1. Power Analysis

Power consumption is a critical design consideration. When designing a PCB, you must determine the power consumption of the FPGA device to develop an accurate power budget, and to design the power supplies, voltage regulators, heat sink, and cooling system.

The Quartus® Prime software includes the Power Analyzer to help you to estimate the power consumption of your compiled design.

Figure 1. Power Analyzer Tool Settings

The Quartus Prime Design Suite also provides the Early Power Estimator (EPE) spreadsheet for Arria® 10 devices, and the Intel® FPGA Power and Thermal Calculator for Agilex™ FPGA portfolio and Stratix® 10 devices to estimate power consumption calculated from your predicted design characteristics.
Power estimation and analysis allows you to confirm that your design does not exceed thermal or power supply requirements throughout the design process:

- **Thermal**—Thermal power is the power that dissipates as heat from the FPGA. Devices use a heatsink or fan to act as a cooling solution. This cooling solution must be sufficient to dissipate the heat that the device generates. Additionally, the computed junction temperature must fall within normal device specifications.

- **Power supply**—Power supply is the power that the device needs to operate. Power supplies must provide adequate current to support device operation.

**Note:** Do not use the results of the Power Analyzer as design specifications. You must also verify the actual power during device operation to account for actual environmental operating conditions.

**Related Information**
- Intel FPGA Power and Thermal Calculator (PTC) User Guide
- Power Analyzer Support Resources

### 1.1. Power Analysis Tools

The Quartus Prime Design Suite provides tools to analyze the power consumption of your FPGA design at different stages of the design process.

- Intel FPGA Power and Thermal Calculator (PTC)—estimates power supply and system thermal requirements before compiling the design, or anytime during the design phase. Supports Agilex FPGA portfolio and Stratix 10 devices.

- Quartus Prime Power Analyzer (QPA)—estimates power consumption for a post-fit design, allowing you to establish guidelines for the power budget.

- Early Power Estimator (EPE) spreadsheet—estimates power consumption for power supply planning before compiling the design. Supports Arria 10 and Stratix 10 devices. (For versions of the Quartus Prime software later than version 19.4, Stratix 10 devices are supported in the Intel FPGA Power and Thermal Calculator.)

**Figure 2. Estimation Accuracy for Different Inputs and Power Analysis Tools**
The accuracy of the power model is determined on a per-power-rail basis for the Quartus Prime Power Analyzer.

- For most Stratix 10 designs, the Quartus Prime Power Analyzer has the following accuracy, assuming final power models: Within 10% of silicon for the majority of power rails with higher power, assuming accurate inputs and toggle rates.
- For most Agilex FPGA portfolio designs, the Quartus Prime Power Analyzer has the following accuracy, assuming final power models: Within 10% of silicon for all power rails, assuming accurate inputs and toggle rates.

Note: The Quartus Prime Power Analyzer does not support power analysis of the following Intel FPGA IP:

- Stratix 10 HBM2 IP
- Stratix 10 HPS IP
- Arria 10 HPS IP

In versions of the Quartus Prime software later than 19.4, you can obtain power estimations for the Stratix 10 HBM2 IP and Stratix 10 HPS IP using the Intel FPGA Power and Thermal Calculator (PTC).

For power estimation of Arria 10 HPS IP, and for power estimation in the Quartus Prime software version 19.4 or earlier, you can obtain power estimations using the Early Power Estimator spreadsheet (EPE).

1.2. Running the Power Analyzer

Before running the Power Analyzer you must run full compilation of your design to generate the post-fit netlist. In addition, you must either provide timing assignments for all clocks in the design, or specify signal activity data for power analysis. You must specify the I/O standard on each device input and output, and the board trace model on each output in the design.

To run the Power Analyzer:

1. To specify device power characteristics, operating voltage, and temperature conditions for power analysis, click Assignments ➤ Settings ➤ Operating Settings and Conditions, as Settings for Power Analysis on page 8 describes.
2. To run full compilation of your design, click Processing ➤ Start Compilation.
3. Click Assignments ➤ Settings ➤ Power Analyzer.
4. Specify the source of signal activity data, as Generating Signal Activity Data for Power Analysis on page 12 describes.
5. To generate a Signal Activity (.saf) file during analysis, turn on Write out signal activities used during power analysis, and specify the file name.
6. You can customize the generated Power and Thermal Calculator export file name. This file summarizes the resource utilization and allows you to perform what-if analyses in PTC
7. Specify the Default toggle rates for unspecified signals, as Specifying the Default Toggle Rate on page 17 describes.
8. To specify temperature range and cooling options, click Cooling Solution and Temperature.
9. To run full compilation of your design, click Processing ➤ Start ➤ Start Power Analyzer.
10. When power analysis is complete, click Report to open the Power Analyzer reports that Viewing Power Analysis Reports on page 19 describes.

Related Information

Specifying Power Analyzer Input on page 8
1.3. Specifying Power Analyzer Input

The Power Analyzer accuracy is driven by design factors, operating conditions, and signal activity data that affect power consumption. The following figure shows how the Power Analyzer interprets these inputs and generates results in the Power Analysis report:

Figure 3. Power Analyzer High-Level Flow

To obtain accurate I/O power estimates, the Power Analyzer requires full compilation of your design, in addition to specifying the following settings:

- The electrical standard on each I/O cell.
- The board trace model on each I/O standard in the design.
- Timing assignments for all the clocks in your design, or use a simulation-based flow to generate activity data.

Note: For accurate results, ensure that any .VCD file used with the Power Analyzer is the result of gate-level simulation.

1.3.1. Settings for Power Analysis

You can specify device power characteristics, operating voltage conditions, operating temperature conditions, Power Analyzer settings and thermal settings, in the Operating Settings and Conditions, Power Analyzer Settings, and Thermal pages of the Settings dialog box.

Table 2. Operating Settings and Conditions

1.3.2. Specifying Signal Activity Data

The accuracy of the power estimation depends on how representative signal activity data is during power analysis. The Power Analyzer allows you to specify signal activity data from the following sources:

- .vcd files from supported simulators
- User-entered node, entity, clock, and toggle rate assignments
- Vectorless estimation (selected devices)

You can mix and match the signal activity data sources on a signal-by-signal basis.

**Figure 7. Priority Scheme Applied to Each Signal**

1.3.2.1. Using Simulation Signal Activity Data in Power Analysis

You can specify a Verilog Value Change Dump File (.vcd) generated by simulating a placed and routed gate-level netlist in a supported simulator as the source of signal activity data for power analysis. Third-party simulators can output a .vcd that contains signal activity and static probability information for power analysis. The .vcd includes all routing resources and the logic array resource usage.

To improve the accuracy of power analysis, you can generate a Standard Delay Output (.sdo) file that includes back-annotated delay estimates of the instances of core atoms for ModelSim* simulation. ModelSim simulation can then output a more accurate .vcd for use as power analysis input. You must run **Fitter (Finalize)** before generating the .sdo.

**Figure 8. Using Simulation Signal Activity Data in Power Analysis**
1.3.2.1.1. Generating Signal Activity Data for Power Analysis

To generate and use simulation signal activity data for power analysis:

1. To run full compilation on your design, click **Processing ➤ Start Compilation**.
2. To specify settings for simulation output, click **Assignments ➤ Settings ➤ EDA Tool Settings ➤ Simulation**. Select your simulator in **Tool name** and the **Format for output netlist** and **Output directory**.

**Figure 9. EDA Tool Settings for Simulation**

3. Turn on **Map illegal HDL characters**. This setting directs the EDA Netlist Writer to map illegal characters for VHDL or Verilog HDL, and results in more accurate data for power analysis.
4. Click the **Power Analyzer Settings** page.
5. For Stratix 10 designs, to generate a Standard Delay Output (.sdo) file that includes back-annotation of delays for power analysis, refer to **Generating Standard Delay Output for Power Analysis** on page 13.
6. Under **Input file**, turn on **Use input files to initialize toggle rates and static probabilities during power analysis**.

**Figure 10. Specifying Power Analysis Input Files**
7. To specify a .vcd for power analysis, click Add and specify the File name, Entity, and Simulation period for the .vcd, and click OK.

8. To enable glitch filtering during power analysis with the .vcd you generate, turn on Perform glitch filtering on VCD files.

9. To run the power analysis, click Start on the Power Analysis step in the Compilation Dashboard. View the toggle rates in the power analysis results.

Note: To improve accuracy of power analysis, the Quartus Prime EDA Netlist writer can generate a Standard Delay Output (.sdo) file that includes back-annotation of delays for a design’s netlist for use during simulation in QuestaSim. Although the .sdo only contains delay estimates and imprecise timing information, including the .sdo in simulation results in a more accurate output .vcd for power analysis. The EDA Netlist Writer currently supports .sdo file generation only for Verilog .vo simulation in the QuestaSim simulator (not ModelSim - Intel FPGA Edition) for Stratix 10 designs. The EDA Netlist Writer does not currently support .sdo file generation for any other simulator or device family.

1.3.2.1.2. Generating Standard Delay Output for Power Analysis

To improve accuracy of power analysis, you can generate a Standard Delay Output (.sdo) file that includes back-annotated delay estimates for QuestaSim simulation. QuestaSim simulation can then output a more accurate .vcd for use as power analysis input. You must run Fitter (Finalize) before generating the .sdo.

Figure 11. Using an SDO in Power Analysis

1. Click Assignments ➤ Settings ➤ EDA Tool Settings ➤ Simulation. In Tool name select QuestaSim and Verilog for Format for output netlist.
2. Click **More EDA Netlist Writer Settings**. Set **Enable SDO Generation for Power Estimation** to **On**. Set **Generate Power Estimate Scripts** to **ALL_NODES**.

3. To run the Fitter, click **Processing ➤ Start ➤ Start Fitter (Finalize)**.

4. Create a representative testbench (.vt) that exercises the design functions appropriately.

5. To specify the appropriate hierarchy level for signals in the output .vcd, add the following line to the project .qsf file: (1)

```
set_global_assignment -name EDA_TEST_BENCH_DESIGN_INSTANCE_NAME <DUT instance path> -section_id eda_simulation
```

6. After Fitter processing is complete, click **Processing ➤ Start ➤ Start EDA Netlist Writer**. EDA Netlist Writer generates the following files in /<project>/simulation/questa/power/:

- `<project>.vo` (contains a reference to the .sdo file by default)
- `<project>_dump_all_vcd_nodes.tcl`—specifies nodes to save in .vcd
- `<project>_v.sdo`—back-annotated delay estimates

7. Create a QuestaSim script (.do) to load the design and testbench, start QuestaSim, and then source the .do script.

8. To specify the signals QuestaSim includes in the .vcd file, source *_dump_all_vcd_nodes.tcl in QuestaSim.

9. To generate the .vcd file, simulate the test bench and netlist in QuestaSim. The .vcd file generates according to your specifications.

10. Specify the .vcd as an input to power analysis, as **Generating Signal Activity Data for Power Analysis** describes.

---

(1) Specify the full hierarchical path in the testbench, not just the instance name. For example, specify a|b|c, not just c.
Note: The EDA Netlist Writer currently supports .sdo file generation only for Verilog .vo simulation in the QuestaSim simulator (not ModelSim - Intel FPGA Edition) for Stratix 10 designs. The EDA Netlist Writer does not currently support .sdo file generation for any other simulator or device family.

1.3.2.1.3. Simulation Glitch Filtering

The Power Analyzer defines a glitch as two signal transitions so closely spaced in time that the pulse, or glitch, occurs faster than the logic and routing circuitry can respond. The output of a transport delay model simulator contains glitches for some signals. The logic and routing structures of the device form a low-pass filter that filters out glitches that are tens to hundreds of picoseconds long, depending on the device family.

Some third-party simulators use different models than the transport delay model as the default model. Different models cause differences in signal activity and power estimation. The inertial delay model, which is the ModelSim default model, filters out more glitches than the transport delay model and usually yields a lower power estimate.

Note: Intel FPGA recommends that you use the transport simulation model when using the Quartus Prime software glitch filtering support with third-party simulators. Simulation glitch filtering has little effect if you use the inertial simulation model.

Glitch filtering in a simulator can also filter a glitch on one logic element (LE) (or other circuit element) output from propagating to downstream circuit elements to ensure that the glitch does not affect simulated results. Glitch filtering prevents a glitch on one signal from producing non-physical glitches on all downstream logic, which can result in a signal toggle rate and a power estimate that are too high. Circuit elements in which every input transition produces an output transition, including multipliers and logic cells configured to implement XOR functions, are especially prone to glitches. Therefore, circuits with such functions can have power estimates that are too high when glitch filtering is not used.

Note: Intel FPGA recommends that you use the glitch filtering feature to obtain the most accurate power estimates. For .vcd files, the Power Analyzer flows support two levels of glitch filtering.

Enable glitch filtering in the .vcd that you generate for use in power analysis by turning on Perform glitch filtering on VCD files.
The .vcd file reader performs glitch filtering that is complementary to simulation glitch filtering, but is often less precise. While the .vcd file reader has the ability to remove glitches on logic blocks, the file reader cannot determine how a given glitch potentially affects downstream logic and routing. Filtering the glitches during simulation avoids switching downstream routing and logic automatically.

**Note:** When running simulation for design verification (rather than to produce input to the Power Analyzer), Intel recommends that you turn off the glitch filtering option to produce the most rigorous and conservative simulation from a functionality viewpoint. When performing simulation to produce input for the Power Analyzer, Intel FPGA recommends that you turn on the glitch filtering to produce the most accurate power estimates.

### 1.3.2.2. Signal Activities from RTL (Functional) Simulation, Supplemented by Vectorless Estimation

In the functional simulation flow, simulation provides toggle rates and static probabilities for all pins and registers in your design. Vectorless estimation fills in the values for all the combinational nodes between pins and registers, giving good results. This flow usually provides a compilation time benefit when you use the third-party RTL simulator.

### 1.3.2.2.1. RTL Simulation Limitation

RTL simulation may not provide signal activities for all registers in the post-fitting netlist because synthesis loses some register names. For example, synthesis might automatically transform state machines and counters, thus changing the names of registers in those structures. As a result, a large number of nodes in the .vcd file may not match the nodes in your design netlist, which can result in the power analysis results being less accurate or of lower confidence.
1.3.2.3. Signal Activities from Vectorless Estimation and User-Supplied Input Pin Activities

The vectorless estimation flow provides a low level of accuracy, because vectorless estimation for registers is not entirely accurate.

1.3.2.4. Signal Activities from User Defaults Only

The user defaults only flow provides the lowest degree of accuracy.

1.3.3. Specifying the Default Toggle Rate

You can specify the **Default toggle rates for unspecified signals** in your design for power analysis. The Power Analyzer uses the default toggle rate when no other method specifies the signal activity data.

**Figure 14. Specifying the Default Toggle Rate**

![Default toggle rates for unspecified signals](image)

You specify the toggle rate in absolute terms (transitions per second), or as a fraction of the clock rate in effect for each node. The toggle rate for a clock derives from the timing settings for the clock. For example, if the Power Analyzer specifies a clock with an \( f_{\text{MAX}} \) constraint of 100 MHz and a default relative toggle rate of 20%, nodes in this clock domain transition in 20% of the clock periods, or 20 million transitions occur per second.

In some cases, the Power Analyzer cannot determine the clock domain for a node because the clock domain is ambiguous. For example, the Power Analyzer cannot determine a clock domain for a node unless you specify sufficient timing constraints for the clock domains. If the Power Analyzer cannot determine the clock domain for a node, the Power Analyzer substitutes and reports a toggle rate of zero.

**Note:** The transceiver I/O toggle rate is determined by the XCVR data rate value specified in your IP catalog settings. Do not include transceiver I/O toggle rate in the default toggle rates that you specify in the Power Analyzer.

**Related Information**

*Toggle Rate* on page 34

1.3.4. Specifying Toggle Rates for Specific Nodes

You can assign toggle rates and static probabilities to individual nodes in the design. These assignments have the highest priority, overriding data from all other signal activity sources.
You must use the Assignment Editor or Tcl commands to create the **Power Toggle Rate** and **Power Static Probability** assignments. You can specify the power toggle rate as an absolute toggle rate in transitions per second using the **Power Toggle Rate** assignment, or you can use the **Power Toggle Rate Percentage** assignment to specify a toggle rate relative to the clock domain of the assigned node for a more specific assignment made in terms of hierarchy level.

**Note:**
If you use the **Power Toggle Rate Percentage** assignment, and the node does not have a clock domain, the Quartus Prime software issues a warning and ignores the assignment.

Assigning toggle rates and static probabilities to individual nodes is appropriate for signals in which you have knowledge of the signal being analyzed. For example, if you know that a 100 MHz data bus or memory output produces data that is essentially random (uncorrelated in time), you can directly enter a 0.5 static probability and a toggle rate of 50 million transitions per second.

The Power Analyzer treats bidirectional I/O pins differently. The combinational input port and the output pad for a pin share the same name. However, those ports might not share the same signal activities. For reading signal activity assignments, the Power Analyzer creates a distinct name `<node_name~output>` when configuring the bidirectional signal as an output and `<node_name~result>` when configuring the signal as an input. For example, if a design has a bidirectional pin named MYPIN, assignments for the combinational input use the name MYPIN~result, and the assignments for the output pad use the name MYPIN~output.

**Note:**
When you create the logic assignment in the Assignment Editor, you cannot find the MYPIN~result and MYPIN~output node names in the Node Finder. Therefore, to create the logic assignment, you must manually enter the two differentiating node names to create the assignment for the input and output port of the bidirectional pin.

### 1.3.4.1. Clock Node Toggle Rates

For clock nodes, the Power Analyzer uses timing requirements to derive the toggle rate when neither simulation data nor user-entered signal activity data is available. \( f_{\text{MAX}} \) requirements specify full cycles per second, but each cycle represents a rising transition and a falling transition. For example, a clock \( f_{\text{MAX}} \) requirement of 100 MHz corresponds to 200 million transitions per second for the clock node.

### 1.3.5. Avoiding Simulation Node Name Match

Node name mismatches happen when you have `.vcd` applied to entities other than the top-level entity. In a modular design flow, the gate-level simulation files created in different Quartus Prime projects might not match their node names with the current Quartus Prime project.

For example, you may have a file named `8b10b_enc.vcd`, which the Quartus Prime software generates in a separate project called `8b10b_enc` while simulating the `8b10b` encoder. If you import the `.vcd` into another project called `Top`, you might encounter name mismatches when applying the `.vcd` to the `8b10b_enc` module in the `Top` project. This mismatch happens because the Quartus Prime software might name all the combinational nodes in the `8b10b_enc.vcd` differently than in the `Top` project. To avoid such mismatches, Intel recommends using `.vcd` files generated from simulation of your top level project.
1.4. Viewing Power Analysis Reports

Following successful power analysis, click the Power Analyzer pulldown in the Table of Contents of the Compilation Report, to view the Power Analysis section of the report.

![Power Analysis Reports](Image)

The Power Analysis reports contains the following sections:

**Summary**

The Summary section of the report shows the estimated total thermal power consumption of your design. This includes dynamic, static, and I/O thermal power consumption. The I/O thermal power includes the total I/O power drawn from the V\textsubscript{CCIO} and V\textsubscript{CCPD} power supplies and the power drawn from V\textsubscript{CCINT} in the I/O subsystem including I/O buffers and I/O registers. The report also includes a confidence metric that reflects the overall quality of the data sources for the signal activities. For example, a Low power estimation confidence value reflects that you have provided insufficient toggle rate data, or most of the signal activity information used for power estimation is from default or vectorless estimation settings. For more information about the input data, refer to the Power Analyzer Confidence Metric report.

**Power Savings Summary**

Lists any savings (in mW) and the type of savings method, such as SmartVID Power Savings.

**Parallel Compilation**

When you enable parallel compilation, the Parallel Compilation report list the number of processors you use during Power Analysis.
Settings

The Settings section of the report shows the Power Analyzer settings information of your design, including the default input toggle rates, operating conditions, and other relevant setting information.

Simulation Files Read

The Simulation Files Read section of the report lists the simulation output file that the .vcd used for power estimation. This section also includes the file ID, file type, entity, VCD start time, VCD end time, the unknown percentage, and the toggle percentage. The unknown percentage indicates the portion of the design module unused by the simulation vectors.

Operating Conditions Used

The Operating Conditions Used section of the report shows device characteristics, voltages, temperature, and cooling solution, if any, during the power estimation. This section also shows the entered junction temperature or auto-computed junction temperature during the power analysis.

Thermal Map Visualization

For Agilex FPGA portfolio designs, the Power Analyzer provides a visualization of the expected thermal distribution on the core die and the transceiver dies. This data is available when you run the Power Analyzer on your compiled Agilex FPGA portfolio design and you have enabled the Thermal Map visualization by selecting one of the following options under the Thermal solver mode selection in the Thermal Settings dialog:

- Find available thermal margin for cooling solution
- Find cooling solution for maximum junction temperature limit
- Find ambient temperature for specified cooling solution

Figure 16. Thermal Settings to Enable Thermal Map Visualization

After you run the Power Analyzer, select the Thermal Map section in the Power Analyzer report. You can set the threshold temperature you want to use, which is useful if you are making any what-if analyses based on your thermal design. You can adjust the threshold temperature in increments of 5°C, between the ambient temperature (or 50°C, whichever is lower), and an upper limit of 100°C.
Knowing the locations of hot spots in your design can help you make modifications as necessary for proper operation of the system.

The thermal map report can show two different views—a temperature view and a power density view. You can choose the view from a pulldown selection in the GUI, when you open the thermal map in the Power Analyzer.

**Thermal Power Dissipated by Block**

The Thermal Power Dissipated by Block section of the report shows estimated thermal dynamic power and thermal static power consumption categorized by atoms. This information provides you with estimated power consumption for each atom in your design.
By default, this section does not contain any data, but you can turn on the report with the **Write power dissipation by block to report file** option on the **Power Analyzer Settings** page.

### On-Chip Power Dissipation by Block Type

The On-Chip Power Dissipation by Block Type section of the report shows the estimated total on-chip power consumption by block type, and estimated on-chip dynamic power and estimated on-chip static power, by block type.

**Figure 19. On-Chip Power Dissipation by Block Type**

### On-Chip Power Dissipation by Hierarchy

This On-Chip Power Dissipation by Hierarchy section of the report shows estimated cumulative and current-hierarchy-level on-chip dynamic power consumption by hierarchy node. This information is useful when locating modules with high power consumption in your design. (Available for Agilex FPGA portfolio devices.)

### Core Dynamic Thermal Power Dissipation by Clock Domain

The Core Dynamic Thermal Power Dissipation by Clock Domain section of the report shows the estimated total core dynamic power dissipation by each clock domain, which provides designs with estimated power consumption for each clock domain in the design. If the clock frequency for a domain is unspecified by a constraint, the clock frequency is listed as “unspecified.” For all the combinational logic, the clock domain is listed as no clock with zero MHz.

### Current Drawn per Supply

The Current Drawn per Supply section of the report lists the current drawn from each voltage supply. The $V_{CCIO}$ and $V_{CCPD}$ voltage supplies are further categorized by I/O bank and by voltage. This section also lists the minimum safe power supply size (current supply ability) for each supply voltage. Minimum current requirement can be higher than user mode current requirement in cases in which the supply has a specific power up current requirement that goes beyond user mode requirement.

The I/O thermal power dissipation on the summary page does not correlate directly to the power drawn from the $V_{CCIO}$ and $V_{CCPD}$ voltage supplies listed in this report. This is because the I/O thermal power dissipation value also includes portions of the $V_{CCINT}$ power, such as the I/O element (IOE) registers, which are modeled as I/O power, but do not draw from the $V_{CCIO}$ and $V_{CCPD}$ supplies.
The reported current drawn from the I/O Voltage Supplies (ICCIO and ICCPD) as reported in the Power Analyzer report includes any current drawn through the I/O into off-chip termination resistors. This can result in ICCIO and ICCPD values that are higher than the reported I/O thermal power, because this off-chip current dissipates as heat elsewhere and does not factor in the calculation of device temperature. Therefore, total I/O thermal power does not equal the sum of current drawn from each $V_{CCIO}$ and $V_{CCPD}$ supply multiplied by $V_{CCIO}$ and $V_{CCPD}$ voltage.

For SoC devices, there is no standalone ICC_AUX_SHARED current drawn information. The ICC_AUX_SHARED is reported together with ICC_AUX.

**Confidence Metric Details**

The Confidence Metric is defined in terms of the total weight of signal activity data sources for both combinational and registered signals. Each signal has two data sources allocated to it; a toggle rate source and a static probability source.

The Confidence Metric Details section also indicates the quality of the signal toggle rate data to compute a power estimate. The confidence metric is low if the signal toggle rate data comes from poor predictors of real signal toggle rates in the device during an operation. Toggle rate data that comes from simulation, user-entered assignments on specific signals or entities are reliable. Toggle rate data from default toggle rates (for example, 12.5% of the clock period) or vectorless estimation are relatively inaccurate. This section gives an overall confidence rating in the toggle rate data, from low to high. This section also summarizes how many pins, registers, and combinational nodes obtained their toggle rates from each of simulation, user entry, vectorless estimation, or default toggle rate estimations. This detailed information helps you understand how to increase the confidence metric, letting you determine your own confidence in the toggle rate data.

**Signal Activities**

The Signal Activities section lists toggle rates and static probabilities assumed by power analysis for all signals with fan-out and pins. This section also lists the signal type (pin, registered, or combinational) and the data source for the toggle rate and static probability. By default, this section does not contain any data, but you can turn on the report with the Write signal activities to report file option on the Power Analyzer Settings page.

Intel recommends that you keep the Write signal activities to report file option turned off for a large design because of the large number of signals present. You can use the Assignment Editor to specify that activities for individual nodes or entities are reported by assigning an on value to those nodes for the Power Report Signal Activities assignment.

**Messages**

The Messages section lists the messages that the Quartus Prime software generates during the analysis.

### 1.5. Power Analysis in Modular Design Flows

In modular or hierarchical design flows you develop each design block separately, and then instantiate these blocks into a higher-level design to form a complete design. The Intel Quartus Prime software supports simulation and power analysis of the top-level design or individual blocks with the design.
You can associate multiple .vcd simulation output files with specific node names, enabling the integration of partial design simulations into a complete design power analysis. When specifying multiple .vcd files for a node, more than one simulation file can contain signal activity information for the same signal. In those cases, the Power Analyzer follows these rules:

- When you apply multiple .vcd files to the same design node, the Power Analyzer calculates the signal activity as the equal-weight arithmetic average of each .vcd.
- When you apply multiple simulation files to design nodes at different levels in the design hierarchy, the signal activity in the power analysis derives from the simulation file that applies to the most specific design node.

The following figure shows an example of a hierarchical design:

The top-level module of the design, called Top, consists of three 8b/10b decoders, followed by a mux. The software encodes the output of the mux to produce the final output of the top-level module. An error-handling module handles any 8b/10b decoding errors. The Top module contains the top-level entity of the design and any logic not defined as part of another module. The design file for the top-level module can be a wrapper for the hierarchical entities or can contain its own logic.
The following usage scenarios show common ways that you can simulate the design and import the .vcd into the Power Analyzer:

### 1.5.1. Complete Design Simulation Power Analysis Flow

You can simulate the entire gate-level design and generate a .vcd from a third-party simulator. The Power Analyzer can then import the .vcd (specifying the top-level design). The resulting power analysis uses the signal activities information from the generated .vcd, including those that apply to submodules, such as decode [1-3], err1, mux1, and encode1.

### 1.5.2. Modular Design Simulation Power Analysis Flow

You can independently simulate the top-level design, and then import all the resulting .vcd files into the Power Analyzer. For example, you can simulate the 8b10b_dec independent of the entire design and mux, 8b10b_rxerr, and 8b10b_enc. You can then import the .vcd files generated from each simulation by specifying the appropriate instance name. For example, if the files produced by the simulations are 8b10b_dec.vcd, 8b10b_enc.vcd, 8b10b_rxerr.vcd, and mux.vcd, you can use the import specifications in the following table:

<table>
<thead>
<tr>
<th>File Name</th>
<th>Entity</th>
</tr>
</thead>
<tbody>
<tr>
<td>8b10b_dec.vcd</td>
<td>Top</td>
</tr>
<tr>
<td>8b10b_dec.vcd</td>
<td>Top</td>
</tr>
<tr>
<td>8b10b_dec.vcd</td>
<td>Top</td>
</tr>
<tr>
<td>8b10b_rxerr.vcd</td>
<td>Top</td>
</tr>
<tr>
<td>8b10b_enc.vcd</td>
<td>Top</td>
</tr>
<tr>
<td>mux.vcd</td>
<td>Top</td>
</tr>
</tbody>
</table>

The resulting power analysis applies the simulation vectors in each file to the assigned instance. Simulation provides signal activities for the pins and for the outputs of functional blocks. If the inputs to an instance are input pins for the entire design, the simulation file associated with that instance does not provide signal activities for the inputs of that instance. For example, an input to an instance such as mux1 has its signal activity specified at the output of one of the decode instances.

### 1.5.3. Multiple Simulation Power Analysis Flow

You can perform multiple simulations of an entire design or specific modules of a design. For example, in the process of verifying the top-level design, you can have three different simulation testbenches: one for normal operation, and two for corner cases. Each of these simulations produces a separate .vcd. In this case, apply the different .vcd file names to the same top-level entity, as shown in the following table.
Table 6. Multiple Simulation File Names and Entities

<table>
<thead>
<tr>
<th>File Name</th>
<th>Entity</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal.vcd</td>
<td>Top</td>
</tr>
<tr>
<td>corner1.vcd</td>
<td>Top</td>
</tr>
<tr>
<td>corner2.vcd</td>
<td>Top</td>
</tr>
</tbody>
</table>

The resulting power analysis uses an arithmetic average of the signal activities calculated from each simulation file to obtain the final signal activities used. If a signal `err_out` has a toggle rate of zero transition per second in `normal.vcd`, 50 transitions per second in `corner1.vcd`, and 70 transitions per second in `corner2.vcd`, the final toggle rate in the power analysis is 40 transitions per second.

If you do not want the Power Analyzer to read information from multiple instances and take an arithmetic average of the signal activities, use a `.vcd` that includes only signals from the instance that you care about.

1.5.4. Overlapping Simulation Power Analysis Flow

You can perform a simulation on the entire design, and more exhaustive simulations on a submodule, such as `8b10b_rxerr`. The following table lists the import specification for overlapping simulations:

Table 7. Overlapping Simulation Import Specifications

<table>
<thead>
<tr>
<th>File Name</th>
<th>Entity</th>
</tr>
</thead>
<tbody>
<tr>
<td>full_design.vcd</td>
<td>Top</td>
</tr>
<tr>
<td>error_cases.vcd</td>
<td>Top</td>
</tr>
</tbody>
</table>

In this case, the software uses signal activities from `error_cases.vcd` for all the nodes in the generated `.vcd` and uses signal activities from `full_design.vcd` for only those nodes that do not overlap with nodes in `error_cases.vcd`. In general, the more specific hierarchy (the most bottom-level module) derives signal activities for overlapping nodes.

1.5.5. Partial Design Simulation Power Analysis Flow

You can perform a simulation in which the entire simulation time is not applicable to signal activity calculation. For example, if you run a simulation for 10,000 clock cycles and reset the chip for the first 2,000 clock cycles. If the Power Analyzer performs the signal activity calculation over all 10,000 cycles, the toggle rates are only 80% of their steady state value (because the chip is in reset for the first 20% of the simulation). In this case, you must specify the useful parts of the `.vcd` for power analysis. The `Limit VCD Period` option enables you to specify a start and end time when performing signal activity calculations.
1. Power Analysis

683174 | 2024.04.01

### 1.5.5.1. Specifying Start and End Time for Signal Activity Calculations

To specify a start and end time for signal activity calculations using the **Limit VCD period** option, follow these steps:

1. In the Quartus Prime software, click **Assignments ➤ Settings**.
2. Under the **Category** list, click **Power Analyzer Settings**.
3. Turn on the **Use input file(s) to initialize toggle rates and static probabilities during power analysis** option.
4. Click **Add**.
5. In the **File name** and **Entity** fields, browse to the necessary files.
6. Under **Simulation period**, turn on **VCD file** and **Limit VCD period** options.
7. In the **Start time** and **End time** fields, specify the desired start and end time.
8. Click **OK**.

You can also use the following Tcl or `.qsf` assignment to specify `.vcd` files:

```tcl
set_global_assignment -name POWER_INPUT_FILE_NAME "test.vcd" -section_id test.vcd
set_global_assignment -name POWER_VCD_FILE_START_TIME "10 ns" -section_id test.vcd
set_global_assignment -name POWER_VCD_FILE_END_TIME "1000 ns" -section_id test.vcd
set_instance_assignment -name POWER_READ_INPUT_FILE test.vcd -to test_design
```

### 1.5.6. Vectorless Estimation Power Analysis Flow

For some device families, the Power Analyzer automatically derives estimates for signal activity on nodes with no simulation or user-entered signal activity data.

Vectorless estimation statistically estimates the signal activity of a node based on the signal activities of nodes feeding that node, and on the actual logic function that the node implements. Vectorless estimation cannot derive signal activities for primary inputs. Vectorless estimation is accurate for combinational nodes, but not for registered nodes. Therefore, the Power Analyzer requires simulation data for at least the registered nodes and I/O nodes for accuracy.

### 1.6. Scripting Support

You can run procedures and create settings described in this chapter in a Tcl script. Alternatively, you can run procedures at a command prompt. For more information about scripting command options, refer to the Quartus Prime Command-Line and Tcl API Help browser. To run the Help browser, type the following command at the command prompt:

```
quartus_sh --qhelp
```

**Related Information**

1.6.1. Running the Power Analyzer from the Command–Line

The executable to run the Power Analyzer is `quartus_pow`. For a complete listing of all command–line options supported by `quartus_pow`, type the following command at a system command prompt:

```
quartus_pow --help
```
or
```
quartus_sh --qhelp
```

The following lists the examples of using the `quartus_pow` executable. Type the command listed in the following section at a system command prompt:

**Note:** These examples assume that operations are performed on Quartus Prime project called `sample`.

- To customize the name of the generated EPE File:
  ```
quartus_pow sample --output_epe=sample.csv
  ```

- To customize the name of the generated Power and Thermal Calculator file:
  ```
quartus_pow sample --output_ptc=sample.qptc
  ```

- To instruct the Power Analyzer to use a `.vcd` as input (`sample.vcd`):
  ```
quartus_pow sample --input_vcd=sample.vcd
  ```

- To instruct the Power Analyzer to use two `.vcd` files as input files (`sample1.vcd` and `sample2.vcd`), perform glitch filtering on the `.vcd` and use a default input I/O toggle rate of 10,000 transitions per second:
  ```
quartus_pow sample --input_vcd=sample1.vcd --input_vcd=sample2.vcd --vcd_filter_glitches=on --default_input_io_toggle_rate=10000transitions/s
  ```

- To instruct the Power Analyzer not to use an input file, specify a default input I/O toggle rate of 60%, with vectorless estimation off, and a default toggle rate of 20% on all remaining signals:
  ```
quartus_pow sample --no_input_file --default_input_io_toggle_rate=60% --use_vectorless_estimation=off --default_toggle_rate=20%
  ```

**Note:** No command–line options are available to specify the information found on the Operating Settings and Conditions and Power Analyzer Settings ➤ Thermal pages. Use the Quartus Prime GUI to specify these options.

The `quartus_pow` executable creates a report file, `<revision name>.pow.rpt`. You can locate the report file in the main project directory. The report file contains the same information that the Power Analyzer Compilation Report.

## 1.7. Power Analysis Revision History

The following revision history applies to this chapter:

<table>
<thead>
<tr>
<th>Document Version</th>
<th>Quartus Prime Version</th>
<th>Changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>2024.04.01</td>
<td>24.1</td>
<td>Updated Agilex 7 to Agilex FPGA portfolio in several topics to include support for Agilex 5 devices.</td>
</tr>
<tr>
<td>2023.12.04</td>
<td>23.4</td>
<td>Revised the information for Device power characteristics in the Settings for Power Analysis.</td>
</tr>
</tbody>
</table>
| 2023.10.02       | 23.3                  | Updated the section "Thermal Map Visualization" with additional information in Viewing Power Analysis Reports.  
                       Updated the Power Analyzer Settings image and relevant description in Settings for Power Analysis.  
                       Updated the product family name to "Intel Agilex 7." |
| 2022.12.12       | 22.4                  | Updated screenshot in Power Analysis topic.  
                       Removed Write out Power and Thermal Calculator file option description from Settings for Power Analysis topic. This setting is replaced by Power and Thermal Calculator File Name option.  
                       Revised Running the Power Analyzer topic for Power and Thermal Calculator File Name option.  
                       Revised Running the Power Analyzer from the Command Line for new GUI option and removal of obsolete commands. |
| 2022.06.22       | 21.4                  | In the Power Analysis Tools topic, added statements about Quartus Prime Power Analyzer accuracy for Stratix 10 and Intel Agilex designs. |
| 2021.12.13       | 21.4                  | In the Settings for Power Analysis topic, modified a Thermal Settings entry in the Power Analyzer and Thermal Settings table. Specifically, changed Apply Recommended Margin to Apply Additional Margin, and modified the description accordingly.  
                       In the Viewing Power Analysis Reports topic, added the Crypto block type to the On-Chip Power Dissipation by Block Type section. |
| 2021.10.04       | 21.3                  | Recast the note in the Power Analysis Tools topic for greater clarity. |
| 2021.03.29       | 21.1                  | In the Power Analysis topic, updated the figure.  
                       In the Running the Power Analyzer topic, modified step 3 and removed the figure following step 9.  
                       Changed the title of the Device Operating Condition Settings for Power Analysis topic to Settings for Power Analysis, updated the existing figure and added an additional figure, recast the existing table and added an additional table.  
                       In the Generating Signal Activity Data for Power Analysis topic, modified step 5 and the figure within step 6.  
                       In the Viewing Power Analysis Reports topic, made minor changes to the first paragraph of the Thermal Map Visualization section.  
                       In the Running the Power Analyzer from the Command–Line topic, modified the note at the bottom of the topic. |
| 2020.12.07       | 20.3.0                | Added note to the Specifying the Default Toggle Rate topic. |
| 2020.10.05       | 20.3.0                | Added mention of gate-level simulation to the Specifying Power Analyzer Input, Specifying Signal Activity Data, Using Simulation Signal Activity Data in Power Analysis, and Complete Design Simulation Power Analysis Flow topics.  
                       Added a sentence to the RTL Simulation Limitation and Avoiding Simulation Node Name Match topics.  
                       Added a Thermal Map Visualization section to the Viewing Power Analysis Reports topic. |

2. Power Optimization

The Quartus Prime software offers power-driven compilation to fully optimize device power consumption. Power-driven compilation focuses on reducing the design's total power consumption in synthesis and place-and-route stages.

This chapter focuses on design optimization options and techniques that help reduce core dynamic power and I/O power. In addition to these techniques, there are additional power optimization techniques available for specific devices, including Programmable Power Technology and Device Speed Grade Selection.

Related Information

- Intel FPGA Literature and Technical Documentation

2.1. Factors Affecting Power Consumption

Understanding the following factors that affect power consumption allows you to use the Power Analyzer and interpret its results effectively:

- Design Activity and Power Analysis on page 32
- Device Selection on page 32
- Environmental Conditions on page 33
- Device Resource Usage on page 33
- Signal Activity on page 34

2.1.1. Design Activity and Power Analysis

Power consumption of a device also depends on the design's activity over time. Static power ($P_{static}$) is the thermal power that a chip dissipates independent of user clocks. $P_{static}$ includes leakage power from all FPGA functional blocks, except for I/O DC bias power and transceiver DC bias power, which are accounted for in the I/O and transceiver sections. Dynamic power is the additional power consumption of a device due to signal activity or switching.

2.1.2. Device Selection

Device families have different power characteristics. Many parameters affect the device family power consumption, including choice of process technology, supply voltage, electrical design, and device architecture.
Power consumption also varies in a single device family. A larger device with more transistors consumes more static power than a smaller device in the same family. In devices that employ global routing architectures, dynamic power can also increase with device size.

The choice of device package also affects the ability of the device to dissipate heat, and you may need to use a different cooling solution to comply with junction temperature constraints.

Process variation can affect power consumption. Process variation primarily impacts static power, because sub-threshold leakage current varies exponentially with changes in transistor threshold voltage. Therefore, you must consult device specifications for static power, and not rely on empirical observation. Process variation has a weak effect on dynamic power.

### 2.1.3. Environmental Conditions

The main environmental parameters affecting junction temperature are operating temperature and the cooling solution. Operating temperature primarily affects device static power consumption. Higher junction temperatures result in higher static power consumption. The device thermal power and cooling solution that you use must keep the device junction temperature within the maximum operating range for the device.

The following table lists the environmental conditions that influence power consumption.

<table>
<thead>
<tr>
<th>Environmental Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Airflow</td>
<td>Measures how quickly the device replaces heated air from the vicinity of the device with air at ambient temperature. You can either specify airflow as &quot;still air&quot; when you are not using a fan, or as the linear feet per minute rating of the fan in the system. Higher airflow decreases thermal resistance.</td>
</tr>
<tr>
<td>Heat Sink and Thermal Compound</td>
<td>A heat sink allows more efficient heat transfer from the device to the surrounding area because of its large surface area exposed to the air. The thermal compound that interfaces the heat sink to the device also influences the rate of heat dissipation. The case-to-ambient thermal resistance (θ_{CA}) parameter describes the cooling capacity of the heat sink and thermal compound employed at a given airflow. Larger heat sinks and more effective thermal compounds reduce θ_{CA}.</td>
</tr>
</tbody>
</table>
| Junction Temperature    | The junction temperature of a device is equal to:  
\[
T_{Junction} = T_{Ambient} + P_{Thermal} \cdot \theta_{JA}
\]
  in which θ_{JA} is the total thermal resistance from the device transistors to the environment, in degrees Celsius per watt. The value θ_{JA} is equal to the sum of the junction-to-case (package) thermal resistance (θ_{JC}), and the case-to-ambient thermal resistance (θ_{CA}) of the cooling solution. |
| Board Thermal Model     | The junction-to-board thermal resistance (θ_{JB}) is the thermal resistance of the path through the board, in degrees Celsius per watt. To compute junction temperature, you can use this board thermal model along with the board temperature, the top-of-chip θ_{JA} and ambient temperatures. |

### 2.1.4. Device Resource Usage

Power consumption depends on the number and types of device resources that a design uses.
2.1.4.1. Number, Type, and Loading of I/O Pins

Output pins drive off-chip components, resulting in high-load capacitance that leads to a high-dynamic power per transition. Terminated I/O standards require external resistors that draw constant (static) power from the output pin.

2.1.4.2. Number and Type of Hard Logic Blocks

A design with more logic elements (LEs), multiplier elements, memory blocks, transceiver blocks, or HPS system tends to consume more power than a design with fewer circuit elements. The operating mode of each circuit element also affects its power consumption.

For example, a DSP block performing 18 × 18 multiplications and a DSP block performing multiply-accumulate operations consume different amounts of dynamic power, because of different amounts of charging internal capacitance on each transition. The operating mode of a circuit element also affects static power.

2.1.4.3. Number and Type of Global Signals

Global signal networks span large portions of the device and have high capacitance, resulting in significant dynamic power consumption. The type of global signal is important as well. Global clocks cover the entire device, whereas quadrant clocks only span one-fourth of the device. Clock networks that span smaller regions have lower capacitance and tend to consume less power. The location of the logic array blocks (LABs) driven by the clock network can also have an impact because the Quartus Prime software automatically disables unused branches of a clock.

2.1.5. Signal Activity

The behavior of each signal in the design is an important factor in estimating power consumption. To get accurate results from the power analysis, the signal activity must represent the actual operating behavior of the design.

The two most important behaviors of a signal are toggle rate and static probability.

2.1.5.1. Toggle Rate

The toggle rate of a signal is the average number of times that the signal changes value per unit of time. The units for toggle rate are transitions per second, and a transition is a change from 1 to 0, or 0 to 1.

*Note:* Inaccurate signal toggle rate data is the largest source of power estimation error.

Dynamic power increases linearly with the toggle rate as you charge the board trace model more frequently for logic and routing. The Quartus Prime software models full rail-to-rail switching. For high toggle rates, especially on circuit output I/O pins, the circuit can transition before fully charging the downstream capacitance. The result is a slightly conservative prediction of power by the Power Analyzer.

*Note:* The transceiver I/O toggle rate is determined by the XCVR data rate value specified in your IP catalog settings. Do not include transceiver I/O toggle rate in the default toggle rates that you specify in the Power Analyzer.
Related Information
Specifying the Default Toggle Rate on page 17

2.1.5.2. Static Probability

The static probability of a signal is the fraction of time that the signal is logic 1 during device operation. Static probability ranges from 0 (always at ground) to 1 (always at logic-high).

The static probability of input signals impacts the design's static power consumption, due to state-dependent leakage in routing and logic. This effect becomes more important for smaller geometries. In output I/O standards that drive termination resistors, the static power also depends on the static probability on I/O pins.

2.2. Design Space Explorer II for Power-Driven Optimization

The Design Space Explorer II (DSE II) tool allows you to find and implement the project settings that result in best power behavior.

The DSE II offers two options in Exploration mode that target power optimization: Power (High Effort) and Power (Aggressive). In both cases, the target is an overall improvement in the design's power; specifically, reducing the total thermal power in the design.

When the optimization targets power, the DSE II runs the Quartus Prime Power Analyzer for every group of settings. The resultant reports help you debug the design and determine trade-offs between power requirements and performance optimization.

• Launch Design Space Explorer Command (Tools Menu)
  In Quartus Prime Help

2.3. Power-Driven Compilation

Quartus Prime software settings that control power-driven compilation are located in the Power optimization during synthesis list in the Advanced Settings (Synthesis) dialog box, and the Power optimization during fitting list on the Advanced Fitter Settings dialog box. The following sections describes these power optimization options at the Analysis and Synthesis and Fitter levels.

2.3.1. Power-Driven Synthesis

Synthesis netlist optimization occurs during the synthesis stage of the compilation flow. You can apply these settings on a project or entity level.
The **Power Optimization During Synthesis** logic option determines how aggressively Analysis & Synthesis optimizes the design for power. To access this option at a project level, click **Assignments ➤ Settings ➤ Compiler Settings ➤ Advanced Settings (Synthesis)**.

### Table 9. Power Optimization During Synthesis Options

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
<th>Optimization Techniques Included</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>The Compiler does not perform netlist, placement, or routing optimizations to minimize power.</td>
<td>-</td>
</tr>
</tbody>
</table>
| Normal compilation (Default) | The Compiler applies low compute effort algorithms to minimize power through netlist optimizations that do not reduce design performance. | • Memory block optimization  
• Power-aware logic mapping |
| Extra effort              | Besides the techniques in the Normal compilation setting, the Compiler applies high-compute-effort algorithms to minimize power through netlist optimizations. Selecting this option might impact performance. | • Memory block optimization  
• Power-aware logic mapping  
• Power-aware memory balance |

You can also control memory optimization options from the Quartus Prime **Settings** dialog box. The **Default Parameters** page allows you to edit the **Low_Power_Mode** parameter. The settings for this parameter are equivalent to the values of the **Power Optimization During Synthesis** logic options. The **Low_Power_Mode** parameter always takes precedence over the **Optimize Power for Synthesis** option for power optimization on memory.

### Table 10. Low Power Mode Parameter Options

- [Quartus Prime Compiler Settings](#) on page 39

### 2.3.1.1. Memory Block Optimization

Memory optimization involves moving user-defined read/write enable signals to associated read-and-write clock enable signals for all memory types.

Memory blocks can represent a large fraction of total design dynamic power. Minimizing the number of memory blocks accessed during each clock cycle can significantly reduce memory power.
In the default implementation of a simple dual-port memory block, write-clock enable signals and read-clock enable signals connect to VCC, making both read and write memory ports active during each clock cycle.

Memory transformation moves the read-enable and write-enable signals to the respective read-clock enable and write-clock enable signals. This technique reduces the design's memory power consumption, because memory ports are shut down when they are not accessed.

2.3.1.2. Power-Aware Logic Mapping

Power-aware logic mapping reduces power by rearranging the logic during synthesis to eliminate nets with high switching rates.

2.3.1.3. Power-Aware Memory Balancing

Power-aware memory balancing chooses the best configuration for a memory implementation and provides optimal power saving by determining the required number of memory blocks, decoder, and multiplexer circuits. When the design does not specify target-embedded memory blocks for the design’s memory functions, the power-aware balancer automatically selects them during memory implementation.

The Compiler includes this optimization technique when the Power Optimization During Synthesis logic option is set to Extra effort.

There is a trade-off between power saved by accessing fewer memories and power consumed by the extra decoder and multiplexer logic. The Quartus Prime software automatically balances the power savings against the costs to choose the lowest power configuration for each logical RAM. The benchmark data shows that the power-driven synthesis can reduce memory power consumption by as much as 60% in Stratix devices.

You can also set the MAXIMUM_DEPTH parameter manually to configure the memory for low power optimization. This technique is the same as the power-aware memory balancer, but it is manual rather than automatic like the Extra effort setting in the Power optimization list. The MAXIMUM_DEPTH parameter always takes precedence over the Optimize Power for Synthesis options for power optimization on memory optimization. You can set the MAXIMUM_DEPTH parameter for memory modules manually in the Intel FPGA IP instantiation or in the IP Catalog.

Related Information
- RAM and ROM Parameter Settings
  In Stratix 10 Embedded Memory User Guide
2.3.2. Power-Driven Fitter

The Quartus Prime software allows you to control the power-driven compilation setting of the Fitter on a project-wide basis. The Advanced Fitter Settings dialog box page provides the Power optimization during Fitting logic option, that determines how aggressively the Fitter optimizes the design for power.

Table 11. Power-Driven Fitter Option

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>The Fitter does not perform optimizations to minimize power.</td>
</tr>
<tr>
<td>Normal compilation</td>
<td>The Fitter applies low compute effort algorithms to minimize power through placement and routing optimizations. These techniques do not reduce</td>
</tr>
<tr>
<td>(Default)</td>
<td>design performance. Includes DSP optimizations that create power-efficient DSP block configurations for DSP functions.</td>
</tr>
<tr>
<td>Extra effort</td>
<td>Besides the optimization techniques of the Normal Compilation option, the Fitter applies high compute effort algorithms to minimize power through</td>
</tr>
<tr>
<td></td>
<td>placement and routing optimizations. These techniques might impact performance. The Extra effort setting for the Fitter requires extensive effort</td>
</tr>
<tr>
<td></td>
<td>to optimize the design for power and can increase compilation time.</td>
</tr>
</tbody>
</table>

The Extra effort setting the Fitter works to minimize power even after the design meets timing requirements by moving the logic closer during placement to localize high-toggling nets and choosing routes with low capacitance.

The Extra effort setting uses a Value Change Dump (.vcd) file that guides the Fitter to fully optimize the design for power, based on the signal activity of the design. The best power optimization during fitting results from using the most accurate signal activity information. If there is no .vcd file, the Quartus Prime software estimates the signal activities from the settings in the Power Analyzer Settings page in the Settings dialog box, such as assignments, clock assignments, and vectorless estimation values.

Related Information
Assignment Editor Options on page 40

2.3.3. Area-Driven Synthesis

Using area optimization rather than timing or delay optimization during synthesis saves power because you use fewer logic blocks. Using less logic usually means less switching activity.

The Quartus Prime software provides Speed, Balanced, or Area for the Optimization Technique option. You can also specify this logic option for specific modules in your design with the Assignment Editor in cases where you want to reduce area using the Area setting (potentially at the expense of register-to-register timing performance) while leaving the default Optimization Technique setting at Balanced (for the best trade-off between area and speed for certain device families). The Speed Optimization Technique can increase the resource usage of your design if the constraints are too aggressive and can also result in increased power consumption.
2.3.4. Gate-Level Register Retiming

You can also use gate-level register retiming to reduce circuit switching activity. Retiming shuffles registers across combinational blocks without changing design functionality.

The **Perform gate-level register retiming** option in the Quartus Prime software enables the movement of registers across combinational logic to balance timing, allowing the software to trade off the delay between critical and noncritical paths.

Retiming uses fewer registers than pipelining. In this example of gate-level register retiming, the 10 ns critical delay is reduced by moving the register relative to the combinational logic, resulting in the reduction of data depth and switching activity.

![Gate-Level Register Retiming Diagram]

Gate-level register retiming makes changes at the gate level. If you are using an atom netlist from a third-party synthesis tool, you must also select the **Perform WYSIWYG primitive resynthesis** option to undo the atom primitives to gates mapping (so that register retiming can be performed), and then to remap gates to Intel primitives.

2.3.5. Quartus Prime Compiler Settings

The Quartus Prime software provides settings that optimize power for the full design.

To set the optimization mode on the Quartus Prime software, click **Assignments ➤ Settings ➤ Compiler Settings**.
Figure 24. Compiler Settings

Aggressive Power (reduces performance)

Makes aggressive effort to optimize synthesis for low power. The Compiler further reduces the routing usage of signals with the highest specified or estimated toggle rates, saving additional dynamic power but potentially affecting performance.

2.3.6. Assignment Editor Options

The Assignment Editor allows you to select Optimization Technique & Synthesis Power Optimization for individual modules. With this feature, you can focus on the parts of the design that require more work.

The Optimization Technique logic option specifies the overall optimization goal for Analysis & Synthesis: attempt to maximize performance or minimize logic usage.
The **Power Optimization During Synthesis** logic option determines how aggressively Analysis & Synthesis optimizes the design for power.

