySymSessionSetupData` `cpaCySymInitSession()`
`cpaCySymSessionCtxGetSize()` `cpaCySymPerformOp()`

```c
CpaStatus cpaCySymSessionCtxGetSize ( const CpaInstanceHandle instanceHandle,
                                        const CpaCySymSessionSetupData * pSessionSetupData,
                                        Cpa32U * pSessionCtxSizeInBytes
                                      )
```

**File:** cpa_cy_sym.h

Gets the minimum size required to store a session context.

This function is used by the client to determine the smallest size of the memory it must allocate in order to store the session context. This MUST be called before the client allocates the memory for the session context and before the client calls the `cpaCySymInitSession` function.

This function is an alternate to `cpaCySymSessionGetSize()`. `cpaCySymSessionCtxGetSize()` will return a fixed size which is the minimum memory size needed to support all possible setup data parameter combinations. `cpaCySymSessionCtxGetSize()` will return the minimum memory size needed to support the specific session setup data parameters provided. This size may be different for different setup
8.12 Function Documentation

data parameters.

CpaStatus cpaCySymInitSession ( const CpaInstanceHandle instanceHandle, const CpaCySymCbFunc pSymCb, const CpaCySymSessionSetupData * pSessionSetupData, CpaCySymSessionCtx sessionCtx )
8.12 Function Documentation

File: cpa\_cy\_sym.h

Initialize a session for symmetric cryptographic API.

This function is used by the client to initialize an asynchronous completion callback function for the symmetric cryptographic operations. Clients MAY register multiple callback functions using this function. The callback function is identified by the combination of userContext, pSymCb and session context (sessionCtx). The session context is the handle to the session and needs to be passed when processing calls. Callbacks on completion of operations within a session are guaranteed to be in the same order they were submitted in.

Context:
   This is a synchronous function and it cannot sleep. It can be executed in a context that does not permit sleeping.

Assumptions:
   None

Side-Effects:
   None

Blocking:
   No.

Reentrant:
   No

Thread-safe:
   Yes

Parameters:
   [in] instanceHandle Instancemage handle.
   [in] pSymCb Pointer to callback function to be registered. Set to NULL if the cpaCySymPerformOp function is required to work in a synchronous manner.
   [in] pSessionSetupData Pointer to session setup data which contains parameters which are static for a given cryptographic session such as operation type, mechanisms, and keys for cipher and/or hash operations.
   [out] sessionCtx Pointer to the memory allocated by the client to store the session context. This will be initialized with this function. This value needs to be passed to subsequent processing calls.

Return values:
   CPA\_STATUS\_SUCCESS Function executed successfully.
   CPA\_STATUS\_FAIL Function failed.
   CPA\_STATUS\_RETRY Resubmit the request.
   CPA\_STATUS\_INVALID\_PARAM Invalid parameter passed in.
   CPA\_STATUS\_RESOURCE Error related to system resources.
   CPA\_STATUS\_RESTARTING API implementation is restarting. Resubmit the request.

Precondition:
   The component has been initialized via cpaCyStartInstance function.

Postcondition:
   None
8.12 Function Documentation

Note:
This is a synchronous function and has no completion callback associated with it.

See also:
CpaCySymSessionCtx, CpaCySymCbFunc, CpaCySymSessionSetupData, cpaCySymRemoveSession(), cpaCySymPerformOp()

File: cpa_cy_sym.h

Remove (delete) a symmetric cryptographic session.

This function will remove a previously initialized session context and the installed callback handler function. Removal will fail if outstanding calls still exist for the initialized session handle. The client needs to retry the remove function at a later time. The memory for the session context MUST not be freed until this call has completed successfully.

Context:
This is a synchronous function that cannot sleep. It can be executed in a context that does not permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
No.

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in] instanceHandle  Instance handle.
[in, out] pSessionCtx Session context to be removed.

Return values:
CPA_STATUS_SUCCESS  Function executed successfully.
CPA_STATUS_FAIL  Function failed.
CPA_STATUS_RETRY  Resubmit the request.
CPA_STATUS_INVALID_PARAM  Invalid parameter passed in.
CPA_STATUS_RESOURCE  Error related to system resources.
CPA_STATUS_RESTARTING  API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:

None

Note:
Note that this is a synchronous function and has no completion callback associated with it.

CpaCySymSessionCtx, cpaCySymInitSession()

```c
CpaStatus cpaCySymPerformOp (const CpaInstanceHandle instanceHandle, void * pCallbackTag, const CpaCySymOpData * pOpData, const CpaBufferList * pSrcBuffer, CpaBufferList * pDstBuffer, CpaBoolean * pVerifyResult)
```

File: cpa_cy_sym.h

Perform a symmetric cryptographic operation on an existing session.

Performs a cipher, hash or combined (cipher and hash) operation on the source data buffer using supported symmetric key algorithms and modes.

This function maintains cryptographic state between calls for partial cryptographic operations. If a partial cryptographic operation is being performed, then on a per-session basis, the next part of the multi-part message can be submitted prior to previous parts being completed, the only limitation being that all parts must be performed in sequential order.

If for any reason a client wishes to terminate the partial packet processing on the session (for example if a packet fragment was lost) then the client MUST remove the session.

When using partial packet processing with algorithm chaining, only the cipher state is maintained between calls. The hash state is not be maintained between calls. Instead the hash digest will be generated/verified for each call. If both the cipher state and hash state need to be maintained between calls, algorithm chaining cannot be used.

The following restrictions apply to the length:

- When performing block based operations on a partial packet (excluding the final partial packet), the data that is to be operated on MUST be a multiple of the block size of the algorithm being used. This restriction only applies to the cipher state when using partial packets with algorithm chaining.

- The final block must not be of length zero (0) if the operation being performed is the authentication algorithm CPA_CY_SYM_HASH_AES_XCBC. This is because this algorithm requires that the final block be XORed with another value internally. If the length is zero, then the return code CPA_STATUS_INVALID_PARAM will be returned.

- The length of the final block must be greater than or equal to 16 bytes when using the CPA_CY_SYM_CIPHER_AES_XTS cipher algorithm.

Partial packet processing is supported only when the following conditions are true:

- The cipher, hash or authentication operation is "in place" (that is, pDstBuffer == pSrcBuffer)
8.12 Function Documentation

- The cipher or hash algorithm is NOT one of Kasumi or SNOW3G
- The cipher mode is NOT F8 mode.
- The instance/implementation supports partial packets as one of its capabilities (see CpaCySymCapabilitiesInfo).

The term "in-place" means that the result of the cryptographic operation is written into the source buffer. The term "out-of-place" means that the result of the cryptographic operation is written into the destination buffer. To perform "in-place" processing, set the pDstBuffer parameter to point at the same location as the pSrcBuffer parameter.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:

- **instanceHandle** [in] Instance handle.
- **pCallbackTag** [in] Opaque data that will be returned to the client in the callback.
- **pOpData** [in] Pointer to a structure containing request parameters. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **pSrcBuffer** [in] The source buffer. The caller MUST allocate the source buffer and populate it with data. For optimum performance, the data pointed to SHOULD be 8-byte aligned. For block ciphers, the data passed in MUST be a multiple of the relevant block size. i.e. padding WILL NOT be applied to the data. For optimum performance, the buffer should only contain the data region that the cryptographic operation(s) must be performed on. Any additional data in the source buffer may be copied to the destination buffer and this copy may degrade performance.
- **pDstBuffer** [out] The destination buffer. The caller MUST allocate a sufficiently sized destination buffer to hold the data output (including the authentication tag in the case of CCM). Furthermore, the destination buffer must be the same size as the source buffer (i.e. the sum of lengths of the buffers in the buffer list must be the same). This effectively means that the source buffer must in fact be big enough to hold the output data, too. This is because, for out-of-place processing, the data outside the regions in the source buffer on which cryptographic operations are performed are copied into the destination buffer. To perform "in-place" processing set the pDstBuffer parameter in cpaCySymPerformOp function to point at the same location.
as pSrcBuffer. For optimum performance, the data pointed to SHOULD be 8-byte aligned.

[out] pVerifyResult In synchronous mode, this parameter is returned when the verifyDigest option is set in the CpaCySymSessionSetupData structure. A value of CPA_TRUE indicates that the compare succeeded. A value of CPA_FALSE indicates that the compare failed for an unspecified reason.

Return values:

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPA_STATUS_SUCCESS</td>
<td>Function executed successfully.</td>
</tr>
<tr>
<td>CPA_STATUS_FAIL</td>
<td>Function failed.</td>
</tr>
<tr>
<td>CPA_STATUS_RETRY</td>
<td>Resubmit the request.</td>
</tr>
<tr>
<td>CPA_STATUS_INVALID_PARAM</td>
<td>Invalid parameter passed in.</td>
</tr>
<tr>
<td>CPA_STATUS_RESOURCE</td>
<td>Error related to system resource.</td>
</tr>
<tr>
<td>CPA_STATUS_RESTARTING</td>
<td>API implementation is restarting. Resubmit the request.</td>
</tr>
</tbody>
</table>

Precondition:
The component has been initialized via cpaCyStartInstance function. A Cryptographic session has been previously setup using the cpaCySymInitSession function call.

Postcondition:
None

Note:
When in asynchronous mode, a callback of type CpaCySymCbFunc is generated in response to this function call. Any errors generated during processing are reported as part of the callback status code.

See also:

CpaStatus CPA_DEPRECATED cpaCySymQueryStats ( const CpaInstanceHandle instanceHandle, struct _CpaCySymStats * pSymStats )

File: cpa_cy_sym.h

Query symmetric cryptographic statistics for a specific instance.

Deprecated:
As of v1.3 of the cryptographic API, this function has been deprecated, replaced by cpaCySymQueryStats64().

This function will query a specific instance for statistics. The user MUST allocate the CpaCySymStats structure and pass the reference to that into this function call. This function will write the statistic results into the passed in CpaCySymStats structure.

Note: statistics returned by this function do not interrupt current data processing and as such can be slightly out of sync with operations that are in progress during the statistics retrieval process.

Context:
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None
8.12 Function Documentation

**Side-Effects:**
None

**Blocking:**
Yes

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**
- `[in] instanceHandle` Instance handle.
- `[out] pSymStats` Pointer to memory into which the statistics will be written.

**Return values:**
- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
- `CPA_STATUS_RESTARTING` API implementation is restarting. Resubmit the request.

**Precondition:**
Component has been initialized.

**Postcondition:**
None

**Note:**
This function operates in a synchronous manner, i.e. no asynchronous callback will be generated.

**See also:**
CpaCySymStats

```c
# CpaStatus cpaCySymQueryStats64 ( const CpaInstanceHandle instanceHandle,
#                                  CpaCySymStats64 * pSymStats )
```

**File: cpa_cy_sym.h**

Query symmetric cryptographic statistics (64-bit version) for a specific instance.

This function will query a specific instance for statistics. The user MUST allocate the CpaCySymStats64 structure and pass the reference to that into this function call. This function will write the statistic results into the passed in CpaCySymStats64 structure.

**Context:**
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
Side-Effects:
None

Blocking:
Yes

Reentrant:
No

Thread-safe:
Yes

Parameters:

[in]  instanceHandle  Instance handle.
[out]  pSymStats  Pointer to memory into which the statistics will be written.

Return values:

CPA_STATUS_SUCCESS  Function executed successfully.
CPA_STATUS_FAIL  Function failed.
CPA_STATUS_INVALID_PARAM  Invalid parameter passed in.
CPA_STATUS_RESOURCE  Error related to system resources.
CPA_STATUS_RESTARTING  API implementation is restarting. Resubmit the request.

Precondition:
Component has been initialized.

Postcondition:
None

Note:
This function operates in a synchronous manner, i.e. no asynchronous callback will be generated.

See also:
CpaCySymStats64

File: cpa_cy_sym.h

Returns capabilities of the symmetric API group of a Cryptographic API instance.

This function is used to determine which specific capabilities are supported within the symmetric sub-group of the Cryptographic API.

Context:
The function shall not be called in an interrupt context.

Assumptions:
None

Side-Effects:
8.12 Function Documentation

None

Blocking:
This function is synchronous and blocking.

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in] instanceHandle Handle to an instance of this API.
[out] pCapInfo Pointer to capabilities info structure. All fields in the structure are populated by the API instance.

Return values:
CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.

Precondition:
The instance has been initialized via the cpaCyStartInstance function.

Postcondition:
None
Collaboration diagram for Symmetric cryptographic Data Plane API:

Symmetric Cipher and Hash Cryptographic API

---

9.1 Detailed Description

File: cpa_cy_sym_dp.h

These data structures and functions specify the Data Plane API for symmetric cipher, hash, and combined cipher and hash operations.

This API is recommended for data plane applications, in which the cost of offload - that is, the cycles consumed by the driver in sending requests to the hardware, and processing responses - needs to be minimized. In particular, use of this API is recommended if the following constraints are acceptable to your application:

- Thread safety is not guaranteed. Each software thread should have access to its own unique instance (CpaInstanceHandle) to avoid contention.
- Polling is used, rather than interrupts (which are expensive). Implementations of this API will provide a function (not defined as part of this API) to read responses from the hardware response queue and dispatch callback functions, as specified on this API.
- Buffers and buffer lists are passed using physical addresses, to avoid virtual to physical address translation costs.
- For GCM and CCM modes of AES, when performing decryption and verification, if verification fails, then the message buffer will NOT be zeroed. (This is a consequence of using physical addresses for the buffers.)
- The ability to enqueue one or more requests without submitting them to the hardware allows for certain costs to be amortized across multiple requests.
- Only asynchronous invocation is supported.
- There is no support for partial packets.
- Implementations may provide certain features as optional at build time, such as atomic counters.
- The "default" instance (CPA_INSTANCE_HANDLE_SINGLE) is not supported on this API. The specific handle should be obtained using the instance discovery functions (cpaCyGetNumInstances, cpaCyGetInstances).

Note:
Performance Trade-Offs Different implementations of this API may have different performance trade-offs; please refer to the documentation for your implementation for details. However, the following concepts informed the definition of this API.

The API distinguishes between enqueuing a request and actually submitting that request to the cryptographic acceleration engine to be performed. This allows multiple requests to be enqueued (either individually or in batch), and then for all enqueued requests to be submitted in a single operation. The rationale is that in some (especially hardware-based) implementations, the submit operation is expensive; for example, it may incur an MMIO instruction. The API allows this cost to be amortized over a number of requests. The precise number of such requests can be tuned for optimal performance.
9.1 Detailed Description

Specifically:

- The function `cpaCySymDpEnqueueOp` allows one request to be enqueued, and optionally for that request (and all previously enqueued requests) to be submitted.
- The function `cpaCySymDpEnqueueOpBatch` allows multiple requests to be enqueued, and optionally for those requests (and all previously enqueued requests) to be submitted.
- The function `cpaCySymDpPerformOpNow` enqueues no requests, but submits all previously enqueued requests.

9.2 Data Structures

- `struct _CpaCySymDpOpData`

9.3 Typedefs

- `typedef void * CpaCySymDpSessionCtx`
- `typedef _CpaCySymDpOpData CpaCySymDpOpData`
- `typedef void(* CpaCySymDpCbFunc)(CpaCySymDpOpData *pOpData, CpaStatus status, CpaBoolean verifyResult)`

9.4 Functions

- `CpaStatus cpaCySymDpRegCbFunc (const CpaInstanceHandle instanceHandle, const CpaCySymDpCbFunc pSymNewCb)`
- `CpaStatus cpaCySymDpSessionCtxGetSize (const CpaInstanceHandle instanceHandle, const CpaCySymSessionSetupData *pSessionSetupData, Cpa32U *pSessionCtxSizeInBytes)`
- `CpaStatus cpaCySymDpSessionCtxGetDynamicSize (const CpaInstanceHandle instanceHandle, const CpaCySymSessionSetupData *pSessionSetupData, Cpa32U *pSessionCtxSizeInBytes)`
- `CpaStatus cpaCySymDpInitSession (CpaInstanceHandle instanceHandle, CpaCySymSessionSetupData *pSessionSetupData, CpaCySymDpSessionCtx sessionCtx)`
- `CpaStatus cpaCySymDpRemoveSession (const CpaInstanceHandle instanceHandle, CpaCySymDpSessionCtx sessionCtx)`
- `CpaStatus cpaCySymDpEnqueueOp (CpaCySymDpOpData *pOpData, const CpaBoolean performOpNow)`
- `CpaStatus cpaCySymDpPerformOpNow (CpaInstanceHandle instanceHandle)`

9.5 Data Structure Documentation

9.5.1 _CpaCySymDpOpData Struct Reference

9.5.1.1 Detailed Description

File: cpa_cy_sym_dp.h

Operation Data for cryptographic data plane API.

This structure contains data relating to a request to perform symmetric cryptographic processing on one or more data buffers.

The physical memory to which this structure points needs to be at least 8-byte aligned.
9.5.1 _CpaCySymDpOpData Struct Reference

All reserved fields SHOULD NOT be written or read by the calling code.

See also:
  cpaCySymDpEnqueueOp, cpaCySymDpEnqueueOpBatch

9.5.1.2 Data Fields

- **Cpa64U reserved0**
  Reserved for internal usage.

- **Cpa32U cryptoStartSrcOffsetInBytes**
  Starting point for cipher processing, specified as number of bytes from start of data in the source buffer.

- **Cpa32U messageLenToCipherInBytes**
  The message length, in bytes, of the source buffer on which the cryptographic operation will be computed.

- **CpaPhysicalAddr iv**
  Initialization Vector or Counter.

- **Cpa64U reserved1**
  Reserved for internal usage.

- **Cpa32U hashStartSrcOffsetInBytes**
  Starting point for hash processing, specified as number of bytes from start of packet in source buffer.

- **Cpa32U messageLenToHashInBytes**
  The message length, in bytes, of the source buffer that the hash will be computed on.

- **CpaPhysicalAddr additionalAuthData**
  Physical address of the Additional Authenticated Data (AAD), which is needed for authenticated cipher mechanisms (CCM and GCM), and to the IV for SNOW3G authentication (CPA_CY_SYM_HASH_SNOW3G_UIA2).

- **CpaPhysicalAddr digestResult**
  If the digestIsAppended member of the CpaCySymSessionSetupData structure is NOT set then this is the physical address of the location where the digest result should be inserted (in the case of digest generation) or where the purported digest exists (in the case of digest verification).

- **CpaInstanceHandle instanceHandle**
  Instance to which the request is to be enqueued.

- **CpaCySymDpSessionCtx sessionCtx**
  Session context specifying the cryptographic parameters for this request.

- **Cpa32U ivLenInBytes**
  Length of valid IV data pointed to by the plv parameter.

- **CpaPhysicalAddr srcBuffer**
  Physical address of the source buffer on which to operate.

- **Cpa32U srcBufferLen**
  Length of source buffer, or CPA_DP_BUFLIST.

- **CpaPhysicalAddr dstBuffer**
  Physical address of the destination buffer on which to operate.

- **Cpa32U dstBufferLen**
  Length of destination buffer, or CPA_DP_BUFLIST.

- **CpaPhysicalAddr thisPhys**
  Physical address of this data structure.

- **Cpa8U * plv**
  Pointer to (and therefore, the virtual address of) the IV field above.

- **Cpa8U * pAdditionalAuthData**
  Pointer to (and therefore, the virtual address of) the additionalAuthData field above.

- **void * pCallbackTag**
  Opaque data that will be returned to the client in the function completion callback.
9.5.1.3 Field Documentation

**Cpa64U** _CpaCySymDpOpData::reserved0_
Reserved for internal usage.

**Cpa32U** _CpaCySymDpOpData::cryptoStartSrcOffsetInBytes_
Starting point for cipher processing, specified as number of bytes from start of data in the source buffer.

The result of the cipher operation will be written back into the buffer starting at this location in the destination buffer.

**Cpa32U** _CpaCySymDpOpData::messageLenToCipherInBytes_
The message length, in bytes, of the source buffer on which the cryptographic operation will be computed.

This must be a multiple of the block size if a block cipher is being used. This is also the same as the result length.

**Note:**
In the case of CCM (**CPA_CY_SYM_HASH_AES_CCM**), this value should not include the length of the padding or the length of the MAC; the driver will compute the actual number of bytes over which the encryption will occur, which will include these values.

For AES-GMAC (**CPA_CY_SYM_HASH_AES_GMAC**), this field should be set to 0.

On some implementations, this length may be limited to a 16-bit value (65535 bytes).

**CpaPhysicalAddr** _CpaCySymDpOpData::iv_
Initialization Vector or Counter.

Specifically, this is the physical address of one of the following:

- For block ciphers in CBC mode, or for Kasumi in F8 mode, or for SNOW3G in UEA2 mode, this is the Initialization Vector (IV) value.
- For ARC4, this is reserved for internal usage.
- For block ciphers in CTR mode, this is the counter.
- For GCM mode, this is either the IV (if the length is 96 bits) or J0 (for other sizes), where J0 is as defined by NIST SP800-38D. Regardless of the IV length, a full 16 bytes needs to be allocated.
- For CCM mode, the first byte is reserved, and the nonce should be written starting at &plv[1] (to allow space for the implementation to write in the flags in the first byte). Note that a full 16 bytes should be allocated, even though the ivLenInBytes field will have a value less than this. The macro **CPA_CY_SYM_CCM_SET_NONCE** may be used here.

**Cpa64U** _CpaCySymDpOpData::reserved1_
Reserved for internal usage.

**Cpa32U** _CpaCySymDpOpData::hashStartSrcOffsetInBytes_
Starting point for hash processing, specified as number of bytes from start of packet in source buffer.

**Note:**
For CCM and GCM modes of operation, this value in this field is ignored, and the field is reserved for internal usage. The fields **additionalAuthData** and **pAdditionalAuthData** should be set instead.
For AES-GMAC (CPA_CY_SYM_HASH_AES_GMAC) mode of operation, this field specifies the start of the AAD data in the source buffer.

**Cpa32U_CpaCySymDpOpData::messageLenToHashInBytes**

The message length, in bytes, of the source buffer that the hash will be computed on.

**Note:**
For CCM and GCM modes of operation, this value in this field is ignored, and the field is reserved for internal usage. The fields additionalAuthData and pAdditionalAuthData should be set instead.

For AES-GMAC (CPA_CY_SYM_HASH_AES_GMAC) mode of operation, this field specifies the length of the AAD data in the source buffer.

On some implementations, this length may be limited to a 16-bit value (65535 bytes).

**CpaPhysicalAddr_CpaCySymDpOpData::additionalAuthData**

Physical address of the Additional Authenticated Data (AAD), which is needed for authenticated cipher mechanisms (CCM and GCM), and to the IV for SNOW3G authentication (CPA_CY_SYM_HASH_SNOW3G_UIA2).

For other authentication mechanisms, this value is ignored, and the field is reserved for internal usage.

The length of the data pointed to by this field is set up for the session in the CpaCySymHashAuthModeSetupData structure as part of the cpaCySymDpInitSession function call. This length must not exceed 240 bytes.

If AAD is not used, this address must be set to zero.

Specifically for CCM (CPA_CY_SYM_HASH_AES_CCM) and GCM (CPA_CY_SYM_HASH_AES_GCM), the caller should be setup as described in the same way as the corresponding field, pAdditionalAuthData, on the "traditional" API (see the CpaCySymOpData).

**Note:**
For AES-GMAC (CPA_CY_SYM_HASH_AES_GMAC) mode of operation, this field is not used and should be set to 0. Instead the AAD data should be placed in the source buffer.

**CpaPhysicalAddr_CpaCySymDpOpData::digestResult**

If the digestIsAppended member of the CpaCySymSessionSetupData structure is NOT set then this is the physical address of the location where the digest result should be inserted (in the case of digest generation) or where the purported digest exists (in the case of digest verification).

At session registration time, the client specified the digest result length with the digestResultLenInBytes member of the CpaCySymHashSetupData structure. The client must allocate at least digestResultLenInBytes of physically contiguous memory at this location.

For digest generation, the digest result will overwrite any data at this location.

**Note:**
For GCM (CPA_CY_SYM_HASH_AES_GCM), for "digest result" read "authentication tag T".

If the digestIsAppended member of the CpaCySymSessionSetupData structure is set then this value is ignored and the digest result is understood to be in the destination buffer for digest generation, and in the source buffer for digest verification. The location of the digest result in this case is immediately following the region over which the digest is computed.

Reference Number: 330685-001
9.5.1 _CpaCySymDpOpData Struct Reference

**CpaInstanceHandle _CpaCySymDpOpData::instanceHandle**
Instance to which the request is to be enqueued.

*Note:*
A callback function must have been registered on the instance using `cpaCySymDpRegCbFunc`.

**CpaCySymDpSessionCtx _CpaCySymDpOpData::sessionCtx**
Session context specifying the cryptographic parameters for this request.

*Note:*
The session must have been created using `cpaCySymDpInitSession`.

**Cpa32U _CpaCySymDpOpData::ivLenInBytes**
Length of valid IV data pointed to by the `plv` parameter.

- For block ciphers in CBC mode, or for Kasumi in F8 mode, or for SNOW3G in UEA2 mode, this is the length of the IV (which must be the same as the block length of the cipher).
- For block ciphers in CTR mode, this is the length of the counter (which must be the same as the block length of the cipher).
- For GCM mode, this is either 12 (for 96-bit IVs) or 16, in which case `plv` points to J0.
- For CCM mode, this is the length of the nonce, which can be in the range 7 to 13 inclusive.

