The Intel® Itanium® processor family has been architected to provide industry-leading performance and capabilities on high-end applications. To take advantage of the benefits of the Itanium® 2 processor, a large and growing number of software applications have been ported to native Itanium architecture code. While optimal performance is realized using native applications, support for IA-32 applications is also provided to enable IT managers flexibility in migrating to Itanium® 2-based Solutions:

- Itanium 2-based Solutions can be deployed when primary, performance-sensitive applications have been ported to Intel Itanium architecture.
- IA-32 versions of secondary applications with less stringent performance requirements can be run on Itanium 2-based platforms.

This provides flexibility to IT managers when converting from RISC solutions because they can tap into the broad IA-32 ecosystem.

Figure A depicts a typical application stack for an Itanium 2-based system deployment where both native Itanium and IA-32 applications are used.

- For optimal performance, the primary, performance-sensitive application (or core application), the database, the operating system, and the drivers have all been ported to run in native Itanium architecture mode.
- In many cases, IA-32 versions of secondary applications (database administration tools, system management, system monitoring, and backup/recovery) will deliver acceptable performance.
- For world-class 32-bit enterprise performance, use Intel® Xeon™ processors.

**The Itanium® 2-based Solution Stack and IA-32 Application Support**

Figure A below represents a typical Itanium 2-based enterprise solution stack.
Considerations for Running 32-bit Applications on 64-bit Platforms

There are other considerations for running 32-bit applications on Intel Itanium®-based systems. Generally, 64-bit operating systems do not support 16-bit applications or 32-bit applications that include 32-bit device drivers. This applies to Itanium as well as other 64-bit platforms. For Itanium 2-based systems, 16-bit applications and 32-bit device drivers must be ported to native Itanium architecture code.

How the IA-32 Execution Layer Works

Itanium 2 processors have always provided the capability to support IA-32 applications using on-die hardware. To enhance this support and add flexibility, Intel developed a new technology called the IA-32 Execution Layer (IA-32 EL).

IA-32 EL is a software binary that will be part of leading operating systems that support Itanium architecture, including Windows* and Linux*.

Execution of the 32-bit applications by either the hardware or the software is transparent to the end-user. When using operating systems with IA-32 EL, support for IA-32 instructions will be provided with IA-32 EL instead of the on-die hardware (IA-32 H/W) (see Figure B below).

IA-32 Instruction Support

Figure B depicts how IA-32 code is supported using IA-32 EL.

The Benefits of the IA-32 Execution Layer

IA-32 EL enhances Itanium 2 processor support for IA-32 applications:

- Greater flexibility in supporting new IA-32 instructions.
- Higher performance with IA-32 applications running on Itanium 2-based platforms. With an Itanium 2 processor 1.50 GHz with 6M L3 cache, IA-32 EL enables performance comparable to an Intel Xeon processor MP 1.50 GHz (varies by application).
- As the performance increases in future generations of the Itanium processor family, performance with IA-32 EL will rise proportionately. Expectations are that IA-32 EL performance will be 50%-70% compared to performance with native Itanium-based applications.

IA-32 Execution Layer Availability and Deployment

Production plans for IA-32 EL are as follows:

- IA-32 EL will be available with Linux operating systems from Red Hat, SUSE, and SGI in 2004.

IA-32 EL will not require any additional enabling from application vendors or end-users. With support in production operating systems, IA-32 EL will become the default solution for running IA-32 applications on Itanium 2-based systems. Operation will be transparent to end-users. IT managers deploying solutions with operating systems carrying the IA-32 Execution Layer will realize the benefits immediately.

Footnotes

1. Based on Intel internal measurements.
2. Use of IA-32 EL with third party software may require you to obtain license rights from such third parties.

Performance tests and ratings are measured using specific computer systems and/or components and reflect the approximate performance of Intel products as measured by those tests. Any difference in system hardware or software design or configuration may affect actual performance. Buyers should consult other sources of information to evaluate the performance of systems or components they are considering purchasing.