### 2.4. Design Guidelines

During FPGA design implementation, you can apply the following design techniques to reduce power consumption. The results of these techniques are different from design to design.

#### 2.4.1. Clock Power Management

Clocks represent a significant portion of dynamic power consumption due to their high switching activity and long paths. Actual clock-related power consumption is higher, because the power consumption of a block includes local clock distribution within logic, memory, and DSP or multiplier blocks.

The Quartus Prime software optimizes clock routing power automatically, enabling only those portions of the clock network that are necessary to feed downstream registers.

#### 2.4.1.1. Clock Gating

For designs containing logic that is not operational 100% of the time, you can reduce power consumption by gating (disabling) the clock that feeds that logic.
This solution requires that the logic in question have its own dedicated clock source. Clock duplication (such as introducing a duplicate PLL clock output) is necessary if the logic in question does not have its own dedicated clock source.

The following topics describe methods for gating clock networks.

### 2.4.1.1.1. Root Clock Gate

You can gate each clock network dynamically at the root level, using the Clock Control Intel FPGA IP Core.

Refer to the *Root Clock Gate* section of the *Clocking and PLL User Guide* for your Intel device.

### 2.4.1.1.2. Sector Clock Gate

You can gate each clock network dynamically at the clock sector level using the Clock Control Intel FPGA IP Core.

Refer to the *Sector Clock Gate* section of the *Clocking and PLL User Guide* for your Intel device.

### 2.4.1.1.3. I/O PLL Clock Gate

You can dynamically gate each of the device's I/O PLL output counters, using I/O PLL Reconfiguration.

Refer to the *I/O PLL Clock Gate* section of the *Clocking and PLL User Guide* for your Intel device.

### 2.4.1.2. Clock Enable in Memory Blocks

In memory blocks, power consumption is tied to the clock rate, and is insensitive to the toggle rate on the data and address lines. Memory consumes approximately 20% of the core dynamic power in typical designs.

When a memory block is clocked, a sequence of timed events occur within the block to execute a read or write. The circuitry that the clock controls consumes the same amount of power, independent of changes in address or data from one cycle to the next. Thus, the toggle rate of input data and the address bus have no impact on memory power consumption.

The key to reducing memory power consumption is to reduce the number of memory clocking events. You can achieve this reduction through network-wide clock gating, or on a per-memory basis through use of the clock enable signals on the memory ports.

#### Figure 27. Memory Clock Enable Signal

Logical view of the internal clock of the memory block. Use the appropriate enable signals on the memory to make use of the clock enable signal instead of gating the clock.

![Memory Clock Enable Signal](image)

The clock enable signal enables the memory only when necessary, and shuts down for the rest of the time, reducing the overall memory power consumption. You include these enable signals when generating the memory block function.
The Quartus Prime software automatically chooses the best design memory configuration for optimal power. However, you can set the `MAXIMUM_DEPTH` parameter for memory modules during the IP core instantiation.

### 2.4.1.3. LAB Clock Power

Another contributor to clock power consumption are LAB clocks, which distribute clock to the registers within a LAB. LAB clock power can be the dominant contributor to overall clock power.
To reduce LAB-wide clock power consumption without disabling the entire clock tree, use the LAB-wide clock enable to gate the LAB-wide clock. The Quartus Prime software automatically promotes register-level clock enable signals to the LAB-level. A shared gated clock controls all registers within an LAB that share a common clock and clock enable. To take advantage of these clock enables, use a clock enable construct in the relevant HDL code for the registered logic.

### 2.4.1.3.1. LAB-Wide Clock Enable Example

This VHDL code makes use of a LAB-wide clock enable. This clock-gating logic is automatically turned into an LAB-level clock enable signal.

```vhdl
IF clk'event AND clock = '1' THEN
    IF logic_is_enabled = '1' THEN
        reg <= value;
    ELSE
        reg <= reg;
    END IF;
END IF;
```

### 2.4.1.4. Clock Enables

Use clock enables instead of the gated clocks shown below:

Avoid the following form of gated clocks:

```vhdl
assign clk_gate = clk1 & gateA & gateB;
always @(posedge clk_gate) begin
    sr[1:0] <= sr[0:0];
    sr[0] <= din1;
end
```

Use clock enables, such as the following:

```vhdl
assign enable = gateA & gateB;
always @(posedge clk2) begin
    if (enable) begin
        sr[1:0] <= sr[0:0];
    end
```
Reduce LAB-wide clock power consumption without disabling the entire clock tree, use the LAB-wide clock enable to gate the LAB-wide clock.

```verilog
always @(posedge clk)
begin
  if (ena)
    temp <= dataa;
  else
    temp <= temp;
end
```

### 2.4.1.5. Global Signals

Intel FPGAs have different kinds of global signal resources available. Global signals can span the entire chip or smaller regions. Choose the clock networks that can cover all the fanout on a specific domain. For example, you can reduce clock power by switching from a clock network that spans the entire chip to one quarter of the chip, provided all the fanout for that clock is within that region of the chip.

#### 2.4.1.5.1. Viewing Clock Details in the Chip Planner

1. Open the Chip Planner (Tools ➤ Chip Planner).
2. In the Task pane, under Clock Reports, double-click Report Clock Details.

**Figure 33. Chip Planner Task Pane**
3. Click OK. The Report pane generates the Clock folder.

4. Expand the Clock folder and select Used spine clock regions to highlight on the Chip planner.

5. In the Layers Settings pane, turn on Regional/Periphery clock region to see whether used spine clock regions are within.

**Figure 35. Clock Highlight in Chip Planner**
This example uses a Regional clock Region instead of a global signal.

---

### 2.4.1.6. Merge Clocks

Evaluate the possibility of merging clocks and PLLs in the design.

- 1Clk & 1PLL
  - Merge clks
  - clk: 365Mhz, Fanout 51277
2.4.2. Pipelining and Retiming

Glitches are unnecessary and unpredictable temporary logic switches at the output of combinational logic. Designs with glitches consume more power, because of faster switching activity. A glitch usually occurs when there is a mismatch in input signal timing, leading to unequal propagation delay.

For example, consider a 2-input XOR gate where one input changes from 1 to 0, and moments later the other input changes from 0 to 1. For a short time, both inputs become 1 (high), resulting in 0 (low) at the output of the XOR gate. Then, when the second input transition takes place, the XOR gate output becomes 1 (high). Therefore, before the output becomes stable, the input delay produces a glitch in the output.

Figure 36. XOR Gate Showing Glitch at the Output

A glitch can propagate to subsequent logic and create unnecessary switching activity, increasing power consumption. Circuits with many XOR functions, such as arithmetic circuits or cyclic redundancy check (CRC) circuits, tend to have many glitches if there are several levels of combinational logic between registers.

Registers stop glitches from propagating through combinational paths. Pipelining is a technique that breaks combinational paths by inserting registers. By reducing logic-level numbers between registers, pipelining can result in higher clock speed operations. However, pipelining increases the latency of a circuit in terms of the number of clock cycles to a first result.

The following figure shows how pipelining breaks a long combinational path.
This reduction in switching activity lowers power dissipation in combinational logic. However, for designs with few glitches, pipelining can increase power consumption by adding unnecessary registers. Pipelining can also increase resource utilization.

2.4.3. Architectural Optimization

Design-level architectural optimizations allow you to take advantage of device architecture features. These features include dedicated memory, DSPs, or multiplier blocks that can perform memory or arithmetic-related functions. You can reduce power consumption by choosing blocks in place of LUTs. For example, you can build large shift registers from RAM-based FIFO buffers instead of building the shift registers from the LE registers.

Related Information
Timing Closure and Optimization
In Quartus Prime Pro Edition User Guide: Design Optimization

2.4.4. I/O Power Guidelines

The Power Analyzer calculates I/O power using the default capacitive load set for the I/O standard in the Capacitive Loading page of the Device and Pin Options dialog box. Any other components defined in the board trace model are not taken into account for the power measurement.

Nonterminated I/O Standards

Nonterminated I/O standards such as LVTTL and LVCMOS have a rail-to-rail output swing. The voltage difference between logic-high and logic-low signals at the output pin is equal to the \( V_{CCIO} \) supply voltage. If the capacitive loading at the output pin is known, the following expression determines the dynamic power consumed in the I/O buffer:

\[
P = F \cdot C \cdot V^2\frac{2}{2}
\]
where:
- $F$ is the output transition frequency
- $C$ is the total load capacitance being switched
- $V$ is equal to $V_{CCIO}$ supply voltage

Because of the quadratic dependence on $V_{CCIO}$, lower voltage standards consume significantly less dynamic power.

Transistor-to-transistor logic (TTL) I/O buffers consume very little static power. As a result, the total power that a LVTTL or LVCMOS output consumes is highly dependent on load and switching frequency.

**Resistively Terminated I/O Standards**

In resistively terminated I/O standards like SSTL and HSTL, the output load voltage swings by a small amount around a bias point. The dynamic power equation above is valid as well, but $V$ is the actual load voltage swing. This voltage is much smaller than $V_{CCIO}$, resulting in lower dynamic power when comparing to nonterminated I/O under similar conditions.

Resistively terminated I/O standards dissipate significant static (frequency-independent) power, because the I/O buffer is constantly driving current into the resistive termination network. However, the lower dynamic power of these I/O standards means they often have lower total power than LVCMOS or LVTTL for high-frequency applications. As a best practice, when using resistively terminated standards choose the lowest drive strength I/O setting that meets the speed and waveform requirements to minimize I/O power.

You can save a small amount of static power by connecting unused I/O banks to the lowest possible $V_{CCIO}$ voltage.

**Related Information**

**Managing Device I/O Pins**

In *Quartus Prime Pro Edition User Guide: Design Constraints*

**2.4.5. Dynamically Controlled On-Chip Terminations (OCT)**

Dynamic OCT enables series termination (RS) and parallel termination (RT) to dynamically turn on/off during the data transfer. This feature is especially useful in FPGAs with external memory interfaces, such as interfacing with DDR memories.

Dynamic OCT eliminates the constant DC power that parallel termination consumes when transmitting data, reducing power consumption when compared to conventional termination. Parallel termination is extremely useful for applications that interface with external memories where I/O standards, such as HSTL and SSTL, are used. Parallel termination supports dynamic OCT, which is useful for bidirectional interfaces.

For more information about dynamic OCT in specific devices, refer to the *Stratix 10 General Purpose I/O User Guide* or the *Arria 10 Core Fabric and General Purpose I/O Handbook*. 
Example 1. Example: Power Saving for a DDR3 Interface with OCT

The static current consumed by parallel OCT is equal to the $V_{CCIO}$ voltage divided by 100 W. For DDR3 interfaces with SSTL-15, the static current per pin is:

$$\frac{1.5V}{100W} = 15mA$$

Therefore, the static power is:

$$1.5V \times 15mA = 22.5mW$$

For an interface with 72 DQ and 18 DQS pins, the static power is:

$$90\text{pins} \times 2.25mW = 2.025W$$

Dynamic parallel OCT disables parallel termination during write operations, so if writing occurs 50% of the time, the power saved by dynamic parallel OCT is:

$$50\% \times 2.025W = 1.0125W$$

For more information about dynamic OCT in Stratix IV devices, refer to the chapter in the *Stratix IV Device Handbook*.

For more information about dynamic OCT in Stratix IV devices, refer to the chapter in the *Stratix IV Device Handbook*.  

Related Information

- Dynamic OCT
  In *Arria 10 Core Fabric and General Purpose I/O Handbook*
- Dynamic OCT
  In *Stratix 10 General Purpose I/O User Guide*
Some guidelines to optimize the use of memories are:

- Port shallow memories from M20K to MLAB.
  
  For example, implement in HDL with `ramstyle` attribute:

  ```
  (* ramstyle = "MLAB" *) reg [0:7] my_ram[0:63];
  ```

- Avoid read-during-write behavior and set to **Don’t care** (at the HDL level) wherever possible.
  
  Read-during-write behavior impact the power of single-port and bidirectional dual-port RAMs. **Don’t care** allows an optimization that sets the read-enable signal to the inversion of the existing write-enable signal (if one exists). This allows the core of the RAM to shut down, which prevents switching, saving a significant amount of power.

- Pack input/output registers in M20K.

### 2.4.6.1. Implementation

#### Table 13.  Single-port Embedded Memory Configurations for Arria 10 Devices

This table lists the maximum configurations that single-port RAM and ROM modes support.

### 2.4.6.2. Rd/Wr Enables

Dedicated RAM blocks dissipate most energy whenever the RAM is accessed for a read or write cycle. You can save power by adding Read/Write enable.

---

(2) Supported through software emulation and consumes additional MLAB blocks.
2.4.7. DDR Memory Controller Settings

The External Memory Interfaces Arria 10 FPGA IP provides low power mode settings. These settings put DDR memory in power saving mode when the controller is idle, providing power savings on external memory DDR. The Enable Auto Power-Down and Auto Power-Down Cycles settings enable this capability.

Low Power Mode Settings

- **Enable Auto Power-Down**—directs the controller to place the memory device in power-down mode after a specific number of idle controller clock cycles. You can configure the idle wait time. All ranks must be idle to enter auto power-down.

- **Auto Power-Down Cycles**—specifies the number of cycles the controller must be IDLE before entering the power down state. You determine the number based on the traffic pattern. If the number is too small, the control enters power down too frequently, affecting efficiency. The Arria 10 device family supports from 1 to 65534 cycles.

Arria 10 EMIF IP DDR3 Parameters: Controller

In *External Memory Interfaces Arria 10 FPGA IP User Guide*

2.4.8. DSP Implementation

When you maximize the packing of DSP blocks, you reduce Logic Utilization, power consumption, and increase efficiency. The HDL coding style grants you control of the DSP resources available in the FPGA.

**Example 2. Implement Multiplier + Accumulator in 1 DSP**

```verilog
always @(posedge clk)
begin
  if (ena)
    begin
      dataout <= dataa * datab + datac * datad;
    end
end
```
Example 3. Implement multiplication in 2 DSPs and the adder in LABs

```verilog
always @ (posedge clk)
begin
  if (ena)
  begin
    mult1 <= dataa * datab;
    mult2 <= datac * datad;
  end
end

always @(posedge clk)
begin
  if (ena)
  begin
    dataout <= mult1 + mult2
  end
end
```

Inferring Multipliers and DSP Functions
In *Quartus Prime Pro Edition User Guide: Design Recommendations*

2.4.9. Reducing High-Speed Tile (HST) Usage

High-Speed tiles are available in the Arria 10 design family.

1. In the **Advanced Fitter Settings** pane, the **Programmable Power Technology Optimization** logic option controls how the fitter configures tiles to operate in high-speed mode or low-power mode. Select **Minimize Power Only**.

![Programmable Power Technology Optimization](image)

2. Identify entity modules that use HST by plotting entity modules and HST heatmap on the Chip Planner and modify the floorplan to reduce usage.
2.4.10. Unused Transceiver Channels

Transceivers in the device degrade over time unless you preserve them. The Quartus Prime software generates a warning message if a design contains unused XCVRs.

You do not need to preserve transceivers under 8Gbps. For transceivers over 8Gbps, the best practice is to preserve if there is a possibility for future usage. Otherwise, you can turn the transceivers off. You enable unused transceivers through dynamic reconfiguration or a new device programming file.

2.4.11. Periphery Power reduction XCVR Settings

2.4.11.1. Transceiver Settings

- Use min VCCR/T possible (depending on data rate).
- Certain devices have DFE ON by default. If possible, turn off the channel. This depends on the how lossy is the channel.
- Turn off PDN compensation. This setting induces jitter, which is necessary to check system tolerance.
- Use one equalizer stage.

<table>

2. Power Optimization

2.4.11.2. I/O Current Strength

As a best practice, choose a low voltage I/O standard and the lowest drive strength that meets the speed requirements.

2.5. Power Optimization Advisor

The Quartus Prime Power Optimization Advisor provides advice and recommendations based on the current design project settings and assignments. You run the Advisor after the Power Analyzer.

Figure 43. Power Optimization Advisor

The Power Optimization Advisor organizes the recommendations into stages that suggest the implementation order. Each recommendation includes a description, summary of the effect of the recommendation, and the action required to make the appropriate setting.

An icon indicates whether each recommended setting is made in the current project. Checkmark icons appear next to recommendations that are already implemented, warning icons appear next to recommendations that are not followed for this compilation. Information icons indicate general suggestions.

Recommendations include a link to the location in the Quartus Prime GUI where you can change the setting. After implementing the recommended changes, recompile your design. You can verify power results with the Power Analyzer.

2.5.1. Set Realistic Timing Constraints

Timing requirements are too high, the Compiler increases HST Usage. In addition, the Fitter efforts focus more in timing than power optimization.
2.5.1.1. Find Timing Information

- To find False or Multi-Cycle Paths, click **Report Ignored Constraints** in the Timing Analyzer **Tasks** pane.

**Figure 44. Report Ignored Constraints**

- To see a list of the 10 paths with highest delay in the design, in the **Reports** pane find **Fitter Summary Report ➤ Estimate Delay Added for Hold Timing ➤ Details**.

2.5.2. Appropriate Device Family

Choose a device family with the dynamic and static power characteristics best suited to your application.

**Related Information**

Device Selection on page 32

2.5.3. Dynamic Power

The recommendations in this section can reduce dynamic power.
2.5.4. Static Power

The recommendations in this section can reduce static power dissipation. Static power is the frequency independent power that a design dissipates, even when the design clocks are stopped.

Small Device

Use the smallest device which can fit your design.

Related Information

Device Selection on page 32

2.5.5. Appropriate I/O Standards

Choose appropriate I/O Standards to minimize design power.

Related Information

I/O Power Guidelines on page 48

2.5.6. Use RAM Blocks

Implement RAMs and medium to large shift registers in RAM blocks instead of logic cell registers.

Related Information

Design Space Explorer II for Power-Driven Optimization on page 35
Power-Driven Synthesis on page 35
Power-Driven Fitter on page 38
Area-Driven Synthesis on page 38
2.5.7. Shut Down RAM Blocks

Use the clock enable, read enable and write enable ports on RAM blocks to shut them down during cycles in which the RAM is not read or written. If your design does not depend on a specific read result when reading and writing the same address, then specify "don't care" for the read-during-write parameter in the RAM IP Catalog.

Related Information
- Clock Enable in Memory Blocks on page 42
- Memory Optimization (M20K/MLAB) on page 50

2.5.8. Clock Enables on Logic

Another technique for power reduction is gating clocks when the logic does not require them. Even though you can build clock-gating logic, this approach can generate clock glitches in FPGAs using ALMs or LEs.

2.5.9. Pipeline Logic to Reduce Glitching

Long chains of cascaded logic blocks can create glitches due to path delay differences between the input signals. Inserting Flip-Flops to cut these long chains terminates the propagation of glitches to consecutive logic cells.

Circuits that heavily use of XIO functions (for example, Cyclic redundancy check) tend to glitch significantly when cascaded. Add pipeline registers or re-architect to reduce signal toggling.

Example 4. Glitch Prone Design

![Glitch Prone Design Diagram]

<tr>
<td>2020.12.07</td>
<td>18.1.0</td>
<td>Added note to the Toggle Rate topic.</td>
</tr>
</tbody>
</table>
| 2019.08.02       | 18.1.0                | • Corrected typo in "Viewing Clock Details in the Chip Planner" topic.  
|                  |                       | • Corrected typo in "Pipelining and Retiming" topic.  
|                  |                       | • Corrected typo in "Implementation" topic.  
|                  |                       | • Updated "DDR Memory Controller Settings" topic for latest IP name and to correct typos.  
|                  |                       | • Corrected typo in "Pipeline Logic to Reduce Glitching" topic. |
| 2018.09.24       | 18.1.0                | • Added topic: Factors Affecting Power Consumption, moved from chapter: Power Analysis  
|                  |                       | • Extended content about Power Optimization Advisor with a description of recommendations.  
|                  |                       | • Added design guidelines: Memories (M20K/MLAB), DDR Memory Controller Settings, DSP Implementation, Reducing High-Speed Tile (HST) Usage, Unused Transceiver Channels, Periphery Power reduction XCVR Settings  
|                  |                       | • Removed content referring to device families not supported in Intel Quartus Prime Pro Edition. |
| 2018.06.11       | 18.0.0                | • Moved general information about the Design Space Explorer (DSE II) to the Design Optimization User Guide, left a section about using DSE II for Power-Driven Optimization. |
| 2018.05.07       | 18.0.0                | • Moved general information about the Design Space Explorer (DSE II) to the Design Optimization User Guide, left a section about using DSE II for Power-Driven Optimization. |
| 2016.10.31       | 16.1.0                | • Implemented Intel rebranding.  
|                  |                       | • Removed statement of support for gate-level timing simulation. |
| 2015.11.02       | 15.1.0                | Changed instances of Quartus II to Quartus Prime.  
|                  |                       | • Updated screenshot for DSE II GUI.  
|                  |                       | • Added information about remote hosts for DSE II. |
| 2014.12.15       | 14.1.0                | • Updated location of Fitter Settings, Analysis & Synthesis Settings, and Physical Synthesis Optimizations to Compiler Settings.  
|                  |                       | • Updated DSE II GUI and optimization settings. |
| 2014.06.30       | 14.0.0                | Updated the format. |
| May 2013         | 13.0.0                | Added a note to "Memory Power Reduction Example" on Qsys and SOPC Builder power savings limitation for on-chip memory block. |
| June 2012        | 12.0.0                | Removed survey link. |
| November 2011    | 10.0.2                | Template update. |
| December 2010    | 10.0.1                | Template update. |

A. Quartus Prime Pro Edition User Guides

Refer to the following user guides for comprehensive information on all phases of the Quartus Prime Pro Edition FPGA design flow.

Related Information

- **Quartus Prime Pro Edition User Guide: Getting Started**
  Introduces the basic features, files, and design flow of the Quartus Prime Pro Edition software, including managing Quartus Prime Pro Edition projects and IP, initial design planning considerations, and project migration from previous software versions.

  Describes creating and optimizing systems using Platform Designer, a system integration tool that simplifies integrating customized IP cores in your project. Platform Designer automatically generates interconnect logic to connect intellectual property (IP) functions and subsystems.

  Describes best design practices for designing FPGAs with the Quartus Prime Pro Edition software. HDL coding styles and synchronous design practices can significantly impact design performance. Following recommended HDL coding styles ensures that Quartus Prime Pro Edition synthesis optimally implements your design in hardware.

- **Quartus Prime Pro Edition User Guide: Design Compilation**
  Describes set up, running, and optimization for all stages of the Quartus Prime Pro Edition Compiler. The Compiler synthesizes, places, and routes your design before generating a device programming file.

  Describes Quartus Prime Pro Edition settings, tools, and techniques that you can use to achieve the highest design performance in Intel FPGAs. Techniques include optimizing the design netlist, addressing critical chains that limit retiming and timing closure, optimizing device resource usage, device floorplanning, and implementing engineering change orders (ECOs).

  Describes operation of the Quartus Prime Pro Edition Programmer, which allows you to configure Intel FPGA devices, and program CPLD and configuration devices, via connection with an Intel FPGA download cable.

- **Quartus Prime Pro Edition User Guide: Block-Based Design**
  Describes block-based design flows, also known as modular or hierarchical design flows. These advanced flows enable preservation of design blocks (or logic that comprises a hierarchical design instance) within a project, and reuse of design blocks in other projects.
  Describes Partial Reconfiguration, an advanced design flow that allows you to reconfigure a portion of the FPGA dynamically, while the remaining FPGA design continues to function. Define multiple personas for a particular design region, without impacting operation in other areas.

- **Quartus Prime Pro Edition User Guide: Third-party Simulation**
  Describes RTL- and gate-level design simulation support for third-party simulation tools by Aldec*, Cadence*, Siemens EDA, and Synopsys* that allow you to verify design behavior before device programming. Includes simulator support, simulation flows, and simulating Intel FPGA IP.

  Describes support for optional synthesis of your design in third-party synthesis tools by Siemens EDA, and Synopsys*. Includes design flow steps, generated file descriptions, and synthesis guidelines.

  Describes support for optional logic equivalence checking (LEC) of your design in third-party LEC tools by OneSpin*.

  Describes a portfolio of Quartus Prime Pro Edition in-system design debugging tools for real-time verification of your design. These tools provide visibility by routing (or "tapping") signals in your design to debugging logic. These tools include System Console, Signal Tap logic analyzer, system debugging toolkits, In-System Memory Content Editor, and In-System Sources and Probes Editor.

  Explains basic static timing analysis principals and use of the Quartus Prime Pro Edition Timing Analyzer, a powerful ASIC-style timing analysis tool that validates the timing performance of all logic in your design using an industry-standard constraint, analysis, and reporting methodology.

  Describes the Quartus Prime Pro Edition Power Analysis tools that allow accurate estimation of device power consumption. Estimate the power consumption of a device to develop power budgets and design power supplies, voltage regulators, heat sink, and cooling systems.

- **Quartus Prime Pro Edition User Guide: Design Constraints**
  Describes timing and logic constraints that influence how the Compiler implements your design, such as pin assignments, device options, logic options, and timing constraints. Use the Interface Planner to prototype interface implementations, plan clocks, and quickly define a legal device floorplan. Use the Pin Planner to visualize, modify, and validate all I/O assignments in a graphical representation of the target device.

  Describes support for optional third-party PCB design tools by Siemens EDA and Cadence*. Also includes information about signal integrity analysis and simulations with HSPICE and IBIS Models.

  Describes use of Tcl and command line scripts to control the Quartus Prime Pro Edition software and to perform a wide range of functions, such as managing projects, specifying constraints, running compilation or timing analysis, or generating reports.

A. Quartus Prime Pro Edition User Guides ............................................................. 101
1. Constraining Designs

The design constraints, assignments, and logic options that you specify influence how the Quartus® Prime Compiler implements your design. The Compiler attempts to synthesize and place logic in a manner than meets your constraints. In addition, design constraints also have an impact on how the Timing Analyzer and the Power Analyzer influence synthesis, placement, and routing.

You can specify design constraints in the GUI, with scripts, or directly in the files that store the constraints. The Quartus Prime software preserves the constraints that you specify in the GUI in the following files:

- Quartus Prime Settings file (<project_directory>/<revision_name>.qsf)—contains project-wide and instance-level assignments for the current revision of the project, in Tcl syntax. Each revision of a project has a separate .qsf file.
- Synopsys® Design Constraints file (<project_directory>/<revision_name>.sdc)—the Timing Analyzer uses industry-standard Synopsys Design Constraint format and stores those constraints in .sdc files.

By combining the syntax of the .qsf files and the .sdc files with procedural Tcl, you can automate iterations over several different settings, changing constraints and recompiling.

What's New In This Version

- Applied initial Altera rebranding throughout.
- Importing and Exporting I/O Pin Assignments topic is updated for current list of file formats supported.

Related Information

  For information about all settings and constraints in the Quartus Prime software.
- Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide

1.1. Specifying Design Constraints in the GUI

Quartus Prime software provides tools that help you manually implement your project. These tools can also support design visualization, pre-filled parameters, and window cross probing, facilitating design exploration and debugging.

When you create or update a constraint in the Quartus Prime software, the System tab of the Messages window displays the equivalent Tcl command. Utilize these commands as references for future scripted design definition and compilation.
1.1.1. Global Constraints and Assignments

Global constraints and project settings affect the entire Quartus Prime project and all the applicable logic in the design. You often define global constraints in early project development; for example, when running the New Project Wizard. Quartus Prime software stores global constraints in .qsf files, one for each project revision.

1.1.2. Node, Entity, and Instance-Level Constraints

Node, entity, and instance-level constraints apply to a subset of the design hierarchy. These constraints take precedence over any global assignment that affects the same sections of the design hierarchy. The following tools are available in the Quartus Prime software to specify node, entity, and instance-level constraints:

<table>
<thead>
<tr>
<th>Assignment Type</th>
<th>Assignment Editor</th>
<th>Interface Planner</th>
<th>NoC Assignment Editor</th>
<th>Chip Planner</th>
<th>Pin Planner</th>
</tr>

1.1.2.1. Specify Instance-Specific Constraints in Assignment Editor

Quartus Prime Assignment Editor (Assignments ➤ Assignment Editor) provides a spreadsheet-like interface for assigning all instance-specific settings and constraints. To help you explore your design, the Assignment Editor allows you to filter assignments by node name or category.

Figure 1. Quartus Prime Assignment Editor

Use the Assignment Editor to:
- Add, edit, or delete assignments for selected nodes
- Display information about specific assignments
- Enable or disable individual assignments
- Add comments to an assignment

Additionally, you can export assignments to a Comma-Separated Value File (.csv).

1.1.2.1.1. Specifying Multi-Dimensional Bus Constraints

The Quartus Prime Pro Edition software traditionally supports only 1- and 2-dimensional bus names for specifying constraints. The Quartus Prime Pro Edition version 19.3 and later now supports multi-dimensional bus names for more efficient constraints.
For example, you can specify the following assignment to apply a constraint to all bits in the reg [31:0] r [0:2][4:5] three-dimensional bus:

```
set_instance_assignment -name PRESERVE_REGISTER ON -to r
```

The constraint then applies to all bits r[0][4][31], r[0][4][30], … , r[1][5][0].

### 1.1.2.2. Specify NoC Constraints in NoC Assignment Editor

For designs targeting Agilex® 7 M-Series FPGAs only, the NoC Assignment Editor in the Quartus Prime Pro Edition software allows you to make logical assignments for hard memory NoC-related blocks in your design. These assignments include grouping, connectivity, address mapping, and bandwidth requirements.

The hard memory NoC facilitates high-bandwidth data movement between the FPGA core logic and memory resources, such as HBM2E and DDR5 memories. Refer to Interface Planner NoC Tool Flow on page 37 and the Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide for details on the complete NoC flow including Interface Planner.

The Quartus Prime software supports the following two flows for NoC design:

- **Platform Designer Connection Flow**—you use Platform Designer to configure and instantiate your NoC-related IP. You also use Platform Designer to make connections between NoC initiator bridges and NoC target bridges and to define the addressing mapping for these connections. Once you generate HDL for your Platform Designer system, your design is ready for RTL simulation. You must use the NoC Assignment Editor to create additional assignments, such as specifying NoC groupings and optional performance targets. You can use Interface Planner to make physical location assignments for your NoC elements. Then you compile your design and review the results.

- **NoC Assignment Editor Connection Flow**—you can configure and instantiate your NoC-related IP in either Platform Designer or directly in RTL. You then use the NoC Assignment Editor to make all NoC assignments including grouping, connectivity, address mapping, and optional performance targets. After completing the assignments and rerunning Analysis & Elaboration, your design is ready for RTL simulation. You can use Interface Planner to make physical location assignments for your NoC elements. Then compile your design and review the results.

Using the NoC Assignment Editor is similar to using the Assignment Editor, but the NoC Assignment Editor is optimized for making NoC assignments only. You must successfully complete Quartus Prime Analysis & Elaboration before using the NoC Assignment Editor. After Analysis & Elaboration, you can access the NoC Assignment Editor by clicking **Assignments ➤ Network on Chip (NoC) Assignment Editor**.

Specify assignments on the following NoC Assignment Editor tabs:

- **Group** tab—specifies the **Group Name** of the NoC initiators and targets.
- **Connection** tab—specifies the connections between NoC initiators and targets or SSM elements.
- **Attributes** tab—specifies address mapping, bandwidth requirements, and transaction sizes for each connection.
The assignments made on the Group tab affect the assignments available in the Connection tab. The assignments made on the Connection tab affect the assignments available in the Attributes tab.

Complete the assignments on each tab in order before moving to the next tab.

After making assignments in the NoC Assignment Editor, you click Validate to validate the assignments, and then click Save to store the assignments in the Quartus Prime settings file (.qsf).

Related Information
Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide

1.1.2.2.1. NoC Assignment Editor Interface Controls
For designs targeting Agilex 7 M-Series FPGAs only, you can use the following interface controls of the NoC Assignment Editor to specify NoC assignments:

Table 4. NoC Assignment Editor Interface Controls

<table>
<thead>
<tr>
<th>NoC Assignment Editor GUI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Tab</td>
<td>After completing Analysis &amp; Elaboration and opening the NoC Assignment Editor, the Group tab displays two columns. The Network Interface Unit column displays a list of all NoC initiator, target, PLL, and SSM elements in your design. The Group Name column allows you to assign each of the elements to one of two NoC groups by entering the name of the group. You can define a custom, case-insensitive Group Name. Default names are NOC_GROUP_0 and NOC_GROUP_1. Each group must contain the NoC initiators and targets.</td>
</tr>
</tbody>
</table>

continued...
that you connect through that high-speed interconnect NoC, as well as one NoC PLL, and one NoC SSM. You must complete all assignments on the Group tab before proceeding to the Connections tab.

### Connections Tab

You use the Connections tab to define connection assignments between NoC initiators and targets. Specify connections between a NoC initiator and a target or SSM by enabling the corresponding checkbox in the connection table. The group subtab includes a connection table with all the NoC initiators for that group listed on the left-hand side, and of all the NoC targets and SSM elements for the group listed across the top. You must complete all assignments on the Connections tab before proceeding to the Attributes tab.

### Attributes Tab

You use the NoC Assignment Editor to create attribute assignments between initiators and targets. You specify assignments for address mapping and bandwidth requirements for each connection on the Attributes tab. The Attributes tab includes a subtab for each group that you specify on the Group tab. Each subtab lists each initiator to target connection. You must complete all assignments on the Attributes tab before you can Save the assignments.

### 1.1.2.2. Troubleshooting NoC Assignment Editor

Use the following FAQs to help you understand conditions and resolve conflicts in the NoC Assignment Editor:

#### Table 5. NoC Assignment Editor FAQs

<table>
<thead>
<tr>
<th>FAQs</th>
<th>Explanation/Resolution</th>
</tr>
</thead>
</table>
| Why are some assignments in NoC Assignment Editor 'read-only'?      | • Any NoC assignment that you make in Platform Designer appears as read-only in NoC Assignment Editor. You cannot modify these read-only assignments inside the NoC Assignment Editor.  
  • To modify such read-only NoC assignments, modify the corresponding elements in Platform Designer and regenerate HDL for the system. |
| Why are there conflicting assignments between Platform Designer and NoC Assignment Editor? | • This condition can occur if you first make assignments in NoC Assignment Editor, and then later make similar NoC assignments in Platform Designer.  
  If you make Platform Designer assignments first, and then later make assignments in NoC Assignment Editor, those Platform Designer assignments appear as read-only in NoC Assignment Editor.  
  • This condition can also occur if you first make NoC assignments in Platform Designer, and then later manually specify NoC assignments in the .qsf file.  
  To avoid this condition, only use Platform Design or only use NoC Assignment Editor to specify NoC connectivity and addressing assignments. Avoid using the .qsf to specify NoC connectivity and addressing assignments. |
| How do I identify conflicting assignments between Platform Designer and NoC Assignment Editor? | • The NoC Assignment Editor cell containing any assignment conflict is highlighted in yellow.  
  • The last assignment in the list takes precedence and is displayed. If the last assignment is a Platform Designer assignment, the cell is also read-only. |
| How can I resolve conflicting assignments between Platform Designer and NoC Assignment Editor? | You can use either of the following methods to replace a conflicting .qsf assignment with the Platform Designer assignment:  
  • Right-click in the highlighted cell with a conflict, and then click Delete.  
  • Manually delete any conflicting assignment from the .qsf. Avoid manually editing the .qsf if you can resolve issues in the NoC Assignment Editor. |
1.1.2.3. Specify I/O Constraints in Pin Planner

Quartus Prime Pin Planner allows you to assign design elements to I/O pins. You can also plan and assign IP interface or user nodes not yet defined in the design.

Figure 3. Quartus Prime Pin Planner GUI

Related Information
Managing Device I/O Pins on page 75

1.1.2.4. Plan Interface Constraints in Interface Planner and Tile Interface Planner

The Interface Planner simplifies the planning of accurate constraints for physical implementation. Similarly, you can use the Tile Interface Planner to build a plan for placement of IP components in each tile available on Agilex 7 F-tile devices. Use Interface Planner to prototype interface implementations, plan clocks, and rapidly define a legal device floorplan.

Interface Planner and Tile Interface Planner interact dynamically with the Quartus Prime Fitter to accurately verify placement legality while you plan. You can evaluate different floorplans, using interactive reports to accurately plan the best implementation without iterative compilation. Fitter verification ensures the highest correlation between your interface plan and actual implementation results. You can apply the interface plan constraints to your project with high confidence in the final implementation.
1. Constraining Designs

1. Adjust Constraints with the Chip Planner

With the Chip Planner you can adjust existing assignments to device resources, such as pins, logic cells, and LABs in a graphical representation of the device floorplan. You can also view equations and routing information and demote assignments by dragging and dropping to Logic Lock regions in the Logic Lock Regions Window.
1. Constraining Designs

1.1.2.6. Constraining Designs with the Design Partition Planner

The Design Partition Planner allows you to view design connectivity and hierarchy and can assist you in creating effective design partitions.

Additionally, the Design Partition Planner allows you to optimize design performance by isolating and resolving failing paths on a partition-by-partition basis.

Related Information
Creating Partitions and Logic Lock Regions with the Design Partition Planner and the Chip Planner
In Quartus Prime Pro Edition User Guide: Design Optimization

1.1.3. Probing Between Components of the Quartus Prime GUI

The Quartus Prime software allows you to locate nodes and instances within the compilation database from any of the following:

- Project Navigator
- Assignment Editor
- Chip Planner

Related Information
Design Floorplan Analysis in the Chip Planner
In Quartus Prime Pro Edition User Guide: Design Optimization

To locate nodes or instances, follow these steps:
1. Right-click the resource you want to display.
2. Click **Locate Node**, and then click any of the available menu options.

The corresponding window opens—or appears in the foreground if it is already open—and shows the element you clicked.

**Example 1. Locate a Resource Selected in the Project Navigator**

In the **Entity** list of the **Hierarchy** tab, right-click any object, and click **Locate ➤ Locate in Chip Planner**.

The Chip Planner opens and displays the instance you selected.
1.1.4. Specifying Timing Constraints

You must specify timing constraints that describe the clock frequency requirements, timing exceptions, and I/O timing requirements of your design for comparison against actual conditions observed during timing analysis. You define timing constraints in one or more Synopsys* Design Constraints (.sdc) files that you add to the project.

You can specify timing constraints in the Timing Analyzer GUI, which automatically generates an .sdc based on your inputs. Click the Constraints menu in the Timing Analyzer to specify timing constraints that you can apply to your project.

Alternatively, you can create an initial .sdc with provided .sdc file templates, or manually in any text editor and then add the .sdc to the project.

In addition, generation of Intel FPGA IP or Platform Designer systems may also automatically generate and add to your project .sdc constraints.

**Figure 6. Constraint menu in Timing Analyzer**

When you specify a constraint in the GUI, the dialog box displays the equivalent SDC command syntax.
Example 2. Create Clock Dialog Box

Individual timing assignments override project-wide requirements.

- To avoid reporting incorrect or irrelevant timing violations, you can assign timing exceptions to nodes and paths.
- The Timing Analyzer supports point-to-point timing constraints, wildcards to identify specific nodes when making constraints, and assignment groups to make individual constraints to groups of nodes.

Refer to the following Related Information:

**Related Information**

1.2. Constraining Designs with Tcl Scripts

You can perform all your design assignments using *.sdc* and *.qsf* setting files. To integrate these files in compilation and optimization flows, use Tcl scripts. Even though *.sdc* and *.qsf* files are written in Tcl syntax, they are not executable by themselves.

When you use Quartus Prime Tcl packages, your scripts can open projects, make the assignments, compile the design, and compare compilation results against known goals and benchmarks. Furthermore, such a script can automate the iterative design process by modifying constraints and recompiling the design.

1.2.1. Create a Project and Apply Constraints

The command-line executables include options for common global project settings and commands. You can use a Tcl script to apply constraints such as pin locations and timing assignments. You can write a Tcl constraint file, or generate one for an existing project by clicking **Project ➤ Generate Tcl File for Project**.
The example creates a project with a Tcl script and applies project constraints using the tutorial design files in the <Quartus Prime installation directory>/qdesigns/fir_filter/ directory.

```tcl
project_new filtref -overwrite
# Assign family, device, and top-level file
set_global_assignment -name FAMILY "Arria 10"
set_global_assignment -name DEVICE <Device>
set_global_assignment -name VERILOG_FILE filtref.v
# Assign pins
set_location_assignment -to clk Pin_28
set_location_assignment -to clkx2 Pin_29
set_location_assignment -to d[0] Pin_139
set_location_assignment -to d[1] Pin_140
#
project_close
```

Save the script in a file called `setup_proj.tcl` and type the commands illustrated in the example at a command prompt to create the design, apply constraints, compile the design, and perform fast-corner and slow-corner timing analysis. Timing analysis results are saved in two files, `filtref_sta_1.rpt` and `filtref_sta_2.rpt`.

```tcl
quartus_sh -t setup_proj.tcl
quartus_syn filtref
quartus_fit filtref
quartus_asm filtref
quartus_sta filtref --model=fast --export_settings=off
mv filtref_sta.rpt filtref_sta_1.rpt
quartus_sta filtref --export_settings=off
mv filtref_sta.rpt filtref_sta_2.rpt
```

Type the following commands to create the design, apply constraints, and compile the design, without performing timing analysis:

```tcl
quartus_sh -t setup_proj.tcl
quartus_sh --flow compile filtref
```

The `quartus_sh --flow compile` command performs a full compilation, and is equivalent to clicking the `Start Compilation` button in the toolbar.

### 1.2.2. Assigning a Pin

To assign a signal to a pin or device location, use the Tcl command shown in this example:

```tcl
set_location_assignment -to <signal name> <location>
```

Valid locations are pin location names. Some device families also support edge and I/O bank locations. Edge locations are `EDGE_BOTTOM`, `EDGE_LEFT`, `EDGE_TOP`, and `EDGE_RIGHT`. I/O bank locations include `IOBANK_1` to `IOBANK_n`, where `n` is the number of I/O banks in a device.

### 1.2.3. Generating Quartus Prime Settings Files

Quartus Prime software allows you to generate `.qsf` files from your revision. You can embed these constraints in a scripted compilation flow, and even create sets of `.qsf` files for design optimization.
To generate a .qsf file from the Quartus Prime software, click Assignments ➤ Export Assignments.

To organize the .qsf in a human readable form, Project ➤ Organize Quartus Prime Settings File.

**Example 3. Organized .qsf File**

This example shows how .qsf files characterize a design revision. The set_global_assignment command makes all global constraints and software settings and set_location_assignment constrains each I/O node in the design to a physical pin on the device.

```
# Project-wide Assignments
set_global_assignment -name SYSTEMVERILOG_FILE top.sv
set_global_assignment -name SYSTEMVERILOG_FILE blinking_led.sv
set_global_assignment -name SDC_FILE blinking_led.sdc
set_global_assignment -name SDC_FILE jtag.sdc
set_global_assignment -name PROJECT_OUTPUT_DIRECTORY output_files
set_global_assignment -name LAST_QUARTUS_VERSION "17.1.0 Pro Edition"
set_global_assignment -name TEXT_FILE blinking_led_generated.txt

# Pin & Location Assignments
set_location_assignment PIN_AN18 -to clock

1.2.4. Synopsys Design Constraint (.sdc) Files

Quartus Prime software keeps timing constraints in .sdc files, which use Tcl syntax. You can embed these constraints in a scripted compilation flow, and even create sets of .sdc files for timing optimization.

Example 4. .sdc File

The example shows the timing constraints of a small design.

```

1.2.5. Tcl-only Script Flows

As an alternative to .sdc and .qsf files, you can perform all design assignments and timing constraints inside the Tcl scripts. In this case, the script that automates compilation and custom results reporting also contains the design constraints.

You can export a design’s contents to a procedural, executable Tcl (.tcl) file, and then use the generated script to restore settings after experimenting with other constraints.

To export your constraints as an executable Tcl script, click Project ➤ Generate Tcl File for Project.
Example 5. blinking\_led\_generated.tcl File

```tcl
# Quartus Prime: Generate Tcl File for Project
# File: blinking\_led\_generated.tcl
# Generated on: Wed May 10 10:14:44 2017

    set_instance_assignment -name IO\_STANDARD "1.8 V" -to led\_one\_on
    set_instance_assignment -name IO\_STANDARD "1.8 V" -to led\_two\_on
    set_instance_assignment -name IO\_STANDARD "1.8 V" -to led\_three\_on
    set_instance_assignment -name SLEW\_RATE 1 -to led\_zero\_on
    set_instance_assignment -name SLEW\_RATE 1 -to led\_one\_on
    set_instance_assignment -name SLEW\_RATE 1 -to led\_two\_on
    set_instance_assignment -name SLEW\_RATE 1 -to led\_three\_on
    set_instance_assignment -name CURRENT\_STRENGTH\_NEW 12MA -to clock
    set_instance_assignment -name CURRENT\_STRENGTH\_NEW 12MA -to led\_zero\_on
    set_instance_assignment -name CURRENT\_STRENGTH\_NEW 12MA -to led\_one\_on
    set_instance_assignment -name CURRENT\_STRENGTH\_NEW 12MA -to led\_two\_on
    set_instance_assignment -name CURRENT\_STRENGTH\_NEW 12MA -to led\_three\_on
    # Commit assignments
    export_assignments
    # Close project
    if {$need_to_close_project} {
        project_close
    }
}
```
The example:
• Opens the project
• Assigns Constraints
• Writes assignments to QSF file
• Closes project

1.3. A Fully Iterative Scripted Flow

The ::quartus::flow Tcl package in the Quartus Prime Tcl API allows you to modify design constraints and recompile in an iterative flow.

                      • Added section “Probing to Source Design Files and Other Quartus Windows” on page 1–2.  
                      • Added description of node type icons (Table 1–3).  
                      • Added explanation of wildcard characters. |
| November 2008    | 8.1                   | Changed to 8½” × 11” page size. No change to content. |
| May 2008         | 8.0                   | Updated Quartus II software 8.0 revision and date. |
2. Interface Planning

Interface planning—the feasibility analysis of interface physical constraints—is a fundamental early step in advanced FPGA design. Periphery placement can be a complex process involving many variables. The Quartus Prime Interface Planner simplifies the planning of accurate constraints for physical implementation.

You can use the Interface Planner to prototype interface implementations, plan clocks, and rapidly define a legal device floorplan.

Similarly, when targeting the Agilex 7 F-tile devices, you can use the Tile Interface Planner to build a plan for placement of IP components in each tile available on the FPGA device.

Interface Planner and Tile Interface Planner (launched from the Tools menu) interact dynamically with the Quartus Prime Fitter to accurately verify placement legality while placing elements. You can evaluate different floorplans, using interactive reports to accurately plan the best implementation without iterative compilation. Fitter verification ensures the highest correlation between your interface plan or tile interface plan and actual implementation results. You can apply the interface plan or tile interface plan constraints to your project with high confidence in the final implementation.

Related Information
- Video Demo: Using Interface Planner to Place DDR-3 and PCI Express Gen3
- Video Demo: Using the Tile Interface Planner

2.1. Using Interface Planner

After design synthesis, you can use Interface Planner to help you to rapidly define a legal device floorplan.

Interface Planner displays your project’s logical hierarchy, post-synthesis design elements, and Fitter-created design elements, alongside a view of target device locations. The GUI supports a variety of methods for placing design elements in the floorplan. As you place elements in the floorplan, the Fitter verifies legality in real time to ensure accurate correlation with the final implementation.

Intel® FPGAs contain core and periphery device locations. The device core locations are adaptive look-up tables (ALUTs), core flip-flops, RAMs, and digital signal processors (DSPs). Device periphery locations include I/O elements, phase-locked loops (PLLs), clock buffers, and hard processor systems (HPS).
Figure 7. Interface Planner Streamlines Legal Placement

Intel FPGAs contain many silicon features in the device periphery, such as hard PCI Express® IP cores, high speed transceivers, hard memory interface circuitry, and embedded processors. Interactions among these periphery elements can be complex. Interface Planner simplifies this complexity and allows you to quickly visualize and place I/O interface and periphery elements, such as:

- I/O elements
- LVDS interfaces
- PLLs
- Clocks
- Hard interface IP Cores
- High-Speed Transceivers
- Hard Memory Interface IP Cores
- The Hard Memory Network-on-Chip (NoC)(1)
- Embedded Processors

2.1.1. Interface Planner User Interface

The Interface Planner user interface includes the following controls for planning your design platform.

Flow Controls on page 25
Home Tab Controls on page 25
Assignments Tab Controls on page 25
Plan Tab Controls on page 26
Reports Tab Controls on page 27

(1) For designs targeting Agilex 7 M-Series FPGAs only.
2.1.1.1. Flow Controls

The Flow control panel provides immediate access to common Interface Planner commands from anywhere within Interface Planner. The Flow controls appear in order of a typical interface planning flow.

Table 7. Flow Controls

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open Project</td>
<td>Allows you to select and open an Quartus Prime project in Interface Planner. Use of Open Project command is only required when using Interface Planner in standalone mode.</td>
</tr>
<tr>
<td>Initialize Interface Planner</td>
<td>Loads the synthesis netlist, starts the Fitter verification engine, and imports assignments from your Quartus Prime project.</td>
</tr>
<tr>
<td>View Assignments</td>
<td>Opens the Assignments tab, which allows you to review and reconcile any conflicting assignments that Interface Planner imports from your project. Enable or disable specific project assignments to resolve any conflicts.</td>
</tr>
<tr>
<td>Update Plan</td>
<td>Applies the enabled project assignments to your interface plan. You cannot perform periphery planning on the Plan tab until you update the plan.</td>
</tr>
<tr>
<td>Plan Design</td>
<td>Opens the Plan tab for placing logic in the interface plan.</td>
</tr>
<tr>
<td>Validate plan</td>
<td>Verifies that all constraints in the interface plan are compatible with placement of all remaining unplaced design elements. You can then directly locate and resolve the source of any reported validation errors. You must successfully validate the plan before running Write Plan File.</td>
</tr>
<tr>
<td>Export Constraints</td>
<td>Saves your interface plan as a Tcl script file for subsequent application in your project. This command is available only after successfully running Validate Plan.</td>
</tr>
<tr>
<td>View Reports</td>
<td>Opens the Reports tab for filtering data and finding entities and locations.</td>
</tr>
<tr>
<td>View Summary Reports</td>
<td>Opens the Interface Planner Summary report that summarizes the percentage of placed and unplaced periphery cells.</td>
</tr>
</tbody>
</table>

2.1.1.2. Home Tab Controls

The Interface Planner Home tab contains controls for opening projects in Interface Planner. You only need the Home tab when Interface Planner is in standalone mode.

Table 8. Home Tab Controls

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recent Projects</td>
<td>Provides quick access to recently opened Quartus Prime projects. A named tile represents each project. Click the tile to display Details about the project. Double-click the tile to open the project in Interface Planner.</td>
</tr>
<tr>
<td>Browse</td>
<td>Allows you to locate and open an Quartus Prime project in Interface Planner. Interface Planner requires the project’s synthesized netlist for operation.</td>
</tr>
<tr>
<td>Details</td>
<td>Provides project and file details such as the file path, revision, and creation date of the Quartus Prime project. You can select a specific project revision.</td>
</tr>
</tbody>
</table>

2.1.1.3. Assignments Tab Controls

The Assignments tab contains controls for resolving potential conflicts with project assignments. Click View Assignments to display the Assignments tab. You can enable or disable specific or classes of assignments until you resolve all potential conflicts. After you are satisfied with the status of all project assignments, click Update Plan to update your interface plan with the enabled project assignments. Interface Planner reports an error for any remaining assignment conflicts.
Table 9. Assignments Tab Controls

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter field</td>
<td>Supports creation of wildcard expressions for assignment targets. <strong>Enabled</strong> and <strong>Disabled</strong> buttons filter only enabled or disabled assignments in the list.</td>
</tr>
<tr>
<td>Enable All Project Assignments</td>
<td>Enables all imported project assignments in your interface plan.</td>
</tr>
<tr>
<td>Disable All Project Assignments</td>
<td>Disables all imported project assignments in the plan.</td>
</tr>
<tr>
<td>Clear</td>
<td>Clears any filter from the Assignments list.</td>
</tr>
</tbody>
</table>

2.1.1.4. Plan Tab Controls

The **Plan** tab contains the following controls to help you locate and place logic in the interface plan. Click **Plan Design** to display the **Plan** tab. Placement or unplacement in the interface plan does not apply to your Quartus Prime project until you add the generated Interface Planner constraints script to your project.