**CpaPhysicalAddr _CpaCySymDpOpData::srcBuffer**
Physical address of the source buffer on which to operate.

This is either:

- The location of the data, of length `srcBufferLen`; or,
- If `srcBufferLen` has the special value `CPA_DP_BUFLIST`, then `srcBuffer` contains the location where a `CpaPhysBufferList` is stored. In this case, the `CpaPhysBufferList` MUST be aligned on an 8-byte boundary.
- For optimum performance, the buffer should only contain the data region that the cryptographic operation(s) must be performed on. Any additional data in the source buffer may be copied to the destination buffer and this copy may degrade performance.

**Cpa32U _CpaCySymDpOpData::srcBufferLen**
Length of source buffer, or `CPA_DP_BUFLIST`.

**CpaPhysicalAddr _CpaCySymDpOpData::dstBuffer**
Physical address of the destination buffer on which to operate.

This is either:

- The location of the data, of length `srcBufferLen`; or,
- If `srcBufferLen` has the special value `CPA_DP_BUFLIST`, then `srcBuffer` contains the location where a `CpaPhysBufferList` is stored. In this case, the `CpaPhysBufferList` MUST be aligned on an 8-byte boundary.

For "in-place" operation, the `dstBuffer` may be identical to the `srcBuffer`.

**Cpa32U _CpaCySymDpOpData::dstBufferLen**
Length of destination buffer, or `CPA_DP_BUFLIST`.
typedef void* CpaCySymDpSessionCtx

File: cpa_cy_sym_dp.h

Cryptographic component symmetric session context handle for the data plane API.

Handle to a cryptographic data plane session context. The memory for this handle is allocated by the client. The size of the memory that the client needs to allocate is determined by a call to the cpaCySymDpSessionCtxGetSize or cpaCySymDpSessionCtxGetDynamicSize functions. The session context memory is initialized with a call to the cpaCySymInitSession function. This memory MUST not be freed until a call to cpaCySymDpRemoveSession has completed successfully.

typedef struct _CpaCySymDpOpData CpaCySymDpOpData

File: cpa_cy_sym_dp.h

Operation Data for cryptographic data plane API.

This structure contains data relating to a request to perform symmetric cryptographic processing on one or more data buffers.

The physical memory to which this structure points needs to be at least 8-byte aligned.

All reserved fields SHOULD NOT be written or read by the calling code.

   cpaCySymDpEnqueueOp, cpaCySymDpEnqueueOpBatch
typedef void(* CpaCySymDpCbFunc)(CpaCySymDpOpData *pOpData, CpaStatus status, CpaBoolean verifyResult)

File: cpa_cy_sym_dp.h

Definition of callback function for cryptographic data plane API.

This is the callback function prototype. The callback function is registered by the application using the cpaCySymDpRegCbFunc function call, and called back on completion of asynchronous requests made via calls to cpaCySymDpEnqueueOp or cpaCySymDpEnqueueOpBatch.

Context:
This callback function can be executed in a context that DOES NOT permit sleeping to occur.

Assumptions:
None

Side-Effects:
None

Reentrant:
No

Thread-safe:
No

Parameters:
- [in] pOpData Pointer to the CpaCySymDpOpData object which was supplied as part of the original request.
- [in] status Status of the operation. Valid values are CPA_STATUS_SUCCESS and CPA_STATUS_FAIL.
- [in] verifyResult This parameter is valid when the verifyDigest option is set in the CpaCySymSessionSetupData structure. A value of CPA_TRUE indicates that the compare succeeded. A value of CPA_FALSE indicates that the compare failed.

Returns:
None

Precondition:
Component has been initialized. Callback has been registered with cpaCySymDpRegCbFunc.

Postcondition:
None

Note:
None

See also:
cpaCySymDpRegCbFunc
CpaStatus cpaCySymDpRegCbFunc ( const CpaInstanceHandle instanceHandle, 
const CpaCySymDpCbFunc pSymNewCb 
) 

File: cpa_cy_sym_dp.h

Registration of the operation completion callback function.

This function allows a completion callback function to be registered. The registered callback function is invoked on completion of asynchronous requests made via calls to cpaCySymDpEnqueueOp or cpaCySymDpEnqueueOpBatch.

If a callback function was previously registered, it is overwritten.

Context:
This is a synchronous function and it cannot sleep. It can be executed in a context that does not permit sleeping.

Assumptions:
None

Side-Effects:
None

Reentrant:
No

Thread-safe:
No

Parameters:

[ina] instanceHandle Instance on which the callback function is to be registered.
[ina] pSymNewCb Callback function for this instance.

Return values:

CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_RESTARTING API implementation is restarting. Resubmit the request.

Precondition:
Component has been initialized.

Postcondition:
None

Note:
None

See also:
CpaCySymDpCbFunc
CpaStatus cpaCySymDpSessionCtxGetSize ( const CpaInstanceHandle instanceHandle, const CpaCySymSessionSetupData * pSessionSetupData, Cpa32U * pSessionCtxSizeInBytes )

File: cpa_cy_sym_dp.h

Gets the size required to store a session context for the data plane API.

This function is used by the client to determine the size of the memory it must allocate in order to store the session context. This MUST be called before the client allocates the memory for the session context and before the client calls the cpaCySymDpInitSession function.

For a given implementation of this API, it is safe to assume that cpaCySymDpSessionCtxGetSize() will always return the same size and that the size will not be different for different setup data parameters. However, it should be noted that the size may change: (1) between different implementations of the API (e.g. between software and hardware implementations or between different hardware implementations) (2) between different releases of the same API implementation.

The size returned by this function is the smallest size needed to support all possible combinations of setup data parameters. Some setup data parameter combinations may fit within a smaller session context size. The alternate cpaCySymDpSessionCtxGetDynamicSize() function will return the smallest size needed to fit the provided setup data parameters.

Context:
This is a synchronous function that cannot sleep. It can be executed in a context that does not permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
No

Reentrant:
No

Thread-safe:
Yes

Parameters:
  [in] instanceHandle Instance handle.
  [in] pSessionSetupData Pointer to session setup data which contains parameters which are static for a given cryptographic session such as operation type, mechanisms, and keys for cipher and/or hash operations.
  [out] pSessionCtxSizeInBytes The amount of memory in bytes required to hold the Session Context.

Return values:
  CPA_STATUS_SUCCESS Function executed successfully.
9.7 Function Documentation

**CPA_STATUS_FAIL** Function failed.

**CPA_STATUS_INVALID_PARAM** Invalid parameter passed in.

**CPA_STATUS_RESOURCE** Error related to system resources.

**Precondition:**
The component has been initialized.

**Postcondition:**
None

**Note:**
This is a synchronous function and has no completion callback associated with it.

**See also:**
- `CpaCySymSessionSetupData`  `cpaCySymDpSessionCtxGetDynamicSize()`  
- `cpaCySymDpInitSession()`

```c
CpaStatus cpaCySymDpSessionCtxGetDynamicSize( 
    const CpaInstanceHandle instanceHandle, 
    const CpaCySymSessionSetupData * pSessionSetupData, 
    Cpa32U * pSessionCtxSizeInBytes 
)
```

**File: cpa_cy_sym_dp.h**

Gets the minimum size required to store a session context for the data plane API.

This function is used by the client to determine the smallest size of the memory it must allocate in order to store the session context. This MUST be called before the client allocates the memory for the session context and before the client calls the `cpaCySymDpInitSession` function.

This function is an alternate to `cpaCySymDpSessionGetSize()`. `cpaCySymDpSessionCtxGetSize()` will return a fixed size which is the minimum memory size needed to support all possible setup data parameter combinations. `cpaCySymDpSessionCtxGetDynamicSize()` will return the minimum memory size needed to support the specific session setup data parameters provided. This size may be different for different setup data parameters.

**Context:**
This is a synchronous function that cannot sleep. It can be executed in a context that does not permit sleeping.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
No

**Reentrant:**
No

**Thread-safe:**
Yes

Reference Number: 330685-001
Parameters:

- **[in]** `instanceHandle` Instance handle.
- **[in]** `pSessionSetupData` Pointer to session setup data which contains parameters which are static for a given cryptographic session such as operation type, mechanisms, and keys for cipher and/or hash operations.
- **[out]** `pSessionCtxSizeInBytes` The amount of memory in bytes required to hold the Session Context.

Return values:

- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.

Precondition:
The component has been initialized.

Postcondition:
None

Note:
This is a synchronous function and has no completion callback associated with it.

CpaStatus cpaCySymDpInitSession (
  CpaInstanceHandle instanceHandle, 
  const CpaCySymSessionSetupData * pSessionSetupData, 
  CpaCySymDpSessionCtx sessionCtx 
)

File: cpa_cy_sym_dp.h

Initialize a session for the symmetric cryptographic data plane API.

This function is used by the client to initialize an asynchronous session context for symmetric cryptographic data plane operations. The returned session context is the handle to the session and needs to be passed when requesting cryptographic operations to be performed.

Only sessions created using this function may be used when invoking functions on this API.

The session can be removed using `cpaCySymDpRemoveSession`.

Context:
This is a synchronous function and it cannot sleep. It can be executed in a context that does not permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
No
9.7 Function Documentation

Reentrant:
No

Thread-safe:
No

Parameters:

[in] `instanceHandle`  
Instance to which the requests will be submitted.

[in] `pSessionSetupData`  
Pointer to session setup data which contains parameters that are static for a given cryptographic session such as operation type, algorithm, and keys for cipher and/or hash operations.

[out] `sessionCtx`  
Pointer to the memory allocated by the client to store the session context. This memory must be physically contiguous, and its length (in bytes) must be at least as big as specified by a call to `cpaCySymDpSessionCtxGetSize`. This memory will be initialized with this function. This value needs to be passed to subsequent processing calls.

Return values:

- `CPA_STATUS_SUCCESS`  
  Function executed successfully.
- `CPA_STATUS_FAIL`  
  Function failed.
- `CPA_STATUS_RETRY`  
  Resubmit the request.
- `CPA_STATUS_INVALID_PARAM`  
  Invalid parameter passed in.
- `CPA_STATUS_RESTARTING`  
  API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized.

Postcondition:
None

Note:
This is a synchronous function and has no completion callback associated with it.

See also:
`cpaCySymDpSessionCtxGetSize`, `cpaCySymDpRemoveSession`

```c
CpaStatus cpaCySymDpRemoveSession ( const CpaInstanceHandle instanceHandle, 
CpaCySymDpSessionCtx sessionCtx )
```

File: `cpa_cy_sym_dp.h`

Remove (delete) a symmetric cryptographic session for the data plane API.

This function will remove a previously initialized session context and the installed callback handler function. Removal will fail if outstanding calls still exist for the initialized session handle. The client needs to retry the remove function at a later time. The memory for the session context MUST not be freed until this call has completed successfully.

Context:
This is a synchronous function that cannot sleep. It can be executed in a context that does not permit sleeping.
Enqueue a single symmetric cryptographic request.

This function enqueues a single request to perform a cipher, hash or combined (cipher and hash) operation. Optionally, the request is also submitted to the cryptographic engine to be performed.

See note about performance trade-offs on the Symmetric cryptographic Data Plane API API.

The function is asynchronous; control is returned to the user once the request has been submitted. On completion of the request, the application may poll for responses, which will cause a callback function (registered via cpaCySymDpRegCbFunc) to be invoked. Callbacks within a session are guaranteed to be
9.7 Function Documentation

in the same order in which they were submitted.

The following restrictions apply to the pOpData parameter:

- The memory MUST be aligned on an 8-byte boundary.
- The structure MUST reside in physically contiguous memory.
- The reserved fields of the structure SHOULD NOT be written or read by the calling code.

Context:
This function will not sleep, and hence can be executed in a context that does not permit sleeping.

Side-Effects:
None

Blocking:
No

Reentrant:
No

Thread-safe:
No

Parameters:

[in] pOpData Pointer to a structure containing the request parameters. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback, which was registered on the instance via cpaCySymDpRegCbFunc. See the above Description for restrictions that apply to this parameter.

[in] performOpNow Flag to specify whether the operation should be performed immediately (CPA_TRUE), or simply enqueued to be performed later (CPA_FALSE). In the latter case, the request is submitted to be performed either by calling this function again with this flag set to CPA_TRUE, or by invoking the function cpaCySymDpPerformOpNow.

Return values:
CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_RETRY Resubmit the request.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.
CPA_STATUS_RESTARTING API implementation is restarting. Resubmit the request.

Precondition:
The session identified by pOpData->sessionCtx was setup using cpaCySymDpInitSession. The instance identified by pOpData->instanceHandle has had a callback function registered via cpaCySymDpRegCbFunc.

Postcondition:
None

Note:
A callback of type CpaCySymDpCbFunc is generated in response to this function call. Any errors generated during processing are reported as part of the callback status code.

See also:
cpaCySymDpInitSession, cpaCySymDpPerformOpNow
Enqueue multiple requests to the symmetric cryptographic data plane API.

This function enqueues multiple requests to perform cipher, hash or combined (cipher and hash) operations.

See note about performance trade-offs on the Symmetric cryptographic Data Plane API API.

The function is asynchronous; control is returned to the user once the request has been submitted. On completion of the request, the application may poll for responses, which will cause a callback function (registered via `cpaCySymDpRegCbFunc`) to be invoked. Separate callbacks will be invoked for each request. Callbacks within a session are guaranteed to be in the same order in which they were submitted.

The following restrictions apply to each element of the pOpData array:

- The memory MUST be aligned on an 8-byte boundary.
- The structure MUST reside in physically contiguous memory.
- The reserved fields of the structure SHOULD NOT be written or read by the calling code.

Context:
This function will not sleep, and hence can be executed in a context that does not permit sleeping.

Assumptions:
Client MUST allocate the request parameters to 8 byte alignment. Reserved elements of the CpaCySymDpOpData structure MUST be 0. The CpaCySymDpOpData structure MUST reside in physically contiguous memory.

Side-Effects:
None

Blocking:
No

Reentrant:
No

Thread-safe:
No

Parameters:

- `numberRequests` (in) The number of requests in the array of CpaCySymDpOpData structures.
- `pOpData` (in) An array of pointers to CpaCySymDpOpData structures. Each of the CpaCySymDpOpData structure contains the request parameters for that request. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback, which was registered on the instance via `cpaCySymDpRegCbFunc`. See the above Description for restrictions that apply to this parameter.
- `performOpNow` (in) Flag to specify whether the operation should be performed immediately (CPA_TRUE), or simply enqueued to be performed later (CPA_FALSE).
In the latter case, the request is submitted to be performed either by calling this function again with this flag set to CPA_TRUE, or by invoking the function `cpaCySymDpPerformOpNow`.

**Return values:**
- `CPA_STATUS_SUCCESS`: Function executed successfully.
- `CPA_STATUS_FAIL`: Function failed.
- `CPA_STATUS_RETRY`: Resubmit the request.
- `CPA_STATUS_INVALID_PARAM`: Invalid parameter passed in.
- `CPA_STATUS_RESTARTING`: API implementation is restarting. Resubmit the request.

**Precondition:**
The session identified by `pOpData[i]->sessionCtx` was setup using `cpaCySymDpInitSession`. The instance identified by `pOpData->instanceHandle[i]` has had a callback function registered via `cpaCySymDpRegCbFunc`.

**Postcondition:**
None

**Note:**
Multiple callbacks of type `CpaCySymDpCbFunc` are generated in response to this function call (one per request). Any errors generated during processing are reported as part of the callback status code.

**See also:**
`cpaCySymDpInitSession`, `cpaCySymDpEnqueueOp`

**CpaStatus**

```c
CpaStatus cpaCySymDpPerformOpNow ( CpalInstanceHandle instanceHandle )
```

**File:** `cpa_cy_sym_dp.h`

Submit any previously enqueued requests to be performed now on the symmetric cryptographic data plane API.

If any requests/operations were enqueued via calls to `cpaCySymDpEnqueueOp` and/or `cpaCySymDpEnqueueOpBatch`, but with the flag `performOpNow` set to `CPA_FALSE`, then these operations will now be submitted to the accelerator to be performed.

See note about performance trade-offs on the Symmetric cryptographic Data Plane API API.

**Context:**
Will not sleep. It can be executed in a context that does not permit sleeping.

**Side-Effects:**
None

**Blocking:**
No

**Reentrant:**
No

**Thread-safe:**
No
Parameters:

[in] instanceHandle Instance to which the requests will be submitted.

Return values:

CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_RETRY Resubmit the request.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.
CPA_STATUS_RESTARTING API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized. A cryptographic session has been previously setup using the cpaCySymDpInitSession function call.

Postcondition:
None

10.7 Data Structure Documentation

10.7.1 _CpaCyKeyGenSslOpData Struct Reference

Collaboration diagram for _CpaCyKeyGenSslOpData:
10.7.1 Detailed Description

File: cpa_cy_key.h

SSL data for key generation functions

This structure contains data for use in key generation operations for SSL. For specific SSL key generation operations, the structure fields MUST be set as follows:

**SSL Master-Secret Derivation:**

```cpp
text
sslOp = CPA_CY_KEY_SSL_OP_MASTER_SECRET_DERIVE
secret = pre-master secret key
seed = client_random + server_random
userLabel = NULL
```

**SSL Key-Material Derivation:**

```cpp
text
sslOp = CPA_CY_KEY_SSL_OP_KEY_MATERIAL_DERIVE
secret = master secret key
seed = server_random + client_random
userLabel = NULL
```

Note that the client/server random order is reversed from that used for master-secret derivation.

**Note:** Each of the client and server random numbers need to be of length CPA_CY_KEY_GEN_SSL_TLS_RANDOM_LEN_IN_BYTES.

In each of the above descriptions, + indicates concatenation.

The label used is predetermined by the SSL operation in line with the SSL 3.0 specification, and can be overridden by using a user defined operation CPA_CY_KEY_SSL_OP_USER_DEFINED and associated userLabel.

10.7.1.2 Data Fields

- **CpaCyKeySslOp sslOp**
  Indicate the SSL operation to be performed.

- **CpaFlatBuffer secret**
  Flat buffer containing a pointer to either the master or pre-master secret key.

- **CpaFlatBuffer seed**
  Flat buffer containing a pointer to the seed data.

- **Cpa32U generatedKeyLenInBytes**
  The requested length of the generated key in bytes.

- **CpaFlatBuffer userLabel**
  Optional flat buffer containing a pointer to a user defined label.

10.7.1.3 Field Documentation

CpaCyKeySslOp _CpaCyKeyGenSslOpData::sslOp
Indicate the SSL operation to be performed.
10.7.2 _CpaCyKeyGenTlsOpData Struct Reference

**CpaFlatBuffer _CpaCyKeyGenSslOpData::secret**
Flat buffer containing a pointer to either the master or pre-master secret key.

The length field indicates the length of the secret key in bytes. Implementation-specific limits may apply to this length.

**CpaFlatBuffer _CpaCyKeyGenSslOpData::seed**
Flat buffer containing a pointer to the seed data.

Implementation-specific limits may apply to this length.

**Cpa32U _CpaCyKeyGenSslOpData::generatedKeyLenInBytes**
The requested length of the generated key in bytes.

Implementation-specific limits may apply to this length.

**CpaFlatBuffer _CpaCyKeyGenSslOpData::userLabel**
Optional flat buffer containing a pointer to a user defined label.

The length field indicates the length of the label in bytes. To use this field, the sslOp must be CPA_CY_KEY_SSL_OP_USER_DEFINED, otherwise it is ignored and can be set to NULL. Implementation-specific limits may apply to this length.

---

### 10.7.2.1 Detailed Description

File: cpa_cy_key.h

Reference Number: 330685-001
TLS data for key generation functions

This structure contains data for use in key generation operations for TLS. For specific TLS key generation operations, the structure fields MUST be set as follows:

**TLS Master-Secret Derivation:**

```
tlsOp = CPA_CY_KEY_TLS_OP_MASTER_SECRET_DERIVE
secret = pre-master secret key
seed = client_random + server_random
userLabel = NULL
```

**TLS Key-Material Derivation:**

```
tlsOp = CPA_CY_KEY_TLS_OP_KEY_MATERIAL_DERIVE
secret = master secret key
seed = server_random + client_random
userLabel = NULL
```

Note that the client/server random order is reversed from that used for Master-Secret Derivation.

**TLS Client finished/Server finished tag Derivation:**

```
tlsOp = CPA_CY_KEY_TLS_OP_CLIENT_FINISHED_DERIVE (client)
or CPA_CY_KEY_TLS_OP_SERVER_FINISHED_DERIVE (server)
secret = master secret key
seed = MD5(handshake_messages) + SHA-1(handshake_messages)
userLabel = NULL
```

Note: Each of the client and server random seeds need to be of length CPA_CY_KEY_GEN_SSL_TLS_RANDOM_LEN_IN_BYTES.

In each of the above descriptions, + indicates concatenation.

The label used is predetermined by the TLS operation in line with the TLS specifications, and can be overridden by using a user defined operation CPA_CY_KEY_TLS_OP_USER_DEFINED and associated userLabel.

### 10.7.2.2 Data Fields

- **CpaCyKeyTlsOp tlsOp**
  TLs operation to be performed.
- **CpaFlatBuffer secret**
  Flat buffer containing a pointer to either the master or pre-master secret key.
- **CpaFlatBuffer seed**
  Flat buffer containing a pointer to the seed data.
- **Cpa32U generatedKeyLenInBytes**
  The requested length of the generated key in bytes.
- **CpaFlatBuffer userLabel**
  Optional flat buffer containing a pointer to a user defined label.
10.7.2.3 Field Documentation

**_CpaCyKeyTlsOp _CpaCyKeyGenTlsOpData::tlsOp**
TLS operation to be performed.

**_CpaFlatBuffer _CpaCyKeyGenTlsOpData::secret**
Flat buffer containing a pointer to either the master or pre-master secret key.

The length field indicates the length of the secret in bytes. Implementation-specific limits may apply to this length.

**_CpaFlatBuffer _CpaCyKeyGenTlsOpData::seed**
Flat buffer containing a pointer to the seed data.

Implementation-specific limits may apply to this length.

**_Cpa32U _CpaCyKeyGenTlsOpData::generatedKeyLenInBytes**
The requested length of the generated key in bytes.

Implementation-specific limits may apply to this length.

**_CpaFlatBuffer _CpaCyKeyGenTlsOpData::userLabel**
Optional flat buffer containing a pointer to a user defined label.

The length field indicates the length of the label in bytes. To use this field, the tlsOp must be CPA_CY_KEY_TLS_OP_USER_DEFINED, otherwise it is ignored and can be set to NULL. Implementation-specific limits may apply to this length.

10.7.3 _CpaCyKeyGenMgfOpData Struct Reference

Collaboration diagram for _CpaCyKeyGenMgfOpData:

---

Reference Number: 330685-001
10.7.3 _CpaCyKeyGenMgfOpData Struct Reference

10.7.3.1 Detailed Description

File: cpa_cy_key.h

Key Generation Mask Generation Function (MGF) Data

This structure contains data relating to Mask Generation Function key generation operations.

Note:
The default hash algorithm used by the MGF is SHA-1. If a different hash algorithm is preferred, then see the extended version of this structure, CpaCyKeyGenMgfOpDataExt.

See also:
cpaCyKeyGenMgf

10.7.3.2 Data Fields

- **CpaFlatBuffer seedBuffer**
  Caller MUST allocate a buffer and populate with the input seed data.

- **Cpa32U maskLenInBytes**
  The requested length of the generated mask in bytes.

10.7.3.3 Field Documentation

**CpaFlatBuffer _CpaCyKeyGenMgfOpData::seedBuffer**

Caller MUST allocate a buffer and populate with the input seed data.

For optimal performance the start of the seed SHOULD be allocated on an 8-byte boundary. The length field represents the seed length in bytes. Implementation-specific limits may apply to this length.

**Cpa32U _CpaCyKeyGenMgfOpData::maskLenInBytes**

The requested length of the generated mask in bytes.

Implementation-specific limits may apply to this length.

10.7.4 _CpaCyKeyGenMgfOpDataExt Struct Reference

Collaboration diagram for _CpaCyKeyGenMgfOpDataExt:
10.7.4 _CpaCyKeyGenMgfOpDataExt Struct Reference

10.7.4.1 Detailed Description

File: cpa_cy_key.h

Extension to the original Key Generation Mask Generation Function (MGF) Data

This structure is an extension to the original MGF data structure. The extension allows the hash function to be specified.

Note:
This structure is separate from the base _CpaCyKeyGenMgfOpData structure in order to retain backwards compatibility with the original version of the API.

See also:
cpaCyKeyGenMgfExt

10.7.4.2 Data Fields

- _CpaCyKeyGenMgfOpData baseOpData
  "Base" operational data for MGF generation
- _CpaCySymHashAlgorithm hashAlgorithm
  Specifies the hash algorithm to be used by the Mask Generation Function.

10.7.4.3 Field Documentation

_CpaCyKeyGenMgfOpData _CpaCyKeyGenMgfOpDataExt::baseOpData
CpaCySymHashAlgorithm_CpaCyKeyGenMgfOpDataExt::hashAlgorithm

Specifies the hash algorithm to be used by the Mask Generation Function.