Table 10. Plan Tab Controls

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>➤</td>
<td>Lists legal locations for placement.</td>
</tr>
<tr>
<td>Locate Node</td>
<td>Display a list of Quartus Prime Pro Edition tools where the selected design element is referenced in the hierarchical database. If the Locate Node command is disabled for a specific element in the Design Elements list, it is because that element is not represented as an element in the design.</td>
</tr>
<tr>
<td>Autoplace All</td>
<td>Attempts to place all unplaced design elements in legal locations in the interface plan.</td>
</tr>
<tr>
<td>Autoplace Fixed</td>
<td>Attempts to place all unplaced design elements that have only one legal location into the interface plan.</td>
</tr>
<tr>
<td>Unplace All</td>
<td>Unplaces all placed design elements in the interface plan.</td>
</tr>
<tr>
<td>Right-click ➤ Auto-place selected element</td>
<td>Attempts to place the selected design element and all its children in a legal location in the interface plan.</td>
</tr>
<tr>
<td>Chip View</td>
<td>Displays the target device chip. Zoom in to display chip details.</td>
</tr>
<tr>
<td>Package View</td>
<td>Displays the target device package. Zoom in to display chip details.</td>
</tr>
<tr>
<td>NoC View</td>
<td>Displays a filtered view of NoC initiators and targets. Refer to Interface Planner NoC Tool Flow</td>
</tr>
<tr>
<td>Show I/O Banks</td>
<td>Selects and color codes the I/O banks in the Plan tab.</td>
</tr>
<tr>
<td>Show Differential Pin Pair Connections</td>
<td>In <strong>Package View</strong>, displays a red connection line between a pair of differential pins. The Package View labels the positive and negative pins with the letters p and n, respectively.</td>
</tr>
<tr>
<td>Show PCIe Hard IP Interface Pins</td>
<td>In <strong>Package View</strong>, selects and color codes the PCIe Hard IP interface pins in the Plan tab. To access this command, right-click in the Plan tab package view, and select <strong>x1 Lanes</strong>, <strong>x2 Lanes</strong>, <strong>x4 Lanes</strong>, <strong>x8 Lanes</strong>, or <strong>by 16 Lanes</strong>. After enabling, view color coding in the Color Legend.</td>
</tr>
<tr>
<td>Show DQ/DQS Pins</td>
<td>In <strong>Package View</strong>, selects and color codes the PCIe Hard IP interface pins in the Plan tab. To access this command, right-click in the Plan tab package view, and select <strong>x4 Mode</strong>, <strong>x8/x9 Mode</strong>, <strong>x16/x16 Mode</strong>, or <strong>x32/x36 Mode</strong>. After enabling, view color coding in the Color Legend.</td>
</tr>
<tr>
<td>Right-click ➤ Report Placeability of Selected Element</td>
<td>After selecting a low level element, displays detailed information on the Reports tab, showing legal locations in the interface plan for the selected cell in order of suitability for fitting.</td>
</tr>
</tbody>
</table>
### Right-click ➤ Report Legal Locations of Selected Element
After selecting a low level element, displays the legal locations in the interface plan for the selected cell in order of suitability for fitting.

### Reset Plan
Unplaces all placed design elements and removes applied project assignments from the interface plan. Resets all project assignments to the enabled state. You must subsequently run **Update Plan** prior to placing design elements. This command only applies to your interface plan and does not impact your Quartus Prime project assignments until you apply the Interface Planner script.

### Load Floorplan
Allows you to select and load an Interface Planner Floorplan Format (.plan) file. You can save Interface Planner floorplan files in the format by clicking **Save Floorplan**.

### Save Floorplan
Allows you to save your Interface Planner floorplan as a .plan file.

## 2.1.1.5. Reports Tab Controls
The Interface Planner **Reports** tab contains the following **Task** pane controls to help you filter data and find entities and locations.

### Table 11. Reports Tab Controls

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| Create all Summary Reports | Creates the following summary reports:  
  - Interface Planner Summary  
  - All Periphery Cells  
  - Placed/Unplaced Periphery Cells  
  - Periphery Location Types. |
| Report All Placed/Unplaced Pins | Reports the name, parent (if any), and type of all placed (Report All Placed Pins) or unplaced (Report All Unplaced Pins) pins in the interface plan, respectively. The Placed Pins report includes the placement location name. The Unplaced Pins report includes the number of potential placement locations. Right-click any cell to place, unplace, or report connectivity or location information. |
| Report All Placed/Unplaced HSSI Channels | Reports the name, parent (if any), and type of all placed (Report All Placed HSSI Channels) or unplaced (Report All Unplaced HSSI Channels) channels in the interface plan, respectively. The Placed HSSI Channels report includes the placement location name. The Unplaced HSSI Channels report includes the number of potential placement locations. Right-click any cell to place, unplace, or report connectivity or location information. |
| Right-click ➤ Report Placed/Unplaced Periphery Cells of Selected Type | Reports the name, parent (if any), and type of placed (Report Placed Periphery Cells of Selected Type) or unplaced (Report Unplaced Periphery Cells of Selected Type) cells matching the selected type. The placed cells report includes the placement location name. The unplaced cells report includes the number of potential placement locations. Right-click any cell to place, unplace, or report connectivity or location information. |
| Right-click ➤ Report Periphery Locations of Selected Type | Reports all locations in the device of the selected type, and whether the location supports merging. |
| Right-click ➤ Report Periphery Cell Connectivity | Reports the source port and type, destination port and type, of connections to the selected cell. Right-click any cell to report the individual cell connectivity. |
| Right-click ➤ Place/Unplace Cell | Places the cell in the selected location of the interface plan. Similarly, you can right-click any cell and then click **Place Cell of Selected Type** or **Unplace Cell of Selected Type** to place or unplace multiple cells of the same type. |

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Right-click ➤ Report Cell Locations for Custom Placement</td>
<td>Reports the preferred legal locations for the selected cell in the interface plan in the Legal Location report. Right-click to immediately place the cell in a location or report all periphery location of the selected type.</td>
</tr>
<tr>
<td>Remove Invalid Reports</td>
<td>Removes outdated Interface Planner reports that you invalidate by changes to the interface plan.</td>
</tr>
<tr>
<td>Report Instance Assignments</td>
<td>Shows all imported project assignments in the interface plan. You can delete these assignments from the plan.</td>
</tr>
<tr>
<td>Report NoC Performance</td>
<td>Performs a static analysis of the NoC initiator and target locations to evaluate whether the placement allows your design to meet the bandwidth requirements and transaction sizes that you specify in the NoC Assignment Editor. You can review the report, and then make changes in the Plan tab based on the results. Refer to Report NoC Performance.</td>
</tr>
</tbody>
</table>

### 2.1.2. Interface Planner General Tool Flow

Interface Planner’s user interface guides you through the design planning steps. Use Interface Planner’s Flow control to execute the main initialization, planning, and validation functions of the flow in sequence.

#### Figure 8. Interface Planner Flow Control

As you run each step in the Flow control, downstream commands and the Assignments, Plan, and Reports tabs become available. Interface Planner only allows you to run commands after completing any prerequisite steps in the flow. After you Initialize Interface Planner, you are prompted to confirm any project assignments that you made before planning starts. Disable or enable any imported project assignments on the Assignments tab to resolve any conflicts and evaluate different implementations.
After you **Update Plan** with the project assignments, you are ready to place design elements onto the target device **Chip View** or **Package View** on the **Plan** tab. As you place design elements in the **Plan** tab, the Fitter verifies placement legality in real-time. Once planning is complete and validated, you export the constraints as a Tcl script for application in your project.

**Note:** The Interface Planner constraints you define do not apply to your project until you export and source them with the generated Tcl script.
The following topics describe these interface planning flow steps in detail:

- **Step 1: Setup and Synthesize the Project** on page 31
- **Step 2: Initialize Interface Planner** on page 31
- **Step 3: Update Plan with Project Assignments** on page 32
- **Step 4: Plan Periphery Placement** on page 32
- **Step 5: Report Placement Data** on page 36
- **Step 6: Validate and Export Plan Constraints** on page 37
2.1.2.1. Step 1: Setup and Synthesize the Project

Interface Planner requires at least a partially complete, synthesized Quartus Prime project as input. You can also use Interface Planner to adjust placement for a fully complete design project.

Follow these steps to setup the project and run synthesis:

1. Complete at least the following steps for your design:
   - Fully define known device periphery interfaces.
   - Instantiate all known interface IP cores.
   - Declare all general purpose I/Os.
   - Define the I/O standard, voltage, drive strength, and slew rate for all general purpose I/Os.
   - Define the core clocking (optional, but recommended).
   - Connect all interfaces of the periphery IP to virtual pins or test logic. This technique creates loop backs on any interfaces in the shell design, helping to ensure that periphery interfaces persist after synthesis optimization.

2. To synthesize the design, click Processing ➤ Start ➤ Start Analysis & Synthesis. You must run at least Analysis & Synthesis before running Interface Planner.

2.1.2.2. Step 2: Initialize Interface Planner

Initializing Interface Planner loads the compilation database for the synthesis snapshot, and enables the View Assignments command and Assignments tab for reconciling project assignments.

To initialize Interface Planner:

1. Click Tools ➤ Interface Planner. The Interface Planner opens, displaying the Home tab.

2. On the Flow control, click Initialize Interface Planner. After initialization, the Fitter dynamically validates your interface plan as you make changes.

Figure 12. Interface Planner Home Tab
2.1.2.3. Step 3: Update Plan with Project Assignments

Before periphery planning in Interface Planner, you must reconcile any conflicting imported project assignments and Update Plan with the assignments you want to retain in the plan.

Follow these steps to review imported project assignments and reconcile any conflicts:

1. On the Flow control, click View Assignments.
2. On the Assignments tab, enable or disable specific or groups of project assignments to resolve any conflicts or experiment with different settings. You can filter the list of assignments by assignment name or status.
3. After resolving all conflicts, click Update Plan on the Flow control to apply the enabled project assignments to your interface plan.

Figure 13. Interface Planner (Assignments Tab)

Related Information
- Home Tab Controls on page 25
- Assignments Tab Controls on page 25
- AN 821: Interface Planning for Intel Stratix 10 FPGAs

2.1.2.4. Step 4: Plan Periphery Placement

Click Plan Design on the Flow control to interactively place IP cores and other design elements in legal locations in the device periphery. The Plan tab displays a list of your project's design elements, alongside a graphical abstraction of the target device architecture.
For efficiency, place design elements in the following order in Interface Planner:

1. Place all I/O pins or elements, such as PLLs, that have known, specific location requirements.
2. Place all known periphery interface IP.
3. (Optional) Place all remaining unplaced cells.

Use the following controls to place design elements in the Interface Planner floorplan:

1. Locate design elements that you want to place in the Design Element list. You can search and filter the list by name, IP, placement status, I/Os, and other criteria.
2. To customize design element color coding definitions, click the Highlight column.

**Figure 14. Interface Planner (Plan Tab)**

3. Use any of the following methods to place design elements in the floorplan:
   - Drag elements from the Design Elements list and drop them onto available device resources in the Chip or Package view. Use Ctrl+Click to drag and pan across the Chip or Package views. You may experience a small delay while dragging as Interface Planner calculates the legal locations.
   - To allow Interface Planner to place an unplaced design element in a legal location, right-click and select Autoplace Selected. You must use Autoplace Selected for all unplaced clocks.
   - Click the button next to the Design Elements to display a list of Legal Locations. Click any legal location in the list to highlight the location in the floorplan. Double-click any location in the list to place the element in the location.
4. To step forward and backward though your plan changes, click the **Undo** and **Redo** buttons.

5. To visualize and traverse design connectivity (for example, to view the reference clock pin and driven destination cells of a PLL), select any design element and then click the **Link Info** tab. Click the **Back** and **Forward** buttons to traverse design connectivity.

6. To generate a report that shows the placement locations the Fitter prefers, select a design element and click **Report Placeability of Selected Element**.

**Figure 16. Link Info Tab for Traversing Connectivity**

**Note:** Changes made in Interface Planner do not apply to your Quartus Prime project until you apply the generated interface plan constraints script to your project.

**Related Information**

Plan Tab Controls on page 26
2.1.2.4.1. Plan Clock Networks

Interface Planner allows you to visualize and plan clock networks. For Arria® 10 and Cyclone® 10 GX devices, you can locate, highlight, place, and edit the type of clock elements in the Plan tab.

Note: The Stratix® 10 device family does not support the Clocking filter in Interface Planner. For Stratix 10 designs, use the Autoplace Selected command to place all unplaced clock elements.

Interface Planner generates a Clocks report that details the signals using low-skew routing networks (clock networks) in the device.

To identify and place clocking elements in your design, click the Clocking filter in the Plan tab. You can refine the list further by entering search text in the Design Element Filter. Interface Planner represents clock networks as groupings of the clock source, clock mux, and the clock region.

Figure 17. Clocking Design Elements

You can place an entire clock group or individual clock elements by dragging into the location, or using the Report Legal Locations of Selected Element or the Autoplace Selected commands. After placement, hover the cursor over the item in the Design Element list to highlight the placement. The placement of clock elements impacts the placement of dependent core and periphery elements.

You can edit the clock type for clocking design elements. The clock type impacts the placement of dependent core and periphery elements. Right-click any clock element to specify one of the available clock types.

2.1.2.4.2. Saving & Loading Floorplans

You can save the state of your Interface Planner floorplan for use in subsequent Interface Planner sessions. Interface Planner saves your plan in Interface Planner Floorplan Format (.plan). You can load a .plan file in Interface Planner to reopen the floorplan.
1. To save an Interface Planner floorplan, click **File ➤ Save Floorplan** and specify a file name.

2. To load an Interface Planner floorplan, click **File ➤ Load Floorplan** and browse for the `.plan` file.

*Note:* .plan files are for use only in Interface Planner and are not for use directly in the Quartus Prime software. Interface Planner generates an error if you attempt to load a .plan file that is not associated with the current Interface Planner project.

### 2.1.2.5. Step 5: Report Placement Data

Generate Interface Planner placement and connectivity reports to help locate cells and make the best decisions about placement for the interfaces and elements in your design. Click **View Reports** on the Flow control to open the **Reports** tab from which you can generate a range of reports.

Follow these steps to report Interface Planner placement data:

1. In the Flow control, click **View Reports**. The list of reports appears in the **Tasks** pane.

2. In the **Tasks** pane, double-click any report name to generate the report in the **Table of Contents** pane.

3. Select design elements in the report and click **Place**, **Unplace**, or report detailed data about the selected elements or locations.

**Figure 18. Reports Tab**

![Reports Tab](image)

**Related Information**
- **Reports Tab Controls** on page 27
- **Interface Planner Reports** on page 44
2.1.2.6. Step 6: Validate and Export Plan Constraints

You must validate your interface plan before exporting the plan constraints to your project as a generated Tcl script. Validation must confirm that the Fitter can place all remaining unplaced design elements before you can generate the script. When you are satisfied with your interface plan, follow these steps to validate and apply the interface plan to your Quartus Prime project:

1. In the **Flow** control, click **Validate Plan**. The Fitter confirms placement of all remaining unplaced design elements. You must correct any errors before you can export constraints.

2. After validation, click **Export Constraints** to generate a Tcl script that applies the plan to your project. The output Tcl file contains instructions to apply the interface plan to your Quartus Prime project.

3. Close Interface Planner.

4. To apply the exported interface plan constraints to your Quartus Prime project, click **Tools** ➤ **Tcl Scripts** and select the `<project name>.pdp_assignments.tcl` script file.

5. Click **Run**. The script runs, applying the Interface Planner constraints to the project. Alternatively, you can run the script from the project directory:

   ```bash
   quartus_sh -t <assignments_file>.tcl
   ```

6. To run synthesis and apply the interface plan in your project, click **Start** ➤ **Start Analysis & Synthesis**.

7. Confirm the implementation of your plan by reviewing the Compilation Report.

2.1.3. Interface Planner NoC Tool Flow

For designs targeting Agilex 7 M-Series FPGAs only, you can use Interface Planner to assign physical locations for Network-on-Chip (NoC) initiators, PLLs, and SSMs. The Hard Memory NoC facilitates high-bandwidth data movement between the FPGA core logic and memory resources, such as HBM2e and DDR5 memories. Refer to the *Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide* for details on the complete NoC flow including Interface Planner.

You can use Interface Planner to assign physical locations for NoC initiators, targets (as part of the HBM2e or external memory interfaces), PLLs, and SSMs. If you do not make physical assignments for NoC elements, the Fitter places NoC elements automatically during compilation.

You use the floorplan view in Interface Planner to place hard memory NoC and periphery elements. There are three floorplan views available:

- **NoC View**—shows a filtered view of NoC initiators and targets.
- **Chip View**—shows the placeable locations for hard memory NoC elements, including NoC initiators, targets, PLLs, and SSMs.
- **Package View**—NoC elements are not visible in the Package View.

In the **Chip View**, the available NoC initiator and target locations appear as rows of small boxes across the top and bottom edges of the device, between the FPGA fabric and the periphery I/O structures. Placing your cursor over locations displays a tooltip indicating whether the location supports only an initiator, only a target, or both an initiator and a target.
The available NoC PLL and NoC SSM locations appear as smaller boxes at the end of the row of initiators and targets. The PLL and SSM locations appear at the left end of the rows (if using the Chip Top view), or at the right end of the rows (if using the Chip Bottom view).

**Interface Planner Chip View, Closeup of NoC Features** shows an example of the Interface Planner Chip View showing the top left corner of the die as viewed from the top. The two smaller pink boxes at the top left corner of the fabric are the locations of the NoC PLL and the NoC SSM.

*Figure 19. Interface Planner Chip View, Closeup of NoC Features*

In the NoC View, only the NoC initiators and targets are visible as larger rectangles. The targets and initiators for both high-speed NoC along the top edge of the die, and the high-speed NoC along the bottom edge of the die, are visible. Initiators and targets that may share the same location in the Chip View are split into separate elements in the NoC View.

The outer-top and outer-bottom rows are the targets for the top-edge NoC and bottom-edge NoC, respectively. Similarly, the inner-top and inner-bottom rows are the initiators for the top-edge NoC and bottom-edge NoC, respectively. As with the Chip View, if you place your cursor over one of these locations, a tooltip reports if that location supports a target or an initiator.

**NoC View Showing Targets and Initiators** is an example of the Interface Planner NoC View, showing the targets and initiators for both the top-edge NoC and the bottom-edge NoC.

2.1.3.1. Placing NoC Design Elements Using Interface Planner

The following steps describe recommended placement of NoC design elements:

1. Open, initialize, and load assignments in Interface Planner, as Interface Planner General Tool Flow describes.

2. Click Plan Design on the Flow control to interactively place NoC elements and other design elements in legal locations in the device periphery. All placeable elements, including NoC elements and periphery elements, appear in the Design Elements list. Refer to Recommended Placement Order for NoC Elements in Interface Planner.

3. Use any of the following methods to place design elements in the Chip View:
   - Drag NoC elements from the Design Elements list and drop them onto available device resources in the Chip view. You may experience a small delay while dragging as Interface Planner calculates the legal locations.
   - To allow Interface Planner to place an unplaced design element in a legal location, right-click and select Autoplace Selected. You must use Autoplace Selected for all unplaced clocks.
   - Right-click an element the Design Elements list, and then click Generate Legal Locations to display a list of Legal Locations for the element. Click any legal location in the list to highlight the location in the floorplan. Double-click any location in the list to place the element in the location.

4. After making all necessary location assignments in Interface Planner, validate the placement by clicking Validate Plan in the Flow pane.
5. To generate a Tcl script to apply the placement constraints to your project, click **Export Constraints** in the **Flow** pane. To automatically run the Tcl script, enable **Apply Assignments**.

6. To report whether the NoC initiator and target location placement allows your design to meet the bandwidth and transaction size requirements, click the **Reports** tab, and then double-click **Report NoC Performance** in the **Tasks** pane. For report details, refer to **Report NoC Performance**.
2.1.3.1.1. Recommended Placement Order for NoC Elements in Interface Planner

For best results, place NoC-related elements in the following order:

**Note:** For important considerations when choosing initiator interface placement, refer to *Horizontal Bandwidth Considerations* in the *Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide* to translate location choices into physical placements.

1. Start by placing the NoC PLL and SSM in the Interface Planner Chip View. Expand the contents of the NoC Clock Control IP by clicking the small triangle to the left of the IP instance name (`noc_clock_ctrl_0`) in the Design Element pane. Place the PLL and SSM instances for each clock control IP at either the top corner or the bottom corner.

2. Use the **Autoplace Selected** command to place the remaining NoC Clock Control Intel FPGA IP.

3. If using HBM2e memory, start by placing the UIB PLL using the Interface Planner Chip View. Expand the contents of the HBM2e IP by clicking the small triangle to the left of the IP instance name (`hbm_fp_0`) in the Design Element pane. Interface Planner may display legal locations on both the top edge and on the bottom edge of the die. Place the IP along the same edge of the die as the corresponding NoC PLL.

4. Place the HBM2e instance (design element name ending in ...|xhbmc). Interface Planner displays only one legal location for the HBM2e instance.

5. Use **Autoplace Selected** to place the remaining HBM2e IP, including all NoC target interfaces.

6. If using high-speed external memory interfaces that connect to the NoC, place these interfaces next. As with the HBM2e Intel FPGA IP above, start by placing the PLL for the external memory interface. Ensure you place this interface along the same edge as the corresponding NoC PLL.

7. Place the `mem_ck` pins to fix the pin-out for the interface.

8. Use **Autoplace Selected** to place the remaining external memory interface IP, including all of the NoC target interfaces.

9. Select the **NoC View** to place the initiator interfaces. The **NoC View** shows the target interfaces that you already placed. As you place each initiator, the targets you connect to highlight. When placing each initiator, consider which targets communicate with the initiator.

Low-speed external memory interfaces and other GPIO functions that bypass the NoC can conflict with initiator interface placement. Depending on design requirements, you can place these I/O functions that bypass the NoC before or after placing the NoC initiator interfaces. Placing I/O functions first gives greater flexibility to their placement, while restricting which initiator locations you can use. Placing NoC initiator interfaces first allows optimal initiator placement, while restricting which I/O locations are available.

Other interfaces, such as transceivers, have no direct interaction with the hard memory NoC. Therefore, you can place such interfaces before or after the NoC.

### 2. Interface Planning

2.1.4. Interface Planner Reports

Use Interface Planner reports to locate cells and assign suitable placement locations for specific interfaces and elements in your design. Interface Planner reports provide detailed, actionable feedback to help you quickly implement the best plan for your design. You can access placement and further reporting functions directly from Interface Planner reports. Interface Planner generates the following reports that provide detailed planning information:

- **Report Summary** on page 45
- **Report Pins** on page 46
- **Report HSSI Channels** on page 47
- **Report Clocks** on page 48
- **Report Periphery Locations** on page 48
- **Report Cell Connectivity** on page 49
- **Report Instance Assignments** on page 50
- **Report NoC Performance** on page 51

**Figure 30. Instance Assignments Report**
2.1.4.8. Report NoC Performance

For designs that include the Hard Memory NoC, you can interactively generate a NoC Performance Report in Interface Planner.

The NoC Performance Report generation performs a static analysis of the NoC initiator and target locations to evaluate whether the placement allows your design to meet the bandwidth requirements and transaction sizes that you specify in the NoC Assignment Editor. You can review the report, and then make changes in the Plan tab based on the results.

To access the NoC Performance Report in Interface Planner, click the Reports tab, and then double-click Report NoC Performance in the Tasks pane.

Figure 31. Sample NoC Performance Report

The NoC Performance Report reports performance data for each initiator to target connection. The latencies in this report are based on the minimum structural latency with respect to the initiator and target placement. These latencies are for the NoC portion of the path only. These latencies do not include any latency of, for instance, external memory access. Nor do these latencies account for potential delay due to congestion on the NoC. You can achieve lower minimum structural latency by placing the NoC initiators and targets closer together.

Table 21. NoC Performance Report Data

<table>
<thead>
<tr>
<th>NoC Performance Report Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested RD BW</td>
<td>The requested read bandwidth.</td>
</tr>
<tr>
<td>Requested WR BW</td>
<td>The requested write bandwidth.</td>
</tr>
<tr>
<td>NoC Req latency</td>
<td>The requested request latency.</td>
</tr>
<tr>
<td>NoC Res latency</td>
<td>The requested response latency.</td>
</tr>
</tbody>
</table>

continued...
<table>
<thead>
<tr>
<th>NoC Performance Report Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initiator placement</td>
<td>The placement location of the initiator element.</td>
</tr>
<tr>
<td>Target placement</td>
<td>The placement location of the target element.</td>
</tr>
<tr>
<td>Message</td>
<td>Text message that identifies the reason that the current placement cannot meet the requested bandwidth.</td>
</tr>
</tbody>
</table>

One possible reason the **Message** reports that the current placement cannot meet the requested bandwidth is because of over-saturation of an initiator or a target. For example, if the sum of all bandwidth requirements through a particular initiator is greater than the bandwidth that the initiator can support, based on the data width and operating frequency of its AXI4 interface. To avoid this problem, either reduce bandwidth requirements or increase bandwidth capability.

Another possible reason that the current placement cannot meet the requested bandwidth is over-saturation of the horizontal bandwidth available in the NoC. This condition is the result of multiple initiator to target connections requesting bandwidth in the same direction through a horizontal section of the NoC. The NoC Performance Report message reports the congested segments. You can adjust initiator placement to alleviate congestion.

**Note:** For important considerations when choosing initiator interface placement, refer to the tables in *Horizontal Bandwidth Considerations*, along with tables in *High-Speed Interconnect NoC Locations in Interface Planner* in the *Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide* to translate location choices into physical placements.

You can also view NoC elements in the Quartus Prime Chip Planner, and view connectivity of NoC elements in following fitting in the NoC Connectivity Report, as the *Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide*.

**Related Information**
*Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide*
2.2. Using Tile Interface Planner

The Quartus Prime Tile Interface Planner helps you to quickly place component IP in legal tile locations of device F-tiles. Tile Interface Planner is an interactive floorplanning tool that simplifies this process.

Tile Interface Planner displays your project's component IP in a hierarchical tree view, next to a visual representation of the device tile segments. You can then locate the potential legal locations for each IP within the tile, place each IP at one of these locations, and apply generated placement constraints to the project for downstream Compiler stages.

As you place elements in the tile floorplan, the legality engine verifies that the placement is legal in real-time, thus ensuring correlation with your intent in the final implementation.

Figure 32. Tile Interface Planner GUI

In contrast with Interface Planner, Tile Interface Planner is specifically for placing component IP on the F-tile, and requires you to run an initial Design Analysis stage before you define a legal tile floorplan for all component IP targeting device tiles.

• Tile Interface Planner Tool Flow on page 55
• Tile Interface Planner GUI Reference on page 69

2.2.1. Tile Interface Planner Terminology

Tile Interface Planner refers to the following terminology:
### Table 22.  Tile Interface Planner Terminology

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic Reconfiguration</td>
<td>Intel FPGA IP technology that allows you to modify some features of a supported multi-rate Intel FPGA IP interface in real time while the FPGA remains in operation. For example, you can dynamically reconfigure the settings in the F-tile CPRI PHY Multi-Rate Intel FPGA IP to run your design at different data rates and features for different IP &quot;profiles.&quot;</td>
</tr>
<tr>
<td>Floorplan</td>
<td>The layout of physical resources on the device. Creating a design floorplan, or floorplanning, is the process of mapping the logical design hierarchy to physical regions in the device. Tile Interface Planner is a tile IP floorplanning tool.</td>
</tr>
</tbody>
</table>
| IP building block             | Intel FPGA IP cores are comprised of building blocks that combine to provide all functionality of the IP. The Design Tree view in Tile Interface Planner displays each IP's building blocks. Building blocks can be movable, fixed, or always movable types.  
  - **Movable building blocks**—building blocks are initially movable. Movable building blocks can be re-placed by the legality engine in potentially one of several legal locations to accommodate other building blocks. You can convert a movable building block to fixed by specifying a fixed placement location. The legality engine cannot change the placement of fixed building blocks. Movable building block placements appear in italic text in the Design Tree view. Movable building blocks have a dithered fill in **Chip View**.  
  - **Fixed building blocks**—building blocks that you place in a fixed, legal location that the legality engine cannot change. You can convert a movable building block to fixed, and a fixed building block to movable. Fixed building block placements appear in plain text in the Design Tree view. Fixed building blocks have a solid fill in **Chip View**.  
  - **Always movable building blocks**—building blocks that are always movable by the legality engine and cannot be fixed. These building blocks must remain movable to prevent inadvertent conflicting constraints. Always movable building blocks appear in gray italic text in the Design Tree view. |
| Quartus Prime Settings File (.qsf) | Quartus Prime software file that preserves project settings and assignments, including the placement of fixed IP building blocks and fixed tile assignments that you specify in Tile Interface Planner. |
| JSON file                     | Quartus Prime software internal file that preserves the most recent placement from the Logic Generation stage of the Compiler. You can load this placement when you click **Update Assignments** if you want the starting point for planning to include the last Logic Generation assignments. |
| Legal location                | Tile Interface Planner legality engine identifies the legal locations in the tile floorplan for placement of the IP or building block that you select in the Design Tree. |
| Legality engine               | Tile Interface Planner function that generates valid legal locations for tile placement, and places movable and always movable building blocks in the tile plan. |
| Placed design element         | IP or building block that you or the legality engine has assigned to a fixed or movable legal location. |
| Support-Logic Generation stage | A Compiler stage, preceding Analysis & Synthesis, that includes the Design Analysis and Logic Generation sub-stages. This stage is only present when targeting F-tile.  
  - **Design Analysis stage**—A Compiler stage, preceding Analysis & Synthesis, that elaborates the design RTL to extract design information about component IP targeting F-tile. You must run this stage before running Tile Interface Planner. This stage is not present for other FPGA device families or for designs without required IP.  
  - **Logic Generation stage**—A Compiler stage, following Design Analysis, that uses your Tile Interface Plan to generate logic for synthesis and implementation of your tile configuration plan. You must run Logic Generation after Design Analysis before you can synthesize your tile plan. |
| Tile plan                     | One or more fixed placements that you define and save in Tile Interface Planner using the (.qsf). |
| Unplaced design element       | IP or building blocks that are unassigned to a fixed or movable legal location. |
2.2.2. Tile Interface Planner Tool Flow

The Tile Interface Planner user interface guides you through each step in the tile interface planning process.

Figure 33. Tile Interface Planner Tool Flow

- **Step 1: Instantiate IP and Run Design Analysis** on page 55—Tile Interface Planner first requires a design with component IP, targeting the Agilex 7 FPGA with F-tile. After initial design setup, you run Design Analysis to elaborate the component IP in the design.
- **Step 2: Initialize Tile Interface Planner** on page 56—launch Tile Interface Planner, component IP and existing assignment data loads, and the legality engine initializes.
- **Step 3: Update Plan with Project Assignments** on page 57—enable or disable any existing placement assignments and optionally load placement data from previous planning sessions for the current tile planning session.
- **Step 4: Create a Tile Plan** on page 58—use the Plan tab to locate the potential legal locations for each unplaced component IP, place the IP in the tile location, and verify that the placement is legal in real-time to ensure correlation in the final implementation.
- **Step 5: Save Tile Plan Assignments** on page 62—save the tile IP plan assignments to the project for design compilation.
- **Step 6: Run Logic Generation and Design Synthesis** on page 63—run the Compiler Logic Generation stage to implement your tile plan and continue synthesis and the remaining design compilation stages.

2.2.2.1. Step 1: Instantiate IP and Run Design Analysis

Tile Interface Planner requires a Quartus Prime project that includes component IP targeting the Agilex 7 FPGA with F-tile.

After instantiating the component IP in a top-level project design file (for example, top.v), you run the Design Analysis compilation stage to elaborate the design RTL to extract component IP and target device information. Upon launch, Tile Interface Planner initializes and displays this component IP information in the Design Tree view.

Follow these steps to instantiate IP and run Design Analysis:

1. Open or create a Quartus Prime project that includes component IP targeting F-tile:
• Create a new project, add design files, and specify the target Agilex 7 FPGA by clicking **File ➤ New Project Wizard**.
  
  Or

• Parameterize and instantiate component IP with IP Catalog (**View ➤ IP Catalog**) or Platform Designer (**Tools ➤ Platform Designer**).

2. To run the Design Analysis stage of the Compiler, double-click **Design Analysis** on the Compilation Dashboard (**Processing ➤ Compilation Dashboard**).

Figure 34. **Design Analysis Stage in Compilation Dashboard**

3. Initialize Tile Interface Planner, as **Step 2: Initialize Tile Interface Planner** on page 56 describes.

2.2.2.2. **Step 2: Initialize Tile Interface Planner**

When you launch Tile Interface Planner, the tool initializes the placement legality engine and loads component IP and target device data extracted by Design Analysis. Tile Interface Planner then displays the component IP information in the Design Tree view and enables the **Flow** control.

Figure 35. **Tile Interface Planner Flow Control**

To initialize Tile Interface Planner:
1. Run the Design Analysis stage of the Compiler, as Step 1: Instantiate IP and Run Design Analysis on page 55 describes.

2. When Design Analysis is complete, launch Tile Interface Planner by clicking the Tile Interface Planner icon in the Compilation Dashboard, the main toolbar, or by clicking **Tools ➤ Tile Interface Planner**.

![Launching Tile Interface Planner](image)

Tile Interface Planner launches and initializes with the legality engine and the component IP and target device data that Design Analysis extracts.

3. Load existing project assignments, as Step 3: Update Plan with Project Assignments on page 57 describes.

### 2.2.2.3. Step 3: Update Plan with Project Assignments

You can determine which fixed assignments to load from the project settings `.qsf`, and optionally load the latest placement from Logic Generation. The enabled assignments become the starting point for the tile plan. Follow these steps to update the plan with existing assignments:

1. On the **Flow** control, click **View Assignments**.

![Plan Assignment Options](image)

2. On the **Assignments** tab, select the assignment types to load for the current planning session, as Assignments Tab Controls on page 70 describes.

3. On the **Assignments** tab, enable or disable assignments to resolve any conflicts or experiment with alternative placements. Filter the list of assignments by assignment name or status.
4. When assignment selections are complete, or if you have no existing assignments, click **Update Plan** on the **Flow** control to apply the enabled project assignments to your current tile interface plan.

5. Place IP components and building blocks on the **Plan** tab, as **Step 4: Create a Tile Plan** on page 58 describes.

### 2.2.2.4. Step 4: Create a Tile Plan

Click **Plan Design** on the **Flow** control to interactively place component IP in legal locations on device tiles. The **Plan** tab displays a hierarchical list of your project component IP design elements, alongside a graphical abstraction of the target device tile architecture. Place IP (and IP building blocks) in legal tile locations within the graphical tile floorplan.

### Figure 39. Tile Interface Planner Design Elements and Chip View

- Unplaced Tile Interface IP
- Tile Chip View
- [pcie0]
Recommended Two-Stage Tile IP Placement

Handle IP tile placement in two stages for the most efficiency:

Table 23. Two-Stage Tile IP Placement

<table>
<thead>
<tr>
<th>Tile IP Placement</th>
<th>Description</th>
</tr>
</thead>
</table>
| Stage 1           | • Place all of the IPs targeting the same tile to ensure that all IP can be placed within the tile, as Placing IP Components on page 59 describes.  
• Fill each tile with the desired IP, before refining any IP building block placement for any specific placement requirements you may have for a particular building block. |
| Stage 2           | • Review the placement of IP building blocks.  
• Refine any building block placement to meet any specific placement requirements, as Constraining IP Building Blocks on page 61 describes. |

Note: Changes made in Tile Interface Planner do not apply to your Quartus Prime project until you apply the generated tile interface plan constraints to your project, as Step 5: Save Tile Plan Assignments on page 62 describes.

Placing IP Components on page 59  
Constraining IP Building Blocks on page 61

2.2.2.4.1. Placing IP Components

To place IP components and create a tile plan, follow these steps:

Note: For placing multi-rate IP components, refer to Constraining Dynamic Reconfiguration IP on page 64.

1. Update the plan with existing assignments, as Step 3: Update Plan with Project Assignments on page 57 describes.
2. In Tile Interface Planner, click the Plan tab. Tile Interface Planner displays the Design Element hierarchy, alongside a graphical representation of the tile chip or package view.
3. In the Design Element list, locate the tile interface IP that you want to place. You can search and filter the list by name, IP, placement status, I/Os, and other criteria.
4. To customize design element color coding, double-click a color in the Highlight column to specify a new color.
5. Use any of the following methods to locate legal tile placements for component IP:
• In the **Design Element** list, right-click the tile interface IP that you want to place, and then click **Generate Legal Locations for Selected Element**. 
  
  **Note:** You can select multiple IP targeting the same tile to generate legal locations for all IP at once.

• Click the ⟩⟩ button next to the **Design Element** to display a list of **Legal Locations**.

**Figure 41.** Listing Legal Locations for Tile Placement

6. In **Legal Locations**, click any location in the list to highlight the location in the floorplan.

**Figure 42.** Highlighting Legal Locations for Tile Placement

7. Double-click any location in **Legal Locations** to place the element in a legal location. Tile Interface Planner places the IP in the legal location on the device tile, as indicated by color highlighting in the Chip View. When listing legal locations for multiple IPs at once, you can also place multiple IPs at once.
2.2.2.4.2. Constraining IP Building Blocks

Intel FPGA IP cores are comprised of building blocks that combine to provide all functionality of the IP. The Design Tree view displays each IP building block hierarchy.

When you place component IP, Tile Interface Planner also places the corresponding IP building blocks in the tile. Each building block has a movable, fixed, or always movable state. You can review the building block placement and determine whether to refine any building block placement, or allow the legality engine to determine the best building block placement.

Follow these steps to constrain or relax the placement of IP building blocks:

1. Place all IP on the tile, as Placing IP Components on page 59 describes.
2. To the left of the Placement column, click the List Legal Locations button to display all legal locations for a building block.
3. To constrain building blocks to specific placement:
• To fix a movable building block, right-click one or more movable building blocks and click **Make Selected Element Fixed**. The building block is fixed and does not move to accommodate other components.

• To fix an IP component's building blocks, right-click the IP component and click **Make Child Elements Fixed**. The IP and child building blocks are fixed and do not move to accommodate other components.

**Figure 45. Make Selected Element Fixed**

4. To remove specific building block placement constraints from fixed building blocks:

• To make fixed building blocks movable, right-click one or more fixed building blocks and click **Make Selected Element Movable**. The building block can move to accommodate other components.

• To make all of an IP component's fixed building blocks movable, right-click the IP component and click **Make Child Elements Movable**. All child building blocks can move automatically to accommodate other components.

**Figure 46. Make Child Elements Movable**

5. When all tile IP placement is complete, save the tile plan, as **Step 5: Save Tile Plan Assignments** on page 62 describes.

### 2.2.2.5. Step 5: Save Tile Plan Assignments

Once you have placed all IP components, and fixed any movable building blocks that you want to constrain, you save the constraints in Tile Interface Planner. Tile Interface Planner saves the fixed tile constraints to the project .qsf. The Compiler reads the .qsf assignments during the Logic Generation stage.

To save the tile plan assignments, follow these steps:

1. Review and consider constraining any IP building blocks. To guarantee placement to exact locations, you must fix the IP building blocks connected to the IP pins to preserve those constraints in the .qsf, as **Constraining IP Building Blocks** on page 61 describes.
2. In Tile Interface Planner, click **Save Assignments** on the Flow control, and then click **OK**.

3. Close Tile Interface Planner and return to the Quartus Prime GUI. The tile IP assignments are visible in the Assignment Editor (**Assignments ➤ Assignment Editor**) and in the .qsf file.

---

**Figure 48.** **Tile IP Assignments in Assignment Editor**

4. Run the Logic Generation stage, as **Step 6: Run Logic Generation and Design Synthesis** on page 63 describes.

---

**2.2.2.6. Step 6: Run Logic Generation and Design Synthesis**

After saving your tile plan assignments, run the Compiler’s Logic Generation stage to implement your tile plan and run the remaining design compilation stages.

To run Logic Generation and design synthesis, follow these steps:

1. Save your tile interface plan, as **Step 5: Save Tile Plan Assignments** on page 62 describes.

2. In the Quartus Prime software, double-click the **Logic Generation** stage in the Compilation Dashboard. Logic Generation reads the tile plan assignments from the .qsf.
3. Once Logic Generation completes, double-click Analysis & Synthesis on the dashboard.

4. Once Analysis & Synthesis complete, run the other remaining downstream stages in the compilation flow when ready.

### 2.2.3. Constraining Dynamic Reconfiguration IP

Tile Interface Planner and Tile Assignment Editor provide support for constraining IP instances that are part of a dynamic reconfiguration group.

Dynamic reconfiguration allows you to modify some features of an Intel FPGA IP interface in real time, while the FPGA remains in continuous operation. This dynamic reconfiguration capability allows you to change your design to run at different data rates, and with different features, for different IP "profiles."

When you generate a dynamically reconfigurable IP instance, the IP includes a .mif file that specifies the base and secondary profiles that you define. Each profile contains the delta programming sequences for the dynamic reconfiguration of the IP in a linked-list format.

**Related Information**

- F-Tile Dynamic Reconfiguration Suite Intel FPGA IP User Guide
- F-Tile Dynamic Reconfiguration Design Example User Guide
- F-tile CPRI PHY IP User Guide
- F-tile CPRI Multi-rate PHY Dynamic Reconfiguration Design Example User Guide

### 2.2.3.1. Defining a Dynamic Reconfiguration Group

You can define a dynamic reconfiguration group to declare the tree structure that defines how dynamic reconfiguration operates for all of the IP instances that you assign to the group. The reconfiguration group can be either **Exclusive** (only one DR group IP instance is active at any time), or **Inclusive** (any combination of DR group IP instances can be active at any time).

You define the members and properties of the group, and then assign the tile placement of the group members. The Tile Assignment Editor allows you to easily create a dynamic reconfiguration group scheme in a unified GUI. You can then visualize and interactively place the dynamic reconfiguration group in the Tile Interface Planner floorplan.
When you place or unplace any member IPs of a multirate DR group, Tile Interface Planner also appropriately places or unplaces the children and sibling IPs in the DR group automatically. You can then expand and refine the placement of member IPs individually.

1. Define and add to your project all of the dynamically reconfigurable IP instances to be included in the dynamic reconfiguration group or groups, as Step 1: Instantiate IP and Run Design Analysis on page 55 describes. Connect the IP instances in a manner that is compatible with the dynamic reconfiguration scheme that you want to create.

2. To run the Design Analysis stage of the Compiler, double-click Design Analysis on the Compilation Dashboard. Design Analysis discovers your project's dynamically reconfigurable IP instance information for use in Tile Assignment Editor and Tile Interface Planner.

3. To open Tile Assignment Editor, click Assignments ➤ Tile Assignment Editor. Tile Assignment Editor displays the Name, Type, and other Properties of the ungrouped and any grouped IP instances that are valid for dynamic reconfiguration grouping within your project.

4. To define a new DR group, double-click <<new DR group>> in the Tile Assignment Editor Name column. The Create New DR Group dialog box appears.

5. In the Group name box, specify a name for the DR group, along with the following options:
Table 24. Create New DR Group Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group parent</td>
<td>Specifies that the DR group is the <code>&lt;root&gt;</code> (parent), or allows you to select an existing DR group as the parent to newly created dynamic reconfiguration group.</td>
</tr>
<tr>
<td>Group type</td>
<td>Specifies that the group is <strong>Exclusive</strong> (only one IP instance is active at any given time) or <strong>Inclusive</strong> (Any combination of IP instances may be active at any given time). Default value is <strong>Exclusive</strong>.</td>
</tr>
<tr>
<td>Reconfig controller</td>
<td>Allows you to select the appropriate reconfiguration controller for the group. You may have multiple reconfiguration controllers in your project. (2)</td>
</tr>
<tr>
<td>Has master clock channel</td>
<td>By default, the group inherits this value from the parent. If your IP group has a master clock channel, or <strong>Off</strong> if your IP group does not have a master clock channel. When <strong>On</strong>, you can also specify the <strong>Building block instance name</strong> and the <strong>Clock port</strong> of the master clock channel.</td>
</tr>
</tbody>
</table>

Figure 52. Create New DR Group Dialog Box

6. To add IP instances to a DR group, right-click the DR instance name and then click **Move IP Instance**. In **Move to group**, select the DR group to add the IP instance and click **OK**.

Figure 53. Move Item To Group

7. To specify the startup instance, right click any instance and then click **Toggle as startup IP instance**.

(2) If you do not specify this option child DR groups inherit this value from the parent.
8. Once you are done defining the DR groups for the project, click **Save Tile Assignment Editor** to save the tile assignments to the project .qsf.

9. Use the DR groups to place DR groups in Tile Interface Planner, as **Assigning Dynamic Reconfiguration Group Placement** on page 67 describes.

### 2.2.3.2. Assigning Dynamic Reconfiguration Group Placement

Once you load a design that includes dynamic reconfiguration groups, Tile Interface Planner displays the tile location of the dynamically reconfigurable IP instances and related building blocks. You can dynamically assign the tile location of IP instances within each dynamic reconfiguration group, and place other IP components in relation to the dynamic reconfiguration group. When placing other components, Tile Interface Planner takes all of the dynamic reconfiguration group placements into account.

### Figure 56. Reconfiguration Groups Tree View

The **Reconfiguration Groups** view shows the members and placement of the dynamic reconfiguration groups that you create. Use the **Reconfiguration Groups** view to select the dynamic reconfiguration group that you want to assign. You can only modify the DR groupings in Tile Assignment Editor, not in Tile Interface Planner.
To assign DR groups to tile locations, follow these steps:

1. Define one or more dynamic reconfiguration groups, as Defining a Dynamic Reconfiguration Group on page 64 describes.

2. To run Logic Generation, double-click Logic Generation on the Compilation Dashboard.

3. To start Tile Interface Planner, click the Tile Interface Planner icon on Compilation Dashboard, as Step 2: Initialize Tile Interface Planner on page 56 describes.

4. In Tile Interface Planner, click the Plan tab. Tile Interface Planner displays the dynamic reconfiguration IP profiles in the Design Element hierarchy.

5. Select an instance in the Reconfiguration Groups tree view, the selection synchronizes with the selection in the Design Elements lists.

Figure 57. Reconfiguration Groups and Design Elements Selection Synchronization

6. Click the button next to the Design Element to display a list of Legal Locations for the selected DR group.

7. Double-click any location in Legal Locations to place the element in a legal location. Tile Interface Planner places the IP in the legal location on the device tile.

Figure 58. Placing One Member Automatically Places All Others in DR Group
Note: When you place or unplace any member IPs of a multirate DR group, Tile Interface Planner also appropriately places or unplaces the children and sibling IPs in the DR group automatically. You can then expand and refine the placement of member IPs individually.

8. Place other IP components in relation to the DR group location, as Placing IP Components on page 59 describes. Tile Interface Planner takes the dynamic reconfiguration group placement into account when you place other IP components.

**Figure 59. Placing Other IP Components**

![Placing Other IP Components](image)

2.2.4. Tile Interface Planner GUI Reference

The Tile Interface Planner user interface includes the following controls for floorplanning your design.

2.2.4.1. Flow Controls

The Flow control panel provides immediate access to common Tile Interface Planner commands from anywhere within Tile Interface Planner.

**Table 25. Flow Controls**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initialize Tile Interface Planner</td>
<td>Launches the placement legality engine and loads the component IP and target device data that Design Analysis extracts.</td>
</tr>
<tr>
<td>View Assignments</td>
<td>Opens the Assignments tab, which allows you to review and enable or disable any existing placement assignments for the current planning session.</td>
</tr>
<tr>
<td>Update Plan</td>
<td>Optionally applies a previous tile planning session fixed placement assignments from the .qsf, and movable placements from a .json to the current tile interface plan.</td>
</tr>
<tr>
<td>Plan Design</td>
<td>Opens the Plan tab for placing component IP in the tile interface plan.</td>
</tr>
<tr>
<td>Save Assignments</td>
<td>Opens the Save Assignments dialog box for saving the fixed tile constraints to the project .qsf and the movable building block constraints to a .json file.</td>
</tr>
</tbody>
</table>
The **Flow** controls appear in order of a typical tile interface planning flow.

**Figure 60. Tile Interface Planner Flow Control**

![Flow controls diagram](image)

2.2.4.2. Home Tab

The Tile Interface Planner **Home** tab is the default tab that displays the **Flow** control and an introductory interface planning infographic. There are no controls specific to the Tile Interface Planner **Home** tab.

2.2.4.3. Assignments Tab Controls

The **Assignments** tab allows you to review and enable or disable any existing placement assignments for the current tile interface planning session. Click **View Assignments** on the **Flow** control to display the **Assignments** tab.

You can enable or disable any placement assignments that Design Analysis finds. After you are satisfied with the status of all project assignments, click **Update Plan** on the **Flow** control to update your tile interface plan with the enabled project assignments.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter field</td>
<td>Supports creation of wildcard expressions for assignment targets. <strong>Enabled</strong> and <strong>Disabled</strong> buttons filter only enabled or disabled assignments in the list.</td>
</tr>
<tr>
<td>Enable All Project Assignments</td>
<td>Enables all existing assignments for the current tile interface planning session. These assignments then become the starting point for your tile plan.</td>
</tr>
<tr>
<td>Disable All Project Assignments</td>
<td>Disables all existing assignments for the current tile interface planning session.</td>
</tr>
<tr>
<td>Clear</td>
<td>Clears any filter from the <strong>Assignments</strong> list.</td>
</tr>
<tr>
<td>Plan Assignment Options</td>
<td>The following options are mutually exclusive:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Load enabled fixed assignments</strong>—loads fixed assignments from <code>.qsf</code>. These assignments then become the starting point for your tile plan.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Load enabled fixed assignments and the most recent placement from Logic Generation</strong>—loads fixed assignments from <code>.qsf</code> and the most recent placement data from the last Logic Generation stage of the Compiler.</td>
</tr>
</tbody>
</table>
2.2.4.4. Plan Tab Controls

The Plan tab contains the Design Tree and tile visualization panes. The Design Tree lists design elements for placement. The tile visualization pane displays a graphical view of the target device tile to help you visualize the appropriate legal locations for placement of component IP.

Click Plan Design on the Flow control to display the Plan tab.

<table>
<thead>

</tr>
</tbody>
</table>

2.2.4.4.1. Design Tree and Filters

The Design Tree View displays a hierarchy of the IP components and building block design elements found during the Design Analysis compilation stage. You can locate the IP and building blocks in the design tree, and then assign the elements to legal locations in the tile floorplan on the Plan tab.

The Design Tree view includes these columns:

- **Design Element**—lists all component IP and building blocks that Design Analysis identifies. IP cores and building blocks are distinguished by different icons. Fixed IP building blocks are shown in plain text. Movable IP building blocks are shown in italic text. Always movable building blocks are shown in gray italic text.

- **Highlight**—indicates the color for display of design elements in the tile visualization pane.

- **Placement**—indicates the placement status (placed, unplaced) or placement tile location for design elements.

You can type a partial or complete name in the design element filter field to refine the list of elements displayed.

- Click the Full icon to show all design elements in the tree.
- Click the IP icon to show only IP level hierarchy in the tree.
- Click the Unplaced icon to show only unplaced design elements in the tree.
- Click the I/Os icon to show only I/O design elements in the tree.
2.2.4.4.2. Reconfiguration Groups View

The Reconfiguration Groups view shows all IP instances that are part of a dynamic reconfiguration group, or in a multi-rate IP instance. Use this view to readily display the dynamic reconfiguration group hierarchy in the current design. The Reconfiguration Groups view shows you which IP instances in the dynamic reconfiguration group are placed, and identifies the tile placement location.

Figure 61. Reconfiguration Groups View (Multi-Rate IP Design)

2.2.4.4.3. Legal Locations Pane

The Legal Locations pane lists the legal locations for tile placement that the legality engine determines. You can enter a text string in the Filter field to limit the list.

- Click any legal location in the list to highlight that location in the tile visualization pane.
- Double-click any legal location in the list to assign placement to that tile location.

2.2.4.5. Tcl Console Window

The Tcl Console Window echoes the commands that you run in the Tile Interface Planner GUI. The Tile Interface Planner GUI operates on top of the Tile Interface Planner API. You can alternatively execute Tile Interface Planner commands in the Tcl console.

2.3. Interface Planning Revision History

This document has the following revision history:
<table>
<thead>
<tr>
<th>Document Version</th>
<th>Intel Quartus Prime Version</th>
<th>Changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>2024.04.01</td>
<td>24.1</td>
<td>• Applied initial Altera rebranding throughout.</td>
</tr>
<tr>
<td>2023.10.02</td>
<td>23.3</td>
<td>• Updated screenshot in Step 1: Instantiate IP and Run Design Analysis for latest Compilation Dashboard.</td>
</tr>
<tr>
<td>2023.04.03</td>
<td>23.1</td>
<td>• Added new Interface Planner NoC Tool Flow section describing general use of new Interface Planner features that support the Hard Memory NoC in Agilex 7 M-Series FPGAs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added new Report NoC Performance topic describing the new NoC Performance Report that Interface Planner can generate.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Updated product family name to &quot;Intel Agilex 7.&quot;</td>
</tr>
<tr>
<td>2022.09.26</td>
<td>22.3</td>
<td>• Updated Defining a Dynamic Reconfiguration Group topic to describe automated placement of children and siblings in DR groups.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added note and image to Assigning Dynamic Reconfiguration Group Placement topic to describe automated placement of children and siblings in DR groups.</td>
</tr>
<tr>
<td>2022.06.21</td>
<td>22.2</td>
<td>• Updated Constraining Dynamic Reconfiguration Group IP topic for Tile Assignment Editor support.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added new Defining a Dynamic Reconfiguration Group topic describing use of new Tile Assignment Editor.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Updated Assigning Dynamic Reconfiguration Group Placement topic for support of interactive placement in Tile Interface Planner.</td>
</tr>
<tr>
<td>2022.03.28</td>
<td>22.1</td>
<td>• Added dynamic reconfiguration to Tile Interface Planner Terminology topic.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Retitled and updated Dynamic Reconfiguration Multi-Rate IP Tile Planning topic for new display of base and secondary dynamic reconfiguration profiles.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added new Reconfiguration Groups View topic.</td>
</tr>
<tr>
<td>2021.10.04</td>
<td>21.3</td>
<td>• Updated Tile Interface Planner Terminology JSON file and IP building block definitions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Updated GUI options in Step 3: Update Plan Assignments and Assignments Tab Controls topics.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added &quot;Multi-Rate IP Tile Planning&quot; topic.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Updated &quot;Step 5: Save Tile Plan Assignments&quot; for latest GUI.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added new video demo link to Interface Planning topic.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added new controls to Flow Controls topic.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Revised Plan Tab Controls topic for new toolbar controls.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Added application note link to Step 3: Update Plan with Project Assignments.</td>
</tr>
<tr>
<td>2021.06.21</td>
<td>21.2</td>
<td>• Integrated new Tile Interface Planning section.</td>
</tr>
<tr>
<td>2019.04.01</td>

3. Managing Device I/O Pins

This chapter describes efficient planning and assignment of I/O pins in your target device. Consider I/O standards, pin placement rules, and your PCB characteristics early in the design phase.