10.7.5 _CpaCyKeyGenStats Struct Reference

10.7.5.1 Detailed Description

File: cpa_cy_key.h

Key Generation Statistics.

Deprecated:
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyKeyGenStats64.

This structure contains statistics on the key and mask generation operations. Statistics are set to zero when the component is initialized, and are collected per instance.

10.7.5.2 Data Fields

- **Cpa32U numSslKeyGenRequests**
  Total number of successful SSL key generation requests.

- **Cpa32U numSslKeyGenRequestErrors**
  Total number of SSL key generation requests that had an error and could not be processed.

- **Cpa32U numSslKeyGenCompleted**
  Total number of SSL key generation operations that completed successfully.

- **Cpa32U numSslKeyGenCompletedErrors**
  Total number of SSL key generation operations that could not be completed successfully due to errors.

- **Cpa32U numTlsKeyGenRequests**
  Total number of successful TLS key generation requests.

- **Cpa32U numTlsKeyGenRequestErrors**
  Total number of TLS key generation requests that had an error and could not be processed.

- **Cpa32U numTlsKeyGenCompleted**
  Total number of TLS key generation operations that completed successfully.

- **Cpa32U numTlsKeyGenCompletedErrors**
  Total number of TLS key generation operations that could not be completed successfully due to errors.

- **Cpa32U numMgfKeyGenRequests**
  Total number of successful MGF key generation requests (including "extended" MGF requests).

- **Cpa32U numMgfKeyGenRequestErrors**
  Total number of MGF key generation requests that had an error and could not be processed.

- **Cpa32U numMgfKeyGenCompleted**
  Total number of MGF key generation operations that completed successfully.

- **Cpa32U numMgfKeyGenCompletedErrors**
  Total number of MGF key generation operations that could not be completed successfully due to errors.

10.7.6 _CpaCyKeyGenStats64 Struct Reference

10.7.6.1 Detailed Description

File: cpa_cy_key.h

Key Generation Statistics (64-bit version).

This structure contains the 64-bit version of the statistics on the key and mask generation operations. Statistics are set to zero when the component is initialized, and are collected per instance.
10.7.6.2 Data Fields

- **Cpa64U numSslKeyGenRequests**
  Total number of successful SSL key generation requests.

- **Cpa64U numSslKeyGenRequestErrors**
  Total number of SSL key generation requests that had an error and could not be processed.

- **Cpa64U numSslKeyGenCompleted**
  Total number of SSL key generation operations that completed successfully.

- **Cpa64U numSslKeyGenCompletedErrors**
  Total number of SSL key generation operations that could not be completed successfully due to errors.

- **Cpa64U numTlsKeyGenRequests**
  Total number of successful TLS key generation requests.

- **Cpa64U numTlsKeyGenRequestErrors**
  Total number of TLS key generation requests that had an error and could not be processed.

- **Cpa64U numTlsKeyGenCompleted**
  Total number of TLS key generation operations that completed successfully.

- **Cpa64U numTlsKeyGenCompletedErrors**
  Total number of TLS key generation operations that could not be completed successfully due to errors.

- **Cpa64U numMgfKeyGenRequests**
  Total number of successful MGF key generation requests (including "extended" MGF requests).

- **Cpa64U numMgfKeyGenRequestErrors**
  Total number of MGF key generation requests that had an error and could not be processed.

- **Cpa64U numMgfKeyGenCompleted**
  Total number of MGF key generation operations that completed successfully.

- **Cpa64U numMgfKeyGenCompletedErrors**
  Total number of MGF key generation operations that could not be completed successfully due to errors.

10.7.6.3 Field Documentation

- **Cpa64U _CpaCyKeyGenStats64::numSslKeyGenRequests**
  Total number of successful SSL key generation requests.

- **Cpa64U _CpaCyKeyGenStats64::numSslKeyGenRequestErrors**
  Total number of SSL key generation requests that had an error and could not be processed.

- **Cpa64U _CpaCyKeyGenStats64::numSslKeyGenCompleted**
  Total number of SSL key generation operations that completed successfully.

- **Cpa64U _CpaCyKeyGenStats64::numSslKeyGenCompletedErrors**
  Total number of SSL key generation operations that could not be completed successfully due to errors.

- **Cpa64U _CpaCyKeyGenStats64::numTlsKeyGenRequests**
  Total number of successful TLS key generation requests.

- **Cpa64U _CpaCyKeyGenStats64::numTlsKeyGenRequestErrors**
  Total number of TLS key generation requests that had an error and could not be processed.

- **Cpa64U _CpaCyKeyGenStats64::numTlsKeyGenCompleted**
  Total number of TLS key generation operations that completed successfully.

- **Cpa64U _CpaCyKeyGenStats64::numTlsKeyGenCompletedErrors**
  Total number of TLS key generation operations that could not be completed successfully due to errors.
10.8 Define Documentation

```c
#define CPA_CY_KEY_GEN_SSL_TLS_RANDOM_LEN_IN_BYTES
```

File: cpa_cy_key.h

SSL or TLS key generation random number length.

Defines the permitted SSL or TLS random number length in bytes that may be used with the functions `cpaCyKeyGenSsl` and `cpaCyKeyGenTls`. This is the length of the client or server random number values.

10.9 Typedef Documentation

```c
typedef enum _CpaCyKeySslOp CpaCyKeySslOp
```

File: cpa_cy_key.h

SSL Operation Types

Enumeration of the different SSL operations that can be specified in the struct `CpaCyKeyGenSslOpData`. It identifies the label.

```c
typedef struct _CpaCyKeyGenSslOpData CpaCyKeyGenSslOpData
```

File: cpa_cy_key.h

SSL data for key generation functions

This structure contains data for use in key generation operations for SSL. For specific SSL key generation operations, the structure fields MUST be set as follows:

**SSL Master-Secret Derivation:**

```c
sslOp = CPA_CY_KEY_SSL_OP_MASTER_SECRET_DERIVE
secret = pre-master secret key
```
10.9 Typedef Documentation

```c
typedef enum _CpaCyKeyTlsOp CpaCyKeyTlsOp
```

**File: cpa_cy_key.h**

**TLS Operation Types**

Enumeration of the different TLS operations that can be specified in the CpaCyKeyGenTlsOpData. It identifies the label.

The functions `cpaCyKeyGenTls` and `cpaCyKeyGenTls2` accelerate the TLS PRF, which is defined as part of RFC2246 (TLS v1.0), RFC4346 (TLS v1.1), and RFC5246 (TLS v1.2). One of the inputs to these functions is a label. This enumerated type defines values that correspond to some of the required labels. However, for some of the operations/labels required by these RFCs, no values are specified.

In such cases, a user-defined value must be provided. The client should use the enum value `CPA_CY_KEY_TLS_OP_USER_DEFINED`, and pass the label using the userLabel field of the `CpaCyKeyGenTlsOpData` data structure.

```c
typedef struct _CpaCyKeyGenTlsOpData CpaCyKeyGenTlsOpData
```

**File: cpa_cy_key.h**

**TLS data for key generation functions**

This structure contains data for use in key generation operations for TLS. For specific TLS key generation operations, the structure fields MUST be set as follows:

**TLS Master-Secret Derivation:**

```c
tlsOp = CPA_CY_KEY_TLS_OP_MASTER_SECRET_DERIVE
secret = pre-master secret key
seed = client_random + server_random
```

Reference Number: 330685-001  116
TLS Key-Material Derivation:

tlsOp = CPA_CY_KEY_TLS_OP_KEY_MATERIAL_DERIVE
secret = master secret key
seed = server_random + client_random
userLabel = NULL

Note that the client/server random order is reversed from that used for Master-Secret Derivation.

TLS Client finished/Server finished tag Derivation:

tlsOp = CPA_CY_KEY_TLS_OP_CLIENT_FINISHED_DERIVE (client)
or CPA_CY_KEY_TLS_OP_SERVER_FINISHED_DERIVE (server)
secret = master secret key
seed = MD5(handshake_messages) + SHA-1(handshake_messages)
userLabel = NULL

Note:
Each of the client and server random seeds need to be of length
CPA_CY_KEY_GEN_SSL_TLSRANDOM_LEN_IN_BYTES.

In each of the above descriptions, + indicates concatenation.

The label used is predetermined by the TLS operation in line with the TLS specifications, and can
be overridden by using a user defined operation CPA_CY_KEY_TLS_OP_USER_DEFINED and
associated userLabel.

typedef struct _CpaCyKeyGenMgfOpData CpaCyKeyGenMgfOpData

File: cpa_cy_key.h

Key Generation Mask Generation Function (MGF) Data

This structure contains data relating to Mask Generation Function key generation operations.

Note:
The default hash algorithm used by the MGF is SHA-1. If a different hash algorithm is preferred,
then see the extended version of this structure, CpaCyKeyGenMgfOpDataExt.

See also:
cpaCyKeyGenMgf

typedef struct _CpaCyKeyGenMgfOpDataExt CpaCyKeyGenMgfOpDataExt

File: cpa_cy_key.h

Extension to the original Key Generation Mask Generation Function (MGF) Data

This structure is an extension to the original MGF data structure. The extension allows the hash function to be specified.

Note:
10.10 Enumeration Type Documentation

This structure is separate from the base CpaCyKeyGenMgfOpData structure in order to retain backwards compatibility with the original version of the API.

See also:
cpaCyKeyGenMgfExt

typedef struct _CpaCyKeyGenStats CPA_DEPRECATED

File: cpa_cy_key.h

Key Generation Statistics.

Deprecated:
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyKeyGenStats64.

This structure contains statistics on the key and mask generation operations. Statistics are set to zero when the component is initialized, and are collected per instance.

typedef struct _CpaCyKeyGenStats64 CpaCyKeyGenStats64

File: cpa_cy_key.h

Key Generation Statistics (64-bit version).

This structure contains the 64-bit version of the statistics on the key and mask generation operations. Statistics are set to zero when the component is initialized, and are collected per instance.

10.10 Enumeration Type Documentation

enum _CpaCyKeySslOp

File: cpa_cy_key.h

SSL Operation Types

Enumeration of the different SSL operations that can be specified in the struct CpaCyKeyGenSslOpData. It identifies the label.

Enumerator:

CPA_CY_KEY_SSL_OP_MASTER_SECRET_DERIVE Derive the master secret.
CPA_CY_KEY_SSL_OP_KEY_MATERIAL_DERIVE Derive the key material.
CPA_CY_KEY_SSL_OP_USER_DEFINED User Defined Operation for custom labels.

enum _CpaCyKeyTlsOp

File: cpa_cy_key.h

TLS Operation Types

Enumeration of the different TLS operations that can be specified in the CpaCyKeyGenTlsOpData. It identifies the label.
The functions `cpaCyKeyGenTls` and `cpaCyKeyGenTls2` accelerate the TLS PRF, which is defined as part of RFC2246 (TLS v1.0), RFC4346 (TLS v1.1), and RFC5246 (TLS v1.2). One of the inputs to these functions is a label. This enumerated type defines values that correspond to some of the required labels. However, for some of the operations/labels required by these RFCs, no values are specified.

In such cases, a user-defined value must be provided. The client should use the enum value `CPA_CY_KEY_TLS_OP_USER_DEFINED`, and pass the label using the userLabel field of the `CpaCyKeyGenTlsOpData` data structure.

### Enumerator:

- **CPA_CY_KEY_TLS_OP_MASTER_SECRET_DERIVE**: Derive the master secret using the TLS PRF. Correlates to RFC2246/5246 section 8.1, operation "Computing the master secret", label "master secret".
- **CPA_CY_KEY_TLS_OP_KEY_MATERIAL_DERIVE**: Derive the key material using the TLS PRF. Correlates to RFC2246/5246 section 6.3, operation "Derive the key material", label "key expansion".
- **CPA_CY_KEY_TLS_OP_CLIENT_FINISHED_DERIVE**: Derive the client finished tag using the TLS PRF. Correlates to RFC2246/5246 section 7.4.9, operation "Client finished", label "client finished".
- **CPA_CY_KEY_TLS_OP_SERVER_FINISHED_DERIVE**: Derive the server finished tag using the TLS PRF. Correlates to RFC2246/5246 section 7.4.9, operation "Server finished", label "server finished".
- **CPA_CY_KEY_TLS_OP_USER_DEFINED**: User Defined Operation for custom labels.

**CpaStatus** `cpaCyKeyGenSsl` ( 
  `const CpaInstanceHandle instanceHandle`, 
  `const CpaCyGenFlatBufCbFunc pKeyGenCb`, 
  `void * pCallbackTag`, 
  `const CpaCyKeyGenSslOpData * pKeyGenSslOpData`, 
  `CpaFlatBuffer * pGeneratedKeyBuffer` )

File: `cpa_cy_key.h`

SSL Key Generation Function.

This function is used for SSL key generation. It implements the key generation function defined in section 6.2.2 of the SSL 3.0 specification as described in Reference Number: 330685-001
The input seed is taken as a flat buffer and the generated key is returned to caller in a flat destination data buffer.

**Context:**
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
Yes when configured to operate in synchronous mode.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**
- **[in]** `instanceHandle` Instance handle.
- **[in]** `pKeyGenCb` Pointer to callback function to be invoked when the operation is complete. If this is set to a NULL value the function will operate synchronously.
- **[in]** `pCallbackTag` Opaque User Data for this specific call. Will be returned unchanged in the callback.
- **[in]** `pKeyGenSslOpData` Structure containing all the data needed to perform the SSL key generation operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[out]** `pGeneratedKeyBuffer` Caller MUST allocate a sufficient buffer to hold the key generation output. The data pointer SHOULD be aligned on an 8-byte boundary. The length field passed in represents the size of the buffer in bytes. The value that is returned is the size of the result key in bytes. On invocation the callback function will contain this parameter in the pOut parameter.

**Return values:**
- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_RETRY` Resubmit the request.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
- `CPA_STATUS_RESTARTING` API implementation is restarting. Resubmit the request.

**Precondition:**
The component has been initialized via `cpaCyStartInstance` function.

**Postcondition:**

Reference Number: 330685-001

TLS Key Generation Function.

This function is used for TLS key generation. It implements the TLS PRF (Pseudo Random Function) as defined by RFC2246 (TLS v1.0) and RFC4346 (TLS v1.1).

The input seed is taken as a flat buffer and the generated key is returned to caller in a flat destination data buffer.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in]</td>
<td>instanceHandle</td>
<td>Instance handle.</td>
</tr>
<tr>
<td>[in]</td>
<td>pKeyGenCb</td>
<td>Pointer to callback function to be invoked when the operation is complete. If this is set to a NULL value the function will operate synchronously.</td>
</tr>
<tr>
<td>[in]</td>
<td>pCallbackTag</td>
<td>Opaque User Data for this specific call. Will be returned unchanged in the callback.</td>
</tr>
<tr>
<td>[in]</td>
<td>pKeyGenTlsOpData</td>
<td>Structure containing all the data needed to perform the TLS key generation operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.</td>
</tr>
<tr>
<td>[out]</td>
<td>pGeneratedKeyBuffer</td>
<td>Caller MUST allocate a sufficient buffer to hold the key generation output. The data pointer SHOULD be aligned on an 8-byte buffer.</td>
</tr>
</tbody>
</table>
boundary. The length field passed in represents the size of the buffer in bytes. The value that is returned is the size of the result key in bytes. On invocation the callback function will contain this parameter in the pOut parameter.

Return values:
- CPA_STATUS_SUCCESS: Function executed successfully.
- CPA_STATUS_FAIL: Function failed.
- CPA_STATUS_RETRY: Resubmit the request.
- CPA_STATUS_INVALID_PARAM: Invalid parameter passed in.
- CPA_STATUS_RESOURCE: Error related to system resources.
- CPA_STATUS_RESTARTING: API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

TLS Key Generation Function version 2.

This function is used for TLS key generation. It implements the TLS PRF (Pseudo Random Function) as defined by RFC5246 (TLS v1.2).

The input seed is taken as a flat buffer and the generated key is returned to caller in a flat destination data buffer.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe: Yes

Parameters:

- **[in]** `instanceHandle` Instance handle.
- **[in]** `pKeyGenCb` Pointer to callback function to be invoked when the operation is complete. If this is set to a NULL value the function will operate synchronously.
- **[in]** `pCallbackTag` Opaque User Data for this specific call. Will be returned unchanged in the callback.
- **[in]** `pKeyGenTlsOpData` Structure containing all the data needed to perform the TLS key generation operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[in]** `hashAlgorithm` Specifies the hash algorithm to use. According to RFC5246, this should be "SHA-256 or a stronger standard hash function."
- **[out]** `pGeneratedKeyBuffer` Caller MUST allocate a sufficient buffer to hold the key generation output. The data pointer SHOULD be aligned on an 8-byte boundary. The length field passed in represents the size of the buffer in bytes. The value that is returned is the size of the result key in bytes. On invocation the callback function will contain this parameter in the pOut parameter.

Return values:

- `CPA_STATUS_SUCCESS`: Function executed successfully.
- `CPA_STATUS_FAIL`: Function failed.
- `CPA_STATUS_RETRY`: Resubmit the request.
- `CPA_STATUS_INVALID_PARAM`: Invalid parameter passed in.
- `CPA_STATUS_RESOURCE`: Error related to system resources.
- `CPA_STATUS_RESTARTING`: API implementation is restarting. Resubmit the request.

```
10.11 Function Documentation

File: cpa_cy_key.h

Mask Generation Function.

This function implements the mask generation function MGF1 as defined by PKCS#1 v2.1, and RFC3447. The input seed is taken as a flat buffer and the generated mask is returned to caller in a flat destination data buffer.

Note:
The default hash algorithm used by the MGF is SHA-1. If a different hash algorithm is preferred, then see the "extended" version of this function, cpaCyKeyGenMgfExt.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:

[in] instanceHandle Instance handle.
[in] pKeyGenCb Pointer to callback function to be invoked when the operation is complete. If this is set to a NULL value the function will operate synchronously.
[in] pCallbackTag Opaque User Data for this specific call. Will be returned unchanged in the callback.
[in] pKeyGenMgfOpData Structure containing all the data needed to perform the MGF key generation operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
[out] pGeneratedMaskBuffer Caller MUST allocate a sufficient buffer to hold the generated mask. The data pointer SHOULD be aligned on an 8-byte boundary. The length field passed in represents the size of the buffer in bytes. The value that is returned is the size of the generated mask in bytes. On invocation the callback function will contain this parameter in the pOut parameter.

Return values:

CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_RETRY Resubmit the request.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.

Reference Number: 330685-001
10.11 Function Documentation

**CPA_STATUS_RESOURCE**  Error related to system resources.
**CPA_STATUS_RESTARTING**  API implementation is restarting. Resubmit the request.

```

**File:** cpa_cy_key.h

Extended Mask Generation Function.

This function is used for mask generation. It differs from the "base" version of the function (cpaCyKeyGenMgf) in that it allows the hash function used by the Mask Generation Function to be specified.

**Context:**
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
Yes when configured to operate in synchronous mode.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**
- `[in]` *instanceHandle*  Instance handle.
- `[in]` *pKeyGenCb*  Pointer to callback function to be invoked when the operation is complete. If this is set to a NULL value the function will operate synchronously.
- `[in]` *pCallbackTag*  Opaque User Data for this specific call. Will be returned unchanged in the callback.
- `[in]` *pKeyGenMgfOpDataExt*
Structure containing all the data needed to perform the extended
MGF key generation operation. The client code allocates the
memory for this structure. This component takes ownership of the
memory until it is returned in the callback.

[out]  pGeneratedMaskBuffer  Caller MUST allocate a sufficient buffer to hold the generated
mask. The data pointer SHOULD be aligned on an 8-byte
boundary. The length field passed in represents the size of the
buffer in bytes. The value that is returned is the size of the
generated mask in bytes. On invocation the callback function will
contain this parameter in the pOut parameter.

Return values:

CPA_STATUS_SUCCESS     Function executed successfully.
CPA_STATUS_FAIL         Function failed.
CPA_STATUS_RETRY        Resubmit the request.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.
CPA_STATUS_RESOURCE    Error related to system resources.
CPA_STATUS_RESTARTING  API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

Note:
This function is only used to generate a mask keys from seed material.

CpaCyKeyGenMgfOpData, CpaCyGenFlatBufCbFunc

File: cpa_cy_key.h
Queries the Key and Mask generation statistics specific to an instance.

Deprecated:
As of v1.3 of the Crypto API, this function has been deprecated, replaced by
cpaCyKeyGenQueryStats64().

This function will query a specific instance for key and mask generation statistics. The user MUST allocate
the CpaCyKeyGenStats structure and pass the reference to that into this function call. This function will
write the statistic results into the passed in CpaCyKeyGenStats structure.

Note: statistics returned by this function do not interrupt current data processing and as such can be slightly
out of sync with operations that are in progress during the statistics retrieval process.

Context:
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES
NOT permit sleeping.
**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
This function is synchronous and blocking.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**
- **[in]** `instanceHandle` Instance handle.
- **[out]** `pKeyGenStats` Pointer to memory into which the statistics will be written.

**Return values:**
- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
- `CPA_STATUS_RESTARTING` API implementation is restarting. Resubmit the request.

**Precondition:**
Component has been initialized.

**Postcondition:**
None

**Note:**
This function operates in a synchronous manner and no asynchronous callback will be generated.

11 RSA API
[Cryptographic API]

Collaboration diagram for RSA API:

11.1 Detailed Description

File: cpa_cy_rsa.h

These functions specify the API for Public Key Encryption (Cryptography) RSA operations. The PKCS #1 V2.1 specification is supported, however the support is limited to "two-prime" mode. RSA multi-prime is not supported.

Note:
These functions implement RSA cryptographic primitives. RSA padding schemes are not implemented. For padding schemes that require the mgf function see Cryptographic Key and Mask Generation API.

Large numbers are represented on the QuickAssist API as described in the Large Number API (Cryptographic Large Number API).

|_CpaCyRsaPublicKey
+ modulusN
+ publicExponentE
```

Reference Number: 330685-001
11.6.1 _CpaCyRsaPublicKey Struct Reference

11.6.1.1 Detailed Description

File: cpa_cy_rsa.h

RSA Public Key Structure.

This structure contains the two components which comprise the RSA public key as defined in the PKCS #1 V2.1 standard. All values in this structure are required to be in Most Significant Byte first order, e.g. modulusN.pData[0] = MSB.

11.6.1.2 Data Fields

- CpaFlatBuffer modulusN
  The modulus (n).
- CpaFlatBuffer publicExponentE
  The public exponent (e).

11.6.1.3 Field Documentation

CpaFlatBuffer _CpaCyRsaPublicKey::modulusN
The modulus (n).

For key generation operations, the client MUST allocate the memory for this parameter; its value is generated. For encrypt operations this parameter is an input.

CpaFlatBuffer _CpaCyRsaPublicKey::publicExponentE
The public exponent (e).

For key generation operations, this field is unused. It is NOT generated by the interface; it is the responsibility of the client to set this to the same value as the corresponding parameter on the CpaCyRsaKeyGenOpData structure before using the key for encryption. For encrypt operations this parameter is an input.

11.6.2 _CpaCyRsaPrivateKeyRep1 Struct Reference

Collaboration diagram for _CpaCyRsaPrivateKeyRep1:

```plaintext
_CpaFlatBuffer
  + dataLenInBytes
  + pData

  modulusN
  privateExponentD

_CpaCyRsaPrivateKeyRep1
  + modulusN

11.6.2 _CpaCyRsaPrivateKeyRep1 Struct Reference

11.6.2.1 Detailed Description

File: cpa_cy_rsa.h

RSA Private Key Structure For Representation 1.

This structure contains the first representation that can be used for describing the RSA private key, represented by the tuple of the modulus (n) and the private exponent (d). All values in this structure are required to be in Most Significant Byte first order, e.g. modulusN.pData[0] = MSB.

11.6.2.2 Data Fields

- **CpaFlatBuffer modulusN**
  The modulus (n).
- **CpaFlatBuffer privateExponentD**
  The private exponent (d).

11.6.2.3 Field Documentation

*CpaFlatBuffer _CpaCyRsaPrivateKeyRep1::modulusN*

The modulus (n).

For key generation operations the memory MUST be allocated by the client and the value is generated. For other operations this is an input. Permitted lengths are:

- 512 bits (64 bytes),
- 1024 bits (128 bytes),
- 1536 bits (192 bytes),
- 2048 bits (256 bytes),
- 3072 bits (384 bytes), or
- 4096 bits (512 bytes).

*CpaFlatBuffer _CpaCyRsaPrivateKeyRep1::privateExponentD*

The private exponent (d).

For key generation operations the memory MUST be allocated by the client and the value is generated. For other operations this is an input. **NOTE:** It is important that the value D is big enough. It is STRONGLY recommended that this value is at least half the length of the modulus N to protect against the Wiener attack.

11.6.3 _CpaCyRsaPrivateKeyRep2 Struct Reference

Collaboration diagram for _CpaCyRsaPrivateKeyRep2:
11.6.3.1 Detailed Description

File: cpa_cy_rsa.h

RSA Private Key Structure For Representation 2.

This structure contains the second representation that can be used for describing the RSA private key. The quintuple of p, q, dP, dQ, and qInv (explained below and in the spec) are required for the second representation. The optional sequence of triplets are not included. All values in this structure are required to be in Most Significant Byte first order, e.g. prime1P.pData[0] = MSB.

11.6.3.2 Data Fields

- **CpaFlatBuffer prime1P**
  The first large prime (p).
- **CpaFlatBuffer prime2Q**
  The second large prime (q).
- **CpaFlatBuffer exponent1Dp**
  The first factor CRT exponent (dP).
- **CpaFlatBuffer exponent2Dq**
  The second factor CRT exponent (dQ).
- **CpaFlatBuffer coefficientQInv**
  The (first) Chinese Remainder Theorem (CRT) coefficient (qInv).

11.6.3.3 Field Documentation

**CpaFlatBuffer _CpaCyRsaPrivateKeyRep2::prime1P**

The first large prime (p).

For key generation operations, this field is unused.
The second large prime (q).

For key generation operations, this field is unused.

d mod (p-1).

d mod (q-1).

(inverse of q) mod p.

Collaboration diagram for _CpaCyRsaPrivateKey:
11.6.4 _CpaCyRsaPrivateKey Struct Reference

11.6.4.1 Detailed Description

File: cpa_cy_rsa.h

RSA Private Key Structure.

This structure contains the two representations that can be used for describing the RSA private key. The privateKeyRepType will be used to identify which representation is to be used. Typically, using the second representation results in faster decryption operations.

11.6.4.2 Data Fields

- **CpaCyRsaVersion version**
  Indicates the version of the PKCS #1 specification that is supported.
- **CpaCyRsaPrivateKeyRepType privateKeyRepType**
  This value is used to identify which of the private key representation types in this structure is relevant.
- **CpaCyRsaPrivateKeyRep1 privateKeyRep1**
  This is the first representation of the RSA private key as defined in the PKCS #1 V2.1 specification.
11.6.4 _CpaCyRsaPrivateKey Struct Reference

- **CpaCyRsaPrivateKeyRep2 privateKeyRep2**
  This is the second representation of the RSA private key as defined in the PKCS #1 V2.1 specification.

11.6.4.3 Field Documentation

**CpaCyRsaVersion _CpaCyRsaPrivateKey::version**
Indicates the version of the PKCS #1 specification that is supported.

Note that this applies to both representations.

**CpaCyRsaPrivateKeyRepType _CpaCyRsaPrivateKey::privateKeyRepType**
This value is used to identify which of the private key representation types in this structure is relevant.

When performing key generation operations for Type 2 representations, memory must also be allocated for the type 1 representations, and values for both will be returned.

**CpaCyRsaPrivateKeyRep1 _CpaCyRsaPrivateKey::privateKeyRep1**
This is the first representation of the RSA private key as defined in the PKCS #1 V2.1 specification.

For key generation operations the memory for this structure is allocated by the client and the specific values are generated. For other operations this is an input parameter.

**CpaCyRsaPrivateKeyRep2 _CpaCyRsaPrivateKey::privateKeyRep2**
This is the second representation of the RSA private key as defined in the PKCS #1 V2.1 specification.

For key generation operations the memory for this structure is allocated by the client and the specific values are generated. For other operations this is an input parameter.

11.6.5 _CpaCyRsaKeyGenOpData Struct Reference

Collaboration diagram for _CpaCyRsaKeyGenOpData:
11.6.5.1 Detailed Description

File: cpa_cy_rsa.h

RSA Key Generation Data.

This structure lists the different items that are required in the cpaCyRsaGenKey function. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the CpaCyRsaKeyGenCbFunc callback function.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyRsaGenKey function, and before it has been returned in the callback, undefined behavior will result. All values in this structure are required to be in Most Significant Byte first order, e.g. prime1P.pData[0] = MSB.

The following limitations on the permutations of the supported bit lengths of p, q and n (written as \(\{p, q, n\}\)) apply:

- \(\{256, 256, 512\}\) or
- \(\{512, 512, 1024\}\) or
- \(\{768, 768, 1536\}\) or
- \(\{1024, 1024, 2048\}\) or
- \(\{1536, 1536, 3072\}\) or
- \(\{2048, 2048, 4096\}\).

11.6.5.2 Data Fields

- **CpaFlatBuffer prime1P**
  A large random prime number (p).
- **CpaFlatBuffer prime2Q**
11.6.5 _CpaCyRsaKeyGenOpData Struct Reference

- A large random prime number (q).
- **Cpa32U modulusLenInBytes**
  - The bit length of the modulus (n).
- **CpaCyRsaVersion version**
  - Indicates the version of the PKCS #1 specification that is supported.
- **CpaCyRsaPrivateKeyRepType privateKeyRepType**
  - This value is used to identify which of the private key representation types is required to be generated.
- **CpaFlatBuffer publicExponentE**
  - The public exponent (e).

11.6.5.3 Field Documentation

- **CpaFlatBuffer _CpaCyRsaKeyGenOpData::prime1P**
  - A large random prime number (p).
  
  This MUST be created by the client. Permitted bit lengths are: 256, 512, 768, 1024, 1536 or 2048. Limitations apply - refer to the description above for details.

- **CpaFlatBuffer _CpaCyRsaKeyGenOpData::prime2Q**
  - A large random prime number (q).
  
  This MUST be created by the client. Permitted bit lengths are: 256, 512, 768, 1024, 1536 or 2048. Limitations apply - refer to the description above for details. If the private key representation type is 2, then this pointer will be assigned to the relevant structure member of the representation 2 private key.

- **Cpa32U _CpaCyRsaKeyGenOpData::modulusLenInBytes**
  - The bit length of the modulus (n).
  
  This is the modulus length for both the private and public keys. The length of the modulus N parameter for the private key representation 1 structure and the public key structures will be assigned to this value. References to the strength of RSA actually refer to this bit length. Recommended minimum is 1024 bits. Permitted lengths are:
  
  - 512 bits (64 bytes),
  - 1024 bits (128 bytes),
  - 1536 bits (192 bytes),
  - 2048 bits (256 bytes),
  - 3072 bits (384 bytes), or
  - 4096 bits (512 bytes). Limitations apply - refer to description above for details.

- **CpaCyRsaVersion _CpaCyRsaKeyGenOpData::version**
  - Indicates the version of the PKCS #1 specification that is supported.
  
  Note that this applies to both representations.

- **CpaCyRsaPrivateKeyRepType _CpaCyRsaKeyGenOpData::privateKeyRepType**
  - This value is used to identify which of the private key representation types is required to be generated.

- **CpaFlatBuffer _CpaCyRsaKeyGenOpData::publicExponentE**
  - The public exponent (e).

RSA Encryption Primitive Operation Data

This structure lists the different items that are required in the cpaCyRsaEncrypt function. As the RSA encryption primitive and verification primitive operations are mathematically identical this structure may also be used to perform an RSA verification primitive operation. When performing an RSA encryption primitive operation, the input data is the message and the output data is the cipher text. When performing an RSA verification primitive operation, the input data is the signature and the output data is the message. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the CpaCyRsaEncryptCbFunc callback function.

**Note:**

If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyRsaEncrypt function, and before it has been returned in the callback, undefined behavior will result. All values in this structure are required to be in Most Significant Byte first order, e.g. `inputData.pData[0] = MSB`. 

Reference Number: 330685-001
11.6.6.2 Data Fields

- **CpaCyRsaPublicKey* pPublicKey**
  Pointer to the public key.
- **CpaFlatBuffer inputData**
  The input data that the RSA encryption primitive operation is performed on.

11.6.6.3 Field Documentation

**CpaCyRsaPublicKey* _CpaCyRsaEncryptOpData::pPublicKey**
Pointer to the public key.

**CpaFlatBuffer _CpaCyRsaEncryptOpData::inputData**
The input data that the RSA encryption primitive operation is performed on.

The data pointed to is an integer that MUST be in big-endian order. The value MUST be between 0 and the modulus n - 1.

### 11.7 Typedef Documentation

#### typedef enum _CpaCyRsaVersion CpaCyRsaVersion

File: cpa_cy_rsa.h

RSA Version.

This enumeration lists the version identifier for the PKCS #1 V2.1 standard.

**Note:**

Multi-prime (more than two primes) is not supported.

#### typedef struct _CpaCyRsaPublicKey CpaCyRsaPublicKey

File: cpa_cy_rsa.h
RSA Public Key Structure.

This structure contains the two components which comprise the RSA public key as defined in the PKCS #1 V2.1 standard. All values in this structure are required to be in Most Significant Byte first order, e.g. modulusN.pData[0] = MSB.

```c
typedef struct _CpaCyRsaPrivateKeyRep1 CpaCyRsaPrivateKeyRep1

File: cpa_cy_rsa.h

RSA Private Key Structure For Representation 1.

This structure contains the first representation that can be used for describing the RSA private key, represented by the tuple of the modulus (n) and the private exponent (d). All values in this structure are required to be in Most Significant Byte first order, e.g. modulusN.pData[0] = MSB.

```c
typedef struct _CpaCyRsaPrivateKeyRep2 CpaCyRsaPrivateKeyRep2

File: cpa_cy_rsa.h

RSA Private Key Structure For Representation 2.

This structure contains the second representation that can be used for describing the RSA private key. The quintuple of p, q, dP, dQ, and qInv (explained below and in the spec) are required for the second representation. The optional sequence of triplets are not included. All values in this structure are required to be in Most Significant Byte first order, e.g. prime1P.pData[0] = MSB.

```c
typedef enum _CpaCyRsaPrivateKeyRepType CpaCyRsaPrivateKeyRepType

File: cpa_cy_rsa.h

RSA private key representation type.

This enumeration lists which PKCS V2.1 representation of the private key is being used.

```c
typedef struct _CpaCyRsaPrivateKey CpaCyRsaPrivateKey

File: cpa_cy_rsa.h

RSA Private Key Structure.

This structure contains the two representations that can be used for describing the RSA private key. The privateKeyRepType will be used to identify which representation is to be used. Typically, using the second representation results in faster decryption operations.

```c
typedef struct _CpaCyRsaKeyGenOpData CpaCyRsaKeyGenOpData

File: cpa_cy_rsa.h

RSA Key Generation Data.

This structure lists the different items that are required in the cpaCyRsaGenKey function. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is
11.7 Typedef Documentation

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyRsaGenKey function, and before it has been returned in the callback, undefined behavior will result. All values in this structure are required to be in Most Significant Byte first order, e.g. prime1P.pData[0] = MSB.

The following limitations on the permutations of the supported bit lengths of p, q and n (written as \(p, q, n\)) apply:

- \{256, 256, 512\} or
- \{512, 512, 1024\} or
- \{768, 768, 1536\} or
- \{1024, 1024, 2048\} or
- \{1536, 1536, 3072\} or
- \{2048, 2048, 4096\}.

typedef struct _CpaCyRsaEncryptOpData CpaCyRsaEncryptOpData

File: cpa_cy_rsa.h

RSA Encryption Primitive Operation Data

This structure lists the different items that are required in the cpaCyRsaEncrypt function. As the RSA encryption primitive and verification primitive operations are mathematically identical this structure may also be used to perform an RSA verification primitive operation. When performing an RSA encryption primitive operation, the input data is the message and the output data is the cipher text. When performing an RSA verification primitive operation, the input data is the signature and the output data is the message. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the CpaCyRsaEncryptCbFunc callback function.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyRsaEncrypt function, and before it has been returned in the callback, undefined behavior will result. All values in this structure are required to be in Most Significant Byte first order, e.g. inputData.pData[0] = MSB.

typedef struct _CpaCyRsaDecryptOpData CpaCyRsaDecryptOpData

File: cpa_cy_rsa.h

RSA Decryption Primitive Operation Data

This structure lists the different items that are required in the cpaCyRsaDecrypt function. typedef struct _CpaCyRsaStats CPA_DEPRECATED

File: cpa_cy_rsa.h

RSA Statistics.

Deprecated:
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyRsaStats64.

This structure contains statistics on the RSA operations. Statistics are set to zero when the component is initialized, and are collected per instance.

typedef struct _CpaCyRsaStats64 CpaCyRsaStats64

File: cpa_cy_rsa.h

RSA Statistics (64-bit version).

This structure contains 64-bit version of the statistics on the RSA operations. Statistics are set to zero when the component is initialized, and are collected per instance.

typedef void(* CpaCyRsaKeyGenCbFunc)(void *pCallbackTag, CpaStatus status, void *pKeyGenOpData, CpaCyRsaPrivateKey *pPrivateKey, CpaCyRsaPublicKey *pPublicKey)

File: cpa_cy_rsa.h

Definition of the RSA key generation callback function.

This is the prototype for the RSA key generation callback function. The callback function pointer is passed in as a parameter to the cpaCyRsaGenKey function. It will be invoked once the request has completed.

Context:
This callback function can be executed in a context that DOES NOT permit sleeping to occur.

Assumptions:
None

Side-Effects:
None

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in] pCallbackTag Opaque value provided by user while making individual function calls.
[in] status Status of the operation. Valid values are CPA_STATUS_SUCCESS and CPA_STATUS_FAIL.
11.8 Enumeration Type Documentation

`enum _CpaCyRsaVersion`

File: cpa_cy_rsa.h

RSA Version.

This enumeration lists the version identifier for the PKCS #1 V2.1 standard.

Note:
Multi-prime (more than two primes) is not supported.

Enumerator:
- `CPA_CY_RSA_VERSION_TWO_PRIME` The version supported is "two-prime".

`enum _CpaCyRSAPrivateKeyRepType`

File: cpa_cy_rsa.h

RSA private key representation type.

This enumeration lists which PKCS V2.1 representation of the private key is being used.

Enumerator:
- `CPA_CY_RSA_PRIVATE_KEY_REP_TYPE_1` The first representation of the RSA private key.
- `CPA_CY_RSA_PRIVATE_KEY_REP_TYPE_2` The second representation of the RSA private key.
### 11.9 Function Documentation

**CpaStatus** `cpaCyRsaGenKey` (const `CpaInstanceHandle` `instanceHandle`,
const `CpaCyRsaKeyGenCbFunc` `pRsaKeyGenCb`,
void * `pCallbackTag`,
const `CpaCyRsaKeyGenOpData` * `pKeyGenOpData`,
`CpaCyRsaPrivateKey` * `pPrivateKey`,
`CpaCyRsaPublicKey` * `pPublicKey`)

**File:** `cpa_cy_rsa.h`

Generate RSA keys.

This function will generate private and public keys for RSA as specified in the PKCS #1 V2.1 standard. Both representation types of the private key may be generated.

**Context:**
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
Yes when configured to operate in synchronous mode.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in]</td>
<td><code>instanceHandle</code> Instance handle.</td>
</tr>
<tr>
<td>[in]</td>
<td><code>pRsaKeyGenCb</code> Pointer to the callback function to be invoked when the operation is complete. If this is set to a NULL value the function will operate synchronously.</td>
</tr>
<tr>
<td>[in]</td>
<td><code>pCallbackTag</code> Opaque User Data for this specific call. Will be returned unchanged in the callback.</td>
</tr>
<tr>
<td>[in]</td>
<td><code>pKeyGenOpData</code> Structure containing all the data needed to perform the RSA key generation operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.</td>
</tr>
<tr>
<td>[out]</td>
<td><code>pPrivateKey</code> Structure which contains pointers to the memory into which the generated private key will be written. The client MUST allocate memory for this structure, and for the pointers within it, recursively; on return, these will be populated.</td>
</tr>
</tbody>
</table>
Structure which contains pointers to the memory into which the generated public key will be written. The memory for this structure and for the modulusN parameter MUST be allocated by the client, and will be populated on return from the call. The field publicExponentE is not modified or touched in any way; it is the responsibility of the client to set this to the same value as the corresponding parameter on the CpaCyRsaKeyGenOpData structure before using the key for encryption.

Return values:
- CPA_STATUS_SUCCESS: Function executed successfully.
- CPA_STATUS_FAIL: Function failed.
- CPA_STATUS_RETRY: Resubmit the request.
- CPA_STATUS_INVALID_PARAM: Invalid parameter passed in.
- CPA_STATUS_RESOURCE: Error related to system resources.
- CPA_STATUS_RESTARTING: API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

Note:
When pRsaKeyGenCb is non-NULL, an asynchronous callback of type is generated in response to this function call. Any errors generated during processing are reported as part of the callback status code. For optimal performance, data pointers SHOULD be 8-byte aligned.

See also:
CpaCyRsaKeyGenOpData, CpaCyRsaKeyGenCbFunc, cpaCyRsaEncrypt(), cpaCyRsaDecrypt()

File: cpa_cy_rsa.h

Perform the RSA encrypt (or verify) primitive operation on the input data.

This function will perform an RSA encryption primitive operation on the input data using the specified RSA public key. As the RSA encryption primitive and verification primitive operations are mathematically identical this function may also be used to perform an RSA verification primitive operation.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Reference Number: 330685-001
11.9 Function Documentation

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:

- **[in]** `instanceHandle` Instance handle.
- **[in]** `pRsaEncryptCb` Pointer to callback function to be invoked when the operation is complete. If this is set to a NULL value the function will operate synchronously.
- **[in]** `pCallbackTag` Opaque User Data for this specific call. Will be returned unchanged in the callback.
- **[in]** `pEncryptOpData` Structure containing all the data needed to perform the RSA encryption operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[out]** `pOutputData` Pointer to structure into which the result of the RSA encryption primitive is written. The client MUST allocate this memory. The data pointed to is an integer in big-endian order. The value will be between 0 and the modulus n - 1. On invocation the callback function will contain this parameter in the pOut parameter.

Return values:

- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_RETRY` Resubmit the request.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
- `CPA_STATUS_RESTARTING` API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via `cpaCyStartInstance` function.

Postcondition:
None

Note:
When `pRsaEncryptCb` is non-NULL an asynchronous callback of type is generated in response to this function call. Any errors generated during processing are reported as part of the callback status code. For optimal performance, data pointers SHOULD be 8-byte aligned.

CpaStatus CPA_DEPRECATED cpayRsaQueryStats ( const CpaInstanceHandle instanceHandle,
                                            struct _CpaCyRsaStats * pRsaStats )

File: cpa_cy_rsa.h

Query statistics for a specific RSA instance.

Deprecated:
As of v1.3 of the Crypto API, this function has been deprecated, replaced by
cpayRsaQueryStats64().

This function will query a specific instance for RSA statistics. The user MUST allocate the CpaCyRsaStats
structure and pass the reference to that into this function call. This function will write the statistic results into
the passed in CpaCyRsaStats structure.

Note: statistics returned by this function do not interrupt current data processing and as such can be slightly
out of sync with operations that are in progress during the statistics retrieval process.

Context:
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES
NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.

Reentrant:
11.9 Function Documentation

No

Thread-safe:
Yes

Parameters:

[in]  
instanceHandle  Instance handle.
[out]  
pRsaStats  Pointer to memory into which the statistics will be written.

Return values:

CPA_STATUS_SUCCESS  Function executed successfully.
CPA_STATUS_FAIL  Function failed.
CPA_STATUS_INVALID_PARAM  Invalid parameter passed in.
CPA_STATUS_Resource  Error related to system resources.
CPA_STATUS_RESTARTING  API implementation is restarting. Resubmit the request.

Precondition:
Component has been initialized.

Postcondition:
None

Note:
This function operates in a synchronous manner and no asynchronous callback will be generated.

See also:
CpaCyRsaStats

12.5 Data Structure Documentation

12.5.1 _CpaCyDhPhase1KeyGenOpData Struct Reference

Collaboration diagram for _CpaCyDhPhase1KeyGenOpData:

File: cpa_cy_dh.h

Diffie-Hellman Phase 1 Key Generation Data.

This structure lists the different items that are required in the cpaCyDhKeyGenPhase1 function. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned with the CpaCyDhPhase1KeyGenOpData structure.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyDhKeyGenPhase1 function, and before it has been returned in the callback, undefined behavior will result. All values in this structure are required to be in Most Significant Byte first order, e.g. primeP.pData[0] = MSB.

12.5.1.2 Data Fields

- **CpaFlatBuffer primeP**
  Flat buffer containing a pointer to the random odd prime number (p).
- **CpaFlatBuffer baseG**
  Flat buffer containing a pointer to base (g).
- **CpaFlatBuffer privateValueX**
  Flat buffer containing a pointer to the private value (x).
12.5.1 _CpaCyDhPhase1KeyGenOpData Struct Reference

12.5.1.3 Field Documentation

CpaFlatBuffer _CpaCyDhPhase1KeyGenOpData::primeP
Flat buffer containing a pointer to the random odd prime number (p).

The bit-length of this number may be one of 768, 1024, 1536, 2048, 3072 or 4096.

CpaFlatBuffer _CpaCyDhPhase1KeyGenOpData::baseG
Flat buffer containing a pointer to base (g).

This MUST comply with the following: 0 < g < p.

CpaFlatBuffer _CpaCyDhPhase1KeyGenOpData::privateValueX
Flat buffer containing a pointer to the private value (x).

This is a random value which MUST satisfy the following condition: 0 < PrivateValueX < (PrimeP - 1)

Refer to PKCS #3: Diffie-Hellman Key-Agreement Standard for details. The client creating this data MUST ensure the compliance of this value with the standard. Note: This value is also needed to complete local phase 2 Diffie-Hellman operation.

12.5.2 _CpaCyDhPhase2SecretKeyGenOpData Struct Reference

Collaboration diagram for _CpaCyDhPhase2SecretKeyGenOpData:

12.5.2.1 Detailed Description

File: cpa_cy_dh.h

Diffie-Hellman Phase 2 Secret Key Generation Data.

This structure lists the different items that required in the cpaCyDhKeyGenPhase2Secret function. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the
memory passes to the function. Ownership of the memory returns to the client when this structure is returned with the callback.

Note: If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyDhKeyGenPhase2Secret function, and before it has been returned in the callback, undefined behavior will result. All values in this structure are required to be in Most Significant Byte first order, e.g. primeP.pData[0] = MSB.

12.5.2.2 Data Fields

- **CpaFlatBuffer primeP**
  Flat buffer containing a pointer to the random odd prime number (p).

- **CpaFlatBuffer remoteOctetStringPV**
  Flat buffer containing a pointer to the remote entity octet string Public Value (PV).

- **CpaFlatBuffer privateValueX**
  Flat buffer containing a pointer to the private value (x).

12.5.2.3 Field Documentation

- **CpaFlatBuffer _CpaCyDhPhase2SecretKeyGenOpData::primeP**
  Flat buffer containing a pointer to the random odd prime number (p).

  The bit-length of this number may be one of 768, 1024, 1536, 2048, 3072 or 4096. This SHOULD be the same prime number as was used in the phase 1 key generation operation.

- **CpaFlatBuffer _CpaCyDhPhase2SecretKeyGenOpData::remoteOctetStringPV**
  Flat buffer containing a pointer to the remote entity octet string Public Value (PV).

- **CpaFlatBuffer _CpaCyDhPhase2SecretKeyGenOpData::privateValueX**
  Flat buffer containing a pointer to the private value (x).

  This value may have been used in a call to the cpaCyDhKeyGenPhase1 function. This is a random value which MUST satisfy the following condition: \(0 < privateValueX < (primeP - 1)\).

12.5.3 _CpaCyDhStats Struct Reference

12.5.3.1 Detailed Description

File: cpa_cy_dh.h

Diffie-Hellman Statistics.

**Deprecated:**
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by **CpaCyDhStats64**.

This structure contains statistics on the Diffie-Hellman operations. Statistics are set to zero when the component is initialized, and are collected per instance.

12.5.3.2 Data Fields

- **Cpa32U numDhPhase1KeyGenRequests**
  Total number of successful Diffie-Hellman phase 1 key generation requests.
12.5.3 _CpaCyDhStats Struct Reference

- **Cpa32U numDhPhase1KeyGenRequestErrors**
  Total number of Diffie-Hellman phase 1 key generation requests that had an error and could not be processed.

- **Cpa32U numDhPhase1KeyGenCompleted**
  Total number of Diffie-Hellman phase 1 key generation operations that completed successfully.

- **Cpa32U numDhPhase1KeyGenCompletedErrors**
  Total number of Diffie-Hellman phase 1 key generation operations that could not be completed successfully due to errors.

- **Cpa32U numDhPhase2KeyGenRequests**
  Total number of successful Diffie-Hellman phase 2 key generation requests.

- **Cpa32U numDhPhase2KeyGenRequestErrors**
  Total number of Diffie-Hellman phase 2 key generation requests that had an error and could not be processed.

- **Cpa32U numDhPhase2KeyGenCompleted**
  Total number of Diffie-Hellman phase 2 key generation operations that completed successfully.

- **Cpa32U numDhPhase2KeyGenCompletedErrors**
  Total number of Diffie-Hellman phase 2 key generation operations that could not be completed successfully due to errors.

Diffie-Hellman Phase 2 Secret Key Generation Data.

This structure lists the different items that required in the cpaCyDhKeyGenPhase2Secret function. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned with the callback.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyDhKeyGenPhase2Secret function, and before it has been returned in the callback, undefined behavior will result. All values in this structure are required to be in Most Significant Byte first order, e.g. primeP.pData[0] = MSB.

typedef struct _CpaCyDhStats CPA_DEPRECATED
12.7 Function Documentation

File: cpa_cy_dh.h

Diffie-Hellman Statistics.

Deprecated:
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyDhStats64.

This structure contains statistics on the Diffie-Hellman operations. Statistics are set to zero when the component is initialized, and are collected per instance.

typedef struct _CpaCyDhStats64 CpaCyDhStats64

File: cpa_cy_dh.h

Diffie-Hellman Statistics (64-bit version).

This structure contains the 64-bit version of the statistics on the Diffie-Hellman operations. Statistics are set to zero when the component is initialized, and are collected per instance.

12.7 Function Documentation

CpaStatus cpaCyDhKeyGenPhase1 ( const CpaInstanceHandle instanceHandle, const CpaCyGenFlatBufCbFunc pDhPhase1Cb, void *pCallbackTag, const CpaCyDhPhase1KeyGenOpData *pPhase1KeyGenData, CpaFlatBuffer *pLocalOctetStringPV )

File: cpa_cy_dh.h

Function to implement Diffie-Hellman phase 1 operations.

This function may be used to implement the Diffie-Hellman phase 1 operations as defined in the PKCS #3 standard. It may be used to generate the the (local) octet string public value (PV) key. The prime number sizes specified in RFC 2409, 4306, and part of RFC 3526 are supported (bit sizes 6144 and 8192 from RFC 3536 are not supported).

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No
Thread-safe:
Yes

Parameters:

- **[in]** instanceHandle
  Instance handle.

- **[in]** pDhPhase1Cb
  Pointer to a callback function to be invoked when the operation is complete. If the pointer is set to a NULL value the function will operate synchronously.

- **[in]** pCallbackTag
  Opaque User Data for this specific call. Will be returned unchanged in the callback.

- **[in]** pPhase1KeyGenData
  Structure containing all the data needed to perform the DH Phase 1 key generation operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.

- **[out]** pLocalOctetStringPV
  Pointer to memory allocated by the client into which the (local) octet string Public Value (PV) will be written. This value needs to be sent to the remote entity with which Diffie-Hellman is negotiating. The size of this buffer in bytes (as represented by the dataLenInBytes field) MUST be at least big enough to store the public value, which may have a bit length up to that of pPrimeP. On invocation the callback function will contain this parameter in the pOut parameter.

Return values:

- **CPA_STATUS_SUCCESS**
  Function executed successfully.

- **CPA_STATUS_FAIL**
  Function failed.

- **CPA_STATUS_RETRY**
  Resubmit the request.

- **CPA_STATUS_INVALID_PARAM**
  Invalid parameter passed in.

- **CPA_STATUS_RESOURCE**
  Error related to system resources.

- **CPA_STATUS_RESTARTING**
  API implementation is restarting. Resubmit the request.

Precondition:

The component has been initialized via cpaCyStartInstance function.

Postcondition:

None

Note:

When pDhPhase1Cb is non-NULL an asynchronous callback of type CpaCyGenFlatBufCbFunc is generated in response to this function call. Any errors generated during processing are reported in the structure returned in the callback.

See also:

CpaCyGenFlatBufCbFunc, CpaCyDhPhase1KeyGenOpData