Figure 62. Quartus Prime Pin Planner GUI

Table 29. Quartus Prime I/O Pin Planning Tools

For more information about special pin assignment features for the Arria 10 SoC devices, refer to Instantiating the HPS Component in the Arria 10 Hard Processor System Technical Reference Manual.

Related Information

Instantiating the HPS Component
3.1. I/O Planning Overview

On FPGA design, I/O planning includes creating pin-related assignments and validating them against pin placement guidelines. This process ensures a successful fit in your target device. When you plan and assign I/O pins in the initial stages of your project, you design for compatibility with your target device and PCB characteristics. As a result, your design process goes through fewer iterations, and you develop an accurate PCB layout sooner.

You can plan your I/O pins even before defining design files. Assign expected nodes not yet defined in design files, including interface IP core signals, and then generate a top-level file. The top-level file instantiates the next level of design hierarchy and includes interface port information like memory, high-speed I/O, device configuration, and debugging tools.

Assign design elements, I/O standards, interface IP, and other properties to the device I/O pins by name or by dragging to cells. You can then generate a top-level design file for I/O validation.

Use I/O assignment validation to fully analyze I/O pins against VCCIO, VREF, electromigration (current density), Simultaneous Switching Output (SSO), drive strength, I/O standard, PCI_IO clamp diode, and I/O pin direction compatibility rules.

Quartus Prime software provides the Pin Planner tool to view, assign, and validate device I/O pin logic and properties. Alternatively, you can enter I/O assignments in a Tcl script, or directly in HDL code.

3.1.1. Basic I/O Planning Flow

The following steps describe the basic flow for assigning and verifying I/O pin assignments:

1. Click Assignments ➤ Device and select a target device that meets your logic, performance, and I/O requirements. Consider and specify I/O standards, voltage and power supply requirements, and available I/O pins.

2. Click Assignments ➤ Pin Planner.

3. Assign I/O properties to match your device and PCB characteristics, including assigning logic, I/O standards, output loading, slew rate, and current strength.

4. Click Run I/O Assignment Analysis in the Tasks pane to validate assignments and generate a synthesized design netlist. Correct any problems reported.

5. Click Processing ➤ Start Compilation. During compilation, the Quartus Prime software runs I/O assignment analysis.

3.1.2. Integrating PCB Design Tools

You can integrate PCB design tools into your work flow to map pin assignments to symbols in your system circuit schematics and board layout.

The Quartus Prime software integrates with board layout tools by allowing import and export of pin assignment information in Quartus Prime Settings Files (.qsf) or Pin-Out Files (.pin).

3.1.3. Intel FPGA Device and I/O Terminology

The following terms describe Intel FPGA device and I/O structures:

<table>
<thead>
<tr>
<th>Terms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Package (BGA example)</td>
<td>Ceramic or plastic heat sink surface mounted with FPGA die and I/O pins or solder balls. In a wire bond BGA example, copper wires connect the bond pads to the solder balls of the package. Click View &gt; Show &gt; Package Top or View &gt; Show &gt; Package Bottom in Pin Planner.</td>
</tr>
<tr>
<td>I/O Bank</td>
<td>I/O pins are grouped in I/O banks for assignment of I/O standards. Each numbered bank has its own voltage source pins, called VCCID pins, for high I/O performance. The specified VCCID pin voltage is between 1.5 V and 3.3 V. Each bank supports multiple pins with different I/O standards. All pins in a bank must use the same VCCID signal. Click View &gt; Show &gt; I/O Banks in Pin Planner.</td>
</tr>
<tr>
<td>I/O Pin</td>
<td>A wire lead or small solder ball on the package bottom or periphery. Each pin has an alphanumeric row and column number, I, O, Q, S, X, and Z are never used. The alphabet is repeated and prefixed with the letter A when exceeded. All I/O pins display by default.</td>
</tr>
<tr>
<td>Pad</td>
<td>I/O pins are connected to pads located on the perimeter of the top metal layer of the silicon die. Each pad is numbered with an ID starting at 0, and increments by one in a counterclockwise direction around the device. Click View &gt; Pad View in Pin Planner.</td>
</tr>
<tr>
<td>VREF Pin Group</td>
<td>A group of pins including one dedicated VREF pin required by voltage-referenced I/O standards. A VREF group contains a smaller number of pins than an I/O bank. This maintains the signal integrity of the VREF pin. One or more VREF groups exist in an I/O bank. The pins in a VREF group share the same VCCID and VREF voltages.</td>
</tr>
</tbody>
</table>

3.2. Assigning I/O Pins

Use the Pin Planner to visualize, modify, and validate I/O assignments in a graphical representation of the target device. You can increase the accuracy of I/O assignment analysis by reserving specific device pins to accommodate undefined but expected I/O.

To assign I/O pins in the Pin Planner, follow these steps:

1. Open an Quartus Prime project, and then click Assignments ➤ Pin Planner.
2. Click Processing ➤ Start Analysis & Elaboration to elaborate the design and display All Pins in the device view.
3. To locate or highlight pins for assignment, click Pin Finder or a pin type under Highlight Pins in the Tasks pane.
4. (Optional) To define a custom group of nodes for assignment, select one or more nodes in the Groups or All Pins list, and click Create Group.
5. Enter assignments of logic, I/O standards, interface IP, and properties for device I/O pins in the All Pins spreadsheet, or by dragging into the package view.

6. To assign properties to differential pin pairs, click Show Differential Pin Pair Connections. A red connection line appears between positive (p) and negative (n) differential pins.

7. (Optional) To create board trace model assignments:
   a. Right-click an output or bidirectional pin, and click Board Trace Model. For differential I/O standards, the board trace model uses a differential pin pair with two symmetrical board trace models.
   b. Specify board trace parameters on the positive end of the differential pin pair. The assignment applies to the corresponding value on the negative end of the differential pin pair.

8. To run a full I/O assignment analysis, click Run I/O Assignment Analysis. The Fitter reports analysis results. Only reserved pins are analyzed prior to design synthesis.

3.2.1. Assigning to Exclusive Pin Groups

You can designate groups of pins for exclusive assignment. When you assign pins to an Exclusive I/O Group, the Fitter does not place the signals in the same I/O bank with any other exclusive I/O group. For example, if you have a set of signals assigned exclusively to group_a, and another set of signals assigned to group_b, the Fitter ensures placement of each group in different I/O banks.

3.2.2. Assigning Slew Rate and Drive Strength

You can designate the device pin slew rate and drive strength. These properties affect the pin’s outgoing signal integrity. Use either the Slew Rate or Slow Slew Rate assignment to adjust the drive strength of a pin with the Current Strength assignment.

Note: The slew rate and drive strength apply during I/O assignment analysis.

3.2.3. Assigning I/O Banks

Some Intel FPGA devices support assignments to I/O banks. I/O banks are a logical grouping of I/O pins for convenience in making certain types of assignments, such as I/O standard assignments.

When targeting a device family that supports I/O bank assignments, the I/O Bank cell value automatically populates in Pin Planner once you select a corresponding pin Location. The rows for various I/O banks are color coded for easy visual identification.

Figure 64. Pin Location and I/O Bank Cells in Pin Planner

<table>
<thead>
<tr>
<th>Node Name</th>
<th>Direction</th>
<th>Location</th>
<th>I/O Bank</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddr4_emif_mem_mem_a[7]</td>
<td>Output</td>
<td>PIN_CE34</td>
<td>2B</td>
</tr>
<tr>
<td>ddr4_emif_mem_mem_a[3]</td>
<td>Output</td>
<td>PIN_CE32</td>
<td>2B</td>
</tr>
<tr>
<td>pio_0_external_connection_export[3]</td>
<td>Output</td>
<td>PIN_C30</td>
<td>3C</td>
</tr>
<tr>
<td>pio_0_external_connection_export[0]</td>
<td>Output</td>
<td>PIN_B31</td>
<td>3C</td>
</tr>
</tbody>
</table>
When you save your Pin Planner constraints, the pin location saves to the project .qsf that also saves the I/O bank locations as a comment. Command-line users can use this comment to identify I/O bank locations for the placed pins without launching the Quartus Prime software GUI.

Figure 65. I/O Bank Location Saved As Comment in QSF

```
set_location_assignment PIN_C30 -to pic_0_external_connection_export[3] -comment IOBANK_3C
set_location_assignment PIN_E31 -to pic_0_external_connection_export[0] -comment IOBANK_3C
set_location_assignment PIN_CE32 -to ddr4 membres_mem[7] -comment IOBANK_3B
set_location_assignment PIN_CE34 -to ddr4 membres_mem[0] -comment IOBANK_3B
```

3.2.4. Changing Pin Planner Highlight Colors

The Pin Planner Task window provides one-click access to execute common pin planning tasks. After clicking a pin planning task, you can view and highlight the results in the Report window by selecting or deselecting I/O types.

You can highlight the various pin types in the current device view for easy visualization and assignment to specific types of pins. You can optionally customize the highlight color for each item in the report window to suit your preferences.

To change the default color for any item in the Pin Planner Report panel, follow these steps:
1. Right-click on any item in the Report window, and then click Change Color.
2. From the color pallet, specify the highlight color for the item.
3. Click OK. The highlight color changes for the selected items in Pin Planner.

Figure 66. 2A I/O Bank Green Before Highlight Color Change

Figure 67. 2A I/O Bank Red After Highlight Color Change

3.2.5. Showing I/O Lanes

You can use the Report window I/O 12 Lanes command to generate a report that displays all I/O lanes in an I/O bank.

You can highlight the various I/O lanes and change color coding for easy visualization and assignment.
3.2.6. Assigning Differential Pins

When you assign a differential I/O standard to a single-ended top-level pin in your design, the Pin Planner automatically recognizes the negative pin as part of the differential pin pair assignment and creates the negative pin for you. The Quartus Prime software writes the location assignment for the negative pin to the .qsf; however, the I/O standard assignment is not added to the .qsf for the negative pin of the differential pair.

The following example shows a design with lvds_in top-level pin, to which you assign a differential I/O standard. The Pin Planner automatically creates the differential pin, lvds_in(n) to complete the differential pin pair.

Note: If you have a single-ended clock that feeds a PLL, assign the pin only to the positive clock pin of a differential pair in the target device. Single-ended pins that feed a PLL and are assigned to the negative clock pin device cause the design to not fit.
If your design contains a large bus that exceeds the pins available in a particular I/O bank, you can use edge location assignments to place the bus. Edge location assignments improve the circuit board routing ability of large buses, because they are close together near an edge. The following figure shows Intel device package edges.

When you assign differential pin pairs in Package View, a red connection line displays between the pair of differential pins. The Package View labels the positive and negative pins with the letters p and n, respectively.
3.2.6.1. Overriding I/O Placement Rules on Differential Pins

I/O placement rules ensure that noisy signals do not corrupt neighboring signals. Each device family has predefined I/O placement rules.

I/O placement rules define, for example, the allowed placement of single-ended I/O with respect to differential pins, or how many output and bidirectional pins you can place within a VREF group when using voltage referenced input standards.

Use the `IO_MAXIMUM_TOGGLE_RATE` assignment to override I/O placement rules on pins, such as system reset pins that do not switch during normal design activity. Setting a value of 0 MHz for this assignment causes the Fitter to recognize the pin at a DC state throughout device operation. The Fitter excludes the assigned pin from placement rule analysis. Do not assign an `IO_MAXIMUM_TOGGLE_RATE` of 0 MHz to any actively switching pin, or your design may not function as you intend.
3.2.7. Entering Pin Assignments with Tcl Commands

You can apply pin assignments with Tcl scripts, by either entering individual Tcl commands in the Tcl Console, or creating a .tcl script and the typing the following in the command line:

Example 6. Applying Tcl Script Assignments

```
quartus_sh -t <my_tcl_script>.tcl
```

Example 7. Scripted Pin Assignment

The following example uses `set_location_assignment` and `set_instance_assignment` Tcl commands to assign a pin to a specific location, I/O standard, and drive strength.

```
set_location_assignment PIN_M20 -to address[10]
set_instance_assignment -name IO_STANDARD "2.5 V" -to address[10]
set_instance_assignment -name CURRENT_STRENGTH_NEW "MAXIMUM CURRENT" -to address[10]
```

Related Information

3.2.8. Entering Pin Assignments in HDL Code

You can use synthesis attributes or low-level I/O primitives to embed I/O pin assignments directly in your HDL code. When you analyze and synthesize the HDL code, the information is converted into the appropriate I/O pin assignments. You can use either of the following methods to specify pin-related assignments with HDL code:

- Assigning synthesis attributes for signal names that are top-level pins
- Using low-level I/O primitives, such as ALT_BUF_IN, to specify input, output, and differential buffers, and for setting parameters or attributes

3.2.8.1. Using Low-Level I/O Primitives

You can alternatively enter I/O pin assignments using low-level I/O primitives. You can assign pin locations, I/O standards, drive strengths, slew rates, and on-chip termination (OCT) value assignments. You can also use low-level differential I/O primitives to define both positive and negative pins of a differential pair in the HDL code for your design.

Primitive-based assignments do not appear in the Pin Planner until after you perform a full compilation and back-annotate pin assignments (Assignments > Back Annotate Assignments).
3.3. Importing and Exporting I/O Pin Assignments

The Quartus Prime software supports transfer of I/O pin assignments across projects, or for analysis in third-party PCB tools. You can import or export I/O pin assignments in the following ways:

Table 31. Importing and Exporting I/O Pin Assignments

<table>
<thead>
<tr>
<th>Import Assignments</th>
<th>Export Assignments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scenario</td>
<td>Scenario</td>
</tr>

<td>Exported .csv files retain column and row order and format. Do not modify the row of column headings if importing the .csv file</td>
</tr>
</tbody>
</table>

3.3.1. Importing and Exporting for PCB Tools

The Pin Planner supports import and export of assignments with PCB tools. You can export valid assignments as a .pin file for analysis in other supported PCB tools. You can also import optimized assignment from supported PCB tools. The .pin file contains pin name, number, and detailed properties.

Table 32. Contents of .pin File

<table>

3.3.2. Migrating Assignments to Another Target Device

Click View ➤ Pin Migration Window to verify whether pin assignments are compatible with migration to a different Intel device.
You can migrate compatible pin assignments from one target device to another. You can migrate to a different density and the same device package. You can also migrate between device packages with different densities and pin counts.

The Quartus Prime software ignores invalid assignments and generates an error message during compilation. After evaluating migration compatibility, modify any incompatible assignments, and then click **Export** to export the assignments to another project.

**Figure 72. Device Migration Compatibility (AC24 does not exist in migration device)**

The migration result for the pin function of highlighted **PIN_AC23** is not an NC but a voltage reference **VREFB1N2** even though the pin is an NC in the migration device. VREF standards have a higher priority than an NC, thus the migration result displays the voltage reference. Even if you do not use that pin for a port connection in the design, you must use the VREF standard for I/O standards that require it on the actual board for the migration device.

If one of the migration devices has pins intended for connection to VCC or GND and these same pins are I/O pins on a different device in the migration path, the Quartus Prime software ensures these pins are not used for I/O. Ensure that these pins are connected to the correct PCB plane.

When migrating between two devices in the same package, pins that are not connected to the smaller die may be intended to connect to VCC or GND on the larger die. To facilitate migration, you can connect these pins to VCC or GND in the original design because the pins are not physically connected to the smaller die.
3.4. Validating Pin Assignments

The Quartus Prime software validates I/O pin assignments against predefined I/O rules for your target device. You can use the following tools to validate your I/O pin assignments throughout the pin planning process:

Table 33. I/O Validation Tools

<table>
<thead>
<tr>
<th>I/O Validation Tool</th>
<th>Description</th>
<th>Click to Run</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

### 3.4.2. I/O Assignment Analysis

I/O assignment analysis validates I/O assignments against the complete set of I/O system and board layout rules. Full I/O assignment analysis validates blocks that directly feed or are fed by resources such as a PLL, LVDS, or gigabit transceiver blocks. In addition, the checker validates the legality of proper VREF pin use, pin locations, and acceptable mixed I/O standards.

Run I/O assignment analysis during early pin planning to validate initial reserved pin assignments before compilation. Once you define design files, run I/O assignment analysis to perform more thorough legality checks with respect to the synthesized netlist. Run I/O assignment analysis whenever you modify I/O assignments.

The Fitter assigns pins to accommodate your constraints. For example, if you assign an edge location to a group of LVDS pins, the Fitter assigns pin locations for each LVDS pin in the specified edge location and then performs legality checks. To display the Fitter-placed pins, click **Show Fitter Placements** in the Pin Planner. To accept these suggested pin locations, you must back-annotate your pin assignments.

View the I/O Assignment Warnings report to view and resolve all assignment warnings. For example, a warning that some design pins have undefined drive strength or slew rate. The Fitter recognizes undefined, single-ended output and bidirectional pins as non-calibrated OCT. To resolve the warning, assign the **Current Strength**, **Slew Rate** or **Slow Slew Rate** for the reported pin. Alternatively, can assign the **Termination** to the pin. You cannot assign drive strength or slew rate settings when a pin has an OCT assignment.
3.4.2.1. Early I/O Assignment Analysis Without Design Files

You can perform basic I/O legality checks before defining HDL design files. This technique produces a preliminary board layout. For example, you can specify a target device and enter pin assignments that correspond to PCB characteristics. You can reserve and assign I/O standards to each pin, and then run I/O assignment analysis to ensure that there are no I/O standard conflicts in each I/O bank.

Figure 73. Assigning and Analyzing Pin-Outs without Design Files

You must reserve all pins you intend to use as I/O pins, so that the Fitter can determine each pin type. After performing I/O assignment analysis, correct any errors reported by the Fitter and rerun I/O assignment analysis until all errors are corrected. A complete I/O assignment analysis requires all design files.

3.4.2.2. I/O Assignment Analysis With Design Files

I/O assignment analysis allows you to perform full I/O legality checks after fully defining HDL design files. When you run I/O assignment analysis on a complete design, the tool verifies all I/O pin assignments against all I/O rules. When you run I/O assignment analysis on a partial design, the tool checks legality only for defined portions of the design. The following figure shows the work flow for analyzing pin-outs with design files.
Figure 74. I/O Assignment Analysis Flow

To obtain better coverage, analyze as much of the design as possible over time, especially logic that connects to pins. For example, if your design includes PLLs or LVDS blocks, define these files prior to full analysis. After performing I/O assignment analysis, correct any errors reported by the Fitter and rerun I/O assignment analysis until all errors are corrected.

The following figure shows the compilation time benefit of performing I/O assignment analysis before running a full compilation.
3.4.2.3. Overriding Default I/O Pin Analysis

You can override the default I/O analysis of pins to accommodate I/O rule exceptions, such as for analyzing VREF or inactive pins.

Each device contains VREF pins, each supporting one or more I/O pins. A VREF pin and its I/O pins comprise a VREF bank. The VREF pins are typically assigned inputs with VREF I/O standards, such as HSTL- and SSTL-type I/O standards. Conversely, VREF outputs do not require the VREF pin. When a voltage-referenced input is present in a VREF bank, only a certain number of outputs can be present in that VREF bank. I/O assignment analysis treats bidirectional signals controlled by different output enables as independent output enables.

To assign the **Output Enable Group** option to bidirectional signals to analyze the signals as a single output enable group, follow these steps:

1. To access this assignment in the Pin Planner, right-click the **All pins** list and click **Customize Columns**.
2. Under **Available columns**, add **Output Enable Group** to **Show these columns in this order**. The column appears in the **All Pins** list.
3. Enter the same integer value for the **Output Enable Group** assignment for all sets of signals that are driving in the same direction.

3.4.3. Understanding I/O Analysis Reports

The detailed I/O assignment analysis reports include the affected pin name and a problem description. The Fitter section of the Compilation report contains information generated during I/O assignment analysis, including the following reports:

- I/O Assignment Warnings—lists warnings generated for each pin
- Resource Section—quantifies use of various pin types and I/O banks
- I/O Rules Section—lists summary, details, and matrix information about the I/O rules tested

The **Status** column indicates whether rules passed, failed, or were not checked. A severity rating indicates the rule’s importance for effective analysis. “Inapplicable” rules do not apply to the target device family.
3.5. Verifying I/O Timing

You must verify board-level signal integrity and I/O timing when assigning I/O pins. High-speed interface operation requires a quality signal and low propagation delay at the far end of the board route. Click Tools ➤ Timing Analyzer to confirm timing after making I/O pin assignments.

For example, if you change the slew rates or drive strengths of some I/O pins with ECOs, you can verify timing without recompiling the design. You must understand I/O timing and what factors affect I/O timing paths in your design. The accuracy of the output load specification of the output and bidirectional pins affects the I/O timing results.

The Quartus Prime software supports three different methods of I/O timing analysis:

Table 36. I/O Timing Analysis Methods

<table>
<thead>
<tr>
<th>I/O Timing Analysis</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced I/O timing analysis</td>
<td>Analyze I/O timing with your board trace model to report accurate, &quot;board-aware&quot; simulation models. Configures a complete board trace model for each I/O standard or pin. Timing Analyzer applies simulation results of the I/O buffer, package, and board trace model to generate accurate I/O delays and system level signal information. Use this information to improve timing and signal integrity.</td>
</tr>
<tr>
<td>I/O timing analysis</td>
<td>Analyze I/O timing with default or specified capacitive load without signal integrity analysis. Timing Analyzer reports tCO to an I/O pin using a default or user-specified value for a capacitive load.</td>
</tr>
<tr>
<td>Full board routing simulation</td>
<td>Use Intel-provided or Quartus Prime software-generated IBIS or HSPICE I/O models for simulation in Mentor Graphics* HyperLynx* and Synopsys HSPICE.</td>
</tr>
</tbody>
</table>

For more information about advanced I/O timing support, refer to the appropriate device handbook for your target device. For more information about board-level signal integrity and tips on how to improve signal integrity in your high-speed designs, refer to the Signal Integrity and Power Integrity – Support Center website.
For information about creating IBIS and HSPICE models with the Quartus Prime software and integrating those models into HyperLynx and HSPICE simulations, refer to the *Signal Integrity Analysis with Third Party Tools* chapter.

**Related Information**

Signal Integrity and Power Integrity – Support Center

### 3.5.1. Running Advanced I/O Timing

Advanced I/O timing analysis uses your board trace model and termination network specification to report accurate output buffer-to-pin timing estimates, FPGA pin and board trace signal integrity and delay values. Advanced I/O timing runs automatically for supported devices during compilation.

#### 3.5.1.1. Board Trace Models

The Quartus Prime software provides board trace model templates for various I/O standards.

The following figure shows the template for a **2.5 V** I/O standard. This model consists of near-end and far-end board component parameters.

Near-end board trace modeling includes the elements which are close to the device. Far-end modeling includes the elements which are at the receiver end of the link, closer to the receiving device. Board trace model topology is conceptual and does not necessarily match the actual board trace for every component. For example, near-end model parameters can represent device-end discrete termination and breakout traces. Far-end modeling can represent the bulk of the board trace to discrete external memory components, and the far end termination network. You can analyze the same circuit with near-end modeling of the entire board, including memory component termination, and far-end modeling of the actual memory component.
The following figure shows the template for the **LVDS I/O standard**. The far-end capacitance (Cf) represents the external-device or multiple-device capacitive load. If you have multiple devices on the far-end, you must find the equivalent capacitance at the far-end, taking into account all receiver capacitances. The far-end capacitance can be the sum of all the receiver capacitances.

The Quartus Prime software models of transmission lines do not consider transmission-line resistance (lossless models). You only need to specify distributed inductance (L) and capacitance (C) values on a per-inch basis, which you can obtain from the PCB vendor or manufacturer, the CAD Design tool, or a signal integrity tool, such as the Mentor Graphics HyperLynx software.
3.5.1.2. Defining the Board Trace Model

The board trace model describes a board trace and termination network as a set of capacitive, resistive, and inductive parameters.

Advanced I/O Timing uses the model to simulate the output signal from the output buffer to the far end of the board trace. You can define the capacitive load, any termination components, and trace impedances in the board routing for any output pin or bidirectional pin in output mode. You can configure an overall board trace model for each I/O standard or for specific pins. Define an overall board trace model for each I/O standard in your design. Use that model for all pins that use the I/O standard. You can customize the model for specific pins using the Board Trace Model window in the Pin Planner.

1. Click Assignments ➤ Device ➤ Device and Pin Options.
2. Click Board Trace Model and define board trace model values for each I/O standard.
3. Click I/O Timing and define default I/O timing options at board trace near and far ends.
4. Click Assignments ➤ Pin Planner and assign board trace model values to individual pins.

Example 8. Specifying Board Trace Model

```bash
## setting the near end series resistance model of sel_p output pin to 25 ohms
set_instance_assignment -name BOARD_MODEL_NEAR_SERIES_R 25 -to sel_p
## Setting the far end capacitance model for sel_p output signal to 6 picofarads
set_instance_assignment -name BOARD_MODEL_FAR_C 6P -to sel_p
```
3.5.1.3. Modifying the Board Trace Model

To modify the board trace model, click View ➤ Board Trace Model in the Pin Planner.

You can modify any of the board trace model parameters within a graphical representation of the board trace model.

The Board Trace Model window displays the routing and components for positive and negative signals in a differential signal pair. Only modify the positive signal of the pair, as the setting automatically applies to the negative signal. Use standard unit prefixes such as p, n, and k to represent pico, nano, and kilo, respectively. Use the short or open value to designate a short or open circuit for a parallel component.

3.5.1.4. Specifying Near-End vs Far-End I/O Timing Analysis

You can select a near-end or far-end point for I/O timing analysis. Near-end timing analysis extends to the device pin. You can apply the set_output_delay constraint during near-end analysis to account for the delay across the board.

With far-end I/O timing analysis, the advanced I/O timing analysis extends to the external device input, at the far-end of the board trace. Whether you choose a near-end or far-end timing endpoint, the board trace models are taken into account during timing analysis.

3.5.1.5. Advanced I/O Timing Analysis Reports

The following reports show advanced I/O timing analysis information:

### Table 37. Advanced I/O Timing Reports

<table>
<thead>
<tr>
<th>I/O Timing Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timing Analyzer Report</td>
<td>Reports signal integrity and board delay data.</td>
</tr>
<tr>
<td>Board Trace Model Assignments report</td>
<td>Summarizes the board trace model component settings for each output and bidirectional signal.</td>
</tr>
<tr>
<td>Signal Integrity Metrics report</td>
<td>Contains all the signal integrity metrics calculated during advanced I/O timing analysis based on the board trace model settings for each output or bidirectional pin. Includes measurements at both the FPGA pin and at the far-end load of board delay, steady state voltages, and rise and fall times.</td>
</tr>
</tbody>
</table>

**Note:** By default, the Timing Analyzer generates the Slow-Corner Signal Integrity Metrics report. To generate a Fast-Corner Signal Integrity Metrics report you must change the delay model by clicking Tools ➤ Timing Analyzer.

3.5.2. Adjusting I/O Timing and Power with Capacitive Loading

When calculating $t_{CO}$ and power for output and bidirectional pins, the Timing Analyzer and the Power Analyzer use a bulk capacitive load. You can adjust the value of the capacitive load per I/O standard to obtain more precise $t_{CO}$ and power measurements, reflecting the behavior of the output or bidirectional net on your PCB. The Quartus Prime software ignores capacitive load settings on input pins. You can adjust the capacitive load settings per I/O standard, in picofarads (pF), for your entire design. During compilation, the Compiler measures power and $t_{CO}$ measurements based on your settings. You can also adjust the capacitive load on an individual pin with the Output Pin Load logic option.
3.6. Viewing Routing and Timing Delays

Right-click any node and click **Locate > Locate in Chip Planner** to visualize and adjust I/O timing delays and routing between user I/O pads and VCC, GND, and VREF pads. The Chip Planner graphically displays logic placement, Logic Lock regions, relative resource usage, detailed routing information, fan-in and fan-out, register paths, and high-speed transceiver channels. You can view physical timing estimates, routing congestion, and clock regions. Use the Chip Planner to change connections between resources and make post-compilation changes to logic cell and I/O atom placement. When you select items in the Pin Planner, the corresponding item is highlighted in Chip Planner.

3.7. Scripting API

The Quartus Prime software allows you to access I/O management functions through Tcl commands, rather than with the GUI. For detailed information about scripting command options and Tcl API packages, type the following at a system command prompt to view the Tcl API Help browser:

```
quartus_sh --qhelp
```

**Related Information**

3.7.1. Generate Mapped Netlist

Enter the following in the Tcl console or in a Tcl script:

```
execute_module -tool map
```

The `execute_module` command is in the `flow` package.

Type the following at a system command prompt:

```
quartus_syn <project name>
```

3.7.2. Reserve Pins

Use the following Tcl command to reserve a pin:

```
set_instance_assignment -name RESERVE_PIN <value> -to <signal name>
```

Use one of the following valid reserved pin values:

- "AS BIDIRECTIONAL"
- "AS INPUT TRI STATED"
- "AS OUTPUT DRIVING AN UNSPECIFIED SIGNAL"
- "AS OUTPUT DRIVING GROUND"
- "AS SIGNALPROBE OUTPUT"

**Note:** You must include the quotation marks when specifying the reserved pin value.
3.7.3. Set Location

Use the following Tcl command to assign a signal to a pin or device location:

```
set_location_assignment <location> -to <signal name>
```

Valid locations are pin locations, I/O bank locations, or edge locations. Pin locations include pin names, such as PIN_A3. I/O bank locations include IOBANK_1 up to IOBANK_n, where n is the number of I/O banks in the device.

Use one of the following valid edge location values:

- EDGE_BOTTOM
- EDGE_LEFT
- EDGE_TOP
- EDGE_RIGHT

3.7.4. Exclusive I/O Group

The following Tcl command creates an exclusive I/O group assignment:

```
set_instance_assignment -name "EXCLUSIVE_IO_GROUP" -to pin
```

3.7.5. Slew Rate and Current Strength

Use the following Tcl commands to create a slew rate and drive strength assignments:

```
set_instance_assignment -name CURRENT_STRENGTH_NEW 8MA -to e[0]
set_instance_assignment -name SLEW_RATE 2 -to e[0]
```

3.8. Managing Device I/O Pins Revision History

The following table shows the revision history for this chapter:

<table>
<thead>
<tr>
<th>Document Version</th>
<th>Quartus Prime Version</th>
<th>Changes</th>
</tr>
</thead>
</table>
| 2024.04.01       | 24.1                  | • Applied initial Altera rebranding throughout.  
|                  |                       | • Updated Pin Planner screenshot in Importing and Exporting I/O Pin Assignments topic for current list of file formats supported. |
|                  |                       | • Updated Pin Planner screenshot in Managing Device I/O Pins topic for removal of VREF Groups and Edges highlight feature. |
| 2023.10.02       | 23.3                  | • Added Assigning I/O Banks topic to describe color coding and saving changes.  
|                  |                       | • Added Changing Pin Planner Highlight Colors topic to describe changing report highlight coloring.  
|                  |                       | • Added Showing I/O Lanes topic to describe new Show I/O 12 Lanes report. |
| 2022.04.27       | 22.1                  | Made a minor fix. |

A. Quartus Prime Pro Edition User Guides

Refer to the following user guides for comprehensive information on all phases of the Quartus Prime Pro Edition FPGA design flow.

Related Information

- **Quartus Prime Pro Edition User Guide: Getting Started**
  Introduces the basic features, files, and design flow of the Quartus Prime Pro Edition software, including managing Quartus Prime Pro Edition projects and IP, initial design planning considerations, and project migration from previous software versions.

  Describes creating and optimizing systems using Platform Designer, a system integration tool that simplifies integrating customized IP cores in your project. Platform Designer automatically generates interconnect logic to connect intellectual property (IP) functions and subsystems.

  Describes best design practices for designing FPGAs with the Quartus Prime Pro Edition software. HDL coding styles and synchronous design practices can significantly impact design performance. Following recommended HDL coding styles ensures that Quartus Prime Pro Edition synthesis optimally implements your design in hardware.

- **Quartus Prime Pro Edition User Guide: Design Compilation**
  Describes set up, running, and optimization for all stages of the Quartus Prime Pro Edition Compiler. The Compiler synthesizes, places, and routes your design before generating a device programming file.

  Describes Quartus Prime Pro Edition settings, tools, and techniques that you can use to achieve the highest design performance in Intel FPGAs. Techniques include optimizing the design netlist, addressing critical chains that limit retiming and timing closure, optimizing device resource usage, device floorplanning, and implementing engineering change orders (ECOs).

  Describes operation of the Quartus Prime Pro Edition Programmer, which allows you to configure Intel FPGA devices, and program CPLD and configuration devices, via connection with an Intel FPGA download cable.

- **Quartus Prime Pro Edition User Guide: Block-Based Design**
  Describes block-based design flows, also known as modular or hierarchical design flows. These advanced flows enable preservation of design blocks (or logic that comprises a hierarchical design instance) within a project, and reuse of design blocks in other projects.
• **Quartus Prime Pro Edition User Guide: Partial Reconfiguration**
  Describes Partial Reconfiguration, an advanced design flow that allows you to reconfigure a portion of the FPGA dynamically, while the remaining FPGA design continues to function. Define multiple personas for a particular design region, without impacting operation in other areas.

• **Quartus Prime Pro Edition User Guide: Third-party Simulation**
  Describes RTL- and gate-level design simulation support for third-party simulation tools by Aldec*, Cadence*, Siemens EDA, and Synopsys that allow you to verify design behavior before device programming. Includes simulator support, simulation flows, and simulating Intel FPGA IP.

• **Quartus Prime Pro Edition User Guide: Third-party Synthesis**
  Describes support for optional synthesis of your design in third-party synthesis tools by Siemens EDA, and Synopsys. Includes design flow steps, generated file descriptions, and synthesis guidelines.

• **Quartus Prime Pro Edition User Guide: Third-party Logic Equivalence Checking Tools**
  Describes support for optional logic equivalence checking (LEC) of your design in third-party LEC tools by OneSpin*.

• **Quartus Prime Pro Edition User Guide: Debug Tools**
  Describes a portfolio of Quartus Prime Pro Edition in-system design debugging tools for real-time verification of your design. These tools provide visibility by routing (or "tapping") signals in your design to debugging logic. These tools include System Console, Signal Tap logic analyzer, system debugging toolkits, In-System Memory Content Editor, and In-System Sources and Probes Editor.

• **Quartus Prime Pro Edition User Guide: Timing Analyzer**
  Explains basic static timing analysis principals and use of the Quartus Prime Pro Edition Timing Analyzer, a powerful ASIC-style timing analysis tool that validates the timing performance of all logic in your design using an industry-standard constraint, analysis, and reporting methodology.

• **Quartus Prime Pro Edition User Guide: Power Analysis and Optimization**
  Describes the Quartus Prime Pro Edition Power Analysis tools that allow accurate estimation of device power consumption. Estimate the power consumption of a device to develop power budgets and design power supplies, voltage regulators, heat sink, and cooling systems.

• **Quartus Prime Pro Edition User Guide: Design Constraints**
  Describes timing and logic constraints that influence how the Compiler implements your design, such as pin assignments, device options, logic options, and timing constraints. Use the Interface Planner to prototype interface implementations, plan clocks, and quickly define a legal device floorplan. Use the Pin Planner to visualize, modify, and validate all I/O assignments in a graphical representation of the target device.

• **Quartus Prime Pro Edition User Guide: PCB Design Tools**
  Describes support for optional third-party PCB design tools by Siemens EDA and Cadence*. Also includes information about signal integrity analysis and simulations with HSPICE and IBIS Models.

• **Quartus Prime Pro Edition User Guide: Scripting**
  Describes use of Tcl and command line scripts to control the Quartus Prime Pro Edition software and to perform a wide range of functions, such as managing projects, specifying constraints, running compilation or timing analysis, or generating reports.

1. Signal Integrity Analysis with Third-Party Tools

1.1. Signal Integrity Analysis with Third-Party Tools

With the ever-increasing operating speed of interfaces in traditional FPGA design, the timing and signal integrity margins between the FPGA and other devices on the board must be within specification and tolerance before building a PCB.

If the board trace design is poor, or the route is too heavily loaded, noise in the signal can cause data corruption, while overshoot and undershoot can potentially damage input buffers over time.

As FPGA devices are used in high-speed applications, signal integrity and timing margin between the FPGA and other devices on the PCB are important for proper system operation. To avoid time-consuming and costly board respins, you must simulate the topology and routing of critical signals. You must accurately model the high-speed interfaces available on FPGA devices.

The Quartus® Prime software provides methodologies, resources, and tools to ensure good signal integrity and timing margin between Intel® FPGA devices and other components on the board. Three types of analysis are possible with the Quartus Prime software:

- I/O timing with a default or user-specified capacitive load and no signal integrity analysis (default)
- Full board routing simulation in third-party tools using Intel-provided or generated Input/Output Buffer Information Specification (IBIS) or HSPICE I/O models

I/O timing using a specified capacitive test load requires no special configuration other than setting the size of the load. The Quartus Prime Timing Analyzer generates I/O timing reports based only on point-to-point delays within the I/O buffer. The Timing Analyzer assumes the presence of the capacitive test load without specifying any other details about the board. The default size of the load derives from the I/O standard that you select for the pin. Timing analysis measures to the FPGA pin without signal integrity analysis details.

The signal integrity information in this chapter refers to board-level signal integrity based on I/O buffer configuration and board parameters, not simultaneous switching noise (SSN).\(^1\) SSN is a product of multiple output drivers switching at the same time, causing an overall drop in the voltage of the chip's power supply. This condition can cause temporary glitches in the specified level of ground or V\(_{CC}\) for the device.

\(^1\) Also known as ground bounce or V\(_{CC}\) sag.
This chapter provides FPGA and board designers with the concepts and steps necessary to perform signal integrity simulation and adjust designs to improve board-level timing and signal integrity. This chapter also includes information about how to obtain and customize simulation models, and how to use those models in simulation software.

### 1.1.1. What's New In This Version

- The current version of the Quartus Prime Pro Edition software supports generation of custom IBIS models for Agilex™ FPGA portfolio devices using the EDA Netlist Writer GUI, as [Generate Custom IBIS Models with the EDA Netlist Writer GUI](#) describes.
- The current version of the Quartus Prime Pro Edition software no longer includes the Enable Advanced I/O Timing option, as reflected throughout this document.

### 1.1.2. Signal Integrity Simulations with HSPICE and IBIS Models

The Quartus Prime software can export accurate HSPICE models with the built-in HSPICE Writer. You can run signal integrity simulations with these complete HSPICE models in Synopsys* HSPICE. You can also easily create and customize IBIS models of the FPGA I/O buffers in the Quartus Prime software.

You can run signal integrity simulations with these complete HSPICE models in Synopsys HSPICE.

You can integrate IBIS models into any third-party simulation tool that supports IBIS models. With the ability to create industry-standard model definition files quickly, you can build accurate simulations that can provide data to help improve board-level signal integrity.

Creating and running accurate simulations can be difficult and time consuming. The Quartus Prime software tools automate the I/O model setup and creation process by generating custom models for your design. These tools allow you to set up and run accurate simulations that guide FPGA and board design.

For a more information about SSN and ways to prevent it, refer to AN 315: Guidelines for Designing High-Speed FPGA PCBs.

For information about basic signal integrity concepts and signal integrity details pertaining to Intel FPGA devices, visit the Intel Signal & Power Integrity Center.

### Related Information

- Intel Signal & Power Integrity Center

### 1.2. I/O Model Selection: IBIS or HSPICE

The Quartus Prime software can export two different types of I/O models that are useful for different simulation situations, IBIS models and HSPICE models.

IBIS models define the behavior of input or output buffers through voltage-current (V-I) and voltage-time (V-t) data tables. HSPICE models, or decks, include complete physical descriptions of the transistors and parasitic capacitances that make up an I/O buffer along with all the parameter settings that you require to run a simulation.
The Quartus Prime software generates HSPICE decks, and adds preconfigured I/O standard, voltage, and pin loading settings for each pin in your design.

The choice of I/O model type is based on many factors.

Table 1. IBIS and HSPICE Model Comparison

<table>
<thead>
<tr>
<th>Feature</th>
<th>IBIS Model</th>
<th>HSPICE Model</th>
</tr>
</thead>
<tbody>
<tr>
<td>I/O Buffer Description</td>
<td>Behavioral—I/O buffers are described by voltage-current and voltage-time tables in typical, minimum, and maximum supply voltage cases.</td>
<td>Physical—I/O buffers and all components in a circuit are described by their physical properties, such as transistor characteristics and parasitic capacitances, as well as their connections to one another.</td>
</tr>
<tr>
<td>Model Customization</td>
<td>Simple and limited—The model completely describes the I/O buffer and does not usually have to be customized.</td>
<td>Fully customizable—Unless connected to an arbitrary board description, the description of the board trace model must be customized in the model file. All parameters of the simulation are also adjustable.</td>
</tr>
<tr>
<td>Simulation Set Up and Run Time</td>
<td>Fast—Simulations run quickly after set up correctly.</td>
<td>Slow—Simulations take time to set up and take longer to run and complete.</td>
</tr>
<tr>
<td>Simulation Accuracy</td>
<td>Good—For most simulations, accuracy is sufficient to make useful adjustments to the FPGA or board design to improve signal integrity.</td>
<td>Excellent—Simulations are highly accurate, making HSPICE simulation almost a requirement for any high-speed design where signal integrity and timing margins are tight.</td>
</tr>
<tr>
<td>Third-Party Tool Support</td>
<td>Excellent—Almost all third-party board simulation tools support IBIS.</td>
<td>Good—Most third-party tools that support SPICE support HSPICE. However, Synopsys HSPICE is required for simulations of Intel's encrypted HSPICE models.</td>
</tr>
</tbody>
</table>

1.3. FPGA to Board Signal Integrity Analysis Flow

Board signal integrity analysis can take place at any point in the FPGA design process and is often performed before and after board layout. If it is performed early in the process as part of a pre-PCB layout analysis, the models used for simulations can be more generic.

These models can be changed as much as required to see how adjustments improve timing or signal integrity and help with the design and routing of the PCB. Simulations and the resulting changes made at this stage allow you to analyze "what if" scenarios to plan and implement your design better. To assist with early board signal integrity analysis, you can download generic IBIS model files for each device family and obtain HSPICE buffer simulation kits from the "Board Level Tools" section of the EDA Tool Support Resource Center.

Typically, if board signal integrity analysis is performed late in the design, it is used for a post-layout verification. The inputs and outputs of the FPGA are defined, and required board routing topologies and constraints are known. Simulations can help you find problems that might still exist in the FPGA or board design before fabrication and assembly. In either case, a simple process flow illustrates how to create accurate IBIS and HSPICE models from a design in the Quartus Prime software and transfer them to third-party simulation tools.

Your design depends on the type of model, IBIS or HSPICE, that you use for your simulations. When you understand the steps in the analysis flow, refer to the section of this chapter that corresponds to the model type you are using.
1. Signal Integrity Analysis with Third-Party Tools

1.3.1. Create I/O and Board Trace Model Assignments

You can configure a board trace model for output signals or for bidirectional signals in output mode. You can then automatically transfer its description to HSPICE decks generated by the HSPICE Writer. This helps improve simulation accuracy.
To configure a board trace model, specify the board trace model assignment settings for each I/O standard used in your design. You can add series or parallel termination, specify the transmission line length, and set the value of the far-end capacitive load. You can configure these parameters in the Board Trace Model view of the Pin Planner (Assignments ➤ Pin Planner).

The Quartus Prime software can generate IBIS models and HSPICE decks without having to configure a board trace model. Generated IBIS models ignore any board trace model settings other than the far-end capacitive load. If any load value is set other than the default, the delay given by IBIS models generated by the IBIS Writer cannot be used to account correctly for the double counting problem.

The load value mismatch between the IBIS delay and the $t_{CO}$ measurement of the Quartus Prime software prevents the delays from being safely added together. Warning messages displayed when the EDA Netlist Writer runs indicate when this mismatch occurs.

### 1.3.2. Customize the Output Files

You can readily customize the files that the IBIS Writer and HSPICE Writer generate. You must customize any generic IBIS files with the correct RLC values for your specific device package before running signal integrity simulations.

If you generate IBIS files with the EDA Netlist Writer or IBIS Writer script, the IBIS Writer automatically customizes the files with the RLC values for the current target device. For details, refer to Simulation with IBIS Models.

You can make additions or adjustments to the default simulation in the generated files to change the parameters of the default simulation or to perform additional measurements. For details, refer to Simulation with HSPICE Models.

### 1.3.3. Set Up and Run Simulations in Third-Party Tools

When you have generated the files, you can use them to perform simulations in your selected simulation tool.

With IBIS models, you can apply them to input, output, or bidirectional buffer entities and quickly set up and run simulations. For HSPICE decks, the simulation parameters are included in the files. Open the files in Synopsys HSPICE and run simulations for each pin as required.

With HSPICE decks generated from the HSPICE Writer, the double counting problem is accounted for, which ensures that your simulations are accurate.

Simulations that involve IBIS models created with anything other than the default loading settings in the Quartus Prime software must take into account the change in the size of the load between the IBIS delay and the Quartus Prime $t_{CO}$ measurement. Warning messages during compilation alert you to this change.

### 1.3.4. Interpret Simulation Results

If you encounter timing or signal integrity issues with your high-speed signals after running simulations, you can make adjustments to I/O assignment settings in the Quartus Prime software.
You can adjust drive strength or I/O standard, or make changes to the board routing or topology. After regenerating models in the Quartus Prime software based on the changes you have made, rerun the simulations to check whether your changes corrected the problem.

1.4. Simulation with IBIS Models

IBIS models provide a way to run accurate signal integrity simulations quickly. IBIS models describe the behavior of I/O buffers with voltage-current and voltage-time data curves.

Because of their behavioral nature, IBIS models do not have to include any information about the internal circuit design of the I/O buffer. Intel provides free IBIS models for use with Intel FPGA designs in signal integrity analysis simulation tools. You can obtain and customize these models for signal integrity design simulation.

1.4.1. IBIS Model Access and Customization Flows

There are different methods of accessing and customizing the IBIS models, depending on your target device family.

|   design as part of a pre-layout analysis: IBIS Models for Intel FPGA Devices. The downloaded models have the RLC package values set to one particular device in each device family.  
   Or  
   • Use the Quartus Prime EDA Netlist Writer GUI to generate custom IBIS models that accurately reflect your device and assignments. | | |
| **Customizing IBIS Models**              |                     |                   |                        |                               |
| • For more accurate IBIS module simulation, you must first customize any generic IBIS files that you download from the Intel website with the correct RLC values for the specific device package you have selected for your design.  
   Or  
   • Generate custom IBIS files that with Quartus Prime EDA Netlist Writer. IBIS files that you generate with the EDA Netlist Writer automatically include the RLC values for your current target device.  
   Note: The ibis_writer.py script does not support generation of IBIS model files for Stratix 10 devices, Arria 10 devices, or Cyclone 10 GX devices. | | | | • For more accurate IBIS module simulation, you must first customize the installed or downloaded IBIS model files with the correct RLC values for the specific target device package using the IBIS Writer script in /quartus/common/misc/ibis_writer/. The README.txt file in this directory provides complete instructions for using the script.  
   • Alternatively, you can generate custom IBIS files by using the Quartus Prime software EDA Netlist Writer GUI. IBIS files that you generate with the EDA Netlist Writer automatically include the RLC values for your current target device. |

Related Information

Generate Custom IBIS Models with the EDA Netlist Writer GUI on page 11
1.4.2. Elements of an IBIS Model

An IBIS model file (.ibs) is a text file that describes the behavior of an I/O buffer across minimum, typical, and maximum temperature and voltage ranges with a specified test load.

The tables and values specified in the IBIS file describe five basic elements of the I/O buffer.

The following elements correspond to each numbered block.

1. **Pulldown**—A voltage-current table describes the current when the buffer is driven low based on a pull-down voltage range of $-V_{CC}$ to $2V_{CC}$.

2. **Pullup**—A voltage-current table describes the current when the buffer is driven high based on a pull-up voltage range of $-V_{CC}$ to $V_{CC}$.

3. **Ground and Power Clamps**—Voltage-current tables describe the current when clamping diodes for electrostatic discharge (ESD) are present. The ground clamp voltage range is $-V_{CC}$ to $V_{CC}$, and the power clamp voltage range is $-V_{CC}$ to ground.

4. **Ramp and Rising/Falling Waveform**—A voltage-time (dv/dt) ratio describes the rise and fall time of the buffer during a logic transition. Optional rising and falling waveform tables can be added to more accurately describe the characteristics of the rising and falling transitions.

5. **Total Output Capacitance and Package RLC**—The total output capacitance includes the parasitic capacitances of the output pad, clamp diodes (if present), and input transistors. The package RLC is device package-specific and defines the resistance, inductance, and capacitance of the bond wire and pin of the I/O.

Figure 2. Five Basic Elements of an I/O Buffer in IBIS Models

[Diagram showing the five basic elements of an I/O buffer in IBIS Models]

**Related Information**

AN 283: Simulating Intel Devices with IBIS Models

For more information about IBIS models and Intel-specific features, including links to the official IBIS specification.
1.4.3. Customizing IBIS Models

There are different options for obtaining and customizing Intel FPGA IBIS models, depending on your target device family, as IBIS Model Access and Customization Flows describes. The following topics describe these different options for obtaining and customizing Intel FPGA IBIS models.

The IBIS file that the Quartus Prime EDA Netlist Writer GUI generates contains models of both input and output termination, and is supported for IBIS model versions of 4.2 and later.

The Quartus Prime IBIS dynamic OCT IBIS model names end in g50c_r50c. For example: sstl15i_ctnio_g50c_r50c.

In the simulation tool, the IBIS model is attached to a buffer.
- When the buffer is assigned as an output, use the series termination r50c.
- When the buffer is assigned as an input, use the parallel termination g50c.

1.4.3.1. Generate Custom IBIS Models with the EDA Netlist Writer GUI

You can use the Quartus Prime EDA Netlist Writer GUI to generate custom IBIS models.

IBIS files that you generate with the EDA Netlist Writer automatically include the RLC values for your current target device.

Before generating the custom IBIS model, you can specify I/O constraints to define things like drive strength, enabling of clamping diodes for ESD protection, and other settings. The custom IBIS models that EDA Netlist Writer generates then reflect the I/O assignments.

To generate custom IBIS models with the EDA Netlist Writer GUI, follow these steps:
1. To specify the format, version, and output location of the generated model files, click Assignments ➤ Settings ➤ EDA Tool Settings.
2. Under Board Level signal integrity analysis, specify IBIS for the Format, the supported IBIS version that you want, and the location of the Output directory for the generated files.
3. Click Assignments ➤ Device. In the Device dialog box, click the Device and Pin Options button and review and specify any optional IBIS settings, as Board Level Signal Integrity Analysis Settings describes.
4. To run the EDA Netlist Writer to generate the custom IBIS model files, click Processing ➤ Start ➤ Start EDA Netlist Writer.

1.4.3.1.1. Board Level Signal Integrity Analysis Settings

The following settings are available for generation of custom IBIS models using the EDA Netlist Writer GUI:

**Table 3. Board Level Signal Integrity Analysis Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Format</strong></td>
<td>Specifies IBIS as the format for output generation of custom IBIS models for board level signal integrity analysis in supported third-party tools.</td>
</tr>
<tr>
<td><strong>IBIS version</strong></td>
<td>Specifies the IBIS version 5.0 or 4.2 for the custom IBIS model you generate. Only version 5.0 is available for Agilex FPGA portfolio devices.</td>
</tr>
<tr>
<td><strong>Output directory</strong></td>
<td>Specifies the directory path for custom IBIS model generation. By default, the path is <code>&lt;project&gt;/board/ibis</code>.</td>
</tr>
<tr>
<td><strong>Enable model selector</strong></td>
<td>Enables the model selector feature that lists all the possible models for each I/O cell in the design. This setting is turned off by default.</td>
</tr>
<tr>
<td><strong>Enable extended model selector</strong></td>
<td>Enables the extended model selector feature. This setting is an extension of the <strong>Enable model selector</strong> setting. The extension lists additional models for I/O standards with Class I and II. This setting is turned off by default.</td>
</tr>
<tr>
<td><strong>Enable per pin RLC package model with mutual coupling</strong></td>
<td>Allows you to generate the per pin RLC package model with mutual coupling. The lumped RLC package model information appears in the IBIS output file. This setting is turned off by default except for Agilex FPGA portfolio devices.</td>
</tr>
<tr>
<td><strong>Enable IBIS-AMI (GPIO Only)</strong></td>
<td>Enables generation of IBIS-AMI models that you can use to model high-speed serial and parallel links that include transmitter and receiver equalization algorithms. This setting is available for only Agilex 5 devices and Agilex 7 M-Series devices. This setting is turned off by default for all applicable devices.</td>
</tr>
</tbody>
</table>

1.4.3.2. Customizing Downloaded or Installed IBIS Model Files for Agilex FPGA Portfolio Devices

The current Quartus Prime Pro Edition software installation includes the Intel FPGA IBIS models and IBIS writer script for Agilex FPGA portfolio devices in `/quartus/common/misc/ibis_writer/`. In addition, you can download the latest models (without the script) from: IBIS Models for Intel FPGA Devices.