```c
CpaStatus cpaCyDhKeyGenPhase2Secret ( const CpaInstanceHandle instanceHandle,
                                 const CpaCyGenFlatBufCbFunc pDhPhase2Cb,
                                 void * pCallbackTag,
                                 const CpaCyDhPhase2SecretKeyGenOpData * pPhase2SecretKeyGenData,
                                 CpaFlatBuffer * pOctetStringSecretKey )
```
Function to implement Diffie-Hellman phase 2 operations.

This function may be used to implement the Diffie-Hellman phase 2 operation as defined in the PKCS #3 standard. It may be used to generate the Diffie-Hellman shared secret key.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:
- [in] instanceHandle: Instance handle.
- [in] pDhPhase2Cb: Pointer to a callback function to be invoked when the operation is complete. If the pointer is set to a NULL value the function will operate synchronously.
- [in] pCallbackTag: Opaque User Data for this specific call. Will be returned unchanged in the callback.
- [in] pPhase2SecretKeyGenData: Structure containing all the data needed to perform the DH Phase 2 secret key generation operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- [out] pOctetStringSecretKey: Pointer to memory allocated by the client into which the octet string secret key will be written. The size of this buffer in bytes (as represented by the dataLenInBytes field) MUST be at least big enough to store the public value, which may have a bit length up to that of pPrimeP. On invocation the callback function will contain this parameter in the pOut parameter.

Return values:
- CPA_STATUS_SUCCESS: Function executed successfully.
- CPA_STATUS_FAIL: Function failed.
- CPA_STATUS_RETRY: Resubmit the request.
- CPA_STATUS_INVALID_PARAM: Invalid parameter passed in.
- CPA_STATUS_RESOURCE: Error related to system resources.
- CPA_STATUS_RESTARTING: API implementation is restarting. Resubmit the request.

Precondition:
12.7 Function Documentation

The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

Note:
When pDhPhase2Cb is non-NULL an asynchronous callback of type CpaCyGenFlatBufCbFunc is generated in response to this function call. Any errors generated during processing are reported in the structure returned in the callback.

CpaCyDhStats64
13 Digital Signature Algorithm (DSA) API

[Cryptographic API]

Collaboration diagram for Digital Signature Algorithm (DSA) API:

13.1 Detailed Description

File: cpa_cy_dsa.h

These functions specify the API for Public Key Encryption (Cryptography) Digital Signature Algorithm (DSA) operations.

Support is provided for FIPS PUB 186-2 with Change Notice 1 specification, and optionally for FIPS PUB 186-3. If an implementation does not support FIPS PUB 186-3, then the corresponding functions may return a status of CPA_STATUS_FAIL.

Support for FIPS PUB 186-2 with Change Notice 1 implies supporting the following choice for the pair L and N:

- \( L = 1024, N = 160 \)

Support for FIPS PUB 186-3 implies supporting the following choices for the pair L and N:

- \( L = 1024, N = 160 \)
- \( L = 2048, N = 224 \)
- \( L = 2048, N = 256 \)
- \( L = 3072, N = 256 \)

Only the modular math aspects of DSA parameter generation and message signature generation and verification are implemented here. For full DSA support, this DSA API SHOULD be used in conjunction with other parts of this overall Cryptographic API. In particular the Symmetric functions (for hashing), the Random Number Generation functions, and the Prime Number Test functions will be required.

Note:

Large numbers are represented on the QuickAssist API as described in the Large Number API (Cryptographic Large Number API).

13.5.1.1 Detailed Description

File: cpa_cy_dsa.h

DSA P Parameter Generation Operation Data.

This structure contains the operation data for the cpaCyDsaGenPParam function. The client MUST allocate the memory for this structure and the items pointed to by this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback function.

For optimal performance all data buffers SHOULD be 8-byte aligned.

All values in this structure are required to be in Most Significant Byte first order, e.g. X.pData[0] = MSB.

**Note:**
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyDsaGenPParam function, and before it has been returned in the callback, undefined behavior will result.

**See also:**
- cpaCyDsaGenPParam()

13.6 Typedef Documentation

typedef struct _CpaCyDsaPPParamGenOpData CpaCyDsaPPParamGenOpData

**File: cpa_cy_dsa.h**

DSA P Parameter Generation Operation Data.

This structure contains the operation data for the cpaCyDsaGenPPParam function. The client MUST allocate the memory for this structure and the items pointed to by this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback function.

For optimal performance all data buffers SHOULD be 8-byte aligned.
13.6 Typedef Documentation

All values in this structure are required to be in Most Significant Byte first order, e.g. X.pData[0] = MSB.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyDsaGenPParam function, and before it has been returned in the callback, undefined behavior will result.

See also:
  cpaCyDsaGenPParam()

typedef struct _CpaCyDsaGParamGenOpData CpaCyDsaGParamGenOpData

File: cpa_cy_dsa.h

DSA G Parameter Generation Operation Data.

This structure contains the operation data for the cpaCyDsaGenGParam function. The client MUST allocate the memory for this structure and the items pointed to by this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback function.

All values in this structure are required to be in Most Significant Byte first order, e.g. P.pData[0] = MSB.

All numbers MUST be stored in big-endian order.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyDsaGenGParam function, and before it has been returned in the callback, undefined behavior will result.

See also:
  cpaCyDsaGenGParam()

typedef struct _CpaCyDsaYParamGenOpData CpaCyDsaYParamGenOpData

File: cpa_cy_dsa.h

DSA Y Parameter Generation Operation Data.

This structure contains the operation data for the cpaCyDsaGenYParam function. The client MUST allocate the memory for this structure and the items pointed to by this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback function.

For optimal performance all data SHOULD be 8-byte aligned.

All values in this structure are required to be in Most Significant Byte first order, e.g. P.pData[0] = MSB.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyDsaGenYParam function, and before it has been returned in the callback, undefined behavior will result.

  cpaCyDsaGenYParam()
typedef struct __CpaCyDsaRSignOpData CpaCyDsaRSignOpData

File: cpa_cy_dsa.h

DSA R Sign Operation Data.

This structure contains the operation data for the cpaCyDsaSignR function. The client MUST allocate the memory for this structure and the items pointed to by this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback function.

For optimal performance all data SHOULD be 8-byte aligned.

All values in this structure are required to be in Most Significant Byte first order, e.g. P.pData[0] = MSB.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyDsaSignR function, and before it has been returned in the callback, undefined behavior will result.

See also:
cpaCyDsaSignR()

typedef struct __CpaCyDsaSSignOpData CpaCyDsaSSignOpData

File: cpa_cy_dsa.h

DSA S Sign Operation Data.

This structure contains the operation data for the cpaCyDsaSignS function. The client MUST allocate the memory for this structure and the items pointed to by this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback function.

For optimal performance all data SHOULD be 8-byte aligned.

All values in this structure are required to be in Most Significant Byte first order, e.g. Q.pData[0] = MSB.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyDsaSignS function, and before it has been returned in the callback, undefined behavior will result.

13.6 Typedef Documentation

This structure contains 64-bit version of the statistics on the Cryptographic DSA operations. Statistics are set to zero when the component is initialized, and are collected per instance.

typedef void(* CpaCyDsaGenCbFunc)(void *pCallbackTag, CpaStatus status, void *pOpData, CpaBoolean protocolStatus, CpaFlatBuffer *pOut)

File: cpa_cy_dsa.h

Definition of a generic callback function invoked for a number of the DSA API functions.

This is the prototype for the cpaCyDsaGenCbFunc callback function.

Context:
This callback function can be executed in a context that DOES NOT permit sleeping to occur.

Assumptions:
None

Side-Effects:
None

Reentrant:
No

Thread-safe:
Yes

Parameters:
- [in] pCallbackTag User-supplied value to help identify request.
- [in] status Status of the operation. Valid values are CPA_STATUS_SUCCESS and CPA_STATUS_FAIL.
- [in] pOpData Opaque pointer to Operation data supplied in request.
- [in] protocolStatus The result passes/fails the DSA protocol related checks.
- [in] pOut Output data from the request.

Return values:
None

Precondition:
Component has been initialized.

Postcondition:
None

Note:
None

**File: cpa_cy_dsa.h**

Definition of callback function invoked for cpaCyDsaSignRS requests.

This is the prototype for the cpaCyDsaSignRS callback function, which will provide the DSA message signature r and s parameters.

**Context:**
This callback function can be executed in a context that DOES NOT permit sleeping to occur.

**Assumptions:**
None

**Side-Effects:**
None

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**
- `[in] pCallbackTag` User-supplied value to help identify request.
- `[in] status` Status of the operation. Valid values are CPA_STATUS_SUCCESS and CPA_STATUS_FAIL.
- `[in] pOpData` Operation data pointer supplied in request.
- `[in] protocolStatus` The result passes/fails the DSA protocol related checks.
- `[in] pR` DSA message signature r.
- `[in] pS` DSA message signature s.

**Return values:**
None

**Precondition:**
Component has been initialized.

**Postcondition:**
None

**Note:**
None

**See also:**

### 13.7 Function Documentation

```c
```

**File:** cpa_cy_dsa.h

Generate DSA P Parameter.

This function performs FIPS 186-3 Appendix A.1.1.2 steps 11.4 and 11.5, and part of step 11.7:
11.4. \( c = X \mod 2^q \). 11.5. \( p = X - (c - 1) \). 11.7. Test whether or not \( p \) is prime as specified in Appendix C.3. [Note that a GCD test against \( \sim 1400 \) small primes is performed on \( p \) to eliminate \( \sim 94\% \) of composites - this is NOT a "robust" primality test, as specified in Appendix C.3.]

The protocol status, returned in the callback function as parameter protocolStatus (or, in the case of synchronous invocation, in the parameter *pProtocolStatus) is used to indicate whether the value \( p \) is in the right range and has passed the limited primality test.

Specifically, (protocolStatus == CPA_TRUE) means \( p \) is in the right range and SHOULD be subjected to a robust primality test as specified in FIPS 186-3 Appendix C.3 (for example, 40 rounds of Miller-Rabin). Meanwhile, (protocolStatus == CPA_FALSE) means \( p \) is either composite, or \( p < 2^{(L-1)} \), in which case the value of \( p \) gets set to zero.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:
- \textbf{[in]} \hspace{1em} \textit{instanceHandle} \hspace{1em} Instance handle.
- \textbf{[in]} \hspace{1em} \textit{pCb} \hspace{1em} Callback function pointer. If this is set to a NULL value the function will operate synchronously.
- \textbf{[in]} \hspace{1em} \textit{pCallbackTag} \hspace{1em} User-supplied value to help identify request.
- \textbf{[in]} \hspace{1em} \textit{pOpData} \hspace{1em} Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- \textbf{[out]} \hspace{1em} \textit{pProtocolStatus} \hspace{1em} The result passes/fails the DSA protocol related checks.
- \textbf{[out]} \hspace{1em} \textit{pP} \hspace{1em} Candidate for DSA parameter \( p \), \( p \) odd and \( 2^{(L-1)} < p < X \) On invocation the callback function will contain this parameter in the pOut parameter.

Return values:
- \textbf{CPA_STATUS_SUCCESS}  \hspace{1em} Function executed successfully.
- \textbf{CPA_STATUS_FAIL} \hspace{1em} Function failed.
- \textbf{CPA_STATUS_RETRY} \hspace{1em} Resubmit the request.
- \textbf{CPA_STATUS_INVALID_PARAM} \hspace{1em} Invalid parameter passed in.
- \textbf{CPA_STATUS_Resource} \hspace{1em} Error related to system resources.
- \textbf{CPA_STATUS_RESTARTING} \hspace{1em} API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized.
Postcondition: None

Note: When pCb is non-NULL an asynchronous callback of type CpaCyDsaPParamGenCbFunc is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

See also: CpaCyDsaPParamGenOpData, CpaCyDsaGenCbFunc

CpaStatus cpaCyDsaGenGParam ( const CpaInstanceHandle instanceHandle, const CpaCyDsaGenCbFunc pCb, void * pCallbackTag, const CpaCyDsaGParamGenOpData * pOpData, CpaBoolean * pProtocolStatus, CpaFlatBuffer * pG )

File: cpa_cy_dsa.h

Generate DSA G Parameter.

This function performs FIPS 186-3 Appendix A.2.1, steps 1 and 3, and part of step 4:

1. e = (p - 1)/q. 3. Set g = h^e mod p. 4. If (g = 1), then go to step 2. Here, the implementation will check for g == 1, and return status accordingly.

The protocol status, returned in the callback function as parameter protocolStatus (or, in the case of synchronous invocation, in the parameter *pProtocolStatus) is used to indicate whether the value g is acceptable.

Specifically, (protocolStatus == CPA_TRUE) means g is acceptable. Meanwhile, (protocolStatus == CPA_FALSE) means g == 1, so a different value of h SHOULD be used to generate another value of g.

Context: When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions: None

Side-Effects: None

Blocking: Yes when configured to operate in synchronous mode.

Reentrant: No

Thread-safe: Yes

Parameters: 13.7 Function Documentation

```c
CpaStatus cpaCyDsaSignR ( const CpaInstanceHandle instanceHandle, const CpaCyDsaGenCbFunc pCb, void * pCallbackTag, const CpaCyDsaRSignOpData * pOpData, CpaBoolean * pProtocolStatus, CpaFlatBuffer * pR )
```
### Function Documentation

**File: cpa_cy_dsa.h**

Generate DSA R Signature.

This function generates the DSA R signature as described in FIPS 186-3 Section 4.6: \( r = (g^k \mod p) \mod q \)

The protocol status, returned in the callback function as parameter protocolStatus (or, in the case of synchronous invocation, in the parameter *pProtocolStatus) is used to indicate whether the value \( r = 0 \).

Specifically, \( \text{protocolStatus} == \text{CPA_TRUE} \) means \( r \neq 0 \), while \( \text{protocolStatus} == \text{CPA_FALSE} \) means \( r == 0 \).

Generation of signature \( r \) does not depend on the content of the message being signed, so this operation can be done in advance for different values of \( k \). Then once each message becomes available only the signature \( s \) needs to be generated.

**Context:**
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
Yes when configured to operate in synchronous mode.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

- **[in]** `instanceHandle` Instance handle.
- **[in]** `pCb` Callback function pointer. If this is set to a NULL value the function will operate synchronously.
- **[in]** `pCallbackTag` User-supplied value to help identify request.
- **[in]** `pOpData` Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[out]** `pProtocolStatus` The result passes/fails the DSA protocol related checks.
- **[out]** `pR` DSA message signature \( r \). On invocation the callback function will contain this parameter in the pOut parameter.

**Return values:**

- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_RETRY` Resubmit the request.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

Note:
When pCb is non-NULL an asynchronous callback of type CpaCyDsaRSignCbFunc is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

See also:
CpaCyDsaRSignOpData, CpaCyDsaGenCbFunc, cpaCyDsaSignS(), cpaCyDsaSignRS()

CpaStatus cpaCyDsaSignS ( const CpaInstanceHandle instanceHandle, const CpaCyDsaGenCbFunc pCb, void * pCallbackTag, const CpaCyDsaSSignOpData * pOpData, CpaBoolean * pProtocolStatus, CpaFlatBuffer * pS )

File: cpa_cy_dsa.h

Generate DSA S Signature.

This function generates the DSA S signature as described in FIPS 186-3 Section 4.6: \( s = (k^{-1}(z + xr)) \mod q \)

Here, \( z \) = the leftmost \( \min(N, \text{outlen}) \) bits of Hash(M). This function does not perform the SHA digest; \( z \) is computed by the caller and passed as a parameter in the pOpData field.

The protocol status, returned in the callback function as parameter protocolStatus (or, in the case of synchronous invocation, in the parameter *pProtocolStatus) is used to indicate whether the value \( s = 0 \).

Specifically, (protocolStatus == CPA_TRUE) means \( s \neq 0 \), while (protocolStatus == CPA_FALSE) means \( s = 0 \).

If signature r has been generated in advance, then this function can be used to generate the signature s once the message becomes available.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.
13.7 Function Documentation

Reentrant:
No

Thread-safe:
Yes

Parameters:

- **instanceHandle** (in) Instance handle.
- **pCb** (in) Callback function pointer. If this is set to a NULL value the function will operate synchronously.
- **pCallbackTag** (in) User-supplied value to help identify request.
- **pOpData** (in) Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **pProtocolStatus** (out) The result passes/fails the DSA protocol related checks.
- **pS** (out) DSA message signature s. On invocation the callback function will contain this parameter in the pOut parameter.

Return values:

- **CPA_STATUS_SUCCESS** Function executed successfully.
- **CPA_STATUS_FAIL** Function failed.
- **CPA_STATUS_RETRY** Resubmit the request.
- **CPA_STATUS_INVALID_PARAM** Invalid parameter passed in.
- **CPA_STATUS_RESOURCE** Error related to system resources.
- **CPA_STATUS_RESTARTING** API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

Note:
When pCb is non-NULL an asynchronous callback of type CpaCyDsaSSignCbFunc is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

```c
CpaStatus cpaCyDsaSignRS ( const CpainstanceHandle instanceHandle, const CpaCyDsaRSSignCbFunc pCb, void * pCallbackTag, const CpaCyDsaRSSignOpData * pOpData, CpaBoolean * pProtocolStatus, CpaFlatBuffer * pR, CpaFlatBuffer * pS )
```

File: cpa_cy_dsa.h

Generate DSA R and S Signatures.

This function generates the DSA R and S signatures as described in FIPS 186-3 Section 4.6:

\[ r = (g^k \mod p) \mod q \quad s = (k^{-1}(z + xr)) \mod q \]
Here, \( z \) = the leftmost \( \min(N, \text{outlen}) \) bits of Hash(M). This function does not perform the SHA digest; \( z \) is computed by the caller and passed as a parameter in the pOpData field.

The protocol status, returned in the callback function as parameter protocolStatus (or, in the case of synchronous invocation, in the parameter *pProtocolStatus) is used to indicate whether either of the values \( r \) or \( s \) are zero.

Specifically, \((\text{protocolStatus} == \text{CPA\_TRUE})\) means neither is zero (i.e. \((r != 0) \land (s != 0))\), while \((\text{protocolStatus} == \text{CPA\_FALSE})\) means that at least one of \( r \) or \( s \) is zero (i.e. \((r == 0) \lor (s == 0))\).

**Context:**
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
Yes when configured to operate in synchronous mode.

**Reentrant:**
No

**Thread-safe:**

```
CpaStatus cpaCyDsaVerify ( const CpaInstanceHandle instanceHandle, const CpaCyDsaVerifyCbFunc pCb, void *pCallbackTag, const CpaCyDsaVerifyOpData *pOpData, CpaBoolean *pVerifyStatus )
```

File: cpa_cy_dsa.h

Verify DSA R and S signatures.

This function performs FIPS 186-3 Section 4.7:  
\[
w = (s')^{-1} \mod q \\
u1 = (zw) \mod q \\
u2 = ((r')w) \mod q \\
v = (((g)^{u1} (y)^{u2}) \mod p) \mod q
\]

Here, \( z \) = the leftmost \( \min(N, \text{outlen}) \) bits of Hash(M'). This function does not perform the SHA digest; \( z \) is computed by the caller and passed as a parameter in the pOpData field.

A response status of ok (verifyStatus == CPA_TRUE) means \( v = r' \). A response status of not ok (verifyStatus == CPA_FALSE) means \( v \neq r' \).

Context: When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions: None

Side-Effects: None

Blocking: Yes when configured to operate in synchronous mode.

Reentrant: No

Thread-safe: Yes

Parameters:
- \textbf{[in]} \textit{instanceHandle} Instance handle.
- \textbf{[in]} \textit{pCb} Callback function pointer. If this is set to a NULL value the function will operate synchronously.
- \textbf{[in]} \textit{pCallbackTag} User-supplied value to help identify request.
- \textbf{[in]} \textit{pOpData} Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes
ownership of the memory until it is returned in the callback.

Return values:

- `CPA_STATUS_SUCCESS`: Function executed successfully.
- `CPA_STATUS_FAIL`: Function failed.
- `CPA_STATUS_RETRY`: Resubmit the request.
- `CPA_STATUS_INVALID_PARAM`: Invalid parameter passed in.
- `CPA_STATUS_RESOURCE`: Error related to system resources.
- `CPA_STATUS_RESTARTING`: API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via `cpaCyStartInstance` function.

Postcondition:
None

Note:
When `pCb` is non-NULL an asynchronous callback of type `CpaCyDsaVerifyCbFunc` is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

File: `cpa_cy_dsa.h`

Query statistics for a specific DSA instance.

Deprecated:
As of v1.3 of the Crypto API, this function has been deprecated, replaced by `cpaCyDsaQueryStats64()`.

This function will query a specific instance of the DSA implementation for statistics. The user MUST allocate the `CpaCyDsaStats` structure and pass the reference to that structure into this function call. This function writes the statistic results into the passed in `CpaCyDsaStats` structure.

Note: statistics returned by this function do not interrupt current data processing and as such can be slightly out of sync with operations that are in progress during the statistics retrieval process.

Context:
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.
13.7 Function Documentation

Reentrant:
No

Thread-safe:
Yes

Parameters:

[in]  instanceHandle  Instance handle.
[out]  pDsaStats  Pointer to memory into which the statistics will be written.

Return values:

CPA_STATUS_SUCCESS  Function executed successfully.
CPA_STATUS_FAIL  Function failed.
CPA_STATUS_INVALID_PARAM  Invalid parameter passed in.
CPA_STATUS_RESOURCE  Error related to system resources.
CPA_STATUS_RESTARTING  API implementation is restarting. Resubmit the request.

Precondition:
Component has been initialized.

Postcondition:
None

Note:
This function operates in a synchronous manner and no asynchronous callback will be generated.

14 Elliptic Curve (EC) API

[Cryptographic API]

Collaboration diagram for Elliptic Curve (EC) API:

![Diagram showing collaboration between Cryptographic API and Elliptic Curve (EC) API]

14.1 Detailed Description

File: cpa_cy_ec.h

These functions specify the API for Public Key Encryption (Cryptography) Elliptic Curve (EC) operations.

All implementations will support at least the following:

- Random curves where the max(\log_2(q), \log_2(n) + \log_2(h)) \leq 512 where q is the modulus, n is the order of the curve and h is the cofactor

Note:
Large numbers are represented on the QuickAssist API as described in the Large Number API (Cryptographic Large Number API).

In addition, the bit length of large numbers passed to the API MUST NOT exceed 576 bits for Elliptic Curve operations.

Note that this does not indicate an error.

### 14.7 Typedef Documentation

typedef enum _CpaCyEcFieldType CpaCyEcFieldType

File: cpa_cy_ec.h

Field types for Elliptic Curve

As defined by FIPS-186-3, for each cryptovariable length, there are two kinds of fields.

- A prime field is the field $GF(p)$ which contains a prime number $p$ of elements. The elements of this field are the integers modulo $p$, and the field arithmetic is implemented in terms of the arithmetic of integers modulo $p$.
- A binary field is the field $GF(2^m)$ which contains $2^m$ elements for some $m$ (called the degree of the field). The elements of this field are the bit strings of length $m$, and the field arithmetic is implemented in terms of operations on the bits.

typedef struct _CpaCyEcPointMultiplyOpData CpaCyEcPointMultiplyOpData

File: cpa_cy_ec.h

EC Point Multiplication Operation Data.

This structure contains the operation data for the cpaCyEcPointMultiply function. The client MUST allocate the memory for this structure and the items pointed to by this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback function.

For optimal performance all data buffers SHOULD be 8-byte aligned.

All values in this structure are required to be in Most Significant Byte first order, e.g. a.pData[0] = MSB.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyEcPointMultiply function, and before it has been returned in the callback, undefined
typedef struct _CpaCyEcPointVerifyOpData CpaCyEcPointVerifyOpData

File: cpa_cy_ec.h

EC Point Verification Operation Data.

This structure contains the operation data for the cpaCyEcPointVerify function. The client MUST allocate
the memory for this structure and the items pointed to by this structure. When the structure is passed into
the function, ownership of the memory passes to the function. Ownership of the memory returns to the
client when this structure is returned in the callback function.

For optimal performance all data buffers SHOULD be 8-byte aligned.

All values in this structure are required to be in Most Significant Byte first order, e.g. a.pData[0] = MSB.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to
the CpaCyEcPointVerify function, and before it has been returned in the callback, undefined
behavior will result.

See also:
cpaCyEcPointVerify()
Thread-safe:
Yes

Parameters:
[in] pCallbackTag User-supplied value to help identify request.
[in] status Status of the operation. Valid values are CPA_STATUS_SUCCESS and CPA_STATUS_FAIL.
[in] pOpData Opaque pointer to Operation data supplied in request.
[in] multiplyStatus Status of the point multiplication.
[in] pXk x coordinate of resultant EC point.
[in] pYk y coordinate of resultant EC point.

Return values:
None

### 14.8 Enumeration Type Documentation

```cpp
typedef enum _CpaCyEcFieldType {
    CPA_CY_EC_FIELD_TYPE_PRIME,
    CPA_CY_EC_FIELD_TYPE_BINARY
} CpaCyEcFieldType;
```

**File:** cpa_cy_ec.h

Field types for Elliptic Curve

As defined by FIPS-186-3, for each cryptoivariable length, there are two kinds of fields.

- A prime field is the field GF(p) which contains a prime number p of elements. The elements of this field are the integers modulo p, and the field arithmetic is implemented in terms of the arithmetic of integers modulo p.
- A binary field is the field GF(2^m) which contains 2^m elements for some m (called the degree of the field). The elements of this field are the bit strings of length m, and the field arithmetic is implemented in terms of operations on the bits.

**Enumerator:**
- `CPA_CY_EC_FIELD_TYPE_PRIME` A prime field, GF(p).
- `CPA_CY_EC_FIELD_TYPE_BINARY` A binary field, GF(2^m).

### 14.9 Function Documentation

```cpp
CpaStatus cpaCyEcPointMultiply ( const CpaInstanceHandle instanceHandle, const CpaCyEcPointMultiplyCbFunc pCb, void * pCallbackTag, const CpaCyEcPointMultiplyOpData * pOpData, CpaBoolean * pMultiplyStatus, CpaFlatBuffer * pXk, CpaFlatBuffer * pYk )
```
Perform EC Point Multiplication.

This function performs Elliptic Curve Point Multiplication as per ANSI X9.63 Annex D.3.2.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:

- **[in]** `instanceHandle` Instance handle.
- **[in]** `pCb` Callback function pointer. If this is set to a NULL value the function will operate synchronously.
- **[in]** `pCallbackTag` User-supplied value to help identify request.
- **[in]** `pOpData` Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[out]** `pMultiplyStatus` In synchronous mode, the multiply output is valid (CPA_TRUE) or the output is invalid (CPA_FALSE).
- **[out]** `pXk` Pointer to xk flat buffer.
- **[out]** `pYk` Pointer to yk flat buffer.

Return values:

- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_RETRY` Resubmit the request.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
- `CPA_STATUS_RESTARTING` API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

Note:
14.9 Function Documentation

When pCb is non-NULL an asynchronous callback of type CpaCyEcPointMultiplyCbFunc is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

See also:
CpaCyEcPointMultiplyOpData, CpaCyEcPointMultiplyCbFunc

CpaStatus cpaCyEcPointVerify ( const CpaInstanceHandle instanceHandle, const CpaCyEcPointVerifyCbFunc pCb, void *pCallbackTag, const CpaCyEcPointVerifyOpData *pOpData, CpaBoolean *pVerifyStatus )

File: cpa_cy_ec.h

Verify that a point is on an elliptic curve.

This function performs Elliptic Curve Point Verification, as per steps a, b and c of ANSI X9.62 Annex A.4.2. (To perform the final step d, the user can call cpaCyEcPointMultiply.)

This function checks if the specified point satisfies the Weierstrass equation for an Elliptic Curve.

For GF(p): y^2 = (x^3 + ax + b) mod p
For GF(2^m): y^2 + xy = x^3 + ax^2 + b mod p

where p is the irreducible polynomial over GF(2^m)

Use this function to verify a point is in the correct range and is NOT the point at infinity.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:

[in] instanceHandle Instance handle.
[in] pCb Callback function pointer. If this is set to a NULL value the function will operate synchronously.
[in] pCallbackTag User-supplied value to help identify request.
[in] pOpData Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes
14.9 Function Documentation

ownership of the memory until it is returned in the callback.

[out] pVerifyStatus

In synchronous mode, set to CPA_FALSE if the point is NOT on the curve or at infinity. Set to CPA_TRUE if the point is on the curve.

Return values:
- **CPA_STATUS_SUCCESS** Function executed successfully.
- **CPA_STATUS_FAIL** Function failed.
- **CPA_STATUS_RETRY** Resubmit the request.
- **CPA_STATUS_INVALID_PARAM** Invalid parameter passed in.
- **CPA_STATUS_Resource** Error related to system resources.
- **CPA_STATUS_RESTARTING** API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

Note:
When pCb is non-NULL an asynchronous callback of type CpaCyEcPointVerifyCbFunc is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

See also:
CpaCyEcPointVerifyOpData, CpaCyEcPointVerifyCbFunc

```c
CpaStatus cpaCyEcQueryStats64 ( const CpaInstanceHandle instanceHandle, CpaCyEcStats64 * pEcStats )
```

File: cpa_cy_ec.h

Query statistics for a specific EC instance.

This function will query a specific instance of the EC implementation for statistics. The user MUST allocate the CpaCyEcStats64 structure and pass the reference to that structure into this function call. This function writes the statistic results into the passed in CpaCyEcStats64 structure.

Note: statistics returned by this function do not interrupt current data processing and as such can be slightly out of sync with operations that are in progress during the statistics retrieval process.

Context:
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.

Reentrant:
No

Thread-safe:
Yes

Parameters:

[in]  instanceHandle  Instance handle.
[out]  pEcStats  Pointer to memory into which the statistics will be written.

Return values:

CPA_STATUS_SUCCESS  Function executed successfully.
CPA_STATUS_FAIL  Function failed.
CPA_STATUS_INVALID_PARAM  Invalid parameter passed in.
CPA_STATUS_RESOURCE  Error related to system resources.
CPA_STATUS_RESTARTING  API implementation is restarting. Resubmit the request.

Precondition:
Component has been initialized.

Postcondition:
None

Note:
This function operates in a synchronous manner and no asynchronous callback will be generated.

15.5 Data Structure Documentation

15.5.1 _CpaCyEcdhPointMultiplyOpData Struct Reference

Collaboration diagram for _CpaCyEcdhPointMultiplyOpData:

---

15.5.1.1 Detailed Description

File: cpa_cy_ecdh.h

ECDH Point Multiplication Operation Data.

This structure contains the operation data for the cpaCyEcdhPointMultiply function. The client MUST allocate the memory for this structure and the items pointed to by this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback function.

For optimal performance all data buffers SHOULD be 8-byte aligned.

All values in this structure are required to be in Most Significant Byte first order, e.g. a.pData[0] = MSB.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyEcdhPointMultiply function, and before it has been returned in the callback, undefined behavior will result.

See also:
15.5.1.2 Data Fields

- **CpaFlatBuffer k**
  scalar multiplier (k > 0 and k < n)
- **CpaFlatBuffer xg**
  x coordinate of curve point
- **CpaFlatBuffer yg**
  y coordinate of curve point
- **CpaFlatBuffer a**
  a equation coefficient
- **CpaFlatBuffer b**
  b equation coefficient
- **CpaFlatBuffer q**
  prime modulus or irreducible polynomial over GF(2^r)
- **CpaFlatBuffer h**
  cofactor of the operation.
- **CpaCyEcFieldType fieldType**
  field type for the operation
- **CpaBoolean pointVerify**
  set to CPA_TRUE to do a verification before the multiplication

15.5.1.3 Field Documentation

- **CpaFlatBuffer _CpaCyEcdhPointMultiplyOpData::k**
  scalar multiplier (k > 0 and k < n)
- **CpaFlatBuffer _CpaCyEcdhPointMultiplyOpData::xg**
  x coordinate of curve point
- **CpaFlatBuffer _CpaCyEcdhPointMultiplyOpData::yg**
  y coordinate of curve point
- **CpaFlatBuffer _CpaCyEcdhPointMultiplyOpData::a**
  a equation coefficient
- **CpaFlatBuffer _CpaCyEcdhPointMultiplyOpData::b**
  b equation coefficient
- **CpaFlatBuffer _CpaCyEcdhPointMultiplyOpData::q**
  prime modulus or irreducible polynomial over GF(2^r)
- **CpaFlatBuffer _CpaCyEcdhPointMultiplyOpData::h**
  cofactor of the operation.

If the cofactor is NOT required then set the cofactor to 1 or the data pointer of the Flat Buffer to NULL. There are some restrictions on the value of the cofactor. Implementations of this API will support at least the following:

- NIST standard curves and their cofactors (1, 2 and 4)
- Random curves where \( \max(\log_2(p), \log_2(n) + \log_2(h)) \leq 512 \), where \( p \) is the modulus, \( n \) is the order of the curve and \( h \) is the cofactor
15.5.2 _CpaCyEcdhStats64 Struct Reference

**CpaCyEcFieldtype _CpaCyEcdhPointMultiplyOpData::fieldType**
field type for the operation

**CpaBoolean _CpaCyEcdhPointMultiplyOpData::pointVerify**
set to CPA_TRUE to do a verification before the multiplication

---

ECDH Point Multiplication.

This function performs ECDH Point Multiplication as defined in ANSI X9.63 2001 section 5.4

**Context:**
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be
15.7 Function Documentation

executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:

- **instanceHandle** [in] Instance handle.
- **pCb** [in] Callback function pointer. If this is set to a NULL value the function will operate synchronously.
- **pCallbackTag** [in] User-supplied value to help identify request.
- **pOpData** [in] Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **pMultiplyStatus** [out] In synchronous mode, the status of the point multiplication and the verification when the pointVerify bit is set in the CpaCyEcdhPointMultiplyOpData structure. Set to CPA_FALSE if the point is NOT on the curve or at infinity. Set to CPA_TRUE if the point is on the curve.
- **pXk** [out] Pointer to x coordinate flat buffer.
- **pYk** [out] Pointer to y coordinate flat buffer.

Return values:

- **CPA_STATUS_SUCCESS** Function executed successfully.
- **CPA_STATUS_FAIL** Function failed.
- **CPA_STATUS_RETRY** Resubmit the request.
- **CPA_STATUS_INVALID_PARAM** Invalid parameter passed in.
- **CPA_STATUS_RESOURCE** Error related to system resources.
- **CPA_STATUS_RESTARTING** API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

Note:
When pCb is non-NULL an asynchronous callback of type CpaCyEcdhPointMultiplyCbFunc is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

**CpaStatus** cpaCyEcdhQueryStats64 ( const CpaInstanceHandle instanceHandle, CpaCyEcdhStats64 *pEcdhStats )

File: cpa_cy_ecdh.h

Query statistics for a specific ECDH instance.

This function will query a specific instance of the ECDH implementation for statistics. The user MUST allocate the CpaCyEcdhStats64 structure and pass the reference to that structure into this function call. This function writes the statistic results into the passed in CpaCyEcdhStats64 structure.

Note: statistics returned by this function do not interrupt current data processing and as such can be slightly out of sync with operations that are in progress during the statistics retrieval process.

**Context:**
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
This function is synchronous and blocking.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**
- **[in]** instanceHandle Instance handle.
- **[out]** pEcdhStats Pointer to memory into which the statistics will be written.

**Return values:**
- CPA_STATUS_SUCCESS Function executed successfully.
- CPA_STATUS_FAIL Function failed.
- CPA_STATUS_INVALID_PARAM Invalid parameter passed in.
- CPA_STATUS_RESOURCE Error related to system resources.
- CPA_STATUS_RESTARTING API implementation is restarting. Resubmit the request.

**Precondition:**
Component has been initialized.

**Postcondition:**
None

**Note:**
This function operates in a synchronous manner and no asynchronous callback will be generated.

ECDSA Verify Operation Data, for Public Key.

This structure contains the operation data for the CpaCyEcdsaVerify function. The client MUST allocate the memory for this structure and the items pointed to by this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback function.
For optimal performance all data buffers SHOULD be 8-byte aligned.

All values in this structure are required to be in Most Significant Byte first order, e.g. a.pData[0] = MSB.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyEcdsaVerify function, and before it has been returned in the callback, undefined behavior will result.

16.5.4.2 Data Fields

- **CpaFlatBuffer xg**
  x coordinate of base point G
- **CpaFlatBuffer yg**
  y coordinate of base point G
- **CpaFlatBuffer n**
  order of the base point G, which shall be prime
- **CpaFlatBuffer q**
  prime modulus or irreducible polynomial over GF(2^r)
- **CpaFlatBuffer a**
  a elliptic curve coefficient
- **CpaFlatBuffer b**
  b elliptic curve coefficient
- **CpaFlatBuffer m**
  digest of the message to be signed
- **CpaFlatBuffer r**
  ECDSA r signature value (r > 0 and r < n).
- **CpaFlatBuffer s**
  ECDSA s signature value (s > 0 and s < n).
- **CpaFlatBuffer xp**
  x coordinate of point P (public key)
- **CpaFlatBuffer yp**
  y coordinate of point P (public key)
- **CpaCyEcFieldType fieldType**
  field type for the operation

16.5.4.3 Field Documentation

- **CpaFlatBuffer _CpaCyEcdsaVerifyOpData::xg**
  x coordinate of base point G
- **CpaFlatBuffer _CpaCyEcdsaVerifyOpData::yg**
  y coordinate of base point G
- **CpaFlatBuffer _CpaCyEcdsaVerifyOpData::n**
  order of the base point G, which shall be prime
- **CpaFlatBuffer _CpaCyEcdsaVerifyOpData::q**
  prime modulus or irreducible polynomial over GF(2^r)
16.5.5  _CpaCyEcdsaStats64 Struct Reference

**CpaFlatBuffer _CpaCyEcdsaVerifyOpData::a**
a elliptic curve coefficient

**CpaFlatBuffer _CpaCyEcdsaVerifyOpData::b**
b elliptic curve coefficient

**CpaFlatBuffer _CpaCyEcdsaVerifyOpData::m**
digest of the message to be signed

**CpaFlatBuffer _CpaCyEcdsaVerifyOpData::r**
ECDSA r signature value \( (r > 0 \text{ and } r < n) \).

**CpaFlatBuffer _CpaCyEcdsaVerifyOpData::s**
ECDSA s signature value \( (s > 0 \text{ and } s < n) \).

**CpaFlatBuffer _CpaCyEcdsaVerifyOpData::xp**
x coordinate of point P (public key)

**CpaFlatBuffer _CpaCyEcdsaVerifyOpData::yp**
y coordinate of point P (public key)

**CpaCyEcFieldType _CpaCyEcdsaVerifyOpData::fieldType**
field type for the operation

16.5.5.1 Detailed Description

File: cpa_cy_ecdsa.h

Cryptographic ECDSA Statistics.

This structure contains statistics on the Cryptographic ECDSA operations. Statistics are set to zero when the component is initialized, and are collected per instance.

16.5.5.2 Data Fields

- **Cpa64U numEcdsaSignRRequests**
  Total number of ECDSA Sign R operation requests.
- **Cpa64U numEcdsaSignRRequestErrors**
  Total number of ECDSA Sign R operation requests that had an error and could not be processed.
- **Cpa64U numEcdsaSignRCompleted**
  Total number of ECDSA Sign R operation requests that completed successfully.
- **Cpa64U numEcdsaSignRCompletedErrors**
  Total number of ECDSA Sign R operation requests that could not be completed successfully due to errors.
- **Cpa64U numEcdsaSignRCompletedOutputInvalid**
  Total number of ECDSA Sign R operation requests could not be completed successfully due to an invalid output.
- **Cpa64U numEcdsaSignSRequests**
  Total number of ECDSA Sign S operation requests.
16.5.5.3 Field Documentation

- **Cpa64U _CpaCyEcdsaStats64::numEcdsaSignSRequests**
  Total number of ECDSA Sign S operation requests.

- **Cpa64U _CpaCyEcdsaStats64::numEcdsaSignSRequestErrors**
  Total number of ECDSA Sign S operation requests that had an error and could not be processed.

- **Cpa64U _CpaCyEcdsaStats64::numEcdsaSignSCompleted**
  Total number of ECDSA Sign S operation requests that completed successfully.

- **Cpa64U _CpaCyEcdsaStats64::numEcdsaSignSCompletedErrors**
  Total number of ECDSA Sign S operation requests that could not be completed successfully due to errors.

- **Cpa64U _CpaCyEcdsaStats64::numEcdsaSignSCompletedOutputInvalid**
  Total number of ECDSA Sign S operation requests could not be completed successfully due to an invalid output.

- **Cpa64U _CpaCyEcdsaStats64::numEcdsaSignRSRequests**
  Total number of ECDSA Sign R & S operation requests.

- **Cpa64U _CpaCyEcdsaStats64::numEcdsaSignRRequestErrors**
  Total number of ECDSA Sign R & S operation requests that had an error and could not be processed.

Cryptographic ECDSA Statistics.
**16.6 Typedef Documentation**

This structure contains statistics on the Cryptographic ECDSA operations. Statistics are set to zero when the component is initialized, and are collected per instance.

```c
typedef void(* CpaCyEcdsaGenSignCbFunc)(void *pCallbackTag, CpaStatus status, void *pOpData, CpaBoolean multiplyStatus, CpaFlatBuffer *pOut)
```

**File: cpa_cy_ecdsa.h**

Definition of a generic callback function invoked for a number of the ECDSA Sign API functions.

This is the prototype for the CpaCyEcdsaGenSignCbFunc callback function.

**Context:**

This callback function can be executed in a context that DOES NOT permit sleeping to occur.

**Assumptions:**

None

**Side-Effects:**

None

**Reentrant:**

No

**Thread-safe:**

Yes

**Parameters:**

- **[in]** `pCallbackTag` User-supplied value to help identify request.
- **[in]** `status` Status of the operation. Valid values are CPA_STATUS_SUCCESS and CPA_STATUS_FAIL.
- **[in]** `pOpData` Opaque pointer to Operation data supplied in request.
- **[in]** `multiplyStatus` Status of the point multiplication.
- **[in]** `pOut` Output data from the request.

**Return values:**

None

**Precondition:**

Component has been initialized.

**Postcondition:**

None

**Note:**

None

16.6 Typedef Documentation

File: cpa_cy_ecdsa.h

Definition of callback function invoked for cpaCyEcdsaSignRS requests.

This is the prototype for the CpaCyEcdsaSignRS_cbFunc callback function, which will provide the ECDSA message signature r and s parameters.

Context:
This callback function can be executed in a context that DOES NOT permit sleeping to occur.

Assumptions:
None

Side-Effects:
None

Reentrant:
No

Thread-safe:
Yes

Parameters:

[in] pCallbackTag User-supplied value to help identify request.
[in] status Status of the operation. Valid values are CPA_STATUS_SUCCESS and CPA_STATUS_FAIL.
[in] multiplyStatus Status of the point multiplication.
[in] pR Ecdsa message signature r.
[in] pS Ecdsa message signature s.

Return values:
None

Precondition:
Component has been initialized.

Postcondition:
None

Note:
None

16.7 Function Documentation

CpaStatus cpaCyEcdsaSignR (const CpaInstanceHandle instanceHandle, const CpaCyEcdsaGenSignCbFunc pCb, void * pCallbackTag, const CpaCyEcdsaSignROpData pOpData, const CpaBoolean * pSignStatus, CpaFlatBuffer * pR)

File: cpa_cy_ecdsa.h

Generate ECDSA Signature R.

This function generates ECDSA Signature R as per ANSI X9.62 2005 section 7.3.
16.7 Function Documentation

**Context:**
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
Yes when configured to operate in synchronous mode.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

- **[in]** `instanceHandle` Instance handle.
- **[in]** `pCb` Callback function pointer. If this is set to a NULL value the function will operate synchronously.
- **[in]** `pCallbackTag` User-supplied value to help identify request.
- **[in]** `pOpData` Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[out]** `pSignStatus` In synchronous mode, the multiply output is valid (CPA_TRUE) or the output is invalid (CPA_FALSE).
- **[out]** `pR` ECDSA message signature r.

**Return values:**
- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_RETRY` Resubmit the request.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
- `CPA_STATUS_RESTARTING` API implementation is restarting. Resubmit the request.

**Precondition:**
The component has been initialized via `cpaCyStartInstance` function.

**Postcondition:**
None

**Note:**
When pCb is non-NULL an asynchronous callback is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

**See also:**
None

Generate ECDSA Signature S.

This function generates ECDSA Signature S as per ANSI X9.62 2005 section 7.3.

**Context:**
- When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
- None

**Side-Effects:**
- None

**Blocking:**
- Yes when configured to operate in synchronous mode.

**Reentrant:**
- No

**Thread-safe:**
- Yes

**Parameters:**
- **instanceHandle**  
  Instance handle.
- **pCb**  
  Callback function pointer. If this is set to a NULL value the function will operate synchronously.
- **pCallbackTag**  
  User-supplied value to help identify request.
- **pOpData**  
  Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **pSignStatus**  
  In synchronous mode, the multiply output is valid (CPA_TRUE) or the output is invalid (CPA_FALSE).
- **pS**  
  ECDSA message signature s.

**Return values:**
- **CPA_STATUS_SUCCESS**  
  Function executed successfully.
- **CPA_STATUS_FAIL**  
  Function failed.
- **CPA_STATUS_RETRY**  
  Resubmit the request.
- **CPA_STATUS_INVALID_PARAM**  
  Invalid parameter passed in.
- **CPA_STATUS_RESOURCE**  
  Error related to system resources.
- **CPA_STATUS_RESTARTING**  
  API implementation is restarting. Resubmit the request.
16.7 Function Documentation

**Precondition:**
The component has been initialized via cpaCyStartInstance function.

**Postcondition:**
None

**Note:**
When pCb is non-NULL an asynchronous callback is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

**See also:**
None

```c
CpaStatus cpaCyEcdsaSignRS ( const CpaInstanceHandle instanceHandle, const CpaCyEcdsaSignRSOpData * pOpData, CpaBoolean * pSignStatus, CpaFlatBuffer * pR, CpaFlatBuffer * pS, void * pCallbackTag, CpaCyEcdsaSignRSCbFunc pCb, void * pCallbackTag )
```

File: cpa_cy_ecdsa.h

Generate ECDSA Signature R & S.

This function generates ECDSA Signature R & S as per ANSI X9.62 2005 section 7.3.

**Context:**
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
Yes when configured to operate in synchronous mode.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**
- `[in]` `instanceHandle` Instance handle.
- `[in]` `pCb` Callback function pointer. If this is set to a NULL value the function will operate synchronously.
- `[in]` `pCallbackTag` User-supplied value to help identify request.
- `[in]` `pOpData` Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes
Ownership of the memory until it is returned in the callback.

[out] `pSignStatus`  In synchronous mode, the multiply output is valid (CPA_TRUE) or the output is invalid (CPA_FALSE).

[out] `pR`  ECDSA message signature r.

[out] `pS`  ECDSA message signature s.

Return values:
- `CPA_STATUS_SUCCESS`  Function executed successfully.
- `CPA_STATUS_FAIL`  Function failed.
- `CPA_STATUS_RETRY`  Resubmit the request.
- `CPA_STATUS_INVALID_PARAM`  Invalid parameter passed in.
- `CPA_STATUS_RESOURCE`  Error related to system resources.
- `CPA_STATUS_RESTARTING`  API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via `cpaCyStartInstance` function.

Postcondition:
None

Note:
When pCb is non-NULL an asynchronous callback is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

See also:
None