The downloaded or installed IBIS models have the RLC package values set to only one particular device in each device family. These generic models describe the full set of models listed for and supported by each device family at: IBIS Models for Intel FPGA Devices.

Alternatively, you can generate custom IBIS models for Agilex FPGA portfolio devices by using the Quartus Prime EDA Netlist Writer GUI, as Generate Custom IBIS Models with the EDA Netlist Writer GUI describes.

To simulate your design with the most accurate model, you must customize the `.ibs` files to adjust the RLC values for accurate device package data using the IBIS Writer script. Use the script to customize the IBIS model file to match the values for your particular device package.

To use the IBIS Writer script, refer to the step by step instructions in the `/quartus/common/misc/ibis_writer/README.txt` file.
1.4.3.3. Customizing Downloaded IBIS Models for Stratix 10 Devices, Arria 10 Devices, and Cyclone 10 GX Devices

You can download the IBIS models for Stratix 10 devices, Arria 10 devices, and Cyclone 10 GX devices from the Intel website. You can use these IBIS models directly to perform early simulations of the I/O buffers that you expect to use in your design as part of a pre-layout analysis.

These downloaded IBIS models have the RLC package values set to only one particular device in each device family. These generic models describe only a certain set of models listed for each device at: IBIS Models for Intel FPGA Devices.

To simulate your design with the most accurate model, you must customize the .ibs files to adjust the RLC values for accurate device package data. Customize the IBIS model file to match the values for your particular device package by performing the following steps:

1. Download and expand the ZIP file (.zip) of the IBIS model for the device family you are using for your design. The .zip file contains the .ibs file along with an IBIS model user guide and a model data correlation report.
2. Download the Package RLC Values spreadsheet for the same device family.
3. Open the spreadsheet and locate the row that describes the device package used in your design.
4. From the package’s I/O row, copy the minimum, maximum, and typical values of resistance, inductance, and capacitance for your device package.
5. Open the .ibs file in a text editor and locate the [Package] section of the file.
6. Overwrite the listed values copied with the values from the spreadsheet and save the file.

1.4.4. Design Simulation Using the Siemens EDA HyperLynx* Software

You must integrate IBIS models into board design simulations to accurately model timing and signal integrity.

The Siemens EDA HyperLynx* software is an industry standard tool for PCB analysis and simulation of high-speed designs. The HyperLynx software makes it easy to integrate IBIS models into simulations.

The HyperLynx software consists of the LineSim and BoardSim products. LineSim is an early simulation tool. Before any board routing takes place, you can use LineSim to simulate “what if” scenarios that assist in creating routing rules and defining board parameters.

BoardSim is a post-layout tool that you can use to analyze existing board routing. You select one or more nets from a board layout file and BoardSim simulates those nets in a manner similar to LineSim. With board and routing parameters, and surrounding signal routing known, highly accurate simulations of the final fabricated PCB are possible.
This document section focuses on LineSim. Because the process of creating and running simulations is very similar for both LineSim and BoardSim, the details of IBIS model use in LineSim also apply to simulations in BoardSim.

You configure simulations in LineSim using a schematic GUI to create connections and topologies between I/O buffers, route trace segments, and termination components. LineSim provides two methods for creating routing schematics: cell-based and free-form. Cell-based schematics are based on fixed cells consisting of typical placements of buffers, trace impedances, and components. Parts of the grid-based cells are filled with the desired objects to create the topology. A topology in a cell-based schematic is limited by the available connections within and between the cells.

A more robust and expandable way to create a circuit schematic for simulation is to use the free-form schematic format in LineSim. The free-form schematic format makes it easy to place parts into any configuration and edit them as required. This section describes the use of IBIS models with free-form schematics, but the process is nearly identical for cell-based schematics.

Figure 4. HyperLynx LineSim Free-Form Schematic Editor
When you use HyperLynx software to perform simulations, you typically perform the following steps:

1. Create a new LineSim free-form schematic document and set up the board stackup for your PCB using the Stackup Editor. In this editor, specify board layer properties including layer thickness, dielectric constant, and trace width.

2. Create a circuit schematic for the net you want to simulate. The schematic represents all the parts of the routed net including source and destination I/O buffers, termination components, transmission line segments, and representations of impedance discontinuities such as vias or connectors.

3. Assign IBIS models to the source and destination I/O buffers to represent their behavior during operation.

4. Attach probes from the digital oscilloscope that is built in to LineSim to points in the circuit that you want to monitor during simulation. Typically, at least one probe is attached to the pin of a destination I/O buffer. For differential signals, you can attach a differential probe to both the positive and negative pins at the destination.

5. Configure and run the simulation. You can simulate a rising or falling edge and test the circuit under different drive strength conditions.

6. Interpret the results and make adjustments. Based on the waveforms captured in the digital oscilloscope, you can adjust anything in the circuit schematic to correct any signal integrity issues, such as overshoot or ringing. If necessary, you can make I/O assignment changes in the Quartus Prime software, regenerate the IBIS file with the IBIS Writer, and apply the updated IBIS model to the buffers in your HyperLynx software schematic.

7. Repeat the simulations and circuit adjustments until you are satisfied with the results.

8. When the operation of the net meets your design requirements, implement changes to your I/O assignments in the Quartus Prime software and optionally adjust your board routing constraints, component values, and placement to match the simulation.

For more information about HyperLynx software, including schematic creation, simulation setup, model usage, product support, licensing, and training, refer to the Siemens EDA webpage.

**Related Information**

eda.sw.siemens.com

### 1.4.5. Configuring LineSim to Use Intel IBIS Models

You must configure LineSim to find and use the IBIS models for your design. To do this, add the location of your .ibs file or files to the LineSim Model Library search path. Next, you apply a selected model to a buffer in your schematic.

To add the Quartus Prime software's default IBIS model location, `<project directory>/board/ibis`, to the HyperLynx LineSim model library search path, perform the following steps in LineSim:

1. From the Options menu, click **Directories**. The **Set Directories** dialog box appears. The **Model-library file path(s)** list displays the order in which LineSim searches file directories for model files.
2. Click **Edit**. A dialog box appears where you can add directories and adjust the order in which LineSim searches them.

3. Click **Add**

4. Browse to the default IBIS model location, `<project directory>/board/ibis`. Click **OK**.

5. Click **Up** to move the IBIS model directory to the top of the list. Click **Generate Model Index** to update LineSim’s model database with the models found in the added directory.

6. Click **OK**. The IBIS model directory for your project is added to the top of the Model-library file path(s) list.

7. To close the **Set Directories** dialog box, click **OK**.
1.4.6. Integrating Intel IBIS Models into LineSim Simulations

When the location for IBIS files has been set, you can assign the downloaded or generated IBIS models to the buffers in your schematic. To do this, perform the following steps:

1. Double-click a buffer symbol in your schematic to open the Assign Models dialog box. You can also click Assign Models from the buffer symbol’s right-click menu.

   ![LineSim Assign Model Dialog Box](image)

2. The pin of the buffer symbol you selected should be highlighted in the Pins list. If you want to assign a model to a different symbol or pin, select it from the list.

3. Click Select. The Select IC Model dialog box appears.
4. To filter the list of available libraries to display only IBIS models, select .IBS. Scroll through the Libraries list, and click the name of the library for your design. By default, this is `<project name>` .ibs.

5. The device for your design should be selected as the only item in the Devices list. If not, select your device from the list.

6. From the Signal list, select the name of the signal you want to simulate. You can also choose to select by device pin number.

7. Click OK. The Assign Models dialog box displays the selected .ibs file and signal.

8. If applicable to the signal you chose, adjust the buffer settings as required for the simulation.

9. Select and configure other buffer pins from the Pins list in the same manner.

10. Click OK when all I/O models are assigned.

**1.4.7. Running and Interpreting LineSim Simulations**

You can run any simulation and make adjustments to the I/O assignments or simulation parameters as required.

For example, if you see too much overshoot in the simulated signal at the destination buffer after running a simulation, you can adjust the drive strength I/O assignment setting to a lower value. Regenerate the .ibs file, and run the simulation again to verify whether the change fixes the problem.
If you see a discontinuity or other anomalies at the destination, such as slow rise and fall times, adjust the termination scheme or termination component values. After making these changes, rerun the simulation to check whether your adjustments solved the problem. In this case, it is not necessary to regenerate the .ibs file.

For more information about board-level signal integrity, and to learn about ways to improve it with simple changes to your design, visit the Intel FPGA Signal & Power Integrity Support Center.

**Related Information**

Intel Signal & Power Integrity Center
1.5. Simulation with HSPICE Models

HSPICE decks are used to perform highly accurate simulations by describing the physical properties of all aspects of a circuit precisely. HSPICE decks describe I/O buffers, board components, and all the connections between them, as well as defining the parameters of the simulation to be run.

By their nature, HSPICE decks are highly customizable and require a detailed description of the circuit under simulation. The HSPICE decks generated by the Quartus Prime HSPICE Writer automatically include board components and topology defined in the Board Trace Model. Configure the board components and topology in the Pin Planner or in the Board Trace Model tab of the Device and Pin Options dialog box. All HSPICE decks generated by the Quartus Prime software include compensation for the double count problem. You can simulate with the default simulation parameters built in to the generated HSPICE decks or make adjustments to customize your simulation.

Related Information
The Double Counting Problem in HSPICE Simulations on page 22

1.5.1. Supported Devices and Signaling

The HSPICE Writer in the Quartus Prime software supports Arria, Cyclone, and Stratix devices for the creation of a board trace model in the Quartus Prime software for automatic inclusion in an HSPICE deck.

The HSPICE files include the board trace description you create in the Board Trace Model view in the Pin Planner or the Board Trace Model tab in the Device and Pin Options dialog box.

Note: Note that for Arria 10 devices, you may need to download the Encrypted HSPICE model from the Intel website.

Related Information

  For information about how to use the Enable Advanced I/O Timing option and configure board trace models for the I/O standards used in your design.
  • SPICE Models for Intel FPGAs
    For more information about the Encrypted HSPICE model.

1.5.2. Accessing HSPICE Simulation Kits

You can access the available HSPICE models with the Quartus Prime software’s HSPICE Writer tool and also at the Spice Models for Intel Devices web page.

The Quartus Prime software HSPICE Writer tool removes many common sources of user error from the I/O simulation process. The HSPICE Writer tool automatically creates preconfigured I/O simulation spice decks that only require the addition of a user board model. All the difficult tasks required to configure the I/O modes and interpret the timing results are handled automatically by the HSPICE Writer tool.

Related Information
SPICE Models for Intel FPGAs
  For more information about the Encrypted HSPICE model.
1.5.3. The Double Counting Problem in HSPICE Simulations

Simulating I/Os using accurate models is extremely helpful for finding and fixing FPGA I/O timing and board signal integrity issues before any boards are built. However, the usefulness of such simulations is directly related to the accuracy of the models used and whether the simulations are set up and performed correctly.

To ensure accuracy in models and simulations created for FPGA output signals you must consider the timing hand-off between $t_{CO}$ timing in the Quartus Prime software and simulation-based board delay. If this hand-off is not handled correctly, the calculated delay could either count some of the delay twice or even miss counting some of the delay entirely.

1.5.3.1. Defining the Double Counting Problem

The double counting problem is inherent to the difference between the method to analyze output timing in the Quartus Prime software versus the method HSPICE models use. The timing analyzer tools in the Quartus Prime software measure delay timing for an output signal from the core logic of the FPGA design through the output buffer, ending at the FPGA pin with a default capacitive load or a specified value for the I/O standard you selected. This measurement is the $t_{CO}$ timing variable.

HSPICE models for board simulation measure $t_{PD}$ (propagation delay) from an arbitrary reference point in the output buffer, through the device pin, out along the board routing, and ending at the signal destination. If you add these two delays, the delay between the output buffer and the device pin appears twice in the calculation. A model or simulation that does not account for this double count creates overly pessimistic simulation results, because the double-counted delay can limit I/O performance artificially.

One approach to fix the problem is subtracting the overlap between $t_{CO}$ and $t_{PD}$ to account for the double count. However, this adjustment is not accurate, because each measurement considers a different load.
Note: Input signals do not exhibit this problem, because the HSPICE models for inputs stop at the FPGA pin instead of at the input buffer. In this case, adding the delays together produces an accurate measurement of delay timing.

1.5.3.2. The Solution to Double Counting

To adjust the measurements to account for the double-counting, the delay between the arbitrary point in the output buffer selected by the HSPICE model and the FPGA pin must be subtracted from either $t_{CO}$ or $t_{PD}$ before adding the results together. The subtracted delay must also be based on a common load between the two measurements. This is done by repeating the HSPICE model measurement, but with the same load used by the Quartus Prime software for the $t_{CO}$ measurement.

Figure 12. Common Test Loads Used for Output Timing

With $t_{TESTLOAD}$ known, the total delay is calculated for the output signal from the FPGA logic to the signal destination on the board, accounting for the double count.

$$t_{delay} = t_{CO} + (t_{PD} - t_{TESTLOAD})$$

The preconfigured simulation files generated by the HSPICE Writer in the Quartus Prime software are designed to account for the double-counting problem based on this calculation automatically.
1.5.4. HSPICE Writer Tool Flow

This section includes information to help you get started using the Quartus Prime software HSPICE Writer tool. The information in this section assumes you have a basic knowledge of the standard Quartus Prime software design flow, such as project and assignment creation, compilation, and timing analysis.

1.5.4.1. Applying I/O Assignments

The first step in the HSPICE Writer tool flow is to configure the I/O standards and modes for each of the pins in your design properly. In the Quartus Prime software, these settings are represented by assignments that map I/O settings, such as pin selection, and I/O standard and drive strength, to corresponding signals in your design.

The Quartus Prime software provides multiple methods for creating these assignments:

- Using the Pin Planner
- Using the assignment editor
- Manually editing the .qsf file
- By making assignments in a scripted Quartus Prime flow using Tcl

1.5.4.2. Enabling HSPICE Writer Using Assignments

You can also use HSPICE Writer in conjunction with a scripted Tcl flow. To enable HSPICE Writer during a full compile, include the following lines in your Tcl script.

Enable HSPICE Writer

```
set_global_assignment -name EDA_BOARD_DESIGN_SIGNAL_INTEGRITY_TOOL "HSPICE (Signal Integrity)"
set_global_assignment -name EDA_OUTPUT_DATA_FORMAT HSPICE -section_id eda_board_design_signal_integrity
set_global_assignment -name EDA_NETLIST_WRITER_OUTPUT_DIR <output_directory> -section_id eda_board_design_signal_integrity
```

As with command-line invocation, specifying the output directory is optional. If not specified, the output directory defaults to `board/hspice`.

1.5.4.3. Naming Conventions for HSPICE Files

HSPICE Writer automatically generates simulation files and names them using the following naming convention: `<device>_<pin #>_<pin_name>_<in/out>_.sp`.

For bidirectional pins, two spice decks are produced; one with the I/O buffer configured as an input, and the other with the I/O buffer configured as an output.

The Quartus Prime software supports alphanumeric pin names that contain the underscore (_) and dash (-) characters. Any illegal characters used in file names are converted automatically to underscores.

Related Information

- Sample Output for I/O HSPICE Simulation Deck on page 35
1.5.4.4. Invoking HSPICE Writer

After HSPICE Writer is enabled, the HSPICE simulation files are generated automatically each time the project is completely compiled. The Quartus Prime software also provides an option to generate a new set of simulation files without having to recompile manually. In the Processing menu, click **Start EDA Netlist Writer** to generate new simulation files automatically.

*Note:* You must perform both Analysis & Synthesis and Fitting on a design before invoking the HSPICE Writer tool.

1.5.4.5. Invoking HSPICE Writer from the Command Line

If you use a script-based flow to compile your project, you can create HSPICE model files by including the following commands in your Tcl script (.tcl file).

**Create HSPICE Model Files**

```tcl
set_global_assignment -name EDA_BOARD_DESIGN_SIGNAL_INTEGRITY_TOOL "HSPICE (Signal Integrity)"
set_global_assignment -name EDA_OUTPUT_DATA_FORMAT HSPICE
-section_ideda_board_design_signal_integrity
set_global_assignment -name EDA_NETLIST_WRITER_OUTPUT_DIR <output_directory> 
-section_id eda_board_design_signal_integrity
```

The `<output_directory>` option specifies the location where HSPICE model files are saved. By default, the `<project directory>/board/hspice` directory is used.

**Invoke HSPICE Writer**

To invoke the HSPICE Writer tool through the command line, type:

```
quartus_eda.exe <project_name> --board_signal_integrity=on --format=HSPICE 
--output_directory=<output_directory>
```

The `<output_directory>` specifies the location where the tool writes the generated spice decks, relative to the design directory. This is an optional parameter and defaults to `board/hspice`.

1.5.4.6. Customizing Automatically Generated HSPICE Decks

HSPICE models generated by the HSPICE Writer can be used for simulation as generated.

A default board description is included, and a default simulation is set up to measure rise and fall delays for both input and output simulations, which compensates for the double counting problem. However, Intel recommends that you customize the board description to more accurately represent your routing and termination scheme.

The sample board trace loading in the generated HSPICE model files must be replaced by your actual trace model before you can run a correct simulation. To do this, open the generated HSPICE model files for all pins you want to simulate and locate the following section.
**Sample Board Trace Section**

* I/O Board Trace and Termination Description
* - Replace this with your board trace and termination description

You must replace the example load with a load that matches the design of your PCB board. This includes a trace model, termination resistors, and, for output simulations, a receiver model. The spice circuit node that represents the pin of the FPGA package is called pin. The node that represents the far pin of the external device is called load-in (for output SPICE decks) and source-in (for input SPICE decks).

For an input simulation, you must also modify the stimulus portion of the spice file. The section of the file that must be modified is indicated in the following comment block.

**Sample Source Stimulus Section**

* Sample source stimulus placeholder
* - Replace this with your I/O driver model

Replace the sample stimulus model with a model for the device that drives the FPGA.

### 1.5.5. Running an HSPICE Simulation

Because simulation parameters are configured directly in the HSPICE model files, running a simulation requires only that you open an HSPICE file in the HSPICE user interface and start the simulation.

**Figure 13. HSPICE User Interface Window**

Click **Open** and browse to the location of the HSPICE model files generated by the Quartus Prime HSPICE Writer. The default location for HSPICE model files is `<project directory>/board/hspice`. Select the .sp file generated by the HSPICE Writer for the signal you want to simulate. Click **OK**.

To run the simulation, click **Simulate**. The status of the simulation is displayed in the window and saved in an .lis file with the same name as the .sp file when the simulation is complete. Check the .lis file if an error occurs during the simulation requiring a change in the .sp file to fix.
1.5.6. Interpreting the Results of an Output Simulation

By default, the automatically generated output simulation spice decks are set up to measure three delays for both rising and falling transitions. Two of the measurements, \( t_{pd\_rise} \) and \( t_{pd\_fall} \), measure the double-counting corrected delay from the FPGA pin to the load pin. To determine the complete clock-edge to load-pin delay, add these numbers to the Quartus Prime software reported default loading \( t_{CO} \) delay.

The remaining four measurements, \( t_{pd\_uncomp\_rise} \), \( t_{pd\_uncomp\_fall} \), \( t_{dblcnt\_rise} \), and \( t_{dblcnt\_fall} \), are required for the double-counting compensation process and are not required for further timing usage.

**Related Information**

Simulation Analysis on page 35

1.5.7. Interpreting the Results of an Input Simulation

By default, the automatically generated input simulation SPICE decks are set up to measure delays from the source’s driver pin to the FPGA’s input pin for both rising and falling transitions.

The propagation delay is reported by HSPICE measure statements as \( t_{pd\_rise} \) and \( t_{pd\_fall} \). To determine the complete source driver pin-to-FPGA register delay, add these numbers to the Quartus Prime software reported \( T_H \) and \( T_{SU} \) input timing numbers.

1.5.8. Viewing and Interpreting Tabular Simulation Results

The \( .lis \) file stores the collected simulation data in tabular form. The default simulation configured by the HSPICE Writer produces delay measurements for rising and falling transitions on both input and output simulations.

These measurements are found in the \( .lis \) file and named \( t_{pd\_rise} \) and \( t_{pd\_fall} \). For output simulations, these values are already adjusted for the double count. To determine the complete delay from the FPGA logic to the load pin, add either of these measurements to the Quartus Prime \( t_{CO} \) delay. For input simulations, add either of these measurements to the Quartus Prime \( T_H \) and \( T_{SU} \) delay values to calculate the complete delay from the far end stimulus to the FPGA logic. Other values found in the \( .lis \) file, such as \( t_{pd\_uncomp\_rise} \), \( t_{pd\_uncomp\_fall} \), \( t_{dblcnt\_rise} \), and \( t_{dblcnt\_fall} \), are parts of the double count compensation calculation. These values are not necessary for further analysis.

1.5.9. Viewing Graphical Simulation Results

You can view the results of the simulation quickly as a graphical waveform display using the AvanWaves viewer included with HSPICE. With the default simulation configured by the HSPICE Writer, you can view the simulated waveforms at both the source and destination in input and output simulations.

To see the waveforms for the simulation, in the HSPICE user interface window, click **AvanWaves**. The AvanWaves viewer opens and displays the **Results Browser**.
The **Results Browser** lets you select which waveform to view quickly in the main viewing window. If multiple simulations are run on the same signal, the list at the top of the **Results Browser** displays the results of each simulation. Click the simulation description to select which simulation to view. By default, the descriptions are derived from the first line of the HSPICE file, so the description might appear as a line of asterisks.

Select the type of waveform to view, by performing the following steps:

1. To see the source and destination waveforms with the default simulation, from the **Types** list, select **Voltages**.
2. On the **Curves** list, double-click the waveform you want to view. The waveform appears in the main viewing window.

You can zoom in and out and adjust the view as desired.
1.5.10. Making Design Adjustments Based on HSPICE Simulations

Based on the results of your simulations, you can make adjustments to the I/O assignments or simulation parameters if required. For example, after you run a simulation and see overshoot or ringing in the simulated signal at the destination buffer, you can adjust the drive strength I/O assignment setting to a lower value. Regenerate the HSPICE deck, and run the simulation again to verify that the change fixed the problem.
If there is a discontinuity or any other anomalies at the destination, adjust the board description in the Quartus Prime Board Trace Model, or in the generated HSPICE model files to change the termination scheme or adjust termination component values. After making these changes, regenerate the HSPICE files if necessary, and rerun the simulation to verify whether your adjustments solved the problem.
For more information about board-level signal integrity and to learn about ways to improve it with simple changes to your FPGA design, visit the Intel Signal & Power Integrity Center

**Related Information**

Intel Signal & Power Integrity Center

### 1.5.11. Sample Input for I/O HSPICE Simulation Deck

The following sections examine a typical HSPICE simulation spice deck for an I/O of type input. Each section presents the simulation file one block at a time.

#### 1.5.11.1. Header Comment

The first block of an input simulation spice deck is the header comment. The purpose of this block is to provide an easily readable summary of how the simulation file has been automatically configured by the Quartus Prime software.

This block has two main components: The first component summarizes the I/O configuration relevant information such as device, speed grade, and so on. The second component specifies the exact test condition that the Quartus Prime software assumes for the given I/O standard.
1.5.11.2. Simulation Conditions

The simulation conditions block loads the appropriate process corner models for the transistors. This condition is automatically set up for the slow timing corner and is modified only if other simulation corners are desired.

Simulation Conditions Block

* Process Settings
  .options brief
  .inc 'sii_tt.inc' * TT process corner

1.5.11.3. Simulation Options

The simulation options block configures the simulation temperature and configures HSPICE with typical simulation options.

Simulation Options Block

* Simulation Options
  .options brief=0
  .options badchr co=132 scale=1e-6 acct ingold=2 nomod dv=1.0
  + dcstep=1 absv=1e-3 absi=1e-8 probe csdf=2 accurate=1
  + converge=1
  .temp 85
Note: For a detailed description of these options, consult your HSPICE manual.

1.5.11.4. Constant Definition

The constant definition block of the simulation file instantiates the voltage sources that controls the configuration modes of the I/O buffer.

Constant Definition Block

* Constant Definition
voeb oeb 0 vc * Set to 0 to enable buffer output
vopdrain opdrain 0 0 * Set to vc to enable open drain
vrambh rambh 0 0 * Set to vc to enable bus hold
vrpullup rpullup 0 0 * Set to vc to enable weak pullup
vpcdp5 rpcdp5 0 rp5 * Set the IO standard
vpcdp4 rpcdp4 0 rp4
vpcdp3 rpcdp3 0 rp3
vpcdp2 rpcdp2 0 rp2
vpcdp1 rpcdp1 0 rp1
vpcdp0 rpcdp0 0 rp0
vpcdn4 rpcdn4 0 rn4
vpcdn3 rpcdn3 0 rn3
vpcdn2 rpcdn2 0 rn2
vpcdn1 rpcdn1 0 rl1
vpcdn0 rpcdn0 0 rn0
vdin din 0 0

Where:
- Voltage source voeb controls the output enable of the buffer and is set to disabled for inputs.
- vopdrain controls the open drain mode for the I/O.
- vrambh controls the bus hold circuitry in the I/O.
- vrpullup controls the weak pullup.
- The next 11 voltages sources control the I/O standard of the buffer and are configured through a later library call.
- vdin is not used on input pins because it is the data pin for the output buffer.

1.5.11.5. Buffer Netlist

The buffer netlist block of the simulation spice deck loads all the load models required for the corresponding input pin.

Buffer Netlist Block

* IO Buffer Netlist
.include 'vio_buffer.inc'

1.5.11.6. Drive Strength

The drive strength block of the simulation SPICE deck loads the configuration bits necessary to configure the I/O into the proper I/O standard and drive strengths.

Although these settings are not relevant to an input buffer, they are provided to allow the SPICE deck to be modifiable to support bidirectional simulations.
### Drive Strength Block

* Drive Strength Settings
  .lib 'drive_select_hio.lib' 3p3ttl_12ma

### 1.5.11.7. I/O Buffer Instantiation

The I/O buffer instantiation block of the simulation SPICE deck instantiates the necessary power supplies and I/O model components that are necessary to simulate the given I/O.

**I/O Buffer Instantiation**

I/O Buffer Instantiation
* Supply Voltages Settings

### 1.5.11.8. Board Trace and Termination

The board trace and termination block of the simulation SPICE deck is provided only as an example. Replace this block with your own board trace and termination models.

**Board Trace and Termination Block**

* I/O Board Trace and Termination Description
* - Replace this with your board trace and termination description
  wtline pin vssn load vssn N=1 L=1 RLGCMODEL=tlinemodel
  .MODEL tlinemodel W MODELTYPE=RLGC N=1 Lo=7.13n Co=2.85p
  Rterm2 load vssn 1x

### 1.5.11.9. Stimulus Model

The stimulus model block of the simulation spice deck is provided only as a place holder example. Replace this block with your own stimulus model. Options for this include an IBIS or HSPICE model, among others.

**Stimulus Model Block**

* Sample source stimulus placeholder
* - Replace this with your I/O driver model
  Vsource source 0 pulse(0 vcn 0s 0.4ns 0.4ns 8.5ns 17.4ns)
1.5.11.10. Simulation Analysis

The simulation analysis block of the simulation file is configured to measure the propagation delay from the source to the FPGA pin. Both the source and end point of the delay are referenced against the 50% $V_{CCN}$ crossing point of the waveform.

Simulation Analysis Block

* Simulation Analysis Setup
* Print out the voltage waveform at both the source and the pin
  .print tran v(source) v(pin)
  .tran 0.020ns 17ns
* Measure the propagation delay from the source pin to the pin
  * referenced against the 50% voltage threshold crossing point
  .measure TRAN tpd_rise TRIG v(source) val='vcn*0.5' rise=1
    + TARG v(pin) val='vcn*0.5' rise=1
  .measure TRAN tpd_fall TRIG v(source) val='vcn*0.5' fall=1
    + TARG v(pin) val='vcn*0.5' fall=1

1.5.12. Sample Output for I/O HSPICE Simulation Deck

A typical HSPICE simulation SPICE deck for an I/O-type output has several sections. Each section presents the simulation file one block at a time.

1.5.12.1. Header Comment

The first block of an output simulation SPICE deck is the header comment. The purpose of this block is to provide a readable summary of how the simulation file has been automatically configured by the Quartus Prime software.

This block has two main components:

- The first component summarizes the I/O configuration relevant information such as device, speed grade, and so on.
- The second component specifies the exact test condition that the Quartus Prime software assumes when generating $t_{CO}$ delay numbers. This information is used as part of the double-counting correction circuitry contained in the simulation file.

The SPICE decks are preconfigured to calculate the slow process corner delay but can also be used to simulate the fast process corner as well. The fast corner conditions are listed in the header under the notes section.

The final section of the header comment lists any warning messages that you must consider when you use the SPICE decks.

Header Comment Block

* Intel Quartus Prime HSPICE Writer I/O Simulation Deck
* This spice simulation deck was automatically generated by
  * Intel Quartus Prime for the following IO settings:
    * Device: EP2S60F1020C3
    * Speed Grade: C3
    * Pin: AA4 (out96)
    * Bank: IO Bank 6 (Row I/O)
    * I/O Standard: LVTTL, 12mA
    * OCT: Off
* Quartus’ default I/O timing delays assume the following slow corner simulation conditions.
  * Specified Test Conditions For Intel Quartus Prime $t_{CO}$
1.5.12.2. Simulation Conditions

The simulation conditions block loads the appropriate process corner models for the transistors. This condition is automatically set up for the slow timing corner and must be modified only if other simulation corners are desired.

Simulation Conditions Block

* Process Settings
  .options brief
  .inc 'sii_tt.inc' * typical-typical process corner

Note: Two separate corners cannot be simulated at the same time. Instead, simulate the base case using the Quartus corner as one simulation and then perform a second simulation using the desired customer corner. The results of the two simulations can be manually added together.

1.5.12.3. Simulation Options

The simulation options block configures the simulation temperature and configures HSPICE with typical simulation options.

Simulation Options Block

* Simulation Options
  .options brief=0
  .options badchr co=132 scale=1e-6 acct ingold=2 nomod dv=1.0
  + dcstep=1 absv=1e-3 absi=1e-8 probe csdf=2 accurate=1
  + converge=1
  .temp 85

Note: For a detailed description of these options, consult your HSPICE manual.

1.5.12.4. Constant Definition

The constant definition block of the output simulation SPICE deck instantiates the voltage sources that controls the configuration modes of the I/O buffer.
**Constant Definition Block**

* Constant Definition
  voeb oeb 0 0 * Set to 0 to enable buffer output
  vopdrain opdrain 0 0 * Set to vc to enable open drain
  vrambh rambh 0 0 * Set to vc to enable bus hold
  vrpullup rpullup 0 0 * Set to vc to enable weak pullup
  vpci rpci 0 0 * Set to vc to enable pci mode
  vpcdp4 rpcdp4 0 rp4 * These control bits set the IO standard
  vpcdp3 rpcdp3 0 rp3
  vpcdp2 rpcdp2 0 rp2
  vpcdp1 rpcdp1 0 rp1
  vpcdp0 rpcdp0 0 rp0
  vpcdn4 rpcdn4 0 rn4
  vpcdn3 rpcdn3 0 rn3
  vpcdn2 rpcdn2 0 rn2
  vpcdn1 rpcdn1 0 rn1
  vpcdn0 rpcdn0 0 rn0
  vdin din 0 pulse(0 vc 0s 0.2ns 0.2ns 8.5ns 17.4ns)

Where:

- **Voltage source** voeb controls the output enable of the buffer.
- **vopdrain** controls the open drain mode for the I/O.
- **vrambh** controls the bus hold circuitry in the I/O.
- **vrpullup** controls the weak pullup.
- **vpci** controls the PCI clamp.
- The next ten voltage sources control the I/O standard of the buffer and are configured through a later library call.
- **vdin** is connected to the data input of the I/O buffer.
- The edge rate of the input stimulus is automatically set to the correct value by the Quartus Prime software.

### 1.5.12.5. I/O Buffer Netlist

The I/O buffer netlist block loads all of the models required for the corresponding pin. These include a model for the I/O output buffer, as well as any loads that might be present on the pin.

**I/O Buffer Netlist Block**

* I/O Buffer Netlist
  .include 'hio_buffer.inc'
  .include 'lvds_input_load.inc'
  .include 'lvds_oct_load.inc'

### 1.5.12.6. Drive Strength

The drive strength block of the simulation spice deck loads the configuration bits for configuring the I/O to the proper I/O standard and drive strength. These options are set by the HSPICE Writer tool and are not changed for expected use.

**Drive Strength Block**

* Drive Strength Settings
  .lib 'drive_select_hio.lib' 3p3ttl_12ma
1.5.12.7. Slew Rate and Delay Chain

Stratix and Cyclone devices have sections for configuring the slew rate and delay chain settings.

Slew Rate and Delay Chain Settings

* Programmable Output Delay Control Settings
  .lib 'lib/output_delay_control.lib' no_delay
* Programmable Slew Rate Control Settings
  .lib 'lib/slew_rate_control.lib' slow_slow

1.5.12.8. I/O Buffer Instantiation

The I/O buffer instantiation block of the output simulation spice deck instantiates the necessary power supplies and I/O model components that are necessary to simulate the given I/O.

I/O Buffer Instantiation Block

* I/O Buffer Instantiation
* Supply Voltages Settings
  .param vcn=3.135
  .param vpd=2.97
  .param vc=1.15
* Instantiate Power Supplies
  vvcc vcc 0 vc * FPGA core voltage
  vvss vss 0 0 * FPGA core ground
  vvccn vccn 0 vcn * IO supply voltage
  vvssn vssn 0 0 * IO ground
  vvccpd vccpd 0 vpd * Pre-drive supply voltage
* Instantiate I/O Buffer
  xhio_buf din oeb opdrain die rambh
  + rpcdn4 rpcdn3 rpcdn2 rpcdn1 rpcdn0
  + rpcdp4 rpcdp3 rpcdp2 rpcdp1 rpcdp0
  + rpullup vccn vccpd vcpad0 hio_buf
* Internal Loading on Pad
  * - This pad has an LVDS input buffer connected to it, along with differential OCT circuitry. Both are disabled but introduce loading on the pad that is modeled below.
  xlvds_input_load die vss vccn lvds_input_load
  xlvds_oct_load die vss vccpd vccn vcpad0 vccn lvds_oct_load
* I/O Buffer Package Model
  * - Single-ended I/O standard on a Row I/O
  .lib 'lib/package.lib' hio
  xpkg die pin hio_pkg

1.5.12.9. Board and Trace Termination

The board trace and termination block of the simulation SPICE deck is provided only as an example. Replace this block with your specific board loading models.

Board Trace and Termination Block

* I/O Board Trace And Termination Description
  * - Replace this with your board trace and termination description
  wtline pin vssn load vssn N=1 L=1 RLGCMODEL=tlinemodel
  .MODEL tlinemodel W MODELTYPE=RLGC N=1 Lo=7.13n Co=2.85p
  Rterm2 load vssn 1x
**1.5.12.10. Double-Counting Compensation Circuitry**

The double-counting compensation circuitry block of the simulation SPICE deck instantiates a second I/O buffer that is used to measure double-counting. The buffer is configured identically to the user I/O buffer but is connected to the Quartus Prime software test load. The simulated delay of this second buffer can be interpreted as the amount of double-counting between the Quartus Prime software and HSPICE Writer simulated results.

As the amount of double-counting is constant for a given I/O standard on a given pin, consider separating the double-counting circuitry from the simulation file. In doing so, you can perform any number of I/O simulations while referencing the delay only once.