```c
CpaStatus cpaCyEcdsaVerify( const CpaInstanceHandle instanceHandle, const CpaCyEcdsaVerifyCbFunc pCb, void *pCallbackTag, const CpaCyEcdsaVerifyOpData *pOpData, CpaBoolean *pVerifyStatus )
```

File: `cpa_cy_ecdsa.h`

Verify ECDSA Public Key.

This function performs ECDSA Verify as per ANSI X9.62 2005 section 7.4.

A response status of ok (verifyStatus == CPA_TRUE) means that the signature was verified.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.
Reentrant:
No

Thread-safe:
Yes

Parameters:

[in] instanceHandle Instance handle.
[in] pCb Callback function pointer. If this is set to a NULL value the function will operate synchronously.
[in] pCallbackTag User-supplied value to help identify request.
[in] pOpData Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
[out] pVerifyStatus In synchronous mode, set to CPA_FALSE if the point is NOT on the curve or at infinity. Set to CPA_TRUE if the point is on the curve.

Return values:

CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_RETRY Resubmit the request.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.
CPA_STATUS_RESOURCE Error related to system resources.
CPA_STATUS_RESTARTING API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

Note:
When pCb is non-NULL an asynchronous callback of type CpaCyEcdsaVerifyCbFunc is generated in response to this function call. For optimal performance, data pointers SHOULD be 8-byte aligned.

See also:
CpaCyEcdsaVerifyOpData, CpaCyEcdsaVerifyCbFunc

CpaStatus cpaCyEcdsaQueryStats64 ( const CpaInstanceHandle instanceHandle, CpaCyEcdsaStats64 * pEcdsaStats )

File: cpa_cy_ecdsa.h

Query statistics for a specific ECDSA instance.

This function will query a specific instance of the ECDSA implementation for statistics. The user MUST allocate the CpaCyEcdsaStats64 structure and pass the reference to that structure into this function call. This function writes the statistic results into the passed in CpaCyEcdsaStats64 structure.

Note: statistics returned by this function do not interrupt current data processing and as such can be slightly out of sync with operations that are in progress during the statistics retrieval process.

Context:
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.

Reentrant:
No

Thread-safe:
Yes

Parameters:

- [in] `instanceHandle` Instance handle.
- [out] `pEcdsaStats` Pointer to memory into which the statistics will be written.

Return values:

- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
- `CPA_STATUS_RESTARTING` API implementation is restarting. Resubmit the request.

Precondition:
Component has been initialized.

Postcondition:
None

Note:
This function operates in a synchronous manner and no asynchronous callback will be generated.

17 Cryptographic Large Number API

[Cryptographic API]

Collaboration diagram for Cryptographic Large Number API:

17.1 Detailed Description

File: cpa_cy_ln.h

These functions specify the Cryptographic API for Large Number Operations.

Note:
Large numbers are represented on the QuickAssist API using octet strings, stored in structures of type CpaFlatBuffer. These octet strings are encoded as described by PKCS#1 v2.1, section 4, which is consistent with ASN.1 syntax. The following text summarizes this. Any exceptions to this encoding are specified on the specific data structure or function to which the exception applies.

An n-bit number, N, has a value in the range $2^{n-1}$ through $2^n-1$. In other words, its most significant bit, bit n-1 (where bit-counting starts from zero) MUST be set to 1. We can also state that the bit-length n of a number N is defined by $n = \text{floor}(\log_2(N))+1$.

The buffer, b, in which an n-bit number N is stored, must be "large enough". In other words, b.dataLenInBytes must be at least $\text{minLenInBytes} = \text{ceiling}(n/8)$.

The number is stored in a "big endian" format. This means that the least significant byte (LSB) is $b[b.dataLenInBytes-1]$, while the most significant byte (MSB) is $b[b.dataLenInBytes-\text{minLenInBytes}]$. In the case where the buffer is "exactly" the right size, then the MSB is $b[0]$. Otherwise, all bytes from $b[0]$ up to the MSB MUST be set to 0x00.

The largest bit-length we support today is 4096 bits. In other words, we can deal with numbers up to a value of $(2^{4096})-1$.

+ dataLenInBytes
+ pData
```

```
_CpaCyLnMcdExpOpData
+ modulus
+ base
+ exponent
```

17.5.1.1 Detailed Description

**File: cpa_cy_ln.h**

Modular Exponentiation Function Operation Data.

This structure lists the different items that are required in the `cpaCyLnModExp` function. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback. The operation size in bits is equal to the size of whichever of the following is largest: the modulus, the base or the exponent.

**Note:**

If the client modifies or frees the memory referenced in this structure after it has been submitted to the `cpaCyLnModExp` function, and before it has been returned in the callback, undefined behavior will...
The values of the base, the exponent and the modulus MUST all be less than \(2^{4096}\), and the modulus must not be equal to zero.

### 17.5.1.2 Data Fields

- **CpaFlatBuffer modulus**
  Flat buffer containing a pointer to the modulus.
- **CpaFlatBuffer base**
  Flat buffer containing a pointer to the base.
- **CpaFlatBuffer exponent**
  Flat buffer containing a pointer to the exponent.

### 17.5.1.3 Field Documentation

**CpaFlatBuffer _CpaCyLnModExpOpData::modulus**

Flat buffer containing a pointer to the modulus.

This number may be up to 4096 bits in length, and MUST be greater than zero.

**CpaFlatBuffer _CpaCyLnModExpOpData::base**

Flat buffer containing a pointer to the base.

This number may be up to 4096 bits in length.

**CpaFlatBuffer _CpaCyLnModExpOpData::exponent**

Flat buffer containing a pointer to the exponent.

This number may be up to 4096 bits in length.

### 17.5.2 _CpaCyLnModInvOpData Struct Reference

Collaboration diagram for _CpaCyLnModInvOpData:
17.5.2 _CpaCyLnModInvOpData Struct Reference

17.5.2.1 Detailed Description

File: cpa_cy_ln.h

Modular Inversion Function Operation Data.

This structure lists the different items that are required in the function **cpaCyLnModInv**. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback.

**Note:**

If the client modifies or frees the memory referenced in this structure after it has been submitted to the **cpaCyLnModInv** function, and before it has been returned in the callback, undefined behavior will result.

Note that the values of A and B MUST NOT both be even numbers, and both MUST be less than 2^4096.

17.5.2.2 Data Fields

- **CpaFlatBuffer A**
  Flat buffer containing a pointer to the value that will be inverted.
- **CpaFlatBuffer B**
  Flat buffer containing a pointer to the value that will be used as the modulus.

17.5.2.3 Field Documentation

**CpaFlatBuffer _CpaCyLnModInvOpData::A**

Flat buffer containing a pointer to the value that will be inverted.

This number may be up to 4096 bits in length, it MUST NOT be zero, and it MUST be co-prime with B.

**CpaFlatBuffer _CpaCyLnModInvOpData::B**

Flat buffer containing a pointer to the value that will be used as the modulus.

This number may be up to 4096 bits in length, it MUST NOT be zero, and it MUST be co-prime with A.

17.5.3 _CpaCyLnStats Struct Reference

17.5.3.1 Detailed Description

File: cpa_cy_ln.h

Look Aside Cryptographic large number Statistics.

**Deprecated:**

As of v1.3 of the Crypto API, this structure has been deprecated, replaced by **CpaCyLnStats64**.

This structure contains statistics on the Look Aside Cryptographic large number operations. Statistics are set to zero when the component is initialized, and are collected per instance.
17.5.3.2 Data Fields

- **Cpa32U numLnModExpRequests**
  Total number of successful large number modular exponentiation requests.

- **Cpa32U numLnModExpRequestErrors**
  Total number of large number modular exponentiation requests that had an error and could not be processed.

- **Cpa32U numLnModExpCompleted**
  Total number of large number modular exponentiation operations that completed successfully.

- **Cpa32U numLnModExpCompletedErrors**
  Total number of large number modular exponentiation operations that could not be completed successfully due to errors.

- **Cpa32U numLnModInvRequests**
  Total number of successful large number modular inversion requests.

- **Cpa32U numLnModInvRequestErrors**
  Total number of large number modular inversion requests that had an error and could not be processed.

- **Cpa32U numLnModInvCompleted**
  Total number of large number modular inversion operations that completed successfully.

- **Cpa32U numLnModInvCompletedErrors**
  Total number of large number modular inversion operations that could not be completed successfully due to errors.

File: cpa_cy_ln.h

Look Aside Cryptographic large number Statistics.

This structure contains statistics on the Look Aside Cryptographic large number operations. Statistics are set to zero when the component is initialized, and are collected per instance.

17.7 Function Documentation

CpaStatus cpaCyLnModExp ( const CpaInstanceHandle instanceHandle, const CpaCyGenFlatBufCbFunc pLnModExpCb, void * pCallbackTag, const CpaCyLnModExpOpData * pLnModExpOpData, CpaFlatBuffer * pResult )

File: cpa_cy_ln.h

Perform modular exponentiation operation.

This function performs modular exponentiation. It computes the following result based on the inputs:

result = (base ^ exponent) mod modulus

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Reentrant:
No

Thread-safe:
17.7 Function Documentation

Parameters:

- **[in]** `instanceHandle`  Instance handle.
- **[in]** `pLnModExpCb`  Pointer to callback function to be invoked when the operation is complete.
- **[in]** `pCallbackTag`  Opaque User Data for this specific call. Will be returned unchanged in the callback.
- **[in]** `pLnModExpOpData`  Structure containing all the data needed to perform the LN modular exponentiation operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[out]** `pResult`  Pointer to a flat buffer containing a pointer to memory allocated by the client into which the result will be written. The size of the memory required MUST be larger than or equal to the size required to store the modulus. On invocation the callback function will contain this parameter in the pOut parameter.

Return values:

- `CPA_STATUS_SUCCESS`  Function executed successfully.
- `CPA_STATUS_FAIL`  Function failed.
- `CPA_STATUS_RETRY`  Resubmit the request.
- `CPA_STATUS_INVALID_PARAM`  Invalid parameter passed in.
- `CPA_STATUS_RESOURCE`  Error related to system resources.
- `CPA_STATUS_RESTARTING`  API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized.

Postcondition:
None

Note:
When `pLnModExpCb` is non null, an asynchronous callback of type `CpaCyLnModExpCbFunc` is generated in response to this function call. Any errors generated during processing are reported in the structure returned in the callback.

See also:
*CpaCyLnModExpOpData, CpaCyGenFlatBufCbFunc*

```c
CpaStatus cpaCyLnModInv ( const CpaInstanceHandle instanceHandle,
                          const CpaCyGenFlatBufCbFunc pLnModInvCb,
                          void * pCallbackTag,
                          const CpaCyLnModInvOpData * pLnModInvOpData,
                          CpaFlatBuffer * pResult )
```

File: *cpa_cy_ln.h*

Perform modular inversion operation.

This function performs modular inversion. It computes the following result based on the inputs:

\[ \text{result} = \left( \frac{1}{A} \right) \mod B. \]
17.7 Function Documentation

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Reentrant:
No

Thread-safe:
Yes

Parameters:

- **[in]** `instanceHandle` Instance handle.
- **[in]** `pLnModInvCb` Pointer to callback function to be invoked when the operation is complete.
- **[in]** `pCallbackTag` Opaque User Data for this specific call. Will be returned unchanged in the callback.
- **[in]** `pLnModInvOpData` Structure containing all the data needed to perform the LN modular inversion operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[out]** `pResult` Pointer to a flat buffer containing a pointer to memory allocated by the client into which the result will be written. The size of the memory required MUST be larger than or equal to the size required to store the modulus. On invocation the callback function will contain this parameter in the pOut parameter.

Return values:

- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_RETRY` Resubmit the request.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
- `CPA_STATUS_RESTARTING` API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized.

Postcondition:
None

Note:
When `pLnModInvCb` is non null, an asynchronous callback of type `CpaCyLnModInvCbFunc` is generated in response to this function call. Any errors generated during processing are reported in the structure returned in the callback.

See also:
`CpaCyLnModInvOpData`, `CpaCyGenFlatBufCbFunc`
CpaStatus CPA_DEPRECATED cpaCyLnStatsQuery ( const CpaInstanceHandle instanceHandle, 
                        struct _CpaCyLnStats * pLnStats )

File: cpa_cy_ln.h

Query statistics for large number operations

Deprecated:
As of v1.3 of the Crypto API, this function has been deprecated, replaced by
cpaCyLnStatsQuery64().

This function will query a specific instance handle for large number statistics. The user MUST allocate the
CpaCyLnStats structure and pass the reference to that structure into this function call. This function writes
the statistic results into the passed in CpaCyLnStats structure.

Note: statistics returned by this function do not interrupt current data processing and as such can be slightly
out of sync with operations that are in progress during the statistics retrieval process.

Context:
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES
NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in] instanceHandle Instance handle.
[out] pLnStats Pointer to memory into which the statistics will be written.

Return values:
CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL Function failed.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.
CPA_STATUS_RESOURCE Error related to system resources.
CPA_STATUS_RESTARTING API implementation is restarting. Resubmit the request.

Precondition:
Acceleration Services unit has been initialized.

Postcondition:
None

Note:
This function operates in a synchronous manner and no asynchronous callback will be generated.
See also:
CpaCyLnStats

18 Prime Number Test API

[Cryptographic API]

Collaboration diagram for Prime Number Test API:

![Diagram of Prime Number Test API and Cryptographic API]

18.1 Detailed Description

File: cpa_cy_prime.h

These functions specify the API for the prime number test operations.

For prime number generation, this API SHOULD be used in conjunction with the Deterministic Random Bit Generation API (Deterministic Random Bit Generation API).

Note:

Large numbers are represented on the QuickAssist API as described in the Large Number API (Cryptographic Large Number API).

In addition, the bit length of large numbers passed to the API MUST NOT exceed 576 bits for Elliptic Curve operations.

18.2 Data Structures

- struct _CpaCyPrimeTestOpData
- struct _CpaCyPrimeStats
- struct _CpaCyPrimeStats64

18.3 Typedefs

- typedef _CpaCyPrimeTestOpData CpaCyPrimeTestOpData
- typedef _CpaCyPrimeStats CPA_DEPRECATED
- typedef _CpaCyPrimeStats64 CpaCyPrimeStats64
- typedef void(* CpaCyPrimeTestCbFunc )(void *pCallbackTag, CpaStatus status, void *pOpData, CpaBoolean testPassed)

18.4 Functions

- CpaStatus cpaCyPrimeTest (const CpInstanceHandle instanceHandle, const CpaCyPrimeTestCbFunc pCb, void *pCallbackTag, const CpaCyPrimeTestOpData *pOpData, CpaBoolean *pTestPassed)

18.5 Data Structure Documentation

Reference Number: 330685-001
18.5 Data Structure Documentation

18.5.1 _CpaCyPrimeTestOpData Struct Reference

Collaboration diagram for _CpaCyPrimeTestOpData:

```
_CpaFlatBuffer
  + dataLenInBytes
  + pData

  primeCandidate

_CpaCyPrimeTestOpData
  + primeCandidate
  + performGcdTest
  + performFermatTest
  + numMillerRabinRounds
  + millerRabinRandomInput
  + performLucasTest
```

18.5.1.1 Detailed Description

**File: cpa_cy_prime.h**

Prime Test Operation Data.

This structure contains the operation data for the cpaCyPrimeTest function. The client MUST allocate the memory for this structure and the items pointed to by this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned in the callback function.

All values in this structure are required to be in Most Significant Byte first order, e.g. `primeCandidate.pData[0]` = MSB.

All numbers MUST be stored in big-endian order.

**Note:**
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyPrimeTest function, and before it has been returned in the callback, undefined behavior will result.

**See also:**
  cpaCyPrimeTest()

18.5.1.2 Data Fields

- **CpaFlatBuffer primeCandidate**
  The prime number candidate to test.
- **CpaBoolean performGcdTest**
A value of CPA_TRUE means perform a GCD Primality Test.

- **CpaBoolean performFermatTest**
  A value of CPA_TRUE means perform a Fermat Primality Test.

- **Cpa32U numMillerRabinRounds**
  Number of Miller Rabin Primality Test rounds.

- **CpaFlatBuffer millerRabinRandomInput**
  Flat buffer containing a pointer to an array of n random numbers for Miller Rabin Primality Tests.

- **CpaBoolean performLucasTest**
  An CPA_TRUE value means perform a Lucas Primality Test.

### 18.5.1 _CpaCyPrimeTestOpData Struct Reference

- **CpaFlatBuffer _CpaCyPrimeTestOpData::primeCandidate**
  The prime number candidate to test.

- **CpaBoolean _CpaCyPrimeTestOpData::performGcdTest**
  A value of CPA_TRUE means perform a GCD Primality Test.

- **CpaBoolean _CpaCyPrimeTestOpData::performFermatTest**
  A value of CPA_TRUE means perform a Fermat Primality Test.

- **Cpa32U _CpaCyPrimeTestOpData::numMillerRabinRounds**
  Number of Miller Rabin Primality Test rounds.

  Set to 0 to perform zero Miller Rabin tests. The maximum number of rounds supported is 50.

- **CpaFlatBuffer _CpaCyPrimeTestOpData::millerRabinRandomInput**
  Flat buffer containing a pointer to an array of n random numbers for Miller Rabin Primality Tests.

  The size of the buffer MUST be
  
  \[ n \times (\text{MAX}(64,x)) \]

  where:

  - n is the requested number of rounds.
  - x is the minimum number of bytes required to represent the prime candidate, i.e. \( x = \text{ceiling}((\text{ceiling}(\text{log2}(p)))/8) \).

  Each random number MUST be greater than 1 and less than the prime candidate - 1, with leading zeroes as necessary.

- **CpaBoolean _CpaCyPrimeTestOpData::performLucasTest**
  An CPA_TRUE value means perform a Lucas Primality Test.

### 18.5.2 _CpaCyPrimeStats Struct Reference

#### 18.5.2.1 Detailed Description

18.6 Typedef Documentation

**Note:**
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyPrimeTest function, and before it has been returned in the callback, undefined behavior will result.

See also:
cpaCyPrimeTest()

typedef struct _CpaCyPrimeStats CPA_DEPRECATED

**File: cpa_cy_prime.h**
Prime Number Test Statistics.

**Deprecated:**
As of v1.3 of the Crypto API, this structure has been deprecated, replaced by CpaCyPrimeStats64.

This structure contains statistics on the prime number test operations. Statistics are set to zero when the component is initialized, and are collected per instance.

typedef struct _CpaCyPrimeStats64 CpaCyPrimeStats64

**File: cpa_cy_prime.h**
Prime Number Test Statistics (64-bit version).

This structure contains a 64-bit version of the statistics on the prime number test operations. Statistics are set to zero when the component is initialized, and are collected per instance.

typedef void(* CpaCyPrimeTestCbFunc)(void *pCallbackTag, CpaStatus status, void *pOpData, CpaBoolean testPassed)

**File: cpa_cy_prime.h**
Definition of callback function invoked for cpaCyPrimeTest requests.

This is the prototype for the cpaCyPrimeTest callback function.

**Context:**
This callback function can be executed in a context that DOES NOT permit sleeping to occur.

**Assumptions:**
None

**Side-Effects:**
None

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**
[in] pCallbackTag User-supplied value to help identify request.

---

**CpaStatus** cpaCyPrimeTest (const CpaInstanceHandle instanceHandle, const CpaCyPrimeTestCbFunc pCb, void * pCallbackTag, const CpaCyPrimeTestOpData * pOpData, CpaBoolean * pTestPassed)

**File:** cpa_cy_prime.h

Prime Number Test Function.

This function will test probabilistically if a number is prime. Refer to ANSI X9.80 2005 for details. The primality result will be returned in the asynchronous callback.

The following combination of GCD, Fermat, Miller-Rabin, and Lucas testing is supported: (up to 1x GCD) + (up to 1x Fermat) + (up to 50x Miller-Rabin rounds) + (up to 1x Lucas) For example: (1x GCD) + (25x Miller-Rabin) + (1x Lucas); (1x GCD) + (1x Fermat); (50x Miller-rabin);

Tests are always performed in order of increasing complexity, for example GCD first, then Fermat, then Miller-Rabin, and finally Lucas.

For all of the primality tests, the following prime number "sizes" (length in bits) are supported: all sizes up to and including 512 bits, as well as sizes 768, 1024, 1536, 2048, 3072 and 4096.

Candidate prime numbers MUST match these sizes accordingly, with leading zeroes present where necessary.

When this prime number test is used in conjunction with combined Miller-Rabin and Lucas tests, it may be used as a means of performing a self test operation on the random data generator.

A response status of ok (pass == CPA_TRUE) means all requested primality tests passed, and the prime candidate is probably prime (the exact probability depends on the primality tests requested). A response
status of not ok (pass == CPA_FALSE) means one of the requested primality tests failed (the prime candidate has been found to be composite).

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:

<table>

19 Deterministic Random Bit Generation API

[Cryptographic API]

Collaboration diagram for Deterministic Random Bit Generation API:

```
Cryptographic_API  Deterministic Random Bit Generation_API
```

19.1 Detailed Description

File: cpa_cy_drbg.h

These functions specify the API for a Deterministic Random Bit Generation (DRBG), compliant with NIST SP 800-90, March 2007, "Recommendation for Random Number Generation Using Deterministic Random Bit Generators (Revised)".

The functions cpaCyDrbgInitSession, cpaCyDrbgGen, cpaCyDrbgReseed and cpaCyDrbgRemoveSession are used to instantiate, generate, reseed and uninstantiate a DRBG mechanism.

Note: These functions supersede the random number generation functions in API group Random Bit/Number Generation API, which are now deprecated.

19.6.3 _CpaCyDrbgReseedOpData Struct Reference

Collaboration diagram for _CpaCyDrbgReseedOpData:
19.6.3.1 Detailed Description

File: cpa_cy_drbg.h

DRBG Reseed Operation Data

This structure contains data relating to reseeding a DRBG session, or instance.

See also:
   cpaCyDrbgReseed()

Note:
   If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyDrbgReseed() function, and before it has been returned in the callback, undefined behavior will result.

19.6.3.2 Data Fields

- CpaCyDrbgSessionHandle sessionHandle
  Session handle, also known as a state handle or instance handle.
- CpaFlatBuffer additionalInput
  An "optional" input to the reseeding.

19.6.3.3 Field Documentation

CpaCyDrbgSessionHandle _CpaCyDrbgReseedOpData::sessionHandle
Session handle, also known as a state handle or instance handle.

CpaFlatBuffer _CpaCyDrbgReseedOpData::additionalInput
An "optional" input to the reseeding.

The length should be less than or equal to the seed length, which is returned by the function cpaCyDrbgInitSession(). A length of 0 can be specified to indicate no additional input.
19.6.4 _CpaCyDrbgStats64 Struct Reference

19.6.4.1 Detailed Description

File: cpa_cy_drbg.h

DRBG Statistics

This structure contains statistics (counters) related to the random bit generation API.

See also:
CpaCyDrbgQueryStats64()

19.6.4.2 Data Fields

- **Cpa64U numSessionsInitialized**
  Number of session initialized.

- **Cpa64U numSessionsRemoved**
  Number of sessions removed.

- **Cpa64U numSessionErrors**
  Total number of errors returned when initializing and removing sessions.

- **Cpa64U numGenRequests**
  Number of successful calls to cpaCyDrbgGen.

- **Cpa64U numGenRequestErrors**
  Number of calls to cpaCyDrbgGen that returned an error and could not be processed.

- **Cpa64U numGenCompleted**
  Number of calls to cpaCyDrbgGen that completed successfully.

- **Cpa64U numGenCompletedErrors**
  Number of calls to cpaCyDrbgGen that completed with an error status.

- **Cpa64U numReseedRequests**
  Number of successful calls to cpaCyDrbgReseed.

- **Cpa64U numReseedRequestErrors**
  Number of calls to cpaCyDrbgReseed that returned an error and could not be processed.

- **Cpa64U numReseedCompleted**
  Number of calls to cpaCyDrbgReseed that completed successfully.

- **Cpa64U numReseedCompletedErrors**
  Number of calls to cpaCyDrbgReseed that completed with an error status.

19.6.4.3 Field Documentation

typedef enum _CpaCyDrbgSecStrength CpaCyDrbgSecStrength

File: cpa_cy_drbg.h

Security Strength

This enum defines the security strength. NIST SP 800-90 defines security strength as "A number associated with the amount of work (that is, the number of operations) that is required to break a cryptographic algorithm or system; a security strength is specified in bits and is a specific value from the set (112, 128, 192, 256) for this Recommendation. The amount of work needed is \(2^{(\text{security_strength})}\)."

typedef struct _CpaCyDrbgSessionSetupData CpaCyDrbgSessionSetupData

File: cpa_cy_drbg.h

DRBG Session (Instance) Setup Data

This structure contains data relating to instantiation of a DRBG session, or instance.

typedef void* CpaCyDrbgSessionHandle

File: cpa_cy_drbg.h

Handle to a DRBG session (or instance).
19.7 Typedef Documentation

This is what NIST SP 800-90 refers to as the "state_handle". That document also refers to the process of creating such a handle as "instantiation", or instance creation. On this API, we use the term "session" to refer to such an instance, to avoid confusion with the crypto instance handle, and for consistency with the similar concept of sessions in symmetric crypto (see Symmetric Cipher and Hash Cryptographic API) and elsewhere on the API.

Note that there can be multiple sessions, or DRBG instances, created within a single instance of a CpaInstanceHandle.

Note:
The memory for this handle is allocated by the client. The size of the memory that the client needs to allocate is determined by a call to the \texttt{cpaCyDrbgSessionGetSize} function. The session memory is initialized with a call to the \texttt{cpaCyDrbgInitSession} function. This memory MUST not be freed until a call to \texttt{cpaCyDrbgRemoveSession} has completed successfully.

```c
typedef struct _CpaCyDrbgGenOpData CpaCyDrbgGenOpData

File: cpa_cy_drbg.h

DRBG Data Generation Operation Data

This structure contains data relating to generation of random bits using a DRBG.

See also:
\texttt{cpaCyDrbgGen()}

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the \texttt{cpaCyDrbgGen()} function, and before it has been returned in the callback, undefined behavior will result.

```c
typedef struct _CpaCyDrbgReseedOpData CpaCyDrbgReseedOpData

File: cpa_cy_drbg.h

DRBG Reseed Operation Data

This structure contains data relating to reseeding a DRBG session, or instance.

See also:
\texttt{cpaCyDrbgReseed()}

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the \texttt{cpaCyDrbgReseed()} function, and before it has been returned in the callback, undefined behavior will result.

```c
typedef struct _CpaCyDrbgStats64 CpaCyDrbgStats64

File: cpa_cy_drbg.h

DRBG Statistics

This structure contains statistics (counters) related to the random bit generation API.
19.8 Enumeration Type Documentation

** See also: CpaCyDrbgQueryStats64()

** 19.8 Enumeration Type Documentation

```c
enum _CpaCyDrbgSecStrength
```

*File: cpa_cy_drbg.h*

** Security Strength

This enum defines the security strength. NIST SP 800-90 defines security strength as "A number associated with the amount of work (that is, the number of operations) that is required to break a cryptographic algorithm or system; a security strength is specified in bits and is a specific value from the set (112, 128, 192, 256) for this Recommendation. The amount of work needed is $2^{(\text{security\_strength})}$."

** 19.9 Function Documentation

```c
CpaStatus cpaCyDrbgSessionGetSize( const CpaInstanceHandle instanceHandle, const CpaCyDrbgSessionSetupData * pSetupData, Cpa32U * pSize )
```

*File: cpa_cy_drbg.h*

** Returns the size (in bytes) of a DRBG session handle.**

This function is used by the client to determine the size of the memory it must allocate in order to store the DRBG session. This MUST be called before the client allocates the memory for the session and before the client calls the *cpaCyDrbgInitSession* function.

** Context:**

This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

** Assumptions:**

None

** Side-Effects:**

None

** Blocking:**

No.

** Reentrant:**

No

** Thread-safe:**

Yes

** Parameters:**

[in]  

`instanceHandle`  

Instance handle.
19.9 Function Documentation

[in]  \( p\text{SetupData} \)  
Pointer to session setup data which contains parameters which are static for a given DRBG session, such as security strength, etc.

[out]  \( p\text{Size} \)  
The amount of memory in bytes required to hold the session.

Return values:

- \( CPA\_\text{STATUS\_SUCCESS} \): Function executed successfully.
- \( CPA\_\text{STATUS\_FAIL} \): Function failed.
- \( CPA\_\text{STATUS\_INVALID\_PARAM} \): Invalid parameter passed in.
- \( CPA\_\text{STATUS\_RESOURCE} \): Error related to system resources.

Precondition:
The component has been initialized via the \texttt{cpaCyStartInstance} function.

Postcondition:
None

\begin{verbatim}
CpaStatus cpaCyDrbgInitSession ( const CpaInstanceHandle instanceHandle, const CpaCyGenFlatBufCbFunc pGenCb, const CpaCyGenericCbFunc pReseedCb, const CpaCyDrbgSessionSetupData * pSetupData, CpaCyDrbgSessionHandle * sessionHandle, Cpa32U * pSeedLen )
\end{verbatim}

File: cpa\_cy\_drbg.h

Instantiates and seeds a DRBG session, or instance.

This function is used by the client to initialize a DRBG session, or instance.

Note:
On some implementations, the client may have to register an entropy source, nonce source, and/or a function which specifies whether a derivation function is required. See the Programmer's Guide for your implementation for more details.

Context:
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
No.

Reentrant:
No

Thread-safe:
Yes

Reference Number: 330685-001
19.9 Function Documentation

Parameters:

[in]  instanceHandle  Instance handle.
[in]  pGenCb  Pointer to callback function to be registered. This is the function that will be called back to indicate completion of the asynchronous cpaCyDrbgGen function. Set this field to NULL if this function is to operate in a synchronous manner.
[in]  pReseedCb  Pointer to callback function to be registered. This is the function that will be called back to indicate completion of the asynchronous cpaCyDrbgReseed function. Set this field to NULL if this function is to operate in a synchronous manner.
[in]  pSetupData  Pointer to setup data.
[optional]  sessionHandle  Pointer to the memory allocated by the client to store the instance handle. This will be initialized with this function. This handle needs to be passed to subsequent processing calls.
[optional]  pSeedLen  Seed length for the supported DRBG mechanism and security strength. The value of this is dependent on the DRBG mechanism implemented by the instance, which is implementation-dependent. This seed length may be used by the client when reseeding.

Return values:

CPA_STATUS_SUCCESS  Function executed successfully.
CPA_STATUS_FAIL  Function failed.
CPA_STATUS_RETRY  Resubmit the request.
CPA_STATUS_INVALID_PARAM  Invalid parameter passed in.
CPA_STATUS_RESOURCE  Error related to system resources.
CPA_STATUS_RESTARTING  API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via the cpaCyStartInstance function.

Postcondition:
None

CpaStatus cpaCyDrbgReseed ( const CpaInstanceHandle instanceHandle, void *pCallbackTag, CpaCyDrbgReseedOpData *pOpData )

File: cpa_cy_drbg.h

Reseeds a DRBG session, or instance.

Reseeding inserts additional entropy into the generation of pseudorandom bits.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None
19.9 Function Documentation

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:
- **[in]** `instanceHandle` Instance handle.
- **[in]** `pCallbackTag` Opaque User Data for this specific call. Will be returned unchanged in the callback.
- **[in]** `pOpData` Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure.

Return values:
- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_RETRY` Resubmit the request.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
- `CPA_STATUS_RESTARTING` API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via the `cpaCyStartInstance` function.

Postcondition:
None

```c
CpaStatus cpaCyDrbgGen ( const CpaInstanceHandle instanceHandle, 
                          void * pCallbackTag, 
                          CpaCyDrbgGenOpData * pOpData, 
                          CpaFlatBuffer * pPseudoRandomBits )
```

File: cpa_cy_drbg.h

Generates pseudorandom bits.

This function is used to request the generation of random bits. The generated data and the length of the data will be returned to the caller in an asynchronous callback function.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
19.9 Function Documentation

Yes when configured to operate in synchronous mode.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

- **[in]** instanceHandle  Instance handle.
- **[in]** pCallbackTag  Opaque User Data for this specific call. Will be returned unchanged in the callback.
- **[in]** pOpData  Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[out]** pPseudoRandomBits  Pointer to the memory allocated by the client where the random data will be written to. For optimal performance, the data pointed to SHOULD be 8-byte aligned. There is no endianness associated with the random data. On invocation the callback function will contain this parameter in its pOut parameter.

**Return values:**

- **CPA_STATUS_SUCCESS**  Function executed successfully.
- **CPA_STATUS_FAIL**  Function failed.
- **CPA_STATUS_RETRY**  Resubmit the request.
- **CPA_STATUS_INVALID_PARAM**  Invalid parameter passed in.
- **CPA_STATUS_RESOURCE**  Error related to system resources. One reason may be for an entropy test failing.
- **CPA_STATUS_RESTARTING**  API implementation is restarting. Resubmit the request.

**Precondition:**
The component has been initialized via the cpaCyStartInstance function. The DRBG session, or instance, has been initialized via the cpaCyDrbgInitSession function.

**Postcondition:**
None

CpaStatus cpaCyDrbgRemoveSession ( const CpaInstanceHandle instanceHandle, CpaCyDrbgSessionHandle sessionHandle )

**File:** cpa_cy_drbg.h

Removes a previously instantiated DRBG session, or instance.

This function will remove a previously initialized DRBG session, or instance, and the installed callback handler function. Removal will fail if outstanding calls still exist for the initialized session. In this case, the client needs to retry the remove function at a later time. The memory for the session handle MUST not be freed until this call has completed successfully.

**Context:**
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Reference Number: 330685-001
19.9 Function Documentation

**Assumptions:**
None

**Side-Effects:**
None

**Blocking:**
No.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

- `[in]` *instanceHandle*  Instance handle.
- `[in]` *sessionHandle*  DRBG session handle to be removed.

**Return values:**

- `CPA_STATUS_SUCCESS`  Function executed successfully.
- `CPA_STATUS_FAIL`  Function failed.
- `CPA_STATUS_RETRY`  Resubmit the request.
- `CPA_STATUS_INVALID_PARAM`  Invalid parameter passed in.
- `CPA_STATUS_RESOURCE`  Error related to system resources.
- `CPA_STATUS_RESTARTING`  API implementation is restarting. Resubmit the request.

**Precondition:**
The component has been initialized via the *cpaCyStartInstance* function. The DRBG session, or instance, has been initialized via the *cpaCyDrbgInitSession* function.

**Postcondition:**
None

```c
CpaStatus cpaCyDrbgQueryStats64 ( const CpaInstanceHandle instanceHandle, CpaCyDrbgStats64 * pStats )
```

**File:** *cpa_cy_drbg.h*

Returns statistics specific to a session, or instance, of the RBG API.

This function will query a specific session for RBG statistics. The user MUST allocate the CpaCyDrbgStats64 structure and pass the reference to that into this function call. This function writes the statistic results into the passed in CpaCyDrbgStats64 structure.

Note: statistics returned by this function do not interrupt current data processing and as such can be slightly out of sync with operations that are in progress during the statistics retrieval process.

**Context:**
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

**Assumptions:**
None
19.9 Function Documentation

**Side-Effects:**
None

**Blocking:**
This function is synchronous and blocking.

**Reentrant:**
No

**Thread-safe:**
Yes

**Parameters:**

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in]</td>
<td>instanceHandle</td>
<td>Instance handle.</td>
</tr>
<tr>
<td>[out]</td>
<td>pStats</td>
<td>Pointer to memory into which the statistics will be written.</td>
</tr>
</tbody>
</table>

**Return values:**

- **CPA_STATUS_SUCCESS** Function executed successfully.
- **CPA_STATUS_FAIL** Function failed.
- **CPA_STATUS_INVALID_PARAM** Invalid parameter passed in.
- **CPA_STATUS_RESOURCE** Error related to system resources.
- **CPA_STATUS_RESTARTING** API implementation is restarting. Resubmit the request.

**Precondition:**
Component has been initialized.

**Postcondition:**
None
20 Non-Deterministic Random Bit Generation API

[Cryptographic API]

Collaboration diagram for Non-Deterministic Random Bit Generation API:

Cryptographic API - Non-Deterministic Random Bit Generation API

20.1 Detailed Description

File: cpa_cy_nrbg.h

These functions specify the API for Non-Deterministic Random Bit Generation (NRBG). This is used to provide entropy to a Deterministic RBG (DRBG).

Note:
These functions supersede the random number generation functions in API group Random Bit/Number Generation API, which are now deprecated.

20.2 Data Structures

20.5 Data Structure Documentation

20.5.1 _CpaCyNrbgOpData Struct Reference

20.5.1.1 Detailed Description

File: cpa_cy_nrbg.h

NRBG Get Entropy Operation Data

This structure contains data relating to generation of entropy using an NRBG.

See also:
  cpaCyNrbgGetEntropy()
If the client modifies or frees the memory referenced in this structure after it has been submitted to the `cpaCyNrbgGetEntropy()` function, and before it has been returned in the callback, undefined behavior will result.

### 20.5.1.2 Data Fields

- **Cpa32U lengthInBytes**
  Requested number of bytes to be generated.

### 20.5.1.3 Field Documentation

**Cpa32U _CpaCyNrbgOpData::lengthInBytes**

Requested number of bytes to be generated.

On calls to `cpaCyNrbgGetEntropy`, this value must be greater than zero (>0).

### 20.6 Typedef Documentation

typedef struct _CpaCyNrbgOpData CpaCyNrbgOpData

**File:** cpa_cy_nrbg.h

NRBG Get Entropy Operation Data

This structure contains data relating to generation of entropy using an NRBG.

**See also:**

- `cpaCyNrbgGetEntropy()`

**Note:**

If the client modifies or frees the memory referenced in this structure after it has been submitted to the `cpaCyNrbgGetEntropy()` function, and before it has been returned in the callback, undefined behavior will result.

### 20.7 Function Documentation

```c
CpaStatus cpaCyNrbgGetEntropy ( const CpaInstanceHandle instanceHandle, const CpaCyGenFlatBufCbFunc pCb, void * pCallbackTag, const CpaCyNrbgOpData * pOpData, CpaFlatBuffer * pEntropy )
```

**File:** cpa_cy_rbg.h

Gets entropy from the NRBG.

This function returns a string of bits of specified length.

**Context:**
20.7 Function Documentation

When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:

- **[in]** `instanceHandle` Instance handle.
- **[in]** `pCb` Pointer to callback function to be invoked when the operation is complete. If this is set to a NULL value the function will operate synchronously.
- **[in]** `pCallbackTag` Opaque User Data for this specific call. Will be returned unchanged in the callback.
- **[in]** `pOpData` Structure containing all the data needed to perform the operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[out]** `pEntropy` Pointer to memory allocated by the client to which the entropy will be written. For optimal performance, the data pointed to SHOULD be 8-byte aligned. There is no endianness associated with the entropy. On invocation the callback function will contain this parameter in its pOut parameter.

Return values:

- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_RETRY` Resubmit the request.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.
- `CPA_STATUS_RESTARTING` API implementation is restarting. Resubmit the request.

Precondition:
The component has been initialized via the `cpaCyStartInstance` function.

Postcondition:
None

Note:
When pCb is non-NULL an asynchronous callback of type `CpaCyGenFlatBufCbFunc` is generated in response to this function call. Any errors generated during processing are reported as part of the callback status code. For optimal performance, data pointers SHOULD be 8-byte aligned.
21 Random Bit/Number Generation API

[Cryptographic API]

Collaboration diagram for Random Bit/Number Generation API:

```
Cryptographic API  Random Bit/Number Generation API
```

21.1 Detailed Description

File: cpa_cy_rand.h

Deprecated:
As of v1.3 of the API, this entire API group has been deprecated, replaced by API groups
Deterministic Random Bit Generation API and Non-Deterministic Random Bit Generation API.

These functions specify the API for the Cryptographic Random Bit and Random number generation.

21.6.1 _CpaCyRandStats Struct Reference

21.6.1.1 Detailed Description

File: cpa_cy_rand.h

Random Data Generator Statistics.

Deprecated:
As of v1.3 of the API, replaced by CpaCyDrbgStats64.

This structure contains statistics on the random data generation operations. Statistics are set to zero when the component is initialized, and are collected per instance.

21.6.1.2 Data Fields

- **Cpa32U numRandNumRequests**
  Total number of successful random number generation requests.

- **Cpa32U numRandNumRequestErrors**
  Total number of random number generation requests that had an error and could not be processed.

- **Cpa32U numRandNumCompleted**
  Total number of random number operations that completed successfully.

- **Cpa32U numRandNumCompletedErrors**
  Total number of random number operations that could not be completed successfully due to errors.

- **Cpa32U numRandBitRequests**
  Total number of successful random bit generation requests.

- **Cpa32U numRandBitRequestErrors**
  Total number of random bit generation requests that had an error and could not be processed.

- **Cpa32U numRandBitCompleted**
  Total number of random bit operations that completed successfully.

- **Cpa32U numRandBitCompletedErrors**
  Total number of random bit operations that could not be completed successfully due to errors.

- **Cpa32U numNumSeedRequests**
  Total number of seed operations requests.

- **Cpa32U numRandSeedCompleted**
  Total number of seed operations completed.

- **Cpa32U numNumSeedErrors**
  Total number of seed operation errors.

21.6.2 _CpaCyRandGenOpData Struct Reference

21.6.2.1 Detailed Description

File: cpa_cy_rand.h

Random Bit/Number Generation Data.

Deprecated:
As of v1.3 of the API, replaced by CpaCyDrbgGenOpData.

This structure lists the different items that are required in the cpaCyRandGen function. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned with the callback.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyRandGen function, and before it has been returned in the callback, undefined behavior will result.

21.6.2.2 Data Fields

- CpaBoolean generateBits
When set to CPA_TRUE then the cpaCyRandGen function will generate random bits which will comply with the ANSI X9.82 Part 1 specification.

- **Cpa32U lenInBytes**
  Specifies the length in bytes of the data returned.

### 21.6.3 _CpaCyRandSeedOpData Struct Reference

**File: cpa_cy_rand.h**

Random Generator Seed Data.

**Deprecated:**
As of v1.3 of the API, replaced by **CpaCyDrbgReseedOpData**.
21.6.3 _CpaCyRandSeedOpData Struct Reference

This structure lists the different items that required in the cpaCyRandSeed function. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned with the callback.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyRandSeed function, and before it has been returned in the callback, undefined behavior will result.

21.6.3.2 Data Fields

- **CpaBoolean seedUpdate**
  When set to CPA_TRUE then the cpaCyRandSeed function will update (combine) the specified seed with the stored seed.

- **CpaFlatBuffer seedData**
  Data for use in either seeding or performing a seed update.

21.6.3.3 Field Documentation

**CpaBoolean _CpaCyRandSeedOpData::seedUpdate**
When set to CPA_TRUE then the cpaCyRandSeed function will update (combine) the specified seed with the stored seed.

When set to CPA_FALSE, the cpaCyRandSeed function will completely discard all existing entropy in the hardware and replace with the specified seed.

**CpaFlatBuffer _CpaCyRandSeedOpData::seedData**
Data for use in either seeding or performing a seed update.

The data that is pointed to are random bits and as such do not have an endian order. For optimal performance the data SHOULD be 8-byte aligned. The length of the seed data is in bytes. This MUST currently be equal to CPA_CY_RAND_SEED_LEN_IN_BYTES.

21.7 Define Documentation

#define CPA_CY_RAND_SEED_LEN_IN_BYTES

File: cpa_cy_rand.h

Random Bit/Number Generator Seed Length

Defines the permitted seed length in bytes that may be used with the cpaCyRandSeed function.

See also:
cpaCyRandSeed

typedef struct _CpaCyRandSeedOpData CPA_DEPRECATED

File: cpa_cy_rand.h

Random Generator Seed Data.

Deprecated:
As of v1.3 of the API, replaced by CpaCyDrbgReseedOpData.

This structure lists the different items that required in the cpaCyRandSeed function. The client MUST allocate the memory for this structure. When the structure is passed into the function, ownership of the memory passes to the function. Ownership of the memory returns to the client when this structure is returned with the callback.

Note:
If the client modifies or frees the memory referenced in this structure after it has been submitted to the cpaCyRandSeed function, and before it has been returned in the callback, undefined behavior will result.

21.9 Function Documentation
Random Bits or Number Generation Function.

Deprecated:
As of v1.3 of the API, replaced by cpaCyDrbgGen().

This function is used to request the generation of random bits or a random number. The generated data and the length of the data will be returned to the caller in an asynchronous callback function. If random number generation is selected, the random bits generated by the hardware will be converted to a random number that is compliant to the ANSI X9.82 Part 1 specification.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
Yes when configured to operate in synchronous mode.

Reentrant:
No

Thread-safe:
Yes

Parameters:

- **[in]** `instanceHandle` Instance handle.
- **[in]** `pRandGenCb` Pointer to callback function to be invoked when the operation is complete. If this is set to a NULL value the function will operate synchronously.
- **[in]** `pCallbackTag` Opaque User Data for this specific call. Will be returned unchanged in the callback.
- **[in]** `pRandGenOpData` Structure containing all the data needed to perform the random bit/number operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.
- **[out]** `pRandData` Pointer to the memory allocated by the client where the random data will be written to. For optimal performance, the data pointed to SHOULD be 8-byte aligned. There is no endianness associated with

File: cpa_cy_rand.h
the random data. On invocation the callback function will contain this
parameter in the pOut parameter.

Return values:
- **CPA_STATUS_SUCCESS** Function executed successfully.
- **CPA_STATUS_FAIL** Function failed.
- **CPA_STATUS_RETRY** Resubmit the request.
- **CPA_STATUS_INVALID_PARAM** Invalid parameter passed in.
- **CPA_STATUS_RESOURCE** Error related to system resources. One reason may be for an
  entropy test failing.

Precondition:
The component has been initialized via cpaCyStartInstance function.

Postcondition:
None

Note:
When pRandGenCb is non-NULL an asynchronous callback of type CpaCyRandGenCbFunc is
generated in response to this function call. Any errors generated during processing are reported as
part of the callback status code. Entropy testing and reseeding are performed automatically by this
function.

See also:
- CpaCyGenFlatBufCbFunc, CpaCyRandGenOpData, cpaCyRandSeed().

CpaStatus CPA_DEPRECATED

```c
CpaCyRandSeed
( const CpaInstanceHandle instanceHandle,
  const CpaCyGenericCbFunc pRandSeedCb,
  void * pCallbackTag,
  const struct _CpaCyRandSeedOpData * pSeedOpData
)
```

File: cpa_cy_rand.h

Random Data Generator Seed Function.

Deprecated:
As of v1.3 of the API, replaced by cpaCyDrbgReseed().

This function is used to either seed or perform a seed update on the random data generator. Replacing the
seed with a user supplied seed value, or performing a seed update are completely optional operations. If
seeding is specified, it has the effect or disregarding all existing entropy within the random data generator
and replacing with the specified seed. If performing a seed update, then the specified seed is mixed into the
stored seed. The seed length MUST be equal to CPA_CY_RAND_SEED_LEN_IN_BYTES.

Context:
When called as an asynchronous function it cannot sleep. It can be executed in a context that does
not permit sleeping. When called as a synchronous function it may sleep. It MUST NOT be
executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Reference Number: 330685-001
**Side-Effects:**

None

**Blocking:**

Yes when configured to operate in synchronous mode.

**Reentrant:**

No

**Thread-safe:**

Yes

**Parameters:**

- `[in] instanceHandle` Instance handle.
- `[in] pRandSeedCb` Pointer to callback function to be invoked when the operation is complete. If this is set to a NULL value the function will operate synchronously.
- `[in] pCallbackTag` Opaque User Data for this specific call. Will be returned unchanged in the callback.
- `[in] pSeedOpData` Structure containing all the data needed to perform the random generator seed operation. The client code allocates the memory for this structure. This component takes ownership of the memory until it is returned in the callback.

**Return values:**

- `CPA_STATUS_SUCCESS` Function executed successfully.
- `CPA_STATUS_FAIL` Function failed.
- `CPA_STATUS_RETRY` Resubmit the request.
- `CPA_STATUS_INVALID_PARAM` Invalid parameter passed in.
- `CPA_STATUS_RESOURCE` Error related to system resources.

**Precondition:**

The component has been initialized via `cpaCyStartInstance` function.

**Postcondition:**

None

**Note:**

When `pRandSeedCn` is non-NULL an asynchronous callback of type `CpaCyRandSeedCbFunc` is generated in response to this function call. Any errors generated during processing are reported as part of the callback status code. Entropy testing and reseeding are performed automatically by the `cpaCyRandGen` function.

**See also:**

`CpaCyGenericCbFunc`, `CpaCyRandSeedOpData`, `cpaCyRandGen()`

```c
CpaStatus CPA_DEPRECATED cpaCyRandQueryStats ( const CpaInstanceHandle instanceHandle, struct _CpaCyRandStats * pRandStats )
```

**File:** cpa_cy_rand.h

Query random number statistics specific to an instance.

**Deprecated:**

As of v1.3 of the API, replaced by `cpaCyDrbgQueryStats64()`.
21.9 Function Documentation

This function will query a specific instance for random number statistics. The user MUST allocate the CpaCyRandStats structure and pass the reference to that into this function call. This function will write the statistic results into the passed in CpaCyRandStats structure.

Note: statistics returned by this function do not interrupt current data processing and as such can be slightly out of sync with operations that are in progress during the statistics retrieval process.

Context:
This is a synchronous function and it can sleep. It MUST NOT be executed in a context that DOES NOT permit sleeping.

Assumptions:
None

Side-Effects:
None

Blocking:
This function is synchronous and blocking.

Reentrant:
No

Thread-safe:
Yes

Parameters:
[in]  instanceHandle Instance handle.
[out]  pRandStats Pointer to memory into which the statistics will be written.

Return values:
CPA_STATUS_SUCCESS Function executed successfully.
CPA_STATUS_FAIL    Function failed.
CPA_STATUS_INVALID_PARAM Invalid parameter passed in.
CPA_STATUS_RESOURCE Error related to system resources.

Precondition:
Component has been initialized.

Postcondition:
None

Note:
This function operates in a synchronous manner and no asynchronous callback will be generated.