*(Part of )Double-Counting Compensation Circuitry Block*

```plaintext
* Double Counting Compensation Circuitry
* The following circuit is designed to calculate the amount of double counting between Intel Quartus Prime and the HSPICE models. If you have not changed the default simulation temperature or transistor corner this spice deck automatically compensates the double counting.
* In the event you wish to simulate an IO at a different temperature or transistor corner you need to remove this section of code and manually account for double counting. A description of Intel's recommended procedure for this process can be found in the Intel Quartus Prime HSPICE Writer AppNote.
* Supply Voltages Settings
.param vcn_tl=3.135
.param vpd_tl=2.97
* Test Load Constant Definition

**1.5.12.11. Simulation Analysis**

The simulation analysis block is set up to measure double-counting corrected delays. This is accomplished by measuring the uncompensated delay of the I/O buffer when connected to the user load, and when subtracting the simulated amount of double-counting from the test load I/O buffer.
Simulation Analysis Block

* Simulation Analysis Setup
* Print out the voltage waveform at both the pin and far end load
  .print tran v(pin) v(load)
  .tran 0.020ns 17ns
* Measure the propagation delay to the load pin. This value
  * includes some double counting with Intel Quartus Prime’s Tco
  .measure TRAN tpd_uncomp_rise TRIG v(din) val='vc*0.5' rise=1+ TARG v(load)
    val='vcn*0.5' rise=1
  .measure TRAN tpd_uncomp_fall TRIG v(din) val='vc*0.5' fall=1
    + TARG v(load) val='vcn*0.5' fall=1
* The test load buffer can calculate the amount of double counting
  .measure TRAN t_dblcnt_rise TRIG v(din) val='vc*0.5' rise=1
    + TARG v(pin_tl) val='vcn_tl*0.5' rise=1
  .measure TRAN t_dblcnt_fall TRIG v(din) val='vc*0.5' fall=1
    + TARG v(pin_tl) val='vcn_tl*0.5' fall=1
* Calculate the true propagation delay by subtraction
  .measure TRAN tpd_rise PARAM='tpd_uncomp_rise-t_dblcnt_rise'
  .measure TRAN tpd_fall PARAM='tpd_uncomp_fall-t_dblcnt_fall'

1.5.13. Advanced Topics

The information in this section describes some of the more advanced topics and methods employed when setting up and running HSPICE simulation files.

1.5.13.1. PVT Simulations

The automatically generated HSPICE simulation files are set up to simulate the slow process corner using low voltage, high temperature, and slow transistors. To ensure a fully robust link, Intel recommends that you run simulations over all process corners.

To perform process, voltage, and temperature (PVT) simulations, manually modify the spice decks in a two step process:

1. Remove the double-counting compensation circuitry from the simulation file. This is required as the amount of double-counting is dependent upon how the Quartus Prime software calculates delays and is not based on which PVT corner is being simulated. By default, the Quartus Prime software provides timing numbers using the slow process corner.

2. Select the proper corner for the PVT simulation by setting the correct HSPICE temperature, changing the supply voltage sources, and loading the correct transistor models.

A more detailed description of HSPICE process corners can be found in the family-specific HSPICE model documentation.

Related Information
Accessing HSPICE Simulation Kits on page 21

1.5.13.2. Hold Time Analysis

Intel recommends performing worst-case hold time analysis using the fast corner models, which use fast transistors, high voltage, and low temperature. This involves modifying the SPICE decks to select the correct temperature option, change the supply voltage sources, and load the correct fast transistor models. The values of these parameters are located in the header comment section of the corresponding simulation deck files.
For a truly worst-case analysis, combine the HSPICE Writer hold time analysis results with the Quartus Prime software fast timing model. This requires that you change the double-counting compensation circuitry in the simulations files to also simulate the fast process corners, as this is what the Quartus Prime software uses for the fast timing model.

**Note:** This method of hold time analysis is recommended only for globally synchronous buses. Do not apply this method of hold-time analysis to source synchronous buses. This is because the source synchronous clocking scheme is designed to cancel out some of the PVT timing effects. If this is not taken into account, the timing results are not accurate. Proper source synchronous timing analysis is beyond the scope of this document.

### 1.5.13.3. I/O Voltage Variations

Use each of the FPGA family datasheets to verify the recommended operating conditions for supply voltages. For current FPGA families, the maximum recommended voltage corresponds to the fast corner, while the minimum recommended voltage corresponds to the slow corner. These voltage recommendations are specified at the power pins of the FPGA and are not necessarily the same voltage that are seen by the I/O buffers due to package IR drops.

The automatically generated HSPICE simulation files model this IR effect pessimistically by including a 50-mV IR drop on the \( V_{CCPD} \) supply when a high drive strength standard is being used.

### 1.5.13.4. Correlation Report

Correlation reports for the HSPICE I/O models are located in the family-specific HSPICE I/O buffer simulation kits.

2. Reviewing Printed Circuit Board Schematics with the Quartus Prime Software

Intel FPGAs and CPLDs offer a multitude of configurable options to allow you to implement a custom application-specific circuit on your PCB.

Your Quartus Prime project provides important information specific to your programmable logic design, which you can use in conjunction with the device literature available on the Intel website to ensure that you implement the correct board-level connections in your schematic.

Refer to the Settings dialog box options, the Fitter report, and Messages window when creating and reviewing your PCB schematic. The Quartus Prime software also provides the Pin Planner to assist you during your PCB schematic review process.

Related Information
Schematic Review Worksheets

2.1. Reviewing Quartus Prime Software Settings

Review these settings in the Quartus Prime software to help you review your PCB schematic.

The Device dialog box in the Quartus Prime software allows you to specify device-specific assignments and settings. You can use the Device dialog box to specify general project-wide options, including specific device and pin options, which help you to implement correct board-level connections in your PCB schematic.

The Device dialog box provides project-specific device information, including the target device and any migration devices you specify. Using migration devices can impact the number of available user I/O pins and internal resources, as well as require connection of some user I/O pins to power/ground pins to support migration.

If you want to use vertical migration, which allows you to use different devices with the same package, you can specify your list of migration devices in the Migration Devices dialog box. The Fitter places the pins in your design based on your targeted migration devices, and allows you to use only I/O pins that are common to all the migration devices.

If a migration device has pins that are power or ground, but the pins are also user I/O pins on a different device in the migration path, the Fitter ensures that these pins are not used as user I/O pins. You must ensure that these pins are connected to the appropriate plane on the PCB.

If you are migrating from a smaller device with NC (no-connect) pins to a larger device with power or ground pins in the same package, you can safely connect the NC pins to power or ground pins to facilitate successful migration.
2.1.1. Device and Pins Options Dialog Box Settings

You can set device and pin options and verify important design-specific data in the Device and Pin Options dialog box, including options found on the General, Configuration, Unused Pin, Dual-Purpose Pins, and Voltage pages.

2.1.1.1. Configuration Settings

The Configuration page of the Device and Pin Options dialog box specifies the configuration scheme and configuration device for the target device. Use the Configuration page settings to verify the configuration scheme with the MSEL pin settings used on your PCB schematic and the I/O voltage of the configuration scheme.

Your specific configuration settings may impact the availability of some dual-purpose I/O pins in user mode.

2.1.1.2. Unused Pin Settings

The Unused Pin page specifies the behavior of all unused pins in your design. Use the Unused Pin page to ensure that unused pin settings are compatible with your PCB.

For example, if you reserve all unused pins as outputs driving ground, you must ensure that you do not connect unused I/O pins to VCC pins on your PCB. Connecting unused I/O pins to VCC pins may result in contention that could lead to higher than expected current draw and possible device overstress.

The Reserve all unused pins list shows available unused pin state options for the target device. The default state for each pin is the recommended setting for each device family.

When you reserve a pin as output driving ground, the Fitter connects a ground signal to the output pin internally. You should connect the output pin to the ground plane on your PCB, although you are not required to do so. Connecting the output driving ground to the ground plane is known as creating a virtual ground pin, which helps to minimize simultaneous switching noise (SSN) and ground bounce effects.

2.1.1.3. Dual-Purpose Pins Settings

The Dual-Purpose Pins page specifies how configuration pins should be used after device configuration completes. You can set the function of the dual-purpose pins by selecting a value for a specific pin in the Dual-purpose pins list. Pin functions should match your PCB schematic. The available options on the Dual-Purpose Pins page may differ depending on the selected configuration mode.
2.1.1.4. Voltage Settings

The **Voltage** page specifies the default VCCIO I/O bank voltage and the default I/O bank voltage for the pins on the target device. VCCIO I/O bank voltage settings made in the **Voltage** page are overridden by I/O standard assignments made on I/O pins in their respective banks.

Ensure that the settings in the **Voltage** page match the settings in your PCB schematic, especially if the target device includes transceivers.

The **Voltage** page settings requirements differ depending on the settings of the transceiver instances in the design. Refer to the Fitter report for the required settings, and verify that the voltage settings are correctly set up for your PCB schematic.

After verifying your settings in the **Device** and **Settings** dialog boxes, you can verify your device pin-out with the Fitter report.

**Related Information**

Reviewing Device Pin-Out Information in the Fitter Report on page 46

2.1.1.5. Error Detection CRC Settings

The **Error Detection CRC** page specifies error detection cyclic redundancy check (CRC) use for the target device. When **Enable error detection CRC** is turned on, the device checks the validity of the programming data in the devices. Any changes made in the data while the device is in operation generates an error.

Turning on the **Enable open drain on CRC error pin** option allows the CRC ERROR pin to be set as an open-drain pin in some devices, which decouples the voltage level of the CRC ERROR pin from VCCIO voltage. You must connect a pull-up resistor to the CRC ERROR pin on your PCB if you turn on this option.

In addition to settings in the **Device** dialog box, you should verify settings in the **Voltage** page of the **Settings** dialog box.

**Related Information**

Device and Pin Options Dialog Box
In Quartus Prime Help

2.2. Reviewing Device Pin-Out Information in the Fitter Report

After you compile your design, you can use the reports in the Resource section of the Fitter report to check your device pin-out in detail.

The Input Pins, Output Pins, and Bidirectional Pins reports identify all the user I/O pins in your design and the features enabled for each I/O pin. For example, you can find use of weak internal pull-ups, PCI clamp diodes, and on-chip termination (OCT) pin assignments in these sections of the Fitter report. You can check the pin assignments reported in the Input Pins, Output Pins, and Bidirectional Pins reports against your PCB schematic to determine whether your PCB requires external components.

These reports also identify whether you made pin assignments or if the Fitter automatically placed the pins. If the Fitter changed your pin assignments, you should make these changes user assignments because the location of pin assignments made by the Fitter may change with subsequent compilations.
Open the *Compilation Report* tab with Ctrl+R. In the *Plan Stage* folder under *Fitter* open the Input Pins report. The following figure shows the pins the Fitter chose for the OCT external calibration resistor connections (RUP/RDN) and the name of the associated termination block in the Input Pins report. You should make these types of assignments user assignments.

The I/O Bank Usage report provides a high-level overview of the VCCIO and VREF requirements for your design, based on your I/O assignments. Verify that the requirements in this report match the settings in your PCB schematic. All unused I/O banks, and all banks with I/O pins with undefined I/O standards, default the VCCIO voltage to the voltage defined in the *Voltage* page of the *Device and Pin Options* dialog box.

The All Package Pins report lists all the pins on your device, including unused pins, dedicated pins and power/ground pins. You can use this report to verify pin characteristics, such as the location, name, usage, direction, I/O standard and voltage for each pin with the pin information in your PCB schematic. In particular, you should verify the recommended voltage levels at which you connect unused dedicated inputs and I/O and power pins, especially if you selected a migration device. Use the All Package Pins report to verify that you connected all the device voltage rails to the voltages reported.

Errors commonly reported include connecting the incorrect voltage to the predriver supply (VCCPD) pin in a specific bank, or leaving dedicated clock input pins floating. Unused input pins that should be connected to ground are designated as GND+ in the *Pin Name/Usage* column in the All Package Pins report.

You can also use the All Package Pins report to check transceiver-specific pin connections and verify that they match the PCB schematic. Unused transceiver pins have the following requirements, based on the pin designation in the Fitter report:

- **GXB_GND**—Unused GXB receiver or dedicated reference clock pin. This pin must be connected to GXB_GND through a 10k Ohm resistor.
- **GXB_NC**—Unused GXB transmitter or dedicated clock output pin. This pin must be disconnected.
Some transceiver power supply rails have dual voltage capabilities, such as VCCA_L/R and VCCH_L/R, that depend on the settings you created for the ALTGX parameter editor. Because these user-defined settings overwrite the default settings, you should use the All Package Pins report to verify that these power pins on the device symbol in the PCB schematics are connected to the voltage required by the transceiver. An incorrect connection may cause the transceiver to function not as expected.

If your design includes a memory interface, the DQS Summary report provides an overview of each DQ pin group. You can use this report to quickly confirm that the correct DQ/DQS pins are grouped together.

Finally, the Fitter Device Options report summarizes some of the settings made in the Device and Pin Options dialog box. Verify that these settings match your PCB schematics.

### 2.3. Reviewing Compilation Error and Warning Messages

If your project does not compile without error or warning messages, you should resolve the issues identified by the Compiler before signing off on your pin-out or PCB schematic. Error messages often indicate illegal or unsupported use of the device resources and IP.

Additionally, you should cross-reference fitting and timing analysis warnings with the design implementation. Timing may be constrained due to nonideal pin placement. You should investigate if you can reassign pins to different locations to prevent fitting and timing analysis warnings. Ensure that you review each warning and consider its potential impact on the design.

### 2.4. Using Additional Quartus Prime Software Features

You can generate IBIS files, which contain models specific to your design and selected I/O standards and options, with the Quartus Prime software.

Because board-level simulation is important to verify, you should check for potential signal integrity issues. You can turn on the Board-Level Signal Integrity feature in the EDA Tool Settings page of the Settings dialog box.

Additionally, using advanced I/O timing allows you to enter physical PCB information to accurately model the load seen by an output pin. This feature facilitates accurate I/O timing analysis.

**Related Information**

- Signal Integrity Analysis with Third-Party Tools on page 4
- Managing Device I/O Pins

### 2.5. Using Additional Quartus Prime Software Tools

Use the Pin Planner to assist you with reviewing your PCB schematics.
2.5.1. Pin Planner

The Quartus Prime Pin Planner helps you visualize, plan, and assign device I/O pins in a graphical view of the target device package. You can quickly locate various I/O pins and assign them design elements or other properties to ensure compatibility with your PCB layout.

You can use the Pin Planner to verify the location of clock inputs, and whether they have been placed on dedicated clock input pins, which is recommended when your design uses PLLs.

You can also use the Pin Planner to verify the placement of dedicated SERDES pins. SERDES receiver inputs can be placed only on DIFFIO_RX pins, while SERDES transmitter outputs can be placed only on DIFFIO_TX pins.

The Pin Planner gives a visual indication of signal-to-signal proximity in the Pad View window, and also provides information about differential pin pair placement, such as the placement of pseudo-differential signals.

3. Siemens EDA PCB Design Tools Support

You can integrate the Siemens EDA DxDesigner* PCB design tool into the Quartus Prime design flow.

With today’s large, high-pin-count and high-speed FPGA devices, good and correct PCB design practices are essential to ensure correct system operation. The PCB design takes place concurrently with the design and programming of the FPGA. The FPGA or ASIC designer initially creates signal and pin assignments, and the board designer must correctly transfer these assignments to the symbols in their system circuit schematics and board layout. As the board design progresses, Intel recommends reassigning pins to optimize the PCB layout. Ensure that you inform the FPGA designer of the pin reassignments so that the new assignments are included in an updated placement and routing of the design.

This chapter covers the following topics:

- Siemens EDA and Quartus Prime software integration flow
- Generating supporting files
- Creating DxDesigner symbols from the Quartus Prime output files

This chapter is intended for board design and layout engineers who want to start the FPGA board integration while the FPGA is still in the design phase. Alternatively, the board designer can plan the FPGA pin-out and routing requirements in the Siemens EDA tools and pass the information back to the Quartus Prime software for placement and routing. Part librarians can also benefit from this chapter by learning how to use output from the Quartus Prime software to create new library parts and symbols.

The procedures in this chapter require the following software:

- The Quartus Prime software version 5.1 or later
- DxDesigner software version 2004 or later

*Note:* To obtain and license the Siemens EDA tools and for product information, support, and training, refer to the Siemens EDA website.

3.1. Integrating with DxDesigner

You can integrate the Siemens EDA DxDesigner schematic capture tool into the Quartus Prime design flow. Use DxDesigner to create flat circuit schematics or to create hierarchical schematics that facilitate design reuse and a team-based design for all PCB types.

If you use DxDesigner without the I/O Designer software, the design flow is one-way, using only the .pin generated by the Quartus Prime software. You can only make signal and pin assignment changes in the Quartus Prime software. You cannot back-annotate changes made in a board layout tool or in a DxDesigner symbol to the Quartus Prime software.
Figure 19. DxDesigner-only Flow

3.1.1. DxDesigner Project Settings

DxDesigner new projects automatically create FPGA symbols by default. To enable the DxBoardLink flow design configuration when creating a new DxDesigner project, follow these steps:

1. Start the DxDesigner software.
2. Click File ➤ New, and then click the Project tab.
3. Click More. Turn on DxBoardLink. To enable the DxBoardLink Flow design configuration for an existing project, click Design Configurations in the Design Configuration toolbar and turn on DxBoardLink.

3.1.2. Creating Schematic Symbols in DxDesigner

You can create schematic symbols in the DxDesigner software manually or with the Symbol wizard. The DxDesigner Symbol wizard is similar to the I/O Designer Symbol wizard, but with fewer fracturing options. The DxDesigner Symbol wizard creates, fractures, and edits FPGA symbols based on the specified Intel FPGA device. To create a symbol with the Symbol wizard, follow these steps;

1. Start the DxDesigner software.
2. Click Symbol Wizard in the toolbar.
3. Type the new symbol name in the name field and click OK.
4. Specify creation of a new symbol or modification of an existing symbol. To modify an existing symbol, specify the library path or alias, and select the existing symbol. To create a new symbol, select DxBoardLink for the symbol source. The DxDesigner block type defaults to Module because the FPGA design does not have an underlying DxDesigner schematic. Choose whether or not to fracture the symbol. Click Next.
5. Type a name for the symbol, an overall part name for all the symbol fractures, and a library name for the new library created for this symbol. By default, the part and library names are the same as the symbol name. Click Next.
6. Specify the appearance of the generated symbol in your DxDesigner project schematic. After making your selections. Click Next.
7. In the FPGA vendor list, select Intel Quartus. In the Pin-Out file to import field, select the .pin from your Quartus Prime project directory. You can also specify Fracturing Scheme, Bus pin, and Power pin options. Click Next.

8. Select to create or modify symbol attributes for use in the DxDesigner software. Click Next.

9. On the Pin Settings page, make any final adjustments to pin and label location and information. Each tabbed spreadsheet represents a fracture of your symbol. Click Save Symbol. After creating the symbol, you can examine and place any fracture of the symbol in your schematic. You can locate separate files of all the fractures you created in the library you specified or created in the /sym directory in your DxDesigner project. You can add the symbols to your schematics or you can manually edit the symbols or with the Symbol wizard.

4. Cadence Board Design Tools Support

4.1. Cadence PCB Design Tools Support

The Quartus Prime software interacts with the following software to provide a complete FPGA-to-board integration design workflow: the Cadence Allegro Design Entry HDL software and the Cadence Allegro Design Entry CIS (Component Information System) software (also known as OrCAD Capture CIS). The information is useful for board design and layout engineers who want to begin the FPGA board integration process while the FPGA is still in the design phase. Part librarians can also benefit by learning the method to use output from the Quartus Prime software to create new library parts and symbols.

With today’s large, high-pin-count and high-speed FPGA devices, good PCB design practices are important to ensure the correct operation of your system. The PCB design takes place concurrently with the design and programming of the FPGA. An FPGA or ASIC designer initially creates the signal and pin assignments and the board designer must transfer these assignments to the symbols used in their system circuit schematics and board layout correctly. As the board design progresses, you must perform pin reassignments to optimize the layout. You must communicate pin reassignments to the FPGA designer to ensure the new assignments are processed through the FPGA with updated placement and routing.

You require the following software:

- The Quartus Prime software version 5.1 or later
- The Cadence Allegro Design Entry HDL software or the Cadence Allegro Design Entry CIS software version 15.2 or later
- The OrCAD Capture software with the optional CIS option version 10.3 or later (optional)

Note: These programs are very similar because the Cadence Allegro Design Entry CIS software is based on the OrCAD Capture software. Any procedural information can also apply to the OrCAD Capture software unless otherwise noted.

4.3. FPGA-to-PCB Design Flow

You can create a design flow integrating an Intel FPGA design from the Quartus Prime software through a circuit schematic in the Cadence Allegro Design Entry HDL software or the Cadence Allegro Design Entry CIS software.
Figure 20. Design Flow with the Cadence Allegro Design Entry HDL Software
To create FPGA symbols using the Cadence Allegro PCB Librarian Part Developer tool, you must obtain the Cadence PCB Librarian Expert license. You can update symbols with changes made to the FPGA design using any of these tools.

4.3.1. Integrating Intel FPGA Designs

To integrate an Intel FPGA design starting in the Quartus Prime software through to a circuit schematic in the Cadence Allegro Design Entry HDL software or the Cadence Allegro Design Entry CIS software, follow these steps:

1. In the Quartus Prime software, compile your design to generate a Pin-Out File (.pin) to transfer the assignments to the Cadence software.

2. If you are using the Cadence Allegro Design Entry HDL software for your schematic design, follow these steps:
   a. Open an existing project or create a new project in the Cadence Allegro Project Manager tool.
   b. Construct a new symbol or update an existing symbol using the Cadence Allegro PCB Librarian Part Developer tool.
   c. With the Cadence Allegro PCB Librarian Part Developer tool, edit your symbol or fracture it into smaller parts (optional).
   d. Instantiate the symbol in your Cadence Allegro Design Entry HDL software schematic and transfer the design to your board layout tool.

3. If you are using the Cadence Allegro Design Entry CIS software for your schematic design, follow these steps:
a. Generate a new part in a new or existing Cadence Allegro Design Entry CIS project, referencing the .pin output file from the Quartus Prime software. You can also update an existing symbol with a new .pin.

b. Split the symbol into smaller parts as necessary.

c. Instantiate the symbol in your Cadence Allegro Design Entry CIS schematic and transfer the design to your board layout tool.

4.4. Setting Up the Quartus Prime Software

You can transfer pin and signal assignments from the Quartus Prime software to the Cadence design tools by generating the Quartus Prime project .pin. The .pin is an output file generated by the Quartus Prime Fitter containing pin assignment information. You can use the Quartus Prime Pin Planner to set and change the assignments in the .pin and then transfer the assignments to the Cadence design tools. You cannot, however, import pin assignment changes from the Cadence design tools into the Quartus Prime software with the .pin.

The .pin lists all used and unused pins on your selected Intel device. The .pin also provides the following basic information fields for each assigned pin on the device:

- Pin signal name and usage
- Pin number
- Signal direction
- I/O standard
- Voltage
- I/O bank
- User or Fitter-assigned

4.4.1. Generating a .pin File

To generate a .pin, follow these steps:

1. Compile your design.
2. Locate the .pin in your Quartus Prime project directory with the name <project name>.pin.

4.5. FPGA-to-Board Integration with the Cadence Allegro Design Entry HDL Software

The Cadence Allegro Design Entry HDL software is a schematic capture tool and is part of the Cadence 600 series design flow. Use the Cadence Allegro Design Entry HDL software to create flat circuit schematics for all types of PCB design. The Cadence Allegro Design Entry HDL software can also create hierarchical schematics to facilitate design reuse and team-based design. With the Cadence Allegro Design Entry HDL software, the design flow from FPGA-to-board is one-way, using only the .pin generated by the Quartus Prime software. You can only make signal and pin assignment changes in the Quartus Prime software and these changes reflect as updated symbols in a Cadence Allegro Design Entry HDL project.
For more information about the design flow with the Cadence Allegro Design Entry HDL software, refer to FPGA-to-PCB Design Flow.

Note: Routing or pin assignment changes made in a board layout tool or a Cadence Allegro Design Entry HDL software symbol cannot be back-annotated to the Quartus Prime software.

Related Information
www.cadence.com
Provides information about the Cadence Allegro Design Entry HDL software and the Cadence Allegro PCB Librarian Part Developer tool, including licensing, support, usage, training, and product updates.

4.5.1. Creating Symbols

In addition to circuit simulation, circuit board schematic creation is one of the first tasks required when designing a new PCB. Schematics must understand how the PCB works, and to generate a netlist for a board layout tool for board design and routing. The Cadence Allegro PCB Librarian Part Developer tool allows you to create schematic symbols based on FPGA designs exported from the Quartus Prime software.

You can create symbols for the Cadence Allegro Design Entry HDL project with the Cadence Allegro PCB Librarian Part Developer tool, which is available in the Cadence Allegro Project Manager tool. Intel recommends using the Cadence Allegro PCB Librarian Part Developer tool to import FPGA designs into the Cadence Allegro Design Entry HDL software.

You must obtain a PCB Librarian Expert license from Cadence to run the Cadence Allegro PCB Librarian Part Developer tool. The Cadence Allegro PCB Librarian Part Developer tool provides a GUI with many options for creating, editing, fracturing, and updating symbols. If you do not use the Cadence Allegro PCB Librarian Part Developer tool, you must create and edit symbols manually in the Symbol Schematic View in the Cadence Allegro Design Entry HDL software.

Note: If you do not have a PCB Librarian Expert license, you can automatically create FPGA symbols using the programmable IC (PIC) design flow found in the Cadence Allegro Project Manager tool.

Before creating a symbol from an FPGA design, you must open a Cadence Allegro Design Entry HDL project with the Cadence Allegro Project Manager tool. If you do not have an existing Cadence Allegro Design Entry HDL project, you can create one with the Cadence Allegro Design Entry HDL software. The Cadence Allegro Design Entry HDL project directory with the name <project name>.cpm contains your Cadence Allegro Design Entry HDL projects.

While the Cadence Allegro PCB Librarian Part Developer tool refers to symbol fractures as slots, the other tools use different names to refer to symbol fractures.

Table 8. Symbol Fracture Naming Conventions

<table>

</tbody>
</table>
4.5.1.1. Cadence Allegro PCB Librarian Part Developer Tool

You can create, fracture, and edit schematic symbols for your designs using the Cadence Allegro PCB Librarian Part Developer tool. Symbols designed in the Cadence Allegro PCB Librarian Part Developer tool can be split or fractured into several functional blocks called slots, allowing multiple smaller part fractures to exist on the same schematic page or across multiple pages.

4.5.1.1.1. Cadence Allegro PCB Librarian Part Developer Tool in the Design Flow

To run the Cadence Allegro PCB Librarian Part Developer tool, you must open a Cadence Allegro Design Entry HDL project in the Cadence Allegro Project Manager tool. To open the Cadence Allegro PCB Librarian Part Developer tool, on the Flows menu, click **Library Management**, and then click **Part Developer**.

**Related Information**

FPGA-to-PCB Design Flow on page 54

4.5.1.1.2. Import and Export Wizard

After starting the Cadence Allegro PCB Librarian Part Developer tool, use the **Import and Export** wizard to import your pin assignments from the Quartus Prime software.

**Note:** Intel recommends using your PCB Librarian Expert license file. To point to your PCB Librarian Expert license file, on the File menu, click **Change Product** and then select the correct product license.
To access the Import and Export wizard, follow these steps:

1. On the File menu, click **Import and Export**.
2. Select **Import ECO-FPGA**, and then click **Next**.
3. In the **Select Source** page of the **Import and Export** wizard, specify the following settings:
   a. In the **Vendor** list, select **Altera**.
   b. In the **PnR Tool** list, select **quartusII**.
   c. In the **PR File** box, browse to select the `.pin` in your Quartus Prime project directory.
   d. Click **Simulation Options** to select simulation input files.
   e. Click **Next**.
4. In the **Select Destination** dialog box, specify the following settings:
   a. Under **Select Component**, click **Generate Custom Component** to create a new component in a library,
   or
   Click **Use standard component** to base your symbol on an existing component.
   
   *Note:* Intel recommends creating a new component if you previously created a generic component for an FPGA device. Generic components can cause some problems with your design. When you create a new component, you can place your pin and signal assignments from the Quartus Prime software on this component and reuse the component as a base when you have a new FPGA design.
   
   b. In the **Library** list, select an existing library. You can select from the cells in the selected library. Each cell represents all the symbol versions and part fractures for a particular part. In the **Cell** list, select the existing cell to use as a base for your part.
   
   c. In the **Destination Library** list, select a destination library for the component. Click **Next**.
   
   d. Review and edit the assignments you import into the Cadence Allegro PCB Librarian Part Developer tool based on the data in the `.pin` and then click **Finish**. The location of each pin is not included in the **Preview of Import Data** page of the **Import and Export** wizard, but input pins are on the left side of the created symbol, output pins on the right, power pins on the top, and ground pins on the bottom.

### 4.5.1.1.3. Editing and Fracturing Symbol

After creating your new symbol in the Cadence Allegro PCB Librarian Part Developer tool, you can edit the symbol graphics, fracture the symbol into multiple slots, and add or change package or symbol properties.

The Part Developer Symbol Editor contains many graphical tools to edit the graphics of a particular symbol. To edit the symbol graphics, select the symbol in the cell hierarchy. The **Symbol Pins** tab appears. You can edit the preview graphic of the symbol in the **Symbol Pins** tab.
Fracturing a Cadence Allegro PCB Librarian Part Developer package into separate symbol slots is useful for FPGA designs. A single symbol for most FPGA packages might be too large for a single schematic page. Splitting the part into separate slots allows you to organize parts of the symbol by function, creating cleaner circuit schematics. For example, you can create one slot for an I/O symbol, a second slot for a JTAG symbol, and a third slot for a power/ground symbol.

**Figure 22. Splitting a Symbol into Multiple Slots**

To fracture a part into separate slots, or to modify the slot locations of pins on parts fractured in the Cadence Allegro PCB Librarian Part Developer tool, follow these steps:

1. Start the Cadence Allegro Design Project Manager.
2. On the Flows menu, click **Library Management**.
3. Click **Part Developer**.
4. Click the name of the package you want to change in the cell hierarchy.
5. Click **Functions/Slots**. If you are not creating new slots but want to change the slot location of some pins, proceed to Step 6. If you are creating new slots, click **Add**. A dialog box appears, allowing you to add extra symbol slots. Set the number of extra slots you want to add to the existing symbol, not the total number of desired slots for the part. Click **OK**.
6. Click **Distribute Pins**. Specify the slot location for each pin. Use the checkboxes in each column to move pins from one slot to another. Click **OK**.
7. After distributing the pins, click the **Package Pin** tab and click **Generate Symbol(s)**.
8. Select whether to create a new symbol or modify an existing symbol in each slot. Click **OK**.

The newly generated or modified slot symbols appear as separate symbols in the cell hierarchy. Each of these symbols can be edited individually.
**Caution:** The Cadence Allegro PCB Librarian Part Developer tool allows you to remap pin assignments in the **Package Pin** tab of the main Cadence Allegro PCB Librarian Part Developer window. If signals remap to different pins in the Cadence Allegro PCB Librarian Part Developer tool, the changes reflect only in regenerated symbols for use in your schematics. You cannot transfer pin assignment changes to the Quartus Prime software from the Cadence Allegro PCB Librarian Part Developer tool, which creates a potential mismatch of the schematic symbols and assignments in the FPGA design. If pin assignment changes are necessary, make the changes in the Quartus Prime Pin Planner instead of the Cadence Allegro PCB Librarian Part Developer tool, and update the symbol as described in the following sections.

For more information about creating, editing, and organizing component symbols with the Cadence Allegro PCB Librarian Part Developer tool, refer to the Part Developer Help.

### 4.5.1.1.4. Updating FPGA Symbols

As the design process continues, you must make logic changes in the Quartus Prime software, placing signals on different pins after recompiling the design, or use the Quartus Prime Pin Planner to make changes manually. The board designer can request such changes to improve the board routing and layout. To ensure signals connect to the correct pins on the FPGA, you must carry forward these types of changes to the circuit schematic and board layout tools. Updating the `.pin` in the Quartus Prime software facilitates this flow.

**Figure 23.** **Updating the FPGA Symbol in the Design Flow**

[Diagram showing the design flow process]

- **Part Developer**
  - Import or Update Pin Assignments
  - Create or Update FPGA Symbol
  - Edit or Fracture Symbol

- **Design Entry HDL**
  - Instantiate Symbol in Schematic
  - Forward to Board Layout Tool

- **Board Layout Tool**
  - Layout & Route FPGA
  - End

Grayed out steps are not part of the FPGA symbol update process.
To update the symbol using the Cadence Allegro PCB Librarian Part Developer tool after updating the .pin, follow these steps:

1. On the File menu, click **Import and Export**. The Import and Export wizard appears.

2. In the list of actions to perform, select **Import ECO - FPGA**. Click **Next**. The **Select Source** dialog box appears.

3. Select the updated source of the FPGA assignment information. In the **Vendor** list, select **Altera**. In the **PnR Tool** list, select **quartusII**. In the **PR File** field, click **browse** to specify the updated .pin in your Quartus Prime project directory. Click **Next**. The Select Destination window appears.

4. Select the source component and a destination cell for the updated symbol. To create a new component based on the updated pin assignment data, select **Generate Custom Component**. Selecting **Generate Custom Component** replaces the cell listed under the **Specify Library and Cell** name header with a new, nonfractured cell. You can preserve these edits by selecting **Use standard component and select the existing library and cell**. Select the destination library for the component and click **Next**. The **Preview of Import Data** dialog box appears.

5. Make any additional changes to your symbol. Click **Next**. A list of ECO messages appears summarizing the changes made to the cell. To accept the changes and update the cell, click **Finish**.

6. The main Cadence Allegro PCB Librarian Part Developer window appears. You can edit, fracture, and generate the updated symbols as usual from the main Cadence Allegro PCB Librarian Part Developer window.

**Note:** If the Cadence Allegro PCB Librarian Part Developer tool is not set up to point to your PCB Librarian Expert license file, an error message appears in red at the bottom of the message text window of the Part Developer when you select the **Import and Export** command. To point to your PCB Librarian Expert license, on the File menu, click **Change Product**, and select the correct product license.

### 4.5.2. Instantiating the Symbol in the Cadence Allegro Design Entry HDL Software

To instantiate the symbol in your Cadence Allegro Design Entry HDL schematic after saving the new symbol in the Cadence Allegro PCB Librarian Part Developer tool, follow these steps:

1. In the Cadence Allegro Project Manager tool, switch to the board design flow.

2. On the Flows menu, click **Board Design**.

3. To start the Cadence Allegro Design Entry HDL software, click **Design Entry**.

4. To add the newly created symbol to your schematic, on the Component menu, click **Add**. The **Add Component** dialog box appears.

5. Select the new symbol library location, and select the name of the cell you created from the list of cells.
The symbol attaches to your cursor for placement in the schematic. To fracture the symbol into slots, right-click the symbol and choose **Version** to select one of the slots for placement in the schematic.

**Related Information**

www.cadence.com

Provides more information about the Cadence Allegro Design Entry HDL software, including licensing, support, usage, training, and product updates.

### 4.6. FPGA-to-Board Integration with Cadence Allegro Design Entry CIS Software

The Cadence Allegro Design Entry CIS software is a schematic capture tool (part of the Cadence 200 series design flow based on OrCAD Capture CIS). Use the Cadence Allegro Design Entry CIS software to create flat circuit schematics for all types of PCB design. You can also create hierarchical schematics to facilitate design reuse and team-based design using the Cadence Allegro Design Entry CIS software. With the Cadence Allegro Design Entry CIS software, the design flow from FPGA-to-board is unidirectional using only the `.pin` generated by the Quartus Prime software. You can only make signal and pin assignment changes in the Quartus Prime software. These changes reflect as updated symbols in a Cadence Allegro Design Entry CIS schematic project.

**Figure 24. Design Flow with the Cadence Allegro Design Entry CIS Software**

Note: Routing or pin assignment changes made in a board layout tool or a Cadence Allegro Design Entry CIS symbol cannot be back-annotated to the Quartus Prime software.
4.6.1. Creating a Cadence Allegro Design Entry CIS Project

The Cadence Allegro Design Entry CIS software has built-in support for creating schematic symbols using pin assignment information imported from the Quartus Prime software.

To create a new project in the Cadence Allegro Design Entry CIS software, follow these steps:

1. On the File menu, point to New and click Project. The New Project wizard starts. When you create a new project, you can select the PC Board wizard, the Programmable Logic wizard, or a blank schematic.
2. Select the PC Board wizard to create a project where you can select which part libraries to use, or select a blank schematic.

The Programmable Logic wizard only builds an FPGA logic design in the Cadence Allegro Design Entry CIS software.

Your new project is in the specified location and consists of the following files:

- OrCAD Capture Project File (.opj)
- Schematic Design File (.dsn)

4.6.2. Generating a Part

After you create a new project or open an existing project in the Cadence Allegro Design Entry CIS software, you can generate a new schematic symbol based on your Quartus Prime FPGA design. You can also update an existing symbol. The Cadence Allegro Design Entry CIS software stores component symbols in OrCAD Library File (.olb). When you place a symbol in a library attached to a project, it is immediately available for instantiation in the project schematic.

You can add symbols to an existing library or you can create a new library specifically for the symbols generated from your FPGA designs. To create a new library, follow these steps:

1. On the File menu, point to New and click Library in the Cadence Allegro Design Entry CIS software to create a default library named library1.olb. This library appears in the Library folder in the Project Manager window of the Cadence Allegro Design Entry CIS software.
2. To specify a desired name and location for the library, right-click the new library and select Save As. Saving the new library creates the library file.
4.6.3. Generating Schematic Symbol

You can now create a new symbol to represent your FPGA design in your schematic.

To generate a schematic symbol, follow these steps:

1. Start the Cadence Allegro Design Entry CIS software.
2. On the Tools menu, click Generate Part. The Generate Part dialog box appears.
3. To specify the .pin from your Quartus Prime design, in the Netlist/source file type field, click Browse.
4. In the Netlist/source file type list, select Altera Pin File
5. Type the new part name.
6. Specify the Destination part library for the symbol. Failing to select an existing library for the part creates a new library with a default name that matches the name of your Cadence Allegro Design Entry CIS project.
7. To create a new symbol for this design, select Create new part. If you updated your .pin in the Quartus Prime software and want to transfer any assignment changes to an existing symbol, select Update pins on existing part in library.
8. Select any other desired options and set Implementation type to <none>. The symbol is for a primitive library part based only on the .pin and does not require special implementation. Click OK.
9. Review the Undo warning and click Yes to complete the symbol generation.

You can locate the generated symbol in the selected library or in a new library found in the Outputs folder of the design in the Project Manager window. Double-click the name of the new symbol to see its graphical representation and edit it manually using the tools available in the Cadence Allegro Design Entry CIS software.

*Note:* For more information about creating and editing symbols in the Cadence Allegro Design Entry CIS software, refer to the Help in the software.

4.6.4. Splitting a Part

After saving a new symbol in a project library, you can fracture the symbol into multiple parts called sections. Fracturing a part into separate sections is useful for FPGA designs. A single symbol for most FPGA packages might be too large for a single schematic page. Splitting the part into separate sections allows you to organize parts of the symbol by function, creating cleaner circuit schematics. For example, you can create one slot for an I/O symbol, a second slot for a JTAG symbol, and a third slot for a power/ground symbol.
Figure 25. Splitting a Symbol into Multiple Sections

- This diagram represents a Cyclone device with JTAG or passive serial (PS) mode configuration option settings. Symbols created for other devices or other configuration modes might have different sets of configuration pins, but can be fractured in a similar manner.
- The power/ground section shows only a representation of power and ground pins because the device contains a high number of power and ground pins.

Note: Although symbol generation in the Design Entry CIS software refers to symbol fractures as sections, other tools use different names to refer to symbol fractures.

To split a part into sections, select the part in its library in the Project Manager window of the Cadence Allegro Design Entry CIS software. On the Tools menu, click Split Part or right-click the part and choose Split Part. The Split Part Section Input Spreadsheet appears.

Figure 26. Split Part Section Input Spreadsheet
Each row in the spreadsheet represents a pin in the symbol. The Section column indicates the section of the symbol to which each pin is assigned. You can locate all pins in a new symbol in section 1. You can change the values in the Section column to assign pins to various sections of the symbol. You can also specify the side of a section on the location of the pin by changing the values in the Location column. When you are ready, click Split. A new symbol appears in the same library as the original with the name <original part name>_Split1.

View and edit each section individually. To view the new sections of the part, double-click the part. The Part Symbol Editor window appears and the first section of the part displays for editing. On the View menu, click Package to view thumbnails of all the part sections. To edit the section of the symbol, double-click the thumbnail.

For more information about splitting parts into sections and editing symbol sections in the Cadence Allegro Design Entry CIS software, refer to the Help in the software.

4.6.5. Instantiating a Symbol in a Design Entry CIS Schematic

After saving a new symbol in a library in your Cadence Allegro Design Entry CIS project, you can instantiate the new symbol on a page in your schematic. Open a schematic page in the Project Manager window of the Cadence Allegro Design Entry CIS software. To add the new symbol to your schematic on the schematic page, on the Place menu, click Part. The Place Part dialog box appears.

Figure 27. Place Part Dialog Box

Select the new symbol library location and the newly created part name. If you select a part that is split into sections, you can select the section to place from the Part menu. Click OK. The symbol attaches to your cursor for placement in the schematic. To place the symbol, click the schematic page.

For more information about using the Cadence Allegro Design Entry CIS software, refer to the Help in the software.

4.6.6. Intel Libraries for the Cadence Allegro Design Entry CIS Software

Intel provides downloadable .olb for many of its device packages. You can add these libraries to your Cadence Allegro Design Entry CIS project and update the symbols with the pin assignments contained in the .pin generated by the Quartus Prime software. You can use the downloaded library symbols as a base for creating custom
schematic symbols with your pin assignments that you can edit or fracture. This method increases productivity by reducing the amount of time it takes to create and edit a new symbol.

4.6.6.1. Using the Intel-provided Libraries with your Cadence Allegro Design Entry CIS Project

To use the Intel-provided libraries with your Cadence Allegro Design Entry CIS project, follow these steps:

1. Download the library of your target device from the Download Center page found through the Support page on the Intel website.

2. Create a copy of the appropriate .olb to maintain the original symbols. Place the copy in a convenient location, such as your Cadence Allegro Design Entry CIS project directory.

3. In the Project Manager window of the Cadence Allegro Design Entry CIS software, click once on the Library folder to select it. On the Edit menu, click Project or right-click the Library folder and choose Add File to select the copy of the downloaded .olb and add it to your project. You can locate the new library in the list of part libraries for your project.

5. In the Netlist/source file field, click Browse to specify the .pin in your Quartus Prime design.

6. From the Netlist/source file type list, select Altera Pin File.

7. For Part name, type the name of the target device the same as it appears in the downloaded library file. For example, if you are using a device from the CYCLONE06.OLB library, type the part name to match one of the devices in this library such as ep1c6f256. You can rename the symbol in the Project Manager window after updating the part.

8. Set the Destination part library to the copy of the downloaded library you added to the project.

9. Select Update pins on existing part in library. Click OK.

10. Click Yes.

The symbol is updated with your pin assignments. Double-click the symbol in the Project Manager window to view and edit the symbol. On the View menu, click Package if you want to view and edit other sections of the symbol. If the symbol in the downloaded library is fractured into sections, you can edit each section but you cannot further fracture the part. You can generate a new part without using the downloaded part library if you require additional sections.

For more information about creating, editing, and fracturing symbols in the Cadence Allegro Design Entry CIS software, refer to the Help in the software.
### 4.7. Cadence Board Design Tools Support Revision History

**Table 9. Document Revision History**

A. Quartus Prime Pro Edition User Guides

Refer to the following user guides for comprehensive information on all phases of the Quartus Prime Pro Edition FPGA design flow.

**Related Information**

- **Quartus Prime Pro Edition User Guide: Getting Started**
  Introduces the basic features, files, and design flow of the Quartus Prime Pro Edition software, including managing Quartus Prime Pro Edition projects and IP, initial design planning considerations, and project migration from previous software versions.

  Describes creating and optimizing systems using Platform Designer, a system integration tool that simplifies integrating customized IP cores in your project. Platform Designer automatically generates interconnect logic to connect intellectual property (IP) functions and subsystems.

  Describes best design practices for designing FPGAs with the Quartus Prime Pro Edition software. HDL coding styles and synchronous design practices can significantly impact design performance. Following recommended HDL coding styles ensures that Quartus Prime Pro Edition synthesis optimally implements your design in hardware.

- **Quartus Prime Pro Edition User Guide: Design Compilation**
  Describes set up, running, and optimization for all stages of the Quartus Prime Pro Edition Compiler. The Compiler synthesizes, places, and routes your design before generating a device programming file.

  Describes Quartus Prime Pro Edition settings, tools, and techniques that you can use to achieve the highest design performance in Intel FPGAs. Techniques include optimizing the design netlist, addressing critical chains that limit retiming and timing closure, optimizing device resource usage, device floorplanning, and implementing engineering change orders (ECOs).

  Describes operation of the Quartus Prime Pro Edition Programmer, which allows you to configure Intel FPGA devices, and program CPLD and configuration devices, via connection with an Intel FPGA download cable.

- **Quartus Prime Pro Edition User Guide: Block-Based Design**
  Describes block-based design flows, also known as modular or hierarchical design flows. These advanced flows enable preservation of design blocks (or logic that comprises a hierarchical design instance) within a project, and reuse of design blocks in other projects.
• **Quartus Prime Pro Edition User Guide: Partial Reconfiguration**
  Describes Partial Reconfiguration, an advanced design flow that allows you to reconfigure a portion of the FPGA dynamically, while the remaining FPGA design continues to function. Define multiple personas for a particular design region, without impacting operation in other areas.

• **Quartus Prime Pro Edition User Guide: Third-party Simulation**
  Describes RTL- and gate-level design simulation support for third-party simulation tools by Aldec*, Cadence*, Siemens EDA, and Synopsys that allow you to verify design behavior before device programming. Includes simulator support, simulation flows, and simulating Intel FPGA IP.

• **Quartus Prime Pro Edition User Guide: Third-party Synthesis**
  Describes support for optional synthesis of your design in third-party synthesis tools by Siemens EDA, and Synopsys. Includes design flow steps, generated file descriptions, and synthesis guidelines.

• **Quartus Prime Pro Edition User Guide: Third-party Logic Equivalence Checking Tools**
  Describes support for optional logic equivalence checking (LEC) of your design in third-party LEC tools by OneSpin*.

• **Quartus Prime Pro Edition User Guide: Debug Tools**
  Describes a portfolio of Quartus Prime Pro Edition in-system design debugging tools for real-time verification of your design. These tools provide visibility by routing (or "tapping") signals in your design to debugging logic. These tools include System Console, Signal Tap logic analyzer, system debugging toolkits, In-System Memory Content Editor, and In-System Sources and Probes Editor.

• **Quartus Prime Pro Edition User Guide: Timing Analyzer**
  Explains basic static timing analysis principals and use of the Quartus Prime Pro Edition Timing Analyzer, a powerful ASIC-style timing analysis tool that validates the timing performance of all logic in your design using an industry-standard constraint, analysis, and reporting methodology.

• **Quartus Prime Pro Edition User Guide: Power Analysis and Optimization**
  Describes the Quartus Prime Pro Edition Power Analysis tools that allow accurate estimation of device power consumption. Estimate the power consumption of a device to develop power budgets and design power supplies, voltage regulators, heat sink, and cooling systems.

• **Quartus Prime Pro Edition User Guide: Design Constraints**
  Describes timing and logic constraints that influence how the Compiler implements your design, such as pin assignments, device options, logic options, and timing constraints. Use the Interface Planner to prototype interface implementations, plan clocks, and quickly define a legal device floorplan. Use the Pin Planner to visualize, modify, and validate all I/O assignments in a graphical representation of the target device.

• **Quartus Prime Pro Edition User Guide: PCB Design Tools**
  Describes support for optional third-party PCB design tools by Siemens EDA and Cadence*. Also includes information about signal integrity analysis and simulations with HSPICE and IBIS Models.

• **Quartus Prime Pro Edition User Guide: Scripting**
  Describes use of Tcl and command line scripts to control the Quartus Prime Pro Edition software and to perform a wide range of functions, such as managing projects, specifying constraints, running compilation or timing analysis, or generating reports.

A. Quartus Prime Pro Edition User Guides.......................................................................736
1. Command Line Scripting

FPGA design software that easily integrates into your design flow saves time and improves productivity. The Quartus® Prime software provides you with a command-line executable for each step of the FPGA design flow to make the design process customizable and flexible.

The command-line executables are completely interchangeable with the Quartus Prime GUI, allowing you to use the exact combination of tools that best suits your needs.

Related Information
- Tcl Design Examples
- TCL Commands and Packages on page 52

1.1. Benefits of Command-Line Executables

Quartus Prime command-line executables give you precise control over each step of the design flow, reduce memory requirements, and improve performance.

You can group Quartus Prime executable files into a script, batch file, or a makefile to automate design flows. These scripting capabilities facilitate the integration of Quartus Prime software and other EDA synthesis, simulation, and verification software. Automatic design flows can perform on multiple computers simultaneously and easily archive and restore projects.

Command-line executables add flexibility without sacrificing the ease-of-use of the Quartus Prime GUI. You can use the Quartus Prime GUI and command-line executables at different stages in the design flow. For example, you might use the Quartus Prime GUI to edit the floorplan for the design, use the command-line executables to perform place-and-route, and return to the Quartus Prime GUI to perform debugging.

Command-line executables reduce the amount of memory required during each step in the design flow. Since each executable targets only one step in the design flow, the executables themselves are relatively compact, both in file size and the amount of memory used during processing. This memory usage reduction improves performance, and is particularly beneficial in design environments where heavy usage of computing resources results in reduced memory availability.

- About Command-Line Executables in Quartus Prime Help
1.2. Command-Line Scripting Help

Help for command-line executables is available through different methods. You can access help built into the executables with command-line options. You can use the Quartus Prime Command-Line and Tcl API Help browser for an easy graphical view of the help information.

To use the Quartus Prime Command-Line and Tcl API Help browser, type the following command:

```
quartus_sh --qhelp
```

This command starts the Quartus Prime Command-Line and Tcl API Help browser, a viewer for information about the Quartus Prime Command-Line executables and Tcl API.

Use the `-h` option with any of the Quartus Prime Command-Line executables to get a description and list of supported options. Use the `--help=<option name>` option for detailed information about each option.

Figure 1. Quartus Prime Command-Line and Tcl API Help Browser

1.3. Project Settings with Command-Line Options

The Quartus Prime software command-line executables accept arguments to set project variables and access common settings.

To make assignments to an individual entity you can use the Quartus Prime Tcl scripting API. On existing projects, you can also open the project in the Quartus Prime GUI, change the assignment, and close the project. The changed assignment is updated in the `.qsf`. Any command-line executables that are run after this update use the updated assignment.

Related Information

- Compilation with quartus_sh --flow on page 8
- Quartus Prime Settings File (.qsf) Definition in Quartus Prime Help
1. Command Line Scripting

1.3.1. Option Precedence

Project assignments follow a set of precedence rules. Assignments for a project can exist in three places:

- Quartus Prime Settings File (.qsf)
- The compiler database
- Command-line options

The .qsf file contains all the project-wide and entity-level assignments and settings for the current revision for the project. The compiler database contains the result of the last compilation in the /db directory, and reflects the assignments at the moment when the project was compiled. Updated assignments first appear in the compiler database and later in the.qsf file.

Command-line options override any conflicting assignments in the .qsf file or the compiler database files. To specify whether the .qsf or compiler database files take precedence for any assignments not specified in the command-line, use the option --read_settings_files.

Table 1. Precedence for Reading Assignments

<table>
<thead>
<tr>
<th>Option Specified</th>
<th>Precedence for Reading Assignments</th>
</tr>
</thead>
<tbody>
<tr>
<td>--read_settings_files = on</td>
<td>1. Command-line options</td>
</tr>
<tr>
<td>(Default)</td>
<td>2. The .qsf for the project</td>
</tr>
<tr>
<td></td>
<td>3. Project database (db directory, if it exists)</td>
</tr>
<tr>
<td></td>
<td>4. Quartus Prime software defaults</td>
</tr>
<tr>
<td>--read_settings_files = off</td>
<td>1. Command-line options</td>
</tr>
<tr>
<td></td>
<td>2. Project database (db directory, if it exists)</td>
</tr>
<tr>
<td></td>
<td>3. Quartus Prime software defaults</td>
</tr>
</tbody>
</table>

The --write_settings_files command-line option lists the locations to which assignments are written.

Table 2. Location for Writing Assignments

<table>
<thead>
<tr>
<th>Option Specified</th>
<th>Location for Writing Assignments</th>
</tr>
</thead>
<tbody>
<tr>
<td>--write_settings_files = on</td>
<td>.qsf file and compiler database</td>
</tr>
<tr>
<td>(Default)</td>
<td></td>
</tr>
<tr>
<td>--write_settings_files = off</td>
<td>Compiler database</td>
</tr>
</tbody>
</table>

Any assignment not specified as a command-line option or found in the .qsf file or compiler database file is set to its default value.

Use the options --read_settings_files=off and --write_settings_files=off (where appropriate) to optimize the way that the Quartus Prime software reads and updates settings files.
1.4. Compilation with quartus_sh --flow

The figure shows a typical Quartus Prime FPGA design flow using command-line executables.

Figure 2. Typical Design Flow

Use the quartus_sh executable with the --flow option to perform a complete compilation flow with a single command. The --flow option supports the smart recompile feature and efficiently sets command-line arguments for each executable in the flow.

You can resume an interrupted compilation with the -resume argument of the --flow option.

After you start a compilation flow with the quartus_sh executable, you can monitor the progress of the compilation flow in the Quartus Prime Pro Edition GUI.
The following example runs analysis & synthesis, fitter, timing analysis, and programming file generation with a single command:

```
quartus_sh --flow compile filtref
```

**Tip:** For information about specialized flows, type `quartus_sh --help=flow` at a command prompt.

**Related Information**
- Resuming a Compilation with `quartus_sh --flow` on page 9

### 1.4.1. Resuming a Compilation with `quartus_sh --flow`

You can resume a compilation flow for a project from the last valid step completed in the flow with the `-resume` option of the `quartus_sh --flow` command. If you want to resume a compilation flow, ensure that no settings that affect the subsequent compilation stages have changed from initial start of the compilation.

You can also use the `-start` and `-stop` options of `quartus_sh --flow` command to start and stop a compilation flow at specific compilation tasks.

Resuming a compilation flow also updates the Compilation Dashboard to show how the flow is progressing.

For command syntax and example of how to use the flow resume feature, run `quartus_sh --help=flow` at a command prompt.

**Related Information**
- Using the Compilation Dashboard

### 1.4.2. Temporarily Overriding the Compiler Optimization Mode

You can run a full compilation flow that temporarily overrides the compiler optimization mode set in the Quartus settings file (`.qsf`) for your design. The optimization mode set for your project in your settings file does not change and remains the default compilation strategy for your project.

Overriding the compiler optimization mode set in your project can be helpful when your project has long compile times and you want to quickly produce a bitstream for on-chip testing.

The following temporary optimization mode compilation flow options are available for the `quartus_sh --flow`, `quartus_fit`, and `quartus_syn` commands:

- `-aggressive_compile_time`
  
  In the Aggressive Compile Time optimization mode, the Compiler reduces its performance optimization efforts and performs minimal reporting to provide a shorter compilation time.

- `-fast_functional_test`
  
  In Fast Functional Test optimization mode, the Compiler minimizes its setup-timing optimization efforts to provide an even shorter compilation time.
For example, to compile revision `rev1` of project `top` with a temporary Fast Functional Test optimization mode that overrides the compiler optimization mode set in the project `.qsf` file, issue the following command:

```
quartus_sh --flow compile top -c rev1 -fast_functional_test
```

The selected optimization mode is enabled only for the duration of the compilation. After the compilation completes, Quartus Prime returns to the compilation optimization strategy that is set in the project settings.

**Important:** With these optimization modes, the clocks in the resulting compilation might not meet setup. You might need to slow down the clocks on your design, such as by using PLL ECOs post-compile, before generating the bitstream.

**Related Information**
- Compiler Optimization Modes in *Intel Quartus Prime Pro Edition User Guide: Design Compilation*

### 1.5. Text-Based Report Files

Each command-line executable creates a text report file when it is run. These files report success or failure, and contain information about the processing performed by the executable.

Report file names contain the revision name and the short-form name of the executable that generated the report file, in the format `<revision>..<executable>.rpt`. For example, using the `quartus_fit` executable to place and route a project with the revision name `design_top` generates a report file named `design_top.fit.rpt`. Similarly, using the `quartus_sta` executable to perform timing analysis on a project with the revision name `fir_filter` generates a report file named `fir_filter.sta.rpt`.

As an alternative to parsing text-based report files, you can use the `::quartus::report` Tcl package.

**Related Information**
- `Text-Format Report File (.rpt) Definition` in Quartus Prime Help
- `::quartus::report` in Quartus Prime Help

### 1.6. Using Command-Line Executables in Scripts

You can use command-line executables in scripts that control other software, in addition to Quartus Prime software. For example, if your design flow uses third-party synthesis or simulation software, and you can run this other software at the command prompt, you can group those commands with Quartus Prime executables in a single script.
To set up a new project and apply individual constraints, such as pin location assignments and timing requirements, you must use a Tcl script or the Quartus Prime GUI.

Command-line executables are very useful for working with existing projects, for making common global settings, and for performing common operations. For more flexibility in a flow, use a Tcl script. Additionally, Tcl scripts simplify passing data between different stages of the design flow.

For example, you can create a UNIX shell script to run a third-party synthesis software, place-and-route the design in the Quartus Prime software, and generate output netlists for other simulation software.

1.7. Common Scripting Examples

You can create scripts including command line executable to control common Quartus Prime processes.

1.7.1. Create a Project and Apply Constraints

The command-line executables include options for common global project settings and commands. You can use a Tcl script to apply constraints such as pin locations and timing assignments. You can write a Tcl constraint file, or generate one for an existing project by clicking Project ➤ Generate Tcl File for Project.

The example creates a project with a Tcl script and applies project constraints using the tutorial design files in the <Quartus Prime installation directory>/qdesigns/fir_filter/directory.

```
project_new filtref -overwrite
# Assign family, device, and top-level file
set_global_assignment -name FAMILY "Arria 10"
set_global_assignment -name DEVICE <Device>
set_global_assignment -name VERILOG_FILE filtref.v
# Assign pins
set_location_assignment -to clk Pin_28
set_location_assignment -to clkx2 Pin_29
set_location_assignment -to d[0] Pin_139
set_location_assignment -to d[1] Pin_140
#
project_close
```

Save the script in a file called setup_proj.tcl and type the commands illustrated in the example at a command prompt to create the design, apply constraints, compile the design, and perform fast-corner and slow-corner timing analysis. Timing analysis results are saved in two files, filtref_sta_1.rpt and filtref_sta_2.rpt.

```
quartus_sh -t setup_proj.tcl
quartus_syn filtref
quartus_fit filtref
quartus_asm filtref
quartus_sta filtref --model=fast --export_settings=off
mv filtref_sta.rpt filtref_sta_1.rpt
quartus_sta filtref --export_settings=off
mv filtref_sta.rpt filtref_sta_2.rpt
```
Type the following commands to create the design, apply constraints, and compile the design, without performing timing analysis:

```
quartus_sh -t setup_proj.tcl
quartus_sh --flow compile filtref
```

The `quartus_sh --flow compile` command performs a full compilation, and is equivalent to clicking the **Start Compilation** button in the toolbar.

### 1.7.2. Check Design File Syntax

The `.tcl` script example below assumes the Quartus Prime software **fir_filter** tutorial project exists in the current directory. You can find the **fir_filter** project in the `<Quartus Prime directory>/qdesigns/fir_filter` directory unless the Quartus Prime software tutorial files are not installed.

When options are not specified, the executable uses the project database values. If not specified in the project database, the executable uses the Quartus Prime software default values.

To run this script, save this script to a file such as `check_syntax.tcl` and then run the following command from a command prompt: `quartus_syn -t check_syntax.tcl`.

```
set dir [pwd]; # set dir to current working directory
# assign quartus_files variable to all files within current working directory
# asterisk (*) may be changed to specific file extensions (i.e. *.v, *.vhdl, *.etc)
set quartus_files [glob -directory $dir *]
# open project fir_filter with revision name filtref
project_open fir_filter -revision filtref
foreach file $quartus_files {
    post_message $file;         # echo which file was analyzed
    analyze_files -files $file -library work; # analyze file for syntax
}
project_close; # close project
```

### 1.7.3. Create a Project and Synthesize a Netlist Using Netlist Optimizations

This example creates a new Quartus Prime project with a file `top.edf` as the top-level entity. The `--enable_register_retiming=on` and `--enable_wysiwyg_resynthesis=on` options cause `quartus_map` to optimize the design using gate-level register retiming and technology remapping.

The `--part` option causes `quartus_syn` to target a device. To create the project and synthesize it using the netlist optimizations described above, type the command shown in this example at a command prompt.

```
quartus_syn top --source=top.edf --enable_register_retiming=on
    --enable_wysiwyg_resynthesis=on --part=<part>
```
1.7.4. Archive and Restore Projects

You can archive or restore an Quartus Prime Archive File (.qar) with a single command. This makes it easy to take snapshots of projects when you use batch files or shell scripts for compilation and project management.

Use the --archive or --restore options for quartus_sh as appropriate. Type the command shown in the example at a command prompt to archive your project.

```
quartus_sh --archive <project name>
```

The archive file is automatically named `<project name>.qar`. If you want to use a different name, type the command with the -output option as shown in example the example.

```
quartus_sh --archive <project name> -output <filename>
```

To restore a project archive, type the command shown in the example at a command prompt.

```
quartus_sh --restore <archive name>
```

The command restores the project archive to the current directory and overwrites existing files.

**Related Information**

Managing Quartus Prime Projects

1.7.5. Update Memory Contents Without Recompiling

You can use two commands to update the contents of memory blocks in your design without recompiling. Use the quartus_cdb executable with the --update_mif option to update memory contents from .mif or .hexout files. Then, rerun the assembler with the quartus_asm executable to regenerate the .sof, .pof, and any other programming files.

```
quartus_cdb --update_mif <project name> [--rev=<revision name>]
quartus_asm <project name> [--rev=<revision name>]
```

The example shows the commands for a DOS batch file for this example. With a DOS batch file, you can specify the project name and the revision name once for both commands. To create the DOS batch file, paste the following lines into a file called update_memory.bat.

```
quartus_cdb --update_mif %1 --rev=%2
quartus_asm %1 --rev=%2
```

To run the batch file, type the following command at a command prompt:

```
update_memory.bat <project name> <revision name>
```
1.7.6. Create Device Configuration Files

You can use the `quartus_cpf` or `quartus_pfg` command line executables to generate different types of device configuration files at the command line, depending on your target device.

- `quartus_pfg`—controls the same programming file generation functions as the Programming File Generator dialog box in the Quartus Prime software GUI, and supports programming file generation for Stratix® 10 and Intel Agilex® 7 device families.

Table 3. `quartus_pfg` Command Examples

<table>
<thead>
<tr>
<th>Command Function</th>
<th>Command Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify the ASX4 operation mode, convert .sof to .jic</td>
<td>`quartus_pfg --c -o device=MT25QU512 -o mode=ASX4 -o flash_loader=1SG280HN333 \</td>
</tr>
<tr>
<td></td>
<td><code>project.sof project.jic</code></td>
</tr>
<tr>
<td>Access full command-line syntax help</td>
<td><code>quartus_pfg --help</code></td>
</tr>
</tbody>
</table>

- `quartus_cpf`—controls the same functions as the Convert Programming Files dialog box in the Quartus Prime software GUI, and supports programming file generation for all device families prior to the Stratix 10 device family.

Table 4. `quartus_cpf` Command Examples

<table>
<thead>
<tr>
<th>Command Function</th>
<th>Command Syntax</th>

<tr>
<td>Convert a .sof programming file to CvP periphery image (*.jam) file</td>
<td><code>quartus_cpf -c &lt;filename&gt;.sof &lt;filename&gt;.jam --cvp</code></td>
</tr>
<tr>
<td>Access full command-line syntax help</td>
<td><code>quartus_cpf --help</code></td>
</tr>
</tbody>
</table>

Note: For complete Quartus Prime command line executable syntax and examples, refer to Command-Line Scripting Help on page 6.

1.7.7. Fit a Design Using Multiple Seeds

This shell script example assumes that the Quartus Prime software tutorial project called `fir_filter` exists in the current directory (defined in the file `fir_filter.qpf`). If the tutorial files are installed on your system, this project exists in the `<Quartus Prime directory>/qdesigns<quartus_version_number> /fir_filter` directory.

Because the top-level entity in the project does not have the same name as the project, you must specify the revision name for the top-level entity with the `--rev` option. The `--seed` option specifies the seeds to use for fitting.
A seed is a parameter that affects the random initial placement of the Quartus Prime Fitter. Varying the seed can result in better performance for some designs.

After each fitting attempt, the script creates new directories for the results of each fitting attempt and copies the complete project to the new directory so that the results are available for viewing and debugging after the script has completed.

```bash
#!/bin/sh
ERROR_SEEDS=""
quartus_syn fir_filter --rev=filtref
# Iterate over a number of seeds
for seed in 1 2 3 4 5
do
  echo "Starting fit with seed=$seed"
  # Perform a fitting attempt with the specified seed
  quartus_fit fir_filter --seed=$seed --rev=filtref
  # If the exit-code is non-zero, the fitting attempt was
  # successful, so copy the project to a new directory
  if [ $? -eq 0 ]
    then
      mkdir ../fir_filter-seed_$seed
      mkdir ../fir_filter-seed_$seed/db
      cp * ../fir_filter-seed_$seed
      cp db/* ../fir_filter-seed_$seed/db
    else
      ERROR_SEEDS="ERROR_SEEDS $seed"
    fi
done
if [ -z "$ERROR_SEEDS" ]
then
  echo "Seed sweeping was successful"
  exit 0
else
  echo "There were errors with the following seed(s)"
  echo $ERROR_SEEDS
  exit 1
fi
```

**Tip:** Use Design Space Explorer II (DSE) included with the Quartus Prime software script (by typing `quartus_dse` at a command prompt) to improve design performance by performing automated seed sweeping.

### 1.8. The QFlow Script

A Tcl/Tk-based graphical interface called QFlow is included with the command-line executables. You can use the QFlow interface to open projects, launch some of the command-line executables, view report files, and make some global project assignments.
The QFlow interface can run the following command-line executables:

- `quartus_syn` (Analysis and Synthesis)
- `quartus_fit` (Fitter)
- `quartus_sta` (Timing Analyzer)
- `quartus_asm` (Assembler)
- `quartus_eda` (EDA Netlist Writer)

To view floorplans or perform other GUI-intensive tasks, launch the Quartus Prime software.

Start QFlow by typing the following command at a command prompt:

```
quartus_sh -g
```

**Tip:** The QFlow script is located in the `<Quartus Prime directory>/common/tcl/apps/qflow/` directory.

### 1.8.1. `--partition` Option

The `--partition` option is for the `--simulation` top-level argument for `quartus_eda`. This option selects an individual partition as the netlist output.

#### `--exclude_sub_partitions`

The `--exclude_sub_partitions` flag limits the output to the netlist of this partition only. This flag is only valid when you use the `--partition` option; this flag outputs the netlist belonging to the partition specified. The software instantiates sub-partitions as separate modules.

For no partition argument, the software writes the entire design out to a single file. The partition argument takes a name of a partition in the design. The sub-option is a flag only and takes no arguments.

When you specify the `--exclude_sub_partitions` flag, the software only writes out the contents of the selected partition. Sub-partitions are instantiated as separate modules. Each call of `quartus_eda` writes one netlist. If you write out the design one partition at a time, excluding sub partitions, they need to call `quartus_eda` for each partition in the design including the root.

#### `root_partition`

You can specify the `root_partition` flag to get the full design. You can provide the partition option to write to a netlist file (`.vo` or `.vho` file). The file contains all the logic and atoms corresponding the contents of the specified partition along with its sub-partition.

#### `--rename`

Additionally, you have the option to rename a module name in the generated netlist file using the `--rename` option. By default, the software uses the partition name as the module name in the netlist file. This option is only valid when you use the partition option. You can elect to rename any module using `--module_name=abc=xyz --module_name=def=prq`. The generated file names format is: `<revision>..<module`
or partition name>.<vo or vho> By default, the software writes the netlist file to the simulation/<3rd party simulation tool> directory (for example, simulation/modelsim), unless you specify an output_directory (using a command line option or .qsf assignment).

1.9. Command-Line Scripting Revision History

The following revision history applies to this chapter:

Table 5. Document Revision History

<table>
<thead>
<tr>
<th>Document Version</th>
<th>Quartus Prime Version</th>
<th>Changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>2024.04.01</td>
<td>24.1</td>
<td>• Applied phase I Altera rebranding throughout.</td>
</tr>
<tr>
<td>2022.04.03</td>
<td>23.1</td>
<td>• Updated name of the Agilex 7 device family.</td>
</tr>
<tr>
<td>2022.09.26</td>
<td>22.3</td>
<td>• Added Top FAQs navigation to document cover.</td>
</tr>
</tbody>
</table>
| 2022.03.28        | 22.1                  | • Added "Temporarily Overriding the Compiler Optimization Mode"  
                      • Added information about monitoring a compilation to "Compilation with quartus_sh --flow" |
| 2021.03.29        | 21.1                  | • Added "Resuming a Compilation with quartus_sh --flow"  
                      • Revised "Check Design File Syntax". |
| 2020.12.14        | 20.4                  | • Updated "Create Device Configuration Files" to include references to the cvp command option and the quartus_pfg command. |
| 2020.04.13        | 20.1                  | Added --partition option. |
| 2017.05.08        | 17.0.0                | • Reorganized content on topics: Benefits of Command-Line Executables and Project Settings with Command-Line Options.  
                      • Removed mentions to unsupported executables and options.  
                      • Removed topics: Introductory Example and Common Scripting Examples |
| 2016.10.31        | 16.1.0                | • Implemented Intel rebranding. |
| 2015.11.02        | 15.1.0                | Changed instances of Quartus II to Quartus Prime. |
| 2015.05.04        | 15.0.0                | Remove descriptions of makefile support that was removed from software in 14.0. |
| December 2014     | 14.1.0                | Updated DSE II commands. |
| June 2014         | 14.0.0                | Updated formatting. |
| November 2013     | 13.1.0                | Removed information about -silnet qmegawiz command |
| June 2012         | 12.0.0                | Removed survey link. |
| November 2011     | 11.0.1                | Template update. |
| May 2011          | 11.0.0                | Corrected quartus_qpf example usage.  
                      Updated examples. |
| December 2010     | 10.1.0                | Template update.  
                      Added section on using a script to regenerate megafunction variations.  
                      Removed references to the Classic Timing Analyzer (quartus_tan).  
                      Removed Qflow illustration. |
| July 2010         | 10.0.0                | Updated script examples to use quartus_sta instead of quartus_tan, and other minor updates throughout document. |

2. Tcl Scripting

You can use Tcl scripts, as an alternative to the GUI, to control the function and operation of Quartus Prime software.

For example, you can use Tcl scripts to perform the following tasks:

• Manage Quartus Prime projects
• Specify assignments and constraints
• Compile your design
• Perform timing analysis
• Generate and view reports about your project

You can also use Tcl scripts to migrate a project or project settings. For example, when working with different projects targeting the same prototype or development board, you can define a Tcl script to automate pin assignments for each project, rather than entering the assignments individually in the GUI. You can automatically generate a Tcl script based on current project assignments, which simplifies transferring the assignments to another project.

The Quartus Prime software Tcl commands follow familiar EDA industry Tcl application programming interface (API) standards for command-line options. If you encounter an error with a command argument, the Tcl interpreter includes help information showing correct usage.

This chapter includes sample Tcl scripts for automating tasks in the Quartus Prime software, along with a complete reference of all supported Tcl commands and arguments. You can modify the example scripts for use with your own designs. Refer to Design Examples section of the Support area on the Intel website.

• TCL Commands and Packages on page 52

2.1. Tool Command Language

Tcl (pronounced “tickle”) stands for Tool Command Language, and is the industry-standard scripting language. Tcl supports control structures, variables, network socket access, and APIs.

With Tcl, you can work seamlessly across most development platforms. Synopsys*, Mentor Graphics*, and Intel software products support the Tcl language.

By combining Tcl commands and Quartus Prime API functions, you can create your own procedures and automate your design flow. Run Quartus Prime software in batch mode, or execute individual Tcl commands interactively in the Quartus Prime Tcl shell.
Quartus Prime software supports Tcl/Tk version 8.5, supplied by the Tcl DeveloperXchange.

2.2. The Quartus Prime Tcl Console Window

A Tcl Console Window is available in the Quartus Prime software GUI by clicking View ➤ Tcl Console. You can run Quartus Prime Tcl commands directly in the Tcl Console window. The Quartus Prime Tcl shell interprets all Tcl commands that you type in the Tcl Console.

In addition, when you run commands in the Quartus Prime GUI, the Tcl Console displays the equivalent Tcl command. You can right-click in the Tcl Console and click Save to File to save a log file of the Tcl commands in the Tcl Console.

Note: Some shell commands such as cd, ls, and others can be run in the Tcl Console window, with the Tcl exec command. However, for best results, run shell commands and Quartus Prime executables from a system command prompt outside of the Quartus Prime software GUI.

Tcl messages appear in the System tab (Messages window). Errors and messages written to stdout and stderr also are shown in the Quartus Prime Tcl Console window.

2.3. Quartus Prime Tcl Packages

The Quartus Prime software groups Tcl commands into packages by function.

Note: Refer to TCL Commands and Packages on page 52 for a comprehensive reference of all Quartus Prime Tcl packages and commands.

</tr>
</tbody>
</table>

To keep memory requirements as low as possible, only the minimum number of packages load automatically with each Quartus Prime executable. To run commands from other packages, load those packages beforehand.

Run your scripts with executables that include the packages you use in the scripts. For example, to use commands in the sdc_ext package, you must use the quartus_sta executable because quartus_sta is the only executable with support for the sdc_ext package.

The following command prints lists of the packages loaded or available to load for an executable, to the console:

```
<executable name> --tcl_eval help
```

For example, type the following command to list the packages loaded or available to load by the quartus_fit executable:

```
quartus_fit --tcl_eval help
```
2.3.1. Loading Tcl Packages

To load an Quartus Prime Tcl package, use the `load_package` command as follows:

```
load_package [-version <version number>] <package name>
```

This command is similar to `package require`, but it allows to alternate between different versions of an Quartus Prime Tcl package.

2.3.2. Quartus Prime Tcl API Help

Quartus Prime Tcl help allows easy access to information about the Quartus Prime Tcl commands.

- This command opens the Quartus Prime Command-Line and Tcl API help browser, which documents all commands and options in the Quartus Prime Tcl API. At a system command prompt, access the Quartus Prime Tcl API Help by typing:

  `quartus_sh --qhelp`

- The Tcl API Help can be accessed from the Tcl console as well. At a Tcl prompt, type `help` to access the help information. The output is:

The Tcl console provides help options that display specific information:

**Table 7. Help Options Available in the Quartus Prime Tcl Environment**

</tr>
</tbody>
</table>

The Tcl API help is also available in Quartus Prime online help. Search for the command or package name to find details about that command or package.

### 2.3.2.1. Command-Line Options

You can use any of the following command line options with executables that support Tcl:
Table 8. Command-Line Options Supporting Tcl Scripting

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td>the following command displays help for the project package:</td>
</tr>
<tr>
<td></td>
<td>quartus_sh --tcl_eval help --pkg project</td>
</tr>
</tbody>
</table>

2.3.2.1.1. Run a Tcl Script

Running an executable with the -t option runs the specified Tcl script. You can also specify arguments to the script. Access the arguments through the argv variable, or use a package such as cmdline, which supports arguments of the following form:

```bash
-<argument name> <argument value>
```

The cmdline package is included in the `<Quartus Prime directory>/common/tcl/packages` directory.

For example, to run a script called myscript.tcl with one argument, Stratix, type the following command at a system command prompt:

```bash
quartus_sh -t myscript.tcl Stratix
```

2.3.2.1.2. Interactive Shell Mode

Running an executable with the -s option starts an interactive Tcl shell. For example, to open the Quartus Prime Timing Analyzer executable in interactive shell mode, type:

```bash
quartus_sta -s
```

Commands you type in the Tcl shell are interpreted when you press Enter. To run a Tcl script in the interactive shell type:

```bash
source <script name>
```

If a command is not recognized by the shell, it is assumed to be external and executed with the exec command.

2.3.2.1.3. Evaluate as Tcl

Running an executable with the --tcl_eval option causes the executable to immediately evaluate the remaining command-line arguments as Tcl commands. This can be useful if you want to run simple Tcl commands from other scripting languages.

For example, the following command runs the Tcl command that prints out the commands available in the project package.

```bash
quartus_sh --tcl_eval help --pkg project
```
2.4. Tcl Design Flow Controls

You can use Tcl scripts to control all aspects of the design flow, including controlling other software, when the other software also includes a scripting interface.

Typically, EDA tools include their own script interpreters that extend core language functionality with tool-specific commands. For example, the Quartus Prime Tcl interpreter supports all core Tcl commands, and adds numerous commands specific to the Quartus Prime software. You can include commands in one Tcl script to run another script, which allows you to combine or chain together scripts to control different tools. Because scripts for different tools must be executed with different Tcl interpreters, it is difficult to pass information between the scripts unless one script writes information into a file and another script reads it.

Within the Quartus Prime software, you can perform many different operations in a design flow (such as synthesis, fitting, and timing analysis) from a single script, making it easy to maintain global state information and pass data between the operations. However, there are some limitations on the operations you can perform in a single script due to the various packages supported by each executable.

There are no limitations on running flows from any executable. Flows include operations found in

Processing ➤ Start in the Quartus Prime GUI, and are also documented as options for the `execute_flow` Tcl command. If you can make settings in the Quartus Prime software and run a flow to get your desired result, you can make the same settings and run the same flow in a Tcl script.

2.4.1. Creating Projects and Making Assignments

You can create a script that makes all the assignments for an existing project, and then use the script at any time to restore your project settings to a known state.

Click Project ➤ Generate Tcl File for Project to automatically generate a `.tcl` file containing your assignments. You can source this file to recreate your project, and you can add other commands to this file, such as commands for compiling the design. This file is a good starting point to learn about project management and assignment commands.

To commit the assignments you create or modify to the `.qsf` file, you use the `export_assignments` or `project_close` commands. However, when you run the `execute_flow` command, Quartus Prime software automatically commits the assignment changes to the `.qsf` file. To prevent this behavior, specify the `--dont_export_assignments` logic option.

**Related Information**

- Interactive Shell Mode on page 24
- Constraining Designs
2.4.2. Compiling Designs

You can run the Quartus Prime command-line executables from Tcl scripts. Use the included flow package to run various Quartus Prime compilation flows, or run each executable directly.

2.4.2.1. The flow Package

The flow package includes two commands for running Quartus Prime command-line executables, either individually or together in standard compilation sequence.

- The execute_module command allows you to run an individual Quartus Prime command-line executable.
- The execute_flow command allows you to run some or all the executables in commonly-used combinations.

Use the flow package instead of system calls to run Quartus Prime executables from scripts or from the Quartus Prime Tcl Console.

2.4.2.2. Compile All Revisions

You can use a simple Tcl script to compile all revisions in your project. Save the following script in a file called compile_revisions.tcl and type the following to run it:

```tcl
quartus_sh -t compile_revisions.tcl <project name>
```

### Compile All Revisions

```tcl
load_package flow project_open [lindex $quartus(args) 0] set original_revision [get_current_revision] foreach revision [get_project_revisions] { set_current_revision $revision execute flow -compile } set_current_revision $original_revision project_close
```

2.4.3. Reporting

You can extract information from the Compilation Report to evaluate results. The Quartus Prime Tcl API provides easy access to report data so you do not have to write scripts to parse the text report files.

If you know the exact report cell or cells you want to access, use the get_report_panel_data command and specify the row and column names (or x and y coordinates) and the name of the appropriate report panel. You can often search for data in a report panel. To do this, use a loop that reads the report one row at a time with the get_report_panel_row command.

Column headings in report panels are in row 0. If you use a loop that reads the report one row at a time, start with row 1 to skip column headings. The get_number_of_rows command returns the number of rows in the report panel, including the column heading row. Since the number of rows includes the column heading row, continue your loop if the loop index is less than the number of rows.
Report panels are hierarchically arranged and each level of hierarchy is denoted by the string "||" in the panel name. For example, the name of the Fitter Settings report panel is Fitter||Fitter Settings because it is in the Fitter folder. Panels at the highest hierarchy level do not use the "||" string. For example, the Flow Settings report panel is named Flow Settings.

The following Tcl code prints a list of all report panel names in your project. You can run this code with any executable that includes support for the report package.

### Print All Report Panel Names

```tcl
load_package report
project_open myproject
load_report
set panel_names [get_report_panel_names]
foreach panel_name $panel_names {
    post_message "$panel_name"
}
```

#### 2.4.3.1. Saving Report Data in csv Format

You can create a Comma Separated Value (.csv) file from any Quartus Prime report to open with a spreadsheet editor.

The following Tcl code shows a simple way to create a .csv file with data from the Fitter panel in a report.

### Create .csv Files from Reports

```tcl
load_package report
project_open my-project
load_report
# This is the name of the report panel to save as a CSV file
set panel_name "Fitter||Fitter Settings"
set csv_file "output.csv"
set fh [open $csv_file w]
set num_rows [get_number_of_rows -name $panel_name]
# Go through all the rows in the report file, including the
# row with headings, and write out the comma-separated data
for { set i 0 } { $i < $num_rows } { incr i } {
    set row_data [get_report_panel_row -name $panel_name -row $i]
    puts $fh [join $row_data ","]
}
close $fh
unload_report
```

You can modify the script to use command-line arguments to pass in the name of the project, report panel, and output file to use. You can run this script example with any executable that supports the report package.

#### 2.4.4. Timing Analysis

The Quartus Prime Timing Analyzer includes support for industry-standard SDC commands in the sdc package.

The Quartus Prime software includes comprehensive Tcl APIs and SDC extensions for the Timing Analyzer in the sta, and sdc_ext packages. The Quartus Prime software also includes a tdc package that obtains information from the Timing Analyzer.
### 2.5. Automating Script Execution

You can configure scripts to run automatically at various points during compilation. Use this capability to automatically run scripts that perform custom reporting, make specific assignments, and perform many other tasks.

The following three global assignments control when a script is run automatically:

- **PRE_FLOW_SCRIPT_FILE** — before a flow starts
- **POST_MODULE_SCRIPT_FILE** — after a module finishes
- **POST_FLOW_SCRIPT_FILE** — after a flow finishes

A module is another term for an Quartus Prime executable that performs one step in a flow. For example, two modules are Analysis and Synthesis (quartus_syn), and timing analysis (quartus_sta).

A flow is a series of modules that the Quartus Prime software runs with predefined options. For example, compiling a design is a flow that typically consists of the following steps (performed by the indicated module):

1. Analysis and Synthesis (quartus_syn)
2. Fitter (quartus_fit)
3. Assembler (quartus_asm)
4. Timing Analyzer (quartus_sta)

Other flows are described in the help for the `execute_flow` Tcl command. In addition, many commands in the Processing menu of the Quartus Prime GUI correspond to this design flow.

To make an assignment automatically run a script, add an assignment with the following form to the .qsf for your project:

```
set_global_assignment -name <assignment name> <executable>:<script name>
```

The Quartus Prime software runs the scripts.

```
<executable> -t <script name> <flow or module name> <project name> <revision name>
```

The first argument passed in the argv variable (or quartus(args) variable) is the name of the flow or module being executed, depending on the assignment you use. The second argument is the name of the project and the third argument is the name of the revision.

The last process, current project, and current revision are passed to the script by the Quartus Prime software and can be accessed by the following commands:

```
set process [lindex $quartus(args) 0]
set project [lindex $quartus(args) 1]
set revision [lindex $quartus(args) 2]
project_open $project -revision $revision
```
When you use the POST_MODULE_SCRIPT_FILE assignment, the specified script is automatically run after every executable in a flow. You can use a string comparison with the module name (the first argument passed in to the script) to isolate script processing to certain modules.

### 2.5.1. Execution Example

To illustrate how automatic script execution works in a complete flow, assume you have a project called top with a current revision called rev_1, and you have the following assignments in the .qsf for your project.

- `set_global_assignment -name PRE_FLOW_SCRIPT_FILE quartus_sh:first.tcl`
- `set_global_assignment -name POST_MODULE_SCRIPT_FILE quartus_sh:next.tcl`
- `set_global_assignment -name POST_FLOW_SCRIPT_FILE quartus_sh:last.tcl`

When you compile your project, the PRE_FLOW_SCRIPT_FILE assignment causes the following command to be run before compilation begins:

```
quartus_sh -t first.tcl compile top rev_1
```

Next, the Quartus Prime software starts compilation with analysis and synthesis, performed by the quartus_syn executable. After the Analysis and Synthesis finishes, the POST_MODULE_SCRIPT_FILE assignment causes the following command to run:

```
quartus_sh -t next.tcl quartus_syn top rev_1
```

Then, the Quartus Prime software continues compilation with the Fitter, performed by the quartus_fit executable. After the Fitter finishes, the POST_MODULE_SCRIPT_FILE assignment runs the following command:

```
quartus_sh -t next.tcl quartus_fit top rev_1
```

Corresponding commands are run after the other stages of the compilation. When the compilation is over, the POST_FLOW_SCRIPT_FILE assignment runs the following command:

```
quartus_sh -t last.tcl compile top rev_1
```

### 2.5.2. Controlling Processing

The POST_MODULE_SCRIPT_FILE assignment causes a script to run after every module. Because the same script is run after every module, you might have to include some conditional statements that restrict processing in your script to certain modules.

For example, if you want a script to run only after timing analysis, use a conditional test like the following example. It checks the flow or module name passed as the first argument to the script and executes code when the module is `quartus_sta`.

**Restrict Processing to a Single Module**

```
set module [lindex $quartus(args) 0]
if [string match "quartus_sta" $module] {
    # Include commands here that are run after timing analysis
    # Use the post-message command to display
```

Send Feedback
2.5.3. Displaying Messages

Because of the way the Quartus Prime software runs the scripts automatically, you must use the `post_message` command to display messages, instead of the `puts` command. This requirement applies only to scripts that are run by the three assignments listed in "Automating Script Execution".

**Related Information**
- [The post_message Command](#) on page 41
- [Automating Script Execution](#) on page 28

2.6. Other Scripting Features

The Quartus Prime Tcl API includes other general-purpose commands and features described in this section.

2.6.1. Natural Bus Naming

The Quartus Prime software supports natural bus naming. Natural bus naming allows you to use square brackets to specify bus indexes in HDL, without including escape characters to prevent Tcl from interpreting the square brackets as containing commands. For example, one signal in a bus named `address` can be identified as `address[0]` instead of `address\[0\]`. You can take advantage of natural bus naming when making assignments.

```
set_location_assignment -to address[10] Pin_M20
```

The Quartus Prime software defaults to natural bus naming. You can turn off natural bus naming with the `disable_natural_bus_naming` command. For more information about natural bus naming, type the following at an Quartus Prime Tcl prompt:

```
enable_natural_bus_naming -h
```

2.6.2. Short Option Names

You can use short versions of command options, if they are unambiguous. For example, the `project_open` command supports two options: `-current_revision` and `-revision`.

You can use any of the following abbreviations of the `-revision` option:
- `-r`
- `-re`
- `-rev`
You can use an extremely short option such as -r because in the case of the project_open command no other option starts with the letter r. However, the report_timing command includes the options -recovery and -removal. You cannot use -r or -re to shorten either of those options, because the abbreviation is not unique.

### 2.6.3. Collection Commands

Some Quartus Prime Tcl functions return very large sets of data that are inefficient as Tcl lists. These data structures are referred to as collections. The Quartus Prime Tcl API uses a collection ID to access the collection.

There are two Quartus Prime Tcl commands for working with collections, foreach_in_collection and get_collection_size. Use the set command to assign a collection ID to a variable.

#### 2.6.3.1. The foreach_in_collection Command

The foreach_in_collection command is similar to the foreach Tcl command. Use it to iterate through all elements in a collection. The following example prints all instance assignments in an open project.

**foreach_in_collection Example**

```tcl
set all_instance_assignments [get_all_instance_assignments -name *] foreach_in_collection asgn $all_instance_assignments {
    # Information about each assignment is
    # returned in a list. For information
    # about the list elements, refer to Help
    # for the get-all-instance-assignments command.
    set to [lindex $asgn 2]
    set name [lindex $asgn 3]
    set value [lindex $asgn 4]
    puts "Assignment to $to: $name = $value"
}
```

**Related Information**

foreach_in_collection (::quartus::misc)
In Quartus Prime Help

#### 2.6.3.2. The get_collection_size Command

Use the get_collection_size command to get the number of elements in a collection. The following example prints the number of global assignments in an open project.

**get_collection_size Example**

```tcl
set all_global_assignments [get_all_global_assignments -name *]
set num_global_assignments [get_collection_size $all_global_assignments]
puts "There are $num_global_assignments global assignments in your project"
```
2.6.4. Node Finder Commands

The Node Finder allows you to find any node name in your project's compilation database. You can then perform various actions on found nodes, such as specifying constraints or assignments to those nodes. You can filter the search on various criteria, and also use wildcard characters in the search string.

A complete set of Node Finder Tcl commands that support the equivalent Node Finder filtering options is available for use in the scripted design flow environment.

The filtering options include the following default filters that appear in the filter combo box in the Node Finder:

- **Design Entry (all names) Filter** on page 32
- **Pins: assigned Filter** on page 33
- **Pins: unassigned Filter** on page 33
- **Pins: input Filter** on page 33
- **Pins: output Filter** on page 34
- **Pins: bidirectional Filter** on page 34
- **Pins: virtual Filter** on page 34
- **Pins: all Filter** on page 35
- **Pins: all & Registers: post-fitting Filter** on page 35
- **Ports: partition** on page 35
- **Entity instance: pre-synthesis Filter** on page 36
- **Registers: pre-synthesis Filter** on page 36
- **Registers: post-fitting Filter** on page 36
- **Post-synthesis Filter** on page 37
- **Post-Compilation Filter** on page 37
- **Signal Tap: pre-synthesis Filter** on page 37
- **Signal Tap: post-fitting Filter** on page 38

2.6.4.1. Design Entry (all names) Filter

This Node Finder filter finds all user-entered names in your design.

The following Tcl command demonstrates the use of the Design Entry (all names) filtering option:

```
set name_ids_col [get_names -filter * -node_type all -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis $name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names Command`, refer to The get_names Command on page 38.
2.6.4.2. Pins: assigned Filter

This Node Finder filter finds all pin names assigned locations or other pin-related assignments.

The following Tcl command demonstrates the use of the Pins: assigned filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type assigned \ -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \ $name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the get_names command, refer to The get_names Command on page 38.

2.6.4.3. Pins: unassigned Filter

This Node Finder filter finds all pin names unassigned locations or other pin related assignments.

The following Tcl command demonstrates the use of the Pins: unassigned filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type unassigned \ -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \ $name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the get_names command, refer to The get_names Command on page 38.

2.6.4.4. Pins: input Filter

This Node Finder filter finds all input pin names in your design files.

The following Tcl command demonstrates the use of the Pins: input filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type input \ -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \ $name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the get_names command, refer to The get_names Command on page 38.
2.6.4.5. Pins: output Filter

This Node Finder filter finds all output pin names in your design files.

The following Tcl command demonstrates the use of the Pins: output filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type output
                 -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis
             $name_id]
    append name "",
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to The `get_names` Command on page 38.

2.6.4.6. Pins: bidirectional Filter

This Node Finder filter finds all bidirectional pin names in your design files.

The following Tcl command demonstrates the use of the Pins: bidirectional filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type bidir
                 -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis
             $name_id]
    append name "",
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to The `get_names` Command on page 38.

2.6.4.7. Pins: virtual Filter

This Node Finder filter finds names of all I/O elements mapped to logic elements with a Virtual Pin logic option assignment.

The following Tcl command demonstrates the use of the Pins: virtual filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type virtual
                 -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis
             $name_id]
    append name "",
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to The `get_names` Command on page 38.
2.6.4.8. Pins: all Filter

This Node Finder filter finds all pin names in your design files.

The following Tcl command demonstrates the use of the Pins: all filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type \pin -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the get_names command, refer to The get_names Command on page 38.

2.6.4.9. Pins: all & Registers: post-fitting Filter

This Node Finder filter finds all pin names in your design along with all register names from your design files that persist after physical synthesis and fitting. The Pins: all & Registers: post-fitting filter is a combination of the Pins: all and Registers: post-fitting filters.

The following Tcl command demonstrates the use of the Pins: all & Registers: post-fitting filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type \all_reg -observable_type post_fitter]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type post_fitter \$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the get_names command, refer to The get_names Command on page 38.

2.6.4.10. Ports: partition

This Node Finder filter must be used after running the Fitter, to find nodes for post-fit partition.

Note: When you run this filter before running the Fitter, a "No nodes available. Run Fitter." message displays.

The following Tcl command demonstrates the use of the Ports: partition filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type partition \-observable_type post_fitter]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type post_fitter \$name_id]
    append name ","
```
append name [get_name_info -info node_type $name_id]
puts $name
}

For more information about the get_names command, refer to The get_names Command on page 38.

### 2.6.4.11. Entity instance: pre-synthesis Filter

This Node Finder filter finds a list of instances in the logical hierarchy for pre-synthesis netlist.

The following Tcl command demonstrates the use of the Entity instance: pre-synthesis filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type hierarchy -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis $name_id]
    append name "," 
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the get_names command, refer to The get_names Command on page 38.

### 2.6.4.12. Registers: pre-synthesis Filter

This Node Finder filter finds all register names you entered in the design after Analysis and Elaboration, but before physical synthesis performs any synthesis optimizations.

The following Tcl command demonstrates the use of the Registers: pre-synthesis filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type reg -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis $name_id]
    append name "," 
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the get_names command, refer to The get_names Command on page 38.

### 2.6.4.13. Registers: post-fitting Filter

This Node Finder filter finds all user-entered register names in your design files that remain after physical synthesis and fitting.

The following Tcl command demonstrates the use of the Registers: post-fitting filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type reg -observable_type post_fitter]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type post_fitter $name_id]
    append name "," 
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```
For more information about the `get_names` command, refer to The `get_names` Command on page 38.

### 2.6.4.14. Post-synthesis Filter

This Node Finder filter finds all user-entered and synthesis-generated names that remain in the design after design elaboration and physical synthesis.

The following Tcl command demonstrates the use of the Post-Synthesis filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type all -observable_type post_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type post_synthesis $name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to The `get_names` Command on page 38.

### 2.6.4.15. Post-Compilation Filter

This Node Finder filter finds all user-centered and Compiler-generated names that remain after fitting and do not have location assignments.

The following Tcl command demonstrates the use of the Post-Compilation filtering option:

```tcl
set name_ids_col [get_names -filter * -node_type all -observable_type post_fitter]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type post_fitter $name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to The `get_names` Command on page 38.

### 2.6.4.16. Signal Tap: pre-synthesis Filter

This Node Finder filter finds all internal device nodes in the pre-synthesis netlist that can be analyzed by the Signal Tap Logic Analyzer.
The following Tcl command demonstrates the use of the Signal Tap: pre-synthesis filtering option:

```
set name_ids_col [get_names -filter * -node_type all -observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set is_signaltap [get_name_info -info signaltapii -observable_type pre_synthesis $name_id]
    if {$is_signaltap == 1} {
        set name [get_name_info -use_cached_database -info full_path -observable_type pre_synthesis $name_id]
        append name ","
        append name [get_name_info -info node_type -observable_type pre_synthesis $name_id]
        puts $name
    }
}
```

For more information about the `get_names` command, refer to The `get_names` Command on page 38.

### 2.6.4.17. Signal Tap: post-fitting Filter

This Node Finder filter finds all internal device nodes in the post fit netlist that can be analyzed by the Signal Tap Logic Analyzer.

The following Tcl command demonstrates the use of the Signal Tap: post-fitting filtering option:

```
set name_ids_col [get_names -filter * -node_type all -observable_type post_fitter]
foreach_in_collection name_id $name_ids_col {
    set is_signaltap [get_name_info -info signaltapii -observable_type post_fitter $name_id]
    if {$is_signaltap == 1} {
        set name [get_name_info -use_cached_database -info full_path -observable_type post_fitter $name_id]
        append name ","
        append name [get_name_info -info node_type -observable_type post_fitter $name_id]
        puts $name
    }
}
```

For more information about the `get_names` command, refer to The `get_names` Command on page 38.

### 2.6.5. The `get_names` Command

To query a filtered output collection of all matching node name IDs found in a compiled Quartus Prime project, use the `get_names` command.

To access each element of the output collection, use the Tcl command `foreach_in_collection`. For `get_names` or `foreach_in_collection` command example, type `get_names -long_help` or `foreach_in_collection -long_help`. 
- If the -node_type option is not specified, the default value is all.
- If the -observable_type option is not specified, the default value is all.
- The node type pin includes input, output, bidir, assigned, unassigned, virtual, and pin.
- The node type qsf include names from the .qsf settings file.
- The node type all includes all node types.
- The node type all_reg includes all node types and registers post-fitting.

The value for -observable_type option can be one of the following:

**Table 9. Values for observable_type Option**

<table>
<thead>
<tr>
<th>Observable Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Use post-Fitter information. If it is not available, post-synthesis information is used. Else, pre-synthesis information is used if it exists.</td>
</tr>
<tr>
<td>pre_synthesis</td>
<td>Use pre-synthesis information.</td>
</tr>
<tr>
<td>post_synthesis</td>
<td>Use post-synthesis information.</td>
</tr>
<tr>
<td>post_fitter</td>
<td>Use post-Fitter information.</td>
</tr>
<tr>
<td>post_asm</td>
<td>Use post-Assembler information. The post-Assembler information is supported only for designs using the HardCopy II device family.</td>
</tr>
<tr>
<td>stp_pre_synthesis</td>
<td>Use Signal Tap pre-synthesis information.</td>
</tr>
</tbody>
</table>

**Arguments**

Following table lists the get_names command arguments:

**Table 10. The get_names Command Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long help</td>
<td>Displays a long help with examples and possible return values.</td>
</tr>
<tr>
<td>-entity&lt;wildcard&gt;</td>
<td>Specifies the entity to get names from hierarchies instantiated by the entity.</td>
</tr>
<tr>
<td>-filter&lt;wildcard&gt;</td>
<td>Specifies the node's full path name and wildcard characters.</td>
</tr>
<tr>
<td>-node_type &lt;all</td>
<td>comb</td>
</tr>
<tr>
<td>-observable_type &lt;all</td>
<td>pre_synthesis</td>
</tr>
</tbody>
</table>
Return Values

Following table lists values returned by the `get_names` command:

<table>
<thead>
<tr>
<th>Code</th>
<th>Code</th>
<th>String Returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Can't find active revision name. Make sure there is an open, active revision name.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Get names cannot return <code>&lt;string&gt;</code> because the name was found in a partition that’s not the root partition. Refine your <code>get_names</code> search pattern to exclude child partitions.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Compiler database does not exist for revision name: <code>&lt;string&gt;</code>. At the minimum, run Analysis &amp; Synthesis with the specified revision name before using this Tcl command.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Illegal node type: <code>&lt;string&gt;</code>. Specify &quot;all&quot;, &quot;comb&quot;, &quot;reg&quot;, &quot;pin&quot;, &quot;hierarchy&quot;, or &quot;bus&quot;.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Illegal observable type: <code>&lt;string&gt;</code>. Specify &quot;all&quot;, &quot;pre_synthesis&quot;, &quot;post_synthesis&quot;, or &quot;post_fitter&quot;.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: You must open a project before you can use this command.</td>
</tr>
</tbody>
</table>

Example Use

```tcl
set accel_name_id [get_names -filter accel -node_type pin -observable_type post_fitter]
foreach_in_collection name_id $accel_name_id {
    # Get the full path name of the node
    set target [get_name_info -info full_path $name_id]
    # Set multicycle assignment
    set_multicycle_assignment -to $target 2
    # Set location assignment
    set_location_assignment -to $target Pin_E22
}
```

```tcl
set name_ids [get_names -filter ????? -observable_type post_fitter]
foreach_in_collection name_id $name_ids {
    # Print the name id
    puts $name_id
    # Print the node type
    puts [get_name_info -info node_type $name_id]
    # Print the full path (which excludes the current focus entity from the path)
    puts [get_name_info -info full_path $name_id]
}
```

```tcl
set name_ids [get_names -filter *eed -observable_type post_fitter]
foreach_in_collection name_id $name_ids {
    # Print the name id
    puts $name_id
    # Print the node type
    puts [get_name_info -info node_type $name_id]
    # Print the full path (which excludes the current focus entity from the path)
    puts [get_name_info -info full_path $name_id]
}
2.6.6. The *post_message* Command

To print messages that are formatted like Quartus Prime software messages, use the *post_message* command. Messages printed by the *post_message* command appear in the **System** tab of the **Messages** window in the Quartus Prime GUI, and are written to standard output when scripts are run. Arguments for the *post_message* command include an optional message type and a required message string.

The message type can be one of the following:

- `info` (default)
- `extra_info`
- `warning`
- `critical_warning`
- `error`

If you do not specify a type, Quartus Prime software defaults to `info`.

With the Quartus Prime software in Windows, you can color code messages displayed at the system command prompt with the *post_message* command. Add the following line to your `quartus2.ini` file:

```
DISPLAY_COMMAND_LINE_MESSAGES_IN_COLOR = on
```

The following example shows how to use the *post_message* command.

```
post_message -type warning "Design has gated clocks"
```

2.6.7. Accessing Command-Line Arguments

The global variable `quartus(args)` is a list of the arguments typed on the command-line following the name of the Tcl script.

**Example 1.** Simple Command-Line Argument Access

The following Tcl example prints all the arguments in the `quartus(args)` variable:

```
set i 0
foreach arg $quartus(args) {
    puts "The value at index $i is $arg"
    incr i
}
```

**Example 2.** Passing Command-Line Arguments to Scripts

If you copy the script in the previous example to a file named `print_args.tcl`, it displays the following output when you type the following at a command prompt.

```
quartus_sh -t print_args.tcl my_project 100MHz
The value at index 0 is my_project
The value at index 1 is 100MHz
```
2.6.7.1. The `cmdline` Package

You can use the `cmdline` package included with the Quartus Prime software for more robust and self-documenting command-line argument passing. The `cmdline` package supports command-line arguments with the form `--<option><value>`.

**cmdline Package**

```tcl
package require cmdline
variable ::argv0 $::quartus(args)
set options {
    { "project.arg" "" "Project name" } 
    { "frequency.arg" "" "Frequency" } 
}
set usage "You need to specify options and values"
array set optshash [::cmdline::getoptions ::argv $options $usage]
puts "The project name is $optshash(project)"
puts "The frequency is $optshash(frequency)"
```

If you save those commands in a Tcl script called `print_cmd_args.tcl` you see the following output when you type the following command at a command prompt.

**Passing Command-Line Arguments for Scripts**

```bash
quartus_sh -t print_cmd_args.tcl -project my_project -frequency 100MHz
```

The project name is my_project
The frequency is 100MHz

Virtually all Quartus Prime Tcl scripts must open a project. You can open a project, and you can optionally specify a revision name with code like the following example. The example checks whether the specified project exists. If it does, the example opens the current revision, or the revision you specify.

**Full-Featured Method to Open Projects**

```tcl
package require cmdline
variable ::argv0 $::quartus(args)
set options {\
    { "project.arg" "" "Project Name" } \\ 
    { "revision.arg" "" "Revision Name" } \\ 
}
array set optshash [::cmdline::getoptions ::argv0 $options]
# Ensure the project exists before trying to open it
if {[project_exists $optshash(project)]} { 
    if {[string equal "" $optshash(revision)]]) { 
        # There is no revision name specified, so default
        # to the current revision
        project_open $optshash(project) -current_revision
    } else { 
        # There is a revision name specified, so open the
        # project with that revision
        project_open $optshash(project) -revision $optshash(revision)
    }
} else { 
    puts "Project $optshash(project) does not exist"
    exit 1
}
# The rest of your script goes here
```

If you do not require this flexibility or error checking, you can use just the `project_open` command.
Simple Method to Open Projects

```tcl
set proj_name [lindex $argv 0]
project_open $proj_name
```

2.6.8. The quartus() Array

The global `quartus()` Tcl array includes other information about your project and the current Quartus Prime executable that might be useful to your scripts. The scripts in the preceding examples parsed command line arguments found in `quartus(args)`.

For information on the other elements of the `quartus()` array, type the following command at a Tcl prompt:

```tcl
help -quartus
```

2.7. The Quartus Prime Tcl Shell in Interactive Mode Example

This section presents how to make project assignments and then compile the finite impulse response (FIR) filter tutorial project with the `quartus_sh` interactive shell.

This example assumes you already have the `fir_filter` tutorial design files in a project directory.

1. To run the interactive Tcl shell, type the following at the system command prompt:

   ```tcl
   quartus_sh -s
   ```

2. Create a new project called `fir_filter`, with a revision called `filtref` by typing:

   ```tcl
   project_new -revision filtref fir_filter
   ```

   **Note:**
   - If the project file and project name are the same, the Quartus Prime software gives the revision the same name as the project.
   - If a `.qpf` file for this project already exists, the Quartus Prime software displays an error stating that the project already exists.

   Because the revision named `filtref` matches the top-level file, all design files are automatically picked up from the hierarchy tree.

3. Set a global assignment for the device:

   ```tcl
   set_global_assignment -name family <device family name>
   ```

   To learn more about assignment names that you can use with the `-name` option, refer to Quartus Prime Help.

   **Note:** For assignment values that contain spaces, enclose the value in quotation marks.

4. To compile a design, use the `::quartus::flow` package, which properly exports the new project assignments and compiles the design with the proper sequence of the command-line executables. First, load the package:

   ```tcl
   load_package flow
   ```

   It returns:

   ```tcl
   1.1
   ```
5. To perform a full compilation of the FIR filter design, use the `execute_flow` command with the `-compile` option:

```
execute_flow -compile
```

This command compiles the FIR filter tutorial project, exporting the project assignments and running `quartus_syn`, `quartus_fit`, `quartus_asm`, and `quartus_sta`. This sequence of events is the same as selecting Processing ➤ Start Compilation in the Quartus Prime GUI.

6. When you are finished with a project, close it with the `project_close` command.

7. To exit the interactive Tcl shell, type `exit` at a Tcl prompt.

### 2.8. The `tclsh` Shell

On the UNIX and Linux operating systems, the `tclsh` shell included with the Quartus Prime software is initialized with a minimal `PATH` environment variable. As a result, system commands might not be available within the `tclsh` shell because certain directories are not in the `PATH` environment variable.

To include other directories in the path searched by the `tclsh` shell, set the `QUARTUS_INIT_PATH` environment variable before running the `tclsh` shell. Directories in the `QUARTUS_INIT_PATH` environment variable are searched by the `tclsh` shell when you execute a system command.

### 2.9. Tcl Scripting Basic Examples

The core Tcl commands support variables, control structures, and procedures. Additionally, there are commands for accessing the file system and network sockets, and running other programs. You can create platform-independent graphical interfaces with the Tk widget set.

Tcl commands are executed immediately as they are typed in an interactive Tcl shell. You can also create scripts (including the examples in this chapter) in files and run them with the Quartus Prime executables or with the `tclsh` shell.

#### 2.9.1. Hello World Example

The following shows the basic “Hello world” example in Tcl:

```
puts "Hello world"
```

Use double quotation marks to group the words `hello` and `world` as one argument. Double quotation marks allow substitutions to occur in the group. Substitutions can be simple variable substitutions, or the result of running a nested command. Use curly braces `{}` for grouping when you want to prevent substitutions.
2.9.2. Variables

Assign a value to a variable with the `set` command. You do not have to declare a variable before using it. Tcl variable names are case-sensitive.

```tcl
set a 1
```

To access the contents of a variable, use a dollar sign ("$") before the variable name. The following example prints "Hello world" in a different way.

```tcl
set a Hello
set b world
puts "$a $b"
```

2.9.3. Substitutions

Tcl performs three types of substitution:

- Variable value substitution
- Nested command substitution
- Backslash substitution

2.9.3.1. Variable Value Substitution

Variable value substitution, refers to accessing the value stored in a variable with a dollar sign ("$") before the variable name.

```tcl
set a \[string length foo\]
```

2.9.3.2. Nested Command Substitution

Nested command substitution refers to how the Tcl interpreter evaluates Tcl code in square brackets. The Tcl interpreter evaluates nested commands, starting with the innermost nested command, and commands nested at the same level from left to right. Each nested command result is substituted in the outer command.

```tcl
puts "This is a \$ special character"
puts "This is a\n$ special character and line continuation"
puts "This is backslash \is ignored"
puts "This is backslash\ continued on next line"
```
2.9.4. Arithmetic

Use the `expr` command to perform arithmetic calculations. Use curly braces ("{ }") to group the arguments of this command for greater efficiency and numeric precision.

```tcl
set a 5
set b [expr { $a + sqrt(2) }]
```

The Quartus Prime software supports all standard Tcl boolean and arithmetic operators, such as && (AND), || (OR), ! (NOT), and comparison operators such as < (less than), > (greater than), and == (equal to).

2.9.5. Lists

A Tcl list is a series of values. Supported list operations include creating lists, appending lists, extracting list elements, computing the length of a list, sorting a list, and more.

```tcl
set a { 1 2 3 }
```

You can use the `lindex` command to extract information at a specific index in a list. Indexes are zero-based. You can use the index `end` to specify the last element in the list, or the index `end-<n>` to count from the end of the list. For example, to print the second element (at index 1) in the list stored in `a` use the following code.

```tcl
puts [lindex $a 1]
```

The `llength` command returns the length of a list.

```tcl
puts [llength $a]
```

The `lappend` command appends elements to a list. If a list does not already exist, the list you specify is created. The list variable name is not specified with a dollar sign ("$").

```tcl
lappend a 4 5 6
```

2.9.6. Arrays

Arrays are similar to lists except that they use a string-based index. Tcl arrays are implemented as hash tables. You can create arrays by setting each element individually or with the `array set` command.

To set an element with an index of `Mon` to a value of `Monday` in an array called `days`, use the following command:

```tcl
set days(Mon) Monday
```
The array set command requires a list of index/value pairs. This example sets the array called days:

```tcl
array set days { Sun Sunday Mon Monday Tue Tuesday
                   Wed Wednesday Thu Thursday Fri Friday Sat Saturday }
```

```tcl
set day_abbreviation Mon
puts $days($day_abbreviation)
```

Use the array names command to get a list of all the indexes in a particular array. The index values are not returned in any specified order. The following example is one way to iterate over all the values in an array.

```tcl
foreach day [array names days] {
    puts "The abbreviation $day corresponds to the day name $days($day)"
}
```

Arrays are a very flexible way of storing information in a Tcl script and are a good way to build complex data structures.

### 2.9.7. Control Structures

Tcl supports common control structures, including if-then-else conditions and for, foreach, and while loops. The position of the curly braces as shown in the following examples ensures the control structure commands are executed efficiently and correctly. The following example prints whether the value of variable `a` is positive, negative, or zero.

#### If-Then-Else Structure

```tcl
if { $a > 0 } { puts "The value is positive"
    } elseif { $a < 0 } { puts "The value is negative"
    } else { puts "The value is zero"
    }
```

The following example uses a `for` loop to print each element in a list.

#### For Loop

```tcl
set a { 1 2 3 }
for { set i 0 } { $i < [llength $a] } { incr i } {
    puts "The list element at index $i is [lindex $a $i]"
}
```

The following example uses a `foreach` loop to print each element in a list.

#### foreach Loop

```tcl
set a { 1 2 3 }
foreach element $a {
    puts "The list element is $element"
}
```

The following example uses a `while` loop to print each element in a list.
while Loop

```
set a { 1 2 3 }
set i 0
while { $i < [llength $a] } { puts "The list element at index $i is [lindex $a $i]"
    incr i
}
```

You do not have to use the `expr` command in boolean expressions in control structure commands because they invoke the `expr` command automatically.

2.9.8. Procedures

Use the `proc` command to define a Tcl procedure (known as a subroutine or function in other scripting and programming languages). The scope of variables in a procedure is local to the procedure. If the procedure returns a value, use the `return` command to return the value from the procedure. The following example defines a procedure that multiplies two numbers and returns the result.

**Simple Procedure**

```
proc multiply { x y } {
    set product [expr { $x * $y }]
    return $product
}
```

The following example shows how to use the `multiply` procedure in your code. You must define a procedure before your script calls it.

**Using a Procedure**

```
proc multiply { x y } {
    set product [expr { $x * $y }]
    return $product
}
set a 1
set b 2
puts [multiply $a $b]
```

Define procedures near the beginning of a script. If you want to access global variables in a procedure, use the `global` command in each procedure that uses a global variable.

**Accessing Global Variables**

```
proc print_global_list_element { i } {
    global my_data
    puts "The list element at index $i is [lindex $my_data $i]"
}
set my_data { 1 2 3}
print_global_list_element 0
```

2.9.9. File I/O

Tcl includes commands to read from and write to files. You must open a file before you can read from or write to it, and close it when the read and write operations are done.
To open a file, use the `open` command; to close a file, use the `close` command. When you open a file, specify its name and the mode in which to open it. If you do not specify a mode, Tcl defaults to read mode. To write to a file, specify `w` for write mode.

**Open a File for Writing**

```tcl
set output [open myfile.txt w]
```

Tcl supports other modes, including appending to existing files and reading from and writing to the same file.

The `open` command returns a file handle to use for read or write access. You can use the `puts` command to write to a file by specifying a file handle.

**Write to a File**

```tcl
set output [open myfile.txt w]
puts $output "This text is written to the file."
close $output
```

You can read a file one line at a time with the `gets` command. The following example uses the `gets` command to read each line of the file and then prints it out with its line number.

**Read from a File**

```tcl
set input [open myfile.txt]
set line_num 1
while { [gets $input line] >= 0 } {
    # Process the line of text here
    puts "$line_num: $line"
incr line_num
}
close $input
```

### 2.9.10. Syntax and Comments

Arguments to Tcl commands are separated by white space, and Tcl commands are terminated by a newline character or a semicolon. You must use backslashes when a Tcl command extends more than one line. The backslash (`\`) must be the last character in the line to designate line extension. If the backslash is followed by any other character including a space, that character is treated as a literal.

Tcl uses the hash or pound character (`#`) to begin comments. The `#` character must begin a comment. If you prefer to include comments on the same line as a command, be sure to terminate the command with a semicolon before the `#` character. The following example is a valid line of code that includes a `set` command and a comment.

```tcl
set a 1;# Initializes a
```

Without the semicolon, the command is invalid because the `set` command does not terminate until the new line after the comment.
The Tcl interpreter counts curly braces inside comments, which can lead to errors that are difficult to track down. The following example causes an error because of unbalanced curly braces.

```tcl
# if { $x > 0 } {
if { $y > 0 } {
    # code here
}
```

### 2.9.11. External References

### 2.10. Tcl Scripting Revision History

The following revision history applies to this chapter:

<table>
<thead>
<tr>
<th>Document Version</th>
<th>Quartus Prime Version</th>
<th>Changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>2024.04.01</td>
<td>24.1</td>
<td>• Applied phase I Altera rebranding throughout.</td>
</tr>
<tr>
<td>2023.10.02</td>
<td>23.3</td>
<td>• Updated <em>The Tcl Console Window</em> topic for Tcl command echo and log file save.</td>
</tr>
<tr>
<td>2022.04.03</td>
<td>23.1</td>
<td>• Updated name of Intel Agilex 7 device family.</td>
</tr>
</tbody>
</table>
| 2020.12.14        | 20.4                  | • Revised "Tcl Scripting" topic to include link to new "Tcl Commands and Packages" reference.  
  • Revised "Tcl Packages" topic for latest supported packages. |
| 2019.06.28        | 19.1                  | Minor correction in *The get_names Command* |
| 2019.04.01        | 19.1                  | • Added Node Finder Tcl commands.  
  • Added the get_names command.  
  • Rectified code snippet formatting in *Compile All Revisions, Arrays, and Control Structures* topics. |
| 2018.05.07        | 18.0.0                | • Removed deprecated options.  
  • External reference links updated.  
  • Corrected typos and made minor content fixes. |
| 2016.10.31        | 16.1.0                | • Implemented Intel rebranding. |

</tbody>
</table>

### 3.1.1.1. `get_back_annotation_assignments` (`::quartus::backannotate`)

The following table displays information for the `get_back_annotation_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::backannotate</code> on page 73</th>
</tr>
</thead>
</table>

#### Syntax

`get_back_annotation_assignments [-h | -help] [-long_help]`

#### Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values

#### Description

Returns an output collection of back-annotation assignments.

Each element of the collection is a list with the following format:

```
{ {<Source>} {<Destination>} {<Assignment name>} {<Assignment value>} {<Entity name>} }
```

#### Example Usage

```
## Print out all the back-annotation assignments
set asgn_col [get_back_annotation_assignments]
foreach_in_collection asgn $asgn_col {
## Each element in the collection has the following
## format:
## { {<Source>} {<Destination>} {<Assignment name>} {<Assignment value>} {<Entity name>} }
```

```
## Example:
## set from [lindex $asgn 0]
## set to [lindex $asgn 1]
## set name [lindex $asgn 2]
## set value [lindex $asgn 3]
```
```tcl
set entity [lindex $asgn 4]
puts "\$entity : \$name \$from \$to = \$value"
```

<td>-no_demote_pin</td>
</tr>
<tr>
<td></td>
<td>-no_demote_ram</td>
</tr>
</tbody>
</table>

continued...
### Description

Back-annotates a LogicLock region and its contents.

When you use the "-routing" option, you must use the "-lock" and "-no_demote_lab" options, without the "-no_contents" option, or use the "-remove_assignments" option.

The "-remove_assignments" option removes all matching region contents. When you use the "-remove_assignments" option, the demotion options, "-no_contents" and "-lock", are not applicable.

The "-resource_filter" option allows you to back-annotate only specific resource types on the device. For example:

```
logiclock_back_annotate -resource_filter "COMBINATORIAL"
```

This command back-annotates all combinatorial nodes in the design. The complete set of options is:

- `COMBINATORIAL` combinatorial nodes
- `REGISTER` registered nodes
- `MEGA` M-RAMs
- `MEDIUM` M4K memory blocks
- `SMALL` M512 memory blocks
- `IO` I/O elements
- `MAC` DSP blocks

Intel recommends that you use a Verilog Quartus(R) Mapping File (.vqm) as the source. When any of the advanced netlist optimizations are enabled, it is possible for the Fitter to create and rename nodes in the design during a place and route operation. Back annotation requires that on subsequent compilations the node names in the netlist match those in the constraint file. Copy all of the existing constraint files into the new project directory and remove all the design files except the new .vqm by using the Add/Remove Files in a Project command (Project menu) in the Quartus Prime GUI.

The Quartus Prime software will create a root region if you back-annotate nodes that are not members of a LogicLock region. The root region is device-size and locked. You can make assignments to the root region but you cannot delete it or modify its size or location.

### Example Usage

```tcl
# Open the project "example_project"
project_open example_project

# Compile the design
package require ::quartus::flow
execute_flow -compile

package require ::quartus::backannotate

# Back annotate all nodes and routing in the region "one_region"
logiclock_back_annotate -routing -lock -no_demote_lab -region one_region

# Back annotate the location of the nodes on all paths that start with a node that matches the "Data_in*" wildcard
```

continued...
# expression, and end with a node that matches the "Data_out*" wildcard expression
logiclock_back_annotate -from Data_in* -to Data_out*

# Back annotate the placement of all the registers in the design
logiclock_back_annotate -resource_filter "REGISTER"

# Close the project
project_close

<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-name &lt;name&gt;</code> The name of the design</td>
</tr>
<tr>
<td></td>
<td>`-source &lt;online</td>
</tr>
<tr>
<td></td>
<td><code>-version &lt;version&gt;</code> The version of the design</td>
</tr>
<tr>
<td>Description</td>
<td>This command returns the document title(s) and URL(s) of documentation(s) of designs that contain the given design name. If no argument is supplied, the command will return the design documentation of all the available designs.</td>
</tr>
</tbody>
</table>

---

3. TCL Commands and Packages

81
### Example Usage

```
set docs [::board::get_design_documents_info -name memory]
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.2.13. get_design_download_link (::quartus::board)

The following table displays information for the `get_design_download_link` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::board on page 76</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_design_download_link [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-link_only</code> If this option is specified, only a list of download link will be returned (instead of list of &lt;design_name, download_link&gt; pair)</td>
</tr>
<tr>
<td></td>
<td><code>-name &lt;name&gt;</code> The name of the design</td>
</tr>
<tr>
<td></td>
<td>`-source &lt;online</td>
</tr>
<tr>
<td></td>
<td><code>-version &lt;version&gt;</code> The version of the design</td>
</tr>
<tr>
<td>Description</td>
<td>This command returns the URL to download the designs that contain the given design name. If no argument is supplied, the command will return the design download link of all the available designs.</td>
</tr>
</tbody>
</table>

### Example Usage

```
set link [::board::get_design_download_link -link_only]
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.2.14. get_design_families (::quartus::board)

The following table displays information for the `get_design_families` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::board on page 76</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_design_families [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>`-source &lt;online</td>
</tr>
<tr>
<td>Description</td>
<td>continued...</td>
</tr>
</tbody>
</table>
This command returns the unique device families of the designs that are loaded from the source argument. If source argument isn't specified, the command will return unique device families of all the loaded designs.

```
set families [::board::get_design_families]
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.2.15. get_design_info (::quartus::board)

The following table displays information for the `get_design_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::board on page 76</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_design_info [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td>`-long_help</td>
</tr>
<tr>
<td></td>
<td>`-family &lt;family&gt;</td>
</tr>
<tr>
<td></td>
<td>`-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>`-source &lt;online</td>
</tr>
<tr>
<td></td>
<td>`-version &lt;version&gt;</td>
</tr>
</tbody>
</table>

This command returns the information of designs that contain the given design name and device family (case insensitive). If no argument is given, the command will return the information of all the available designs.

```
set designs [::board::get_design_info -name pll -family agilex -source online]
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.2.16. get_design_quartus_versions (::quartus::board)

The following table displays information for the `get_design_quartus_versions` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::board on page 76</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_design_quartus_versions [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td>`-long_help</td>
</tr>
<tr>
<td></td>
<td>`-max_count &lt;max_count&gt;</td>
</tr>
</tbody>
</table>

This command returns the information of designs that contain the given design name and device family (case insensitive). If no argument is given, the command will return the information of all the available designs.

```
set designs [::board::get_design_info -name pll -family agilex -source online]
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

continued...
-source <online|quartus|my_download|all>  The Load From sources of the designs (Online, Pre-installed, Downloaded or All)

Description
This command returns the unique Quartus versions of the designs that are loaded from the source argument. If source argument isn’t specified, the command will return unique Quartus versions of all the loaded designs.

Example Usage
set quartus_versions [::board::get_design_quartus_versions -max_count 5]

Return Value
<table>
<thead>
<tr>
<th>Code</th>
<th>Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td></td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.2.17. get_design_rich_description (::quartus::board)

The following table displays information for the get_design_rich_description Tcl command:

Tcl Package and Version  Belongs to ::quartus::board on page 76
Syntax
get_design_rich_description [-h | -help] [-long_help] [-name <name>] [-source <online|quartus|my_download|all>] [-version <version>]
Arguments
-h | -help  Short help
-long_help  Long help with examples and possible return values
-name <name>  The name of the design
-source <online|quartus|my_download|all>  The Load From sources of the designs (Online, Pre-installed, Downloaded or All)
-version <version>  The version of the design
Description
This command returns the rich-text description information of designs that contain the given design name. If no argument is supplied, the command will return the rich-text description of all the available designs.

Example Usage
set rich_description [::board::get_design_rich_description]

Return Value
<table>
<thead>
<tr>
<th>Code</th>
<th>Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td></td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.2.18. get_ui_file (::quartus::board)

The following table displays information for the get_ui_file Tcl command:

Tcl Package and Version  Belongs to ::quartus::board on page 76
Syntax
Arguments
-h | -help  Short help
-long_help  Long help with examples and possible return values
-destination_dir <destination_dir>  The directory to save the UI file
### 3.1.2.19. `launch_qsys (::quartus::board)`

The following table displays information for the `launch_qsys` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::board on page 76</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-board &lt;board&gt;</code> The name of the board (e.g. Intel Agilex F-Series Transceiver-SoC Development Kit DK-SI-AGF014EA)</td>
</tr>
<tr>
<td></td>
<td><code>-qpf_file &lt;qpf_file&gt;</code> The full path to the Quartus Project file (QPF, *.qpf file)</td>
</tr>
<tr>
<td></td>
<td><code>-qsf_file &lt;qsf_file&gt;</code> The full path to the Quartus Setting file (QSF, *.qsf file)</td>
</tr>
<tr>
<td></td>
<td><code>-qsys_file &lt;qsys_file&gt;</code> The full path to the Platform Designer System (QSYS, *.qsys file)</td>
</tr>
</tbody>
</table>

**Description**

This command will launch Platform Designer application in GUI mode. With `qsys_file`, `qpf_file` and `board` argument supplied, the Platform Designer will open the project and skip the Open System dialog.

**Example Usage**

```tcl```
::board::launch_qsys
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.2.20. `load_design_info (::quartus::board)`

The following table displays information for the `load_design_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::board on page 76</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`load_design_info [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td>`-source &lt;online</td>
</tr>
</tbody>
</table>

**Description**

This command returns the UI filename of designs that contain the given design name. If no argument is supplied, the command will return the UI filename of all the available designs.

**Example Usage**

```
set ui_file [::board::get_ui_file -name pll]
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
3.1.2.21. reset_board_info (::quartus::board)

The following table displays information for the `reset_board_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>::quartus::board on page 76</td>
<td>Clear the loaded board information.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Arguments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`reset_board_info [-h</td>
<td>-help] [-long_help]`</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.3. ::quartus::bpps

The following table displays information for the `::quartus::bpps` Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>::quartus::bpps 1.0</td>
<td>This package provides non-backend support for pin-planner mode in Interface Planner.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Availability</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>This package is loaded by default in the following executables:</td>
<td></td>
</tr>
<tr>
<td>qacv</td>
<td>qgpl</td>
</tr>
<tr>
<td>qgro</td>
<td>quartus</td>
</tr>
<tr>
<td>quartus_bpps</td>
<td>quartus_dcc</td>
</tr>
<tr>
<td>quartus_ddp</td>
<td>quartus_pow</td>
</tr>
<tr>
<td>quartus_sta</td>
<td>quartus_staw</td>
</tr>
</tbody>
</table>
3. TCL Commands and Packages

### Tcl Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bpps::apply_assignments (::quartus::bpps)</td>
<td>In classic mode, applies all changes to constraints and reloads them into Interface Planner. After the platform has been updated with the constraints, placement operations can be performed. In pin planner mode, loads the QSF constraints related to pin assignments.</td>
</tr>
<tr>
<td>bpps::check_plan (::quartus::bpps)</td>
<td>Performs a check on the current placement to ensure that all constraints are satisfied.</td>
</tr>
<tr>
<td>bpps::export_constraints_to_qsf (::quartus::bpps)</td>
<td>Exports the constraints to a QSF file.</td>
</tr>
<tr>
<td>bpps::get_cell_info (::quartus::bpps)</td>
<td>Retrieves information about a specific cell.</td>
</tr>
<tr>
<td>bpps::get_device (::quartus::bpps)</td>
<td>Returns information about the device.</td>
</tr>
<tr>
<td>bpps::get_hdbpath_from_id (::quartus::bpps)</td>
<td>Retrieves the HDB path from an ID.</td>
</tr>
<tr>
<td>bpps::get_id_from_hdbpath (::quartus::bpps)</td>
<td>Retrieves the ID from a HDB path.</td>
</tr>
<tr>
<td>bpps::get_location_info (::quartus::bpps)</td>
<td>Provides information about a specific location.</td>
</tr>
<tr>
<td>bpps::get_placement (::quartus::bpps)</td>
<td>Returns information about a specific placement.</td>
</tr>
<tr>
<td>bpps::get_placements (::quartus::bpps)</td>
<td>Returns information about all placements.</td>
</tr>
<tr>
<td>bpps::get_placements_of_group (::quartus::bpps)</td>
<td>Returns information about placements of a specific group.</td>
</tr>
<tr>
<td>bpps::harden_cell (::quartus::bpps)</td>
<td>Hardens a specific cell.</td>
</tr>
<tr>
<td>bpps::harden_cells (::quartus::bpps)</td>
<td>Hardens all cells.</td>
</tr>
<tr>
<td>bpps::initialize (::quartus::bpps)</td>
<td>Initializes the platform.</td>
</tr>
<tr>
<td>bpps::load_floorplan (::quartus::bpps)</td>
<td>Loads a floorplan.</td>
</tr>
<tr>
<td>bpps::place_cells (::quartus::bpps)</td>
<td>Places cells on the floorplan.</td>
</tr>
<tr>
<td>bpps::read_tpl_placement (::quartus::bpps)</td>
<td>Reads a TPL placement.</td>
</tr>
<tr>
<td>bpps::remove_invalid_reports (::quartus::bpps)</td>
<td>Removes invalid reports.</td>
</tr>
<tr>
<td>bpps::report_all (::quartus::bpps)</td>
<td>Reports all placement information.</td>
</tr>
<tr>
<td>bpps::report_cell_connectivity (::quartus::bpps)</td>
<td>Reports the connectivity of cells.</td>
</tr>
<tr>
<td>bpps::report_cell_placement_reasons (::quartus::bpps)</td>
<td>Reports the reasons for cell placement.</td>
</tr>
<tr>
<td>bpps::report_cells (::quartus::bpps)</td>
<td>Reports information about all cells.</td>
</tr>
<tr>
<td>bpps::report_clocks (::quartus::bpps)</td>
<td>Reports information about clocks.</td>
</tr>
<tr>
<td>bpps::report_legal_cell_locations (::quartus::bpps)</td>
<td>Reports legal cell locations.</td>
</tr>
<tr>
<td>bpps::report_location_types (::quartus::bpps)</td>
<td>Reports location types.</td>
</tr>
<tr>
<td>bpps::report_locations (::quartus::bpps)</td>
<td>Reports locations.</td>
</tr>
<tr>
<td>bpps::reset_plan (::quartus::bpps)</td>
<td>Resets the placement plan.</td>
</tr>
<tr>
<td>bpps::save_floorplan (::quartus::bpps)</td>
<td>Saves the floorplan.</td>
</tr>
<tr>
<td>bpps::save_pin_assignments (::quartus::bpps)</td>
<td>Saves pin assignments.</td>
</tr>
<tr>
<td>bpps::select_dr_ips (::quartus::bpps)</td>
<td>Selects DR IPs.</td>
</tr>
<tr>
<td>bpps::set_mode (::quartus::bpps)</td>
<td>Sets the operation mode.</td>
</tr>
<tr>
<td>bpps::shutdown (::quartus::bpps)</td>
<td>Shuts down the platform.</td>
</tr>
<tr>
<td>bpps::soften_cell (::quartus::bpps)</td>
<td>Softens a specific cell.</td>
</tr>
<tr>
<td>bpps::soften_cells (::quartus::bpps)</td>
<td>Softens all cells.</td>
</tr>
<tr>
<td>bpps::undo_last_placement (::quartus::bpps)</td>
<td>Undoes the last placement operation.</td>
</tr>
<tr>
<td>bpps::unplace_cells (::quartus::bpps)</td>
<td>Unplaces cells.</td>
</tr>
<tr>
<td>bpps::validate_placement (::quartus::bpps)</td>
<td>Validates the placement.</td>
</tr>
<tr>
<td>bpps::write_plan (::quartus::bpps)</td>
<td>Writes a plan.</td>
</tr>
<tr>
<td>bpps::write_tpl_placement (::quartus::bpps)</td>
<td>Writes TPL placement.</td>
</tr>
</tbody>
</table>

#### 3.1.3.1. bpps::apply_assignments (::quartus::bpps)

The following table displays information for the `bpps::apply_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::bpps</code> on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`bpps::apply_assignments [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td>Description</td>
<td>In classic mode, applies all changes to constraints and reloads them into Interface Planner. After the platform has been updated with the constraints, placement operations can be performed. In pin planner mode, loads the QSF constraints related to pin assignments.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>project_open onewire_nf</td>
</tr>
<tr>
<td></td>
<td>blueprint::initialize</td>
</tr>
<tr>
<td></td>
<td>bpps::update_plan</td>
</tr>
<tr>
<td></td>
<td>blueprint::shutdown</td>
</tr>
<tr>
<td></td>
<td>project_close</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>
### 3.1.3.2. `bpps::check_plan (::quartus::bpps)`

The following table displays information for the `bpps::check_plan` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::bpps</code> on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`bpps::check_plan [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>In classic mode, checks the legality of the current plan. In pin planner mode, this will be a stub. Assignments are checked real time, no backend engine to check legality of anything.</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td><code>project_open onewire_nf</code></td>
</tr>
<tr>
<td></td>
<td><code>blueprint::initialize</code></td>
</tr>
<tr>
<td></td>
<td><code>bpps::update_plan</code></td>
</tr>
<tr>
<td></td>
<td><code>bpps::check_plan</code></td>
</tr>
<tr>
<td></td>
<td><code>project_close</code></td>
</tr>
<tr>
<td><strong>Return Value</strong></td>
<td><strong>Code Name</strong></td>
</tr>
<tr>
<td></td>
<td><code>TCL_OK</code></td>
</tr>
</tbody>
</table>

### 3.1.3.3. `bpps::export_constraints_to_qsf (::quartus::bpps)`

The following table displays information for the `bpps::export_constraints_to_qsf` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::bpps</code> on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-bb_locations</code> Write out building block location assignments</td>
</tr>
<tr>
<td></td>
<td><code>-close_pdp</code> Send call back to PDPW to close after exporting is done</td>
</tr>
<tr>
<td></td>
<td><code>-disabled</code> Write out disabled assignments</td>
</tr>
<tr>
<td></td>
<td><code>-pin_locations</code> Write out pin location assignments</td>
</tr>
<tr>
<td></td>
<td><code>-tile_locations</code> Write out tile location assignments</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>In Tile Planner mode, export constraints to qsf file</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td><code>project_open onewire_nf</code></td>
</tr>
<tr>
<td></td>
<td><code>blueprint::initialize</code></td>
</tr>
<tr>
<td></td>
<td><code>bpps::update_plan</code></td>
</tr>
<tr>
<td></td>
<td><code>set io_cells [bpps::get_cells -unplaced -type IO_CLUSTER]</code></td>
</tr>
<tr>
<td></td>
<td><code>bpps::place_cells -cells $io_cells</code></td>
</tr>
</tbody>
</table>
### 3.1.3.4. bpps::get_cell_info (::quartus::bpps)

The following table displays information for the `bpps::get_cell_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::bpps</code> on page 86</th>
</tr>
</thead>
</table>

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-children` Return the the cell id of the children cells
- `-guide_cell_id` Returns the guide cell's elem_id
- `-ip_type` Returns the IP type if the cell is an IP cell or an empty string otherwise
- `-links` Return the given design element’s connections to other cells
- `-location` Returns the location ID if the cell is placed or an empty string otherwise
- `-name` Return the cell name of the cell id
- `-parent` Return the the cell id of the parent cells
- `-type` Return the the type of the cell
- `<cell_id>` Single cell id

**Description**

Gets information about the specified cell (referenced by cell ID). You can obtain cell using the `periph::get_cells` Tcl command.

**Example Usage**

```tcl
project_open onewire_nf
blueprint::initialize
periph::update_plan
foreach cell [periph::get_cells -type IO_CLUSTER] {
    puts "Found cell ID $cell named [periph::get_cell_info -name $cell]"
}
blueprint::shutdown
project_close
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
### 3.1.3.5. bpps::get_device (::quartus::bpps)

The following table displays information for the bpps::get_device Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>bpps::get_device [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-compress</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Internal function to get the device tree in json, this gets the complete device model.</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td>This command currently contains no example usage.</td>
</tr>
<tr>
<td><strong>Return Value</strong></td>
<td><strong>Code</strong></td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

### 3.1.3.6. bpps::get_hdbpath_from_id (::quartus::bpps)

The following table displays information for the bpps::get_hdbpath_from_id Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td></td>
<td>-ips \hspace{1cm} Get placements for IPs only</td>
</tr>
<tr>
<td></td>
<td>&lt;cell_id&gt; \hspace{1cm} Single cell id</td>
</tr>
</tbody>
</table>

**Description**

In classic mode, returns a vector of placements for the supplied cell

In pin planner mode, returns a vector of compatible locations for the supplied pin

**Example Usage**

This command currently contains no example usage.

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>

</tbody>
</table>

continued...
### bpps::place_cells

- **-cells <cells>**
  - One or more cell IDs
- **-ips**
  - Get placements for IPs only

**Description**

Given a list of design cell IDs, returns a vector of possible placement IDs for all the cells.

**Example Usage**

```
project_open onewire_nf
blueprint::initialize
bpps::update_plan
bpps::place_cells -unplaced_cells
bpps::check_plan
project_close
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The supplied ID &lt;string&gt; is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>

</tbody>
</table>

### bpps::harden_cell (::quartus::bpps)

The following table displays information for the bpps::harden_cell Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>bpps::harden_cell [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>-cell &lt;cell&gt;</td>
</tr>
<tr>
<td></td>
<td>Harden the existing placement of the specified cell</td>
</tr>
</tbody>
</table>

**Description**

In modes that support soft / hard placements (i.e. Tile Planner mode), hardens the existing placement of the specified cell. If the cell is subsequently unplaced and placed again, the placement soft / hard attribute will be based on the new placement action.

For modes that do not support soft / hard placements, nothing is performed.

**Example Usage**

```
bpps::harden_cell -cell <design_cell_id>
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
3.1.3.14. bpps::harden_cells (::quartus::bpps)

The following table displays information for the bpps::harden_cells Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>bpps::harden_cells [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-cells &lt;cells&gt;</td>
</tr>
</tbody>
</table>

**Description**

In modes that support soft / hard placements (ie. Tile Planner mode), hardens the existing placement of the specified cell.

If the cell is subsequently unplaced and placed again, the placement soft / hard attribute will be based on the new placement action.

For modes that do not support soft / hard placements, nothing is performed.

**Example Usage**

bpps::harden_cells -cells [design_cell_id]

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.3.15. bpps::initialize (::quartus::bpps)

The following table displays information for the bpps::initialize Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>bpps::initialize [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
</tbody>
</table>

**Description**

Replaces blueprint::initialize command. It will create the design and device models without a backend separate-exe engine.

**Example Usage**

project_open onewire_nf
bpps::initialize
bpps::update_plan
bpps::shutdown
project_close

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
### 3.1.3.16. bpps::load_floorplan (::quartus::bpps)

The following table displays information for the `bpps::load_floorplan` Tcl command:

</tbody>
</table>

3.1.3.21. bpps::report_cell_connectivity (::quartus::bpps)

The following table displays information for the `bpps::report_cell_connectivity` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
</tbody>
</table>

continued...
-fanins  Report only the fanins of the cell
-fanouts  Report only the fanouts of the cell
-panel_name <name>  Sends the results to the panel and specifies the name of the new panel
<cell_id>  Single cell id

Description
In classic mode, creates a report of the connectivity for a cell.
In pin planner mode, this is a stub call.

Example Usage
This command currently contains no example usage.

Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>

<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
</tbody>
</table>
|                         | continued...
### Description

In classic mode, returns a list of periphery cells based on the specified criteria. In pin planner mode, this is a stub call.

### Example Usage

This command currently contains no example usage.

### Return Value

<table>
<thead>
<tr>
<th>Code</th>
<th>Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td></td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>

#### 3.1.3.24. bpps::report_clocks (::quartus::bppps)

The following table displays information for the `bpps::report_clocks` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to::quartus::bppps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>bpps::report_clocks [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
</tbody>
</table>

**Description**

In classic mode, show the signals that are using low-skew routing networks (clock networks) in the device. If applicable, also show any signals that were considered for automatic clock network promotion, but were not promoted.

In pin planner mode, this is a stub call.

**Example Usage**

This command currently contains no example usage.

**Return Value**

<table>
<thead>
<tr>
<th>Code</th>
<th>Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td></td>
<td>0</td>
<td>INFO: Operation successful</td>

### 3.1.3.28. bpps::report_regions (::quartus::bpps)

The following table displays information for the `bpps::report_regions` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`bpps::report_regions [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-panel_name &lt;name&gt;</code> Sends the results to the panel and specifies the name of the new panel</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>In pin planner mode, this is a stub call.</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td>This command currently contains no example usage.</td>
</tr>
<tr>
<td><strong>Return Value</strong></td>
<td><strong>Code</strong></td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>
3.1.3.29. bpps::report_summary (::quartus::bpps)

The following table displays information for the `bpps::report_summary` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`bpps::report_summary [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-panel_name &lt;name&gt;</code></td>
</tr>
</tbody>
</table>

Description

In pin planner mode, this is a stub call.

Example Usage

This command currently contains no example usage.

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.3.30. bpps::reset_plan (::quartus::bpps)

The following table displays information for the `bpps::reset_plan` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`bpps::reset_plan [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
</tbody>
</table>

Description

In classic mode, reverts the current design to be unplaced and without assignments applied.

In pin planner mode, removes all the user created pin assignments. Keeps the original assignments. (currently just a stub still)

Example Usage

```
project_open onewire_nf
blueprint::initialize
bpps::update_plan
bpps::reset_plan
blueprint::shutdown
project_close
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
### 3.1.3.31. bpps::save_floorplan (::quartus::bpps)

The following table displays information for the `bpps::save_floorplan` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::bpps</code> on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`bpps::save_floorplan [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-filename &lt;filename&gt;</code> Filename to write to</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>In classic mode, write the Interface Planner floorplan that can be reloaded in Interface Planner. In pin planner mode, write the user pin assignments as constraints to QSF file. It is preferred to use the new <code>save_pin_assignments</code> call instead in pin planner mode.</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td><code>project_open onewire_nf</code></td>
</tr>
<tr>
<td></td>
<td><code>blueprint::initialize</code></td>
</tr>
<tr>
<td></td>
<td><code>bpps::update_plan</code></td>
</tr>
<tr>
<td></td>
<td><code>set io_cells [bpps::get_cells -unplaced -type IO_CLUSTER]</code></td>
</tr>
<tr>
<td></td>
<td><code>bpps::place_cells -cells $io_cells</code></td>
</tr>
<tr>
<td></td>
<td><code>bpps::save_floorplan -filename onewire_blueprint_floorplan.plan</code></td>
</tr>
<tr>
<td></td>
<td><code>project_close</code></td>
</tr>
<tr>
<td><strong>Return Value</strong></td>
<td><code>Code Name</code></td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

### 3.1.3.32. bpps::save_pin_assignments (::quartus::bpps)

The following table displays information for the `bpps::save_pin_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::bpps</code> on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`bpps::save_pin_assignments [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Write the Interface Planner floorplan that can be reloaded in Interface Planner</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td><code>project_open onewire_nf</code></td>
</tr>
<tr>
<td></td>
<td><code>blueprint::initialize</code></td>
</tr>
<tr>
<td></td>
<td><code>bpps::update_plan</code></td>
</tr>
<tr>
<td></td>
<td><code>bpps::save_pin_assignments</code></td>
</tr>
<tr>
<td></td>
<td><code>project_close</code></td>
</tr>
<tr>
<td><strong>Return Value</strong></td>
<td><code>Code Name</code></td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>
### 3.1.3.33. bpps::select_dr_ips (::quartus::bpps)

The following table displays information for the `bpps::select_dr_ips` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`bpps::select_dr_ips [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td>Short help</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-deselect</code></td>
</tr>
<tr>
<td></td>
<td>Deselects any selections previously made</td>
</tr>
<tr>
<td></td>
<td><code>-ips &lt;ips&gt;</code></td>
</tr>
<tr>
<td></td>
<td>One or more ip ids that exist in DR groups</td>
</tr>
</tbody>
</table>

**Description**

Selects the DR ips. Any placement sync requests afterwards will only return placements for those selected DR IPs. All other non-DR placements are still returned. Any IP IDs passed over that are inside DR groups will be ignored.

**Example Usage**

This command currently contains no example usage.

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.3.34. bpps::set_mode (::quartus::bpps)

The following table displays information for the `bpps::set_mode` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`bpps::set_mode [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td>Short help</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
</tbody>
</table>

**Description**

Internal use only for PDPW to set the mode of the middleware. Also defines what plugins will be loaded

**Example Usage**

DO NOT call this explicitly

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.3.35. bpps::shutdown (::quartus::bpps)

The following table displays information for the `bpps::shutdown` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`bpps::shutdown [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td>Short help</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
</tbody>
</table>

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

**continued...**
### 3.1.3.36. bpps::soften_cell (::quartus::bpps)

The following table displays information for the `bpps::soften_cell` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>bpps::soften_cell [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-cell &lt;cell&gt; Soften the existing placement of the specified cell</td>
</tr>
</tbody>
</table>

**Description**

In modes that support soft / hard placements (ie. Tile Planner mode), softens the existing placement of the specified cell. If the cell is subsequently unplaced and placed again, the placement soft / hard attribute will be based on the new placement action.

For modes that do not support soft / hard placements, nothing is performed.

**Example Usage**

`bpps::soften_cell -cell <design_cell_id>`

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>

### 3.1.3.37. bpps::soften_cells (::quartus::bpps)

The following table displays information for the `bpps::soften_cells` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>bpps::soften_cells [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-cells &lt;cells&gt; One or more cell ids to soften</td>
</tr>
</tbody>
</table>

**Description**

In modes that support soft / hard placements (ie. Tile Planner mode), softens the existing placement of the specified cell. If the cell is subsequently unplaced and placed again, the placement soft / hard attribute will be based on the new placement action.

For modes that do not support soft / hard placements, nothing is performed.

**Example Usage**

`bpps::soften_cells -cells <cell_ids>`

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>

*continued...*
on the new placement action.
For modes that do not support soft / hard placements, nothing is performed.

Example Usage

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.3.38. bpps::undo_last_placement (::quartus::bpps)

The following table displays information for the bpps::undo_last_placement Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>bpps::undo_last_placement [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td>Description</td>
<td>In classic mode, undo the last placement or unplacement operation.</td>
</tr>
<tr>
<td></td>
<td>In classic mode, undo the last pin assignment or assignment removal operation.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>This command currently contains no example usage.</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

3.1.3.39. bpps::unplace_cells (::quartus::bpps)

The following table displays information for the bpps::unplace_cells Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>bpps::unplace_cells [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-cells &lt;cells&gt;</td>
</tr>
<tr>
<td></td>
<td>-placed_cells</td>
</tr>
<tr>
<td>Description</td>
<td>In classic mode, removes the placement from the specified cells. Any constraints for the cells remain, but the cell no longer has a placement.</td>
</tr>
<tr>
<td></td>
<td>In pin planner mode, similar to classic mode, unassigns pin locations made within this session.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>project_open onewire_nf</td>
</tr>
<tr>
<td></td>
<td>blueprint::initialize</td>
</tr>
<tr>
<td></td>
<td>bpps::update_plan</td>
</tr>
</tbody>
</table>

continued...
3. TCL Commands and Packages

3.1.3.40. bpps::update_pdpw (::quartus::bpps)

The following table displays information for the `bpps::update_pdpw` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`bpps::update_pdpw [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help: Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-assignments: Indicates assignment model needs updating</td>
</tr>
<tr>
<td></td>
<td>-placement: Indicates placement needs updating</td>
</tr>
<tr>
<td>Description</td>
<td>In classic mode, this command update everything that needs updating in pdpw. This essentially sends a single TCL command to pdpw to update everything as needed. Used in the TCL proc source wrapper only. In pin planner mode, this command is just a stub.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>project_open onewire_nf</code> <code>blueprint::initialize</code> <code>bpps::update_pdpw -pdp_state [blueprint_internal::get_pdp_state]</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>

3.1.3.41. bpps::validate_placement (::quartus::bpps)

The following table displays information for the `bpps::validate_placement` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`bpps::validate_placement [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help: Long help with examples and possible return values</td>
</tr>
<tr>
<td>Description</td>
<td>Removes the exception to ignore the given project assignments. The result is the project assignments will take affect on the active design.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>This command currently contains no example usage.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>
3.1.3.42. bpps::write_plan (::quartus::bpps)

The following table displays information for the bpps::write_plan Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-clocks</td>
</tr>
<tr>
<td></td>
<td>-disabled</td>
</tr>
<tr>
<td></td>
<td>-filename &lt;filename&gt;</td>
</tr>
<tr>
<td></td>
<td>-force</td>
</tr>
<tr>
<td></td>
<td>-other_locations</td>
</tr>
<tr>
<td></td>
<td>-pin_locations</td>
</tr>
</tbody>
</table>

Description

In classic mode, export the floorplan constraints Tcl script
In pin planner mode, does nothing (we’re not exporting to any TCL file, instead we write to QSF directly in save_floorplan, or save_pin_assignments (recommended), calls.

Example Usage

project_open onewire_nf
blueprint::initialize
bpps::update_plan
bpps::place_cells -unplaced_cells
bpps::check_plan
bpps::write_plan -filename onewire_blueprint_assignments.tcl
project_close

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.3.43. bpps::write_tpl_placement (::quartus::bpps)

The following table displays information for the bpps::write_tpl_placement Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::bpps on page 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>bpps::write_tpl_placement [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-filename &lt;filename&gt;</td>
</tr>
</tbody>
</table>

Description

In TilePlanner mode, write out the placement JSON file. Nothing happens (should not be available in GUI) in other modes.

continued...
Example Usage

```
project_open onewire_nf
blueprint::initialize
bpps::update_plan
bpps::place_cells -unplaced_cells
bpps::check_plan
bpps::write_tpl_placement -filename onewire_blueprint_assignments.tcl
project_close
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Filename provided incorrectly</td>
</tr>
</tbody>
</table>

### 3.1.4. ::quartus::chip_planner

The following table displays information for the ::quartus::chip_planner Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::chip_planner 2.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>This package contains the set of Tcl functions for identifying and modifying resource usage and routing with the Chip Planner.</td>
</tr>
<tr>
<td>Availability</td>
<td>This package is available for loading in the following executables: qacv qpro quartus quartus_cdb</td>
</tr>
<tr>
<td>Tcl Commands</td>
<td>check_node (...): on page 110 close_chip_planner (...): on page 111 design_has_acs_support (...): on page 111 design_has_encrypt_ip (...): on page 112 get_info_parameters (...): on page 112 get_iports (...): on page 113 get_node_by_name (...): on page 114 get_node_info (...): on page 114 get_nodes (...): on page 115 get_oports (...): on page 115 get_port_by_type (...): on page 116 get_port_info (...): on page 117 get_sp_pin_list (...): on page 118 get_tile_power_setting (...): on page 118 read_netlist (...): on page 119 set_batch_node (...): on page 119</td>
</tr>
</tbody>
</table>

### 3.1.4.1. check_node (::quartus::chip_planner)

The following table displays information for the check_node Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::chip_planner on page 110</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>check_node [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-gen_id &lt;gen_id&gt;</td>
</tr>
</tbody>
</table>

continued...
### check_node

- **Description**: Checks whether the specified node is legal. Returns 1, if the node is legal. Returns 0, otherwise. Even if a node is legal, you still must run the `check_netlist_and_save` command to verify the node legality within the netlist.

- **Example Usage**: `check_node -node 3`

- **Return Value**
  - **TCL_OK**: Code 0, String Return: INFO: Operation successful
  - **TCL_ERROR**: Code 1, String Return: ERROR: Conflicting arguments. Consult help for the Tcl command for details.
  - **TCL_ERROR**: Code 1, String Return: ERROR: Illegal node generic ID: %u. Specify a legal node generic ID.
  - **TCL_ERROR**: Code 1, String Return: ERROR: Illegal node ID: %u. Specify a legal node ID.
  - **TCL_ERROR**: Code 1, String Return: ERROR: The node you specified is a legalization node. Modification of legalization nodes is not supported.
  - **TCL_ERROR**: Code 1, String Return: ERROR: Unable to find Chip Planner netlist. Read the netlist by using the `read_netlist` command.

### close_chip_planner

- **Syntax**: `close_chip_planner [-h | -help] [-long_help]`

- **Arguments**
  - `-h | -help`: Short help
  - `-long_help`: Long help with examples and possible return values

- **Description**: Releases the chip planner netlist from use.

- **Example Usage**: `close_chip_planner`

- **Return Value**
  - **TCL_OK**: Code 0, String Return: INFO: Operation successful

### design_has_ace_support

- **Syntax**: `design_has_ace_support [-h | -help] [-long_help]`

- **Arguments**
  - `-h | -help`: Short help

- **Description**: The following table displays information for the `design_has_ace_support` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::chip_planner on page 110</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`design_has_ace_support [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>Description</td>
<td>Releases the chip planner netlist from use.</td>
</tr>
</tbody>
</table>

- **Example Usage**: `design_has_ace_support`

- **Return Value**
  - **TCL_OK**: Code 0, String Return: INFO: Operation successful

---

**3.1.4.2. close_chip_planner (::quartus::chip_planner)**

The following table displays information for the `close_chip_planner` Tcl command:

---

**3.1.4.3. design_has_ace_support (::quartus::chip_planner)**

The following table displays information for the `design_has_ace_support` Tcl command:
-long_help

**Description**

Determines whether Chip Planner operations can be performed on the current design.

**Example Usage**

design_has_ace_support

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Unable to find Chip Planner netlist. Read the netlist by using the read_netlist command.</td>
</tr>
</tbody>
</table>

### 3.1.4.4. design_has_encrypted_ip (::quartus::chip_planner)

The following table displays information for the `design_has_encrypted_ip` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::chip_planner on page 110</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`design_has_encrypted_ip [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Determines whether the current design contains encrypted IP. Returns 1, if the design contains encrypted IP. You may be able to view or edit individual nodes of the design if they are not part of an encrypted IP. To check individual nodes, use the command &quot;get_node_info -node &lt;node id&gt; -info encrypted&quot;. Returns 0, otherwise.</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td><code>design_has_encrypted_ip</code></td>
</tr>
<tr>
<td><strong>Return Value</strong></td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
</tbody>
</table>

### 3.1.4.5. get_info_parameters (::quartus::chip_planner)

The following table displays information for the `get_info_parameters` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::chip_planner on page 110</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-file &lt;file name&gt;</td>
</tr>
<tr>
<td></td>
<td>-for_chip</td>
</tr>
</tbody>
</table>

Continued...
### Description
Returns a Tcl list of information parameters.
When you use the -file option, the list is redirected to the specified output file. If the output file already exists, it is overwritten without warning.

### Example Usage
```
get_info_parameters
get_info_parameters -file the_list.txt
```

### Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.4.6. `get_iports` (::quartus::chip_planner)
The following table displays information for the `get_iports` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::chip_planner on page 110</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Description</th>
<th>String Return</th>
</tr>
</thead>

</tbody>
</table>

### Description
Returns a collection of input ports for the specified node.
You can use the collection with the "foreach_in_collection" command.

### Example Usage
```
get_iports -node 3
get_iports -src_gen_id 5
```

<table>

### 3.1.4.12. `get_port_info` (::quartus::chip_planner)

The following table displays information for the `get_port_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to :<code>::quartus::chip_planner</code> on page 110</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_port_info [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-gen_id &lt;gen id&gt;</td>
</tr>
<tr>
<td></td>
<td>-info &lt;information type&gt;</td>
</tr>
<tr>
<td></td>
<td>-node &lt;node id&gt;</td>
</tr>
<tr>
<td></td>
<td>-port_id &lt;port id&gt;</td>
</tr>
<tr>
<td></td>
<td>-type &lt;iport</td>
</tr>
</tbody>
</table>

**Description**

Returns the requested type of information for the specified port.

To get available information types, use the `get_info_parameters` command.

If the information type is legal for the specified port, the result is the requested information. Otherwise, the result is an empty string.

**Example Usage**

```
get_port_info -node 3 -port_id 2 -type iport -info port_name
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td></td>
<td>0</td>
<td>INFO: Operation successful</td>

</tr>
<tr>
<td>TCL_ERROR</td>
<td></td>
<td>1</td>
<td>ERROR: &lt;string&gt; value &lt;string&gt; is not valid for the specified port. Specify a legal value.</td>
</tr>
</tbody>
</table>

continued...
### 3.1.4.13. `get_sp_pin_list` (::quartus::chip_planner)

The following table displays information for the `get_sp_pin_list` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::chip_planner on page 110</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_sp_pin_list [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td>Description</td>
<td>Returns a list of the pins available for use as signal probe output pins.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>get_sp_pin_list</code></td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

### 3.1.4.14. `get_tile_power_setting` (::quartus::chip_planner)

The following table displays information for the `get_tile_power_setting` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::chip_planner on page 110</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_tile_power_setting [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-X &lt;X location&gt;</code> X location</td>
</tr>
<tr>
<td></td>
<td><code>-Y &lt;Y location&gt;</code> Y location</td>
</tr>
<tr>
<td></td>
<td><code>-gen_id &lt;gen id&gt;</code> Generic id</td>
</tr>
<tr>
<td>Description</td>
<td>Returns the High-Speed/Low Power setting of the tile at the specified location.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>get_tile_power_setting -gen_id 12345</code></td>
</tr>
<tr>
<td></td>
<td><code>get_tile_power_setting -X 12 -Y 5</code></td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>
3. TCL Commands and Packages

3.1.4.15. read_netlist (::quartus::chip_planner)

The following table displays information for the read_netlist Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::chip_planner on page 110</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>read_netlist [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
</tbody>
</table>

**Description**

Reads the Chip Planner netlist from the last compilation.

You must open a project before using this command.

**Example Usage**

read_netlist

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>

<tr>
<td></td>
<td>-flat</td>
</tr>
<tr>
<td></td>
<td>-from &lt;from&gt;</td>
</tr>
<tr>
<td></td>
<td>-insts_only</td>
</tr>
</tbody>
</table>

**Description**

This command reports the timing fanout of specified source ports or inst_port in the design.

**Example Usage**

dni::all_fanout -from [dni::get_ports {a[0]}]

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>

#### 3.1.5.5. dni::all_inputs (::quartus::dcmd_dni)

The following table displays information for the dni::all_inputs Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::all_inputs [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
</tbody>
</table>

**Description**

This command reports the timing fanin of specified sink ports or inst_port in the design.

**Example Usage**

dni::all_inputs -to [dni::get_ports {a[0]}]

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

*continued...*
Description
This command creates a collection of all input ports in the current design.

Example Usage
# List all input ports from top module in current design.
dni::all_inputs

Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.5.6. dni::all_outputs (::quartus::dcmd_dni)

The following table displays information for the dni::all_outputs Tcl command:

<table>
<thead>
<tr>

<td>set copied_collection [:dni::copy_collection $collection]</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

3.1.5.11. dni::create_clock (::quartus::dcmd_dni)

The following table displays information for the dni::create_clock Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::create_clock [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-add</td>
</tr>
<tr>
<td></td>
<td>-comment &lt;comment&gt;</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-period &lt;period&gt;</td>
</tr>
<tr>
<td></td>
<td>-waveform &lt;waveform&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;targets&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Defines a clock. If the -name option is not used, the clock name is the same as the first target in the list or collection. The clock name is used to refer to the clock in other commands.</td>
</tr>
<tr>
<td></td>
<td>The -period option specifies the clock period. It is also possible to use this option to specify a frequency to define the clock period. This can be done by using -period option followed by either &lt;frequency&gt;Hz or &quot;&lt;frequency&gt; MHz&quot;. Please note this is a convenience extension and using it is non-standard SDC syntax.</td>
</tr>
<tr>
<td></td>
<td>The -waveform option specifies the rising and falling edges (duty cycle) of the clock, and is specified as a list of two time values: the first rising edge and the next falling edge. The rising edge must be within the range [0, period). The falling edge must be within one clock period of the rising edge. The waveform defaults to (0, period/2).</td>
</tr>
</tbody>
</table>
If a clock with the same name is already assigned to a given target, the create_clock command will return an error. If a clock with a different name exists on the given target, the create_clock command will be ignored unless the -add option is used. The -add option can be used to assign multiple clocks to a pin or port.

If the target of the clock is internal (i.e. not an input port), the source latency is zero by default.

If a clock is on a path after another clock, then it blocks or overwrites the previous clock from that point forward.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl substitution rules.

<table>
<thead>
<tr>
<th>Example Usage</th>
<th>dni::create_clock $period</th>
</tr>
</thead>
</table>

<table>
<thead>

<tr>
<td>Description</td>
<td>Short help</td>
</tr>
<tr>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>An instance name relative to the current instance</td>
</tr>
</tbody>
</table>

This command sets the instance as current point of reference for object names (e.g. relative path names) used in object query commands. This command returns the new current instance hierarchy or empty if current is design top.

continued...
If no instance name specified, the current instance is set to the current design top. If instance name specified as ".", the current instance is not changed. If instance name specified as "..", move current instance one level up in the hierarchy.

The instance name can include any number of "." (separated by hierarchy separators '|') as well as hierarchy instance names.

The new current instance cannot be a leaf cell.

Example Usage

move current instance up two levels
dni::current_instance ..|..

# move current instance to foo under parent of current instance
dni::current_instance ..|foo

# Save the current instance
set saved_ci [dni::current_instance .]

# make the design top the new current instance
dni::current_instance

# query top-level objects
set top_level_foo [dni::get_cells foo]

# restore saved current instance
current_instance $saved_ci

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>

<td>-filter &lt;expression&gt;</td>
</tr>
<tr>
<td></td>
<td>-hierarchical</td>
</tr>
</tbody>
</table>

continued...
### Description

This command creates a collection of instance ports from given search specifications.

### Example Usage

```tcl
# Creates a collection of instance ports with prefix out from top module.
dni::get_pins out*

# Creates a collection of instance ports connected to net h1_i1|n1.
dni::get_pins -of_objects [dni::get_nets h1_i1|n1]

# Creates a collection of instance ports from hierarchy h1* with direction as input and name prefix.
dni::get_pins h1*|* -filter {direction==input && name=~in*}
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.5.22. dni::get_ports (::quartus::dcmd_dni)

The following table displays information for the `dni::get_ports` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::dcmd_dni</code> on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>[-h</td>
</tr>
<tr>
<td></td>
<td>[-long_help] (Long help with examples and possible return values)</td>
</tr>
<tr>
<td></td>
<td>[-exact] (Exact patterns to search for object. Exact patterns cannot include wildcard characters &quot;*&quot; or &quot;?&quot; and escaped characters \).</td>
</tr>
<tr>
<td></td>
<td>[-filter &lt;expression&gt;] (Filter search by expression)</td>
</tr>
<tr>
<td></td>
<td>[-hierarchical] (Search level-by-level down from current instance)</td>
</tr>
<tr>
<td></td>
<td>[-nocase] (Perform case insensitive search)</td>
</tr>
<tr>
<td></td>
<td>[-of_objects &lt;objects&gt;] (Search based on relationship to objects)</td>
</tr>
<tr>
<td></td>
<td>[-quiet] (Suppress error, warning, or information messages)</td>
</tr>
<tr>
<td></td>
<td>[ &lt;patterns&gt;] (Patterns to search for object. Patterns can include wildcard characters &quot;*&quot; or &quot;?&quot;. Wildcard characters do not match with hierarchy separator)</td>
</tr>
</tbody>
</table>

**Description**

This command creates a collection of ports from the current design, relative to the current instance.

**Example Usage**

```tcl
# Creates a collection of ports from top module.
dni::get_ports

# Creates a collection of ports filter by output direction.
dni::get_pins -filter {direction==output}
```

**continued...**
### 3. TCL Commands and Packages

#### 3.1.5.23. dni::get_property (::quartus::dcmd_dni)

The following table displays information for the dni::get_property Tcl command:

### 3.1.5.25. dni::index_collection (::quartus::dcmd_dni)

The following table displays information for the dni::index_collection Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::index_collection [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>&lt;collection&gt; The base collection</td>
</tr>
<tr>
<td></td>
<td>&lt;index&gt; The index to locate an object in the collection</td>
</tr>
<tr>
<td></td>
<td>&lt;index2&gt; The second index to locate an item in the collection. If present, a list of objects between index and index2 in the base collection will be used to create a new collection</td>
</tr>
<tr>
<td>Description</td>
<td>Given a collection and an index, if the index is in range, create a new collection containing only the single object. Optionally a second index can be passed to create a new collection with the objects between the two indices in the base collection.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>set new_collection ::dni::index_collection $collection 0 10</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

### 3.1.5.26. dni::is_dni_mode (::quartus::dcmd_dni)

The following table displays information for the dni::is_dni_mode Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::is_dni_mode [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td>Description</td>
<td>Command to check if it is in DNI mode.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>dni::is_dni_mode</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>
### 3.1.5.27. dni::is_dni_mode_for_developer_testing (::quartus::dcmd_dni)

The following table displays information for the 
dni::is_dni_mode_for_developer_testing Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::is_dni_mode_for_developer_testing [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td>Description</td>
<td>Command to check if it is in DNI mode for developer testing.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>dni::is_dni_mode_for_developer_testing</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

### 3.1.5.28. dni::list_properties (::quartus::dcmd_dni)

The following table displays information for the dni::list_properties Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::list_properties [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-object &lt;object&gt;</td>
</tr>
<tr>
<td></td>
<td>-type &lt;type&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>This command gets the list of property names of an object or a specific object type.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>set prop_list [dni::list_properties -type $type -object $object]</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

### 3.1.5.29. dni::load_design (::quartus::dcmd_dni)

The following table displays information for the dni::load_design Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::load_design [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
</tbody>
</table>

...continued...
### 3. TCL Commands and Packages

- **checkpoint <checkpoint name>**
  - **Description:**
    - Open the specified checkpoint into a sandbox and load the design from the sandbox.
    - The opened design becomes the default design used for Tcl commands query.

- **mode <mode>**
  - **Example Usage:**
    - `dni::load_design -checkpoint "elaborated"`

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.5.30. dni::read_sdc (::quartus::dcmd_dni)

The following table displays information for the dni::read_sdc Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::read_sdc [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-replace</td>
</tr>
<tr>
<td></td>
<td>&lt;sdc_file&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Command to source constraints from sdc file.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>dni::read_sdc top.sdc</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.5.31. dni::remove_from_collection (::quartus::dcmd_dni)

The following table displays information for the dni::remove_from_collection Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::remove_from_collection [-h</td>

<tr>
<td></td>
<td>&lt;collection&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;object_spec&gt;</td>
</tr>
</tbody>
</table>

continued...
3. TCL Commands and Packages

3.1.5.32. dni::selection (::quartus::dcmd_dni)

The following table displays information for the dni::selection Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::selection [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-action &lt;action&gt;</td>
</tr>
<tr>
<td></td>
<td>-object &lt;object&gt;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>Command for object selection.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example Usage</td>
<td>dni::selection -action clear</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

3.1.5.33. dni::set_property (::quartus::dcmd_dni)

The following table displays information for the dni::set_property Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::set_property [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-object &lt;object&gt;</td>
</tr>
<tr>
<td></td>
<td>-value &lt;value&gt;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>Command to set property.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example Usage</td>
<td>dni::set_property -object $mod_port -name name -value {new_name}</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>
### 3.1.5.34. dni::set_time_format (::quartus::dcmd_dni)

The following table displays information for the `dni::set_time_format` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>dni::set_time_format</code> on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`dni::set_time_format [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-decimal_places &lt;decimal_places&gt;</code> Number of decimal places to use</td>
</tr>
<tr>
<td></td>
<td><code>-unit &lt;unit&gt;</code> Default time unit to use</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Sets time format, including time unit and decimal places.</td>
</tr>
<tr>
<td></td>
<td>Time units are assumed to be nanoseconds (ns) by default. The &quot;-unit&quot; option overrides the default time units. Legal time unit values are: ps, ns, us, ms.</td>
</tr>
<tr>
<td></td>
<td>Time units are displayed with three decimal places by default. The &quot;-decimal_places&quot; option overrides the default number of decimal places to show.</td>
</tr>
<tr>
<td></td>
<td>The smallest resolution of all time units is one picosecond (ps). Any additional specified precision will be truncated.</td>
</tr>
</tbody>
</table>

**Example Usage**

# Create two clocks with a clock period of 8 nanoseconds.
create_clock -period 8.000 clk1
set_time_format -unit ps -decimal_places 0
create_clock -period 8000 clk2

<table>
<thead>
<tr>
<th><strong>Return Value</strong></th>
<th><strong>Code Name</strong></th>
<th><strong>Code</strong></th>
<th><strong>String Return</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified number of decimal places is invalid. Please specify an integral value &gt;= 0.</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The default time unit can be set to ms, us, ns, or ps. Please specify one of these units instead.</td>
<td></td>
</tr>
</tbody>
</table>

### 3.1.5.35. dni::set_time_unit (::quartus::dcmd_dni)

The following table displays information for the `dni::set_time_unit` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>dni::set_time_unit</code> on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`dni::set_time_unit [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>&lt;unit&gt;</code> Default time unit to use</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Time units are assumed to be nanoseconds (ns) by default unless otherwise specified. Time or delay values are also displayed in nanoseconds by default without time units. The <code>dni::set_time_unit</code> COMMAND overrides the default time units assumed by the Timing Analyzer.</td>
</tr>
</tbody>
</table>

continued...
Legal values are: ps, ns, us, ms
The smallest resolution of all times units is one picosecond (ps). Any additional specified precision will be truncated.

Example Usage
# Create two clocks with a clock period of 8 nanoseconds.
clock -period 8.000 ckl1
dni::set_time_unit ps
clock -period 8000 ckl2

3.1.5.36. dni::sizeof_collection (::quartus::dcmd_dni)

The following table displays information for the dni::sizeof_collection Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-categorize</td>
</tr>
<tr>
<td></td>
<td>&lt;collection&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Returns the number of objects in a collection.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>set size ::dni::sizeof_collection $collection</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

3.1.5.37. dni::sort_collection (::quartus::dcmd_dni)

The following table displays information for the dni::sort_collection Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-descending</td>
</tr>
</tbody>
</table>

continued...
Sort strings dictionary order. For example "a30" would come after "a4"

Only return the first unique values from the primary sort key

The base collection

Specifies a list of one or more application or user-defined attributes to use as sort keys

Description

Sorts a collection based on one or more attributes, resulting in a new, sorted collection. The sort is ascending by default.

Example Usage

```
set size [::dni::sort_collection $collection [is_hierarchy]]
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.5.38. dni::unload_design (::quartus::dcmd_dni)

The following table displays information for the dni::unload_design Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::unload_design [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td>Description</td>
<td>Closes the design of the current opened sandbox and closes the sandbox.</td>
</tr>
</tbody>
</table>
| Example Usage           | dni::load_design -checkpoint "elaborated" ...
                        | dni::unload_design |
| Return Value            | Code Name | Code | String Return |
|                         | TCL_OK    | 0    | INFO: Operation successful |

3.1.5.39. dni::write_sdc (::quartus::dcmd_dni)

The following table displays information for the dni::write_sdc Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dcmd_dni on page 120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-command &lt;command&gt; Only output constraint statements defined with this command</td>
</tr>
<tr>
<td></td>
<td>-design &lt;design&gt; Design for CDMS design related commands</td>
</tr>
</tbody>
</table>

continued...
3. TCL Commands and Packages

- **-file <file>** Only output constraint statements defined in this file
- **-include_file_info** Include the file name and line number where the constraint is defined
- **-line <line>** Only output constraint statements defined on this line number
- **-output_file <output_file>** Path to output file where constraint statements are written

**Description**

Write the SDC constraint statements currently loaded for this design.

**Example Usage**

```tcl
# Write the SDC constraints to the console
dni::write_sdc

# Write the SDC constraints to a file
dni::write_sdc -output_file write_sdc_output.txt
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.6. ::quartus::design

The following table displays information for the ::quartus::design Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::design 1.0</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>This package contains the set of Tcl functions for manipulating databases including the assignments database. Using this package makes it possible to create instance assignments without modifying the Quartus Prime Settings File (.qsf).</td>
</tr>
<tr>
<td><strong>Availability</strong></td>
<td>This package is loaded by default in the following executable: quartus_cdb. This package is available for loading in the following executables: qacv, qpro, qpro_sh, quartus, quartus_fit, quartus_map, quartus_pow, quartus_sh, quartus_sta, quartus_syn</td>
</tr>
<tr>

</tr>
</tbody>
</table>
3. TCL Commands and Packages

3.1.6.1. design::commit_design (::quartus::design)

The following table displays information for the design::commit_design Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>design::commit_design [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td>Description</td>
<td>Commit any changes to the databases to disk.</td>
</tr>
<tr>
<td></td>
<td>Assignments created or modified on a design loaded as writeable are not saved to the databases unless you explicitly call this command.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>project_open onewire_nf</td>
</tr>
<tr>
<td></td>
<td>design::load_design -latest_snapshot -writeable</td>
</tr>
<tr>
<td></td>
<td>design::delete_assignments [design::get_assignments -name location]</td>
</tr>
<tr>
<td></td>
<td>design::commit_design</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

3.1.6.2. design::convert_partition (::quartus::design)

The following table displays information for the design::convert_partition Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>design::convert_partition [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-infile \ &lt;QDB file name&gt;</td>
</tr>
<tr>
<td></td>
<td>-outfile \ &lt;QDB file name&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Convert a partition's QDB file in version-compatible ASCII format into a QDB file in BINARY format for current version of Quartus.</td>
</tr>
<tr>
<td>Example Usage</td>
<td># The input QDB file is created by running design::export_partition</td>
</tr>
<tr>
<td></td>
<td># from compiled source design with Quartus of older or current version</td>
</tr>
<tr>
<td></td>
<td>project_open onewire_nf</td>
</tr>
<tr>
<td></td>
<td>design::export_partition core_ptn -snapshot synthesized -file src_ip.qdb -compatible</td>
</tr>
<tr>
<td></td>
<td>project_close</td>
</tr>
<tr>
<td></td>
<td># Make sure you are using the same version of Quartus that will use to compile your design.</td>
</tr>
<tr>
<td></td>
<td>project_open onewire_nf</td>
</tr>
<tr>
<td></td>
<td>design::convert_partition -infile src_ip.qdb -outfile ip.qdb</td>
</tr>
<tr>
<td></td>
<td>project_close</td>
</tr>
</tbody>
</table>

continued...
### 3.1.6.3. `design::create_assignment` (::quartus::design)

The following table displays information for the `design::create_assignment` Tcl command:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td></td>
<td>ERROR: The specified archive &lt;string&gt; does not exist.</td>
</tr>
</tbody>
</table>

#### Syntax

```
design::create_assignment [-h | -help] [-long_help] [-from <from>] -name <name> -to <to> -value <value>
```

#### Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-from <from>` The source name of the assignment
- `-name <name>` The type name of the assignment
- `-to <to>` The destination name of the assignment
- `-value <value>` The value of the assignment

#### Description

Create a new assignment in the assignment database

#### Example Usage

```tcl
project_open onewire_nf
design::load_design -latest_snapshot -writeable
design::create_assignment -name location -to in1 -value PIN_A5
design::commit_design
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>

<td>1</td>
<td></td>
<td>ERROR: Either the -to or -from argument is required.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td></td>
<td>ERROR: The -to argument is required.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td></td>
<td>ERROR: The value of an assignment cannot be empty.</td>
</tr>
</tbody>
</table>

### 3.1.6.4. `design::delete_assignments` (::quartus::design)

The following table displays information for the `design::delete_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
</table>

#### Syntax

```
design::delete_assignments [-h | -help] [-long_help] <assignment>
```

#### Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `<assignment>` one or more assignment ids

#### Example Usage

```tcl
project_open onewire_nf
design::load_design -latest_snapshot -writeable
design::delete_assignments -name location -to in1 -value PIN_A5
design::commit_design
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>

</table>

### 3.1.6.5. `design::disable_assignments` (::quartus::design)

The following table displays information for the `design::disable_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::design</code> on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`design::disable_assignments [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>&lt;assignment&gt;</code> one or more assignment ids</td>
</tr>
<tr>
<td>Description</td>
<td>Disables one or more assignments from the assignment database</td>
</tr>
</tbody>
</table>

```
project_open onewire_nf

design::load_design -latest_snapshot -writeable
design::disable_assignments [design::get_assignments -name location]
design::commit_design
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>

</tr>
</tbody>
</table>

3.1.6.7. design::export_design (::quartus::design)

The following table displays information for the design::export_design Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>design::export_design [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>Short help</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-file &lt;file&gt;</td>
</tr>
<tr>
<td></td>
<td>The file.qdb to export to</td>
</tr>
<tr>
<td></td>
<td>-quartus_metadata &lt;quartus_metadata&gt;</td>
</tr>
<tr>
<td></td>
<td>A space-separated list of Quartus Metadata to export. Valid Quartus Metadata options include &lt;none&gt; project_information</td>
</tr>
<tr>
<td></td>
<td>-snapshot &lt;snapshot&gt;</td>
</tr>
<tr>
<td></td>
<td>The snapshot you want to export. Valid snapshot &lt;synthesized</td>
</tr>
<tr>
<td></td>
<td>-user_metadata &lt;user_metadata&gt;</td>
</tr>
<tr>
<td></td>
<td>The absolute or relative path to the User Metadata configuration file.</td>
</tr>
</tbody>
</table>
Export the specified metadata and loaded databases for the open project and revision and snapshot to `<file>.qdb` in a version-compatible format. This command is available only in the `quartus_cdb` executable.

**Example Usage**
```
project_open onewire_nf
design::export_design -file onewire.qdb -snapshot synthesized
project_close
```

**Return Value**
```
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
```

### 3.1.6.8. `design::export_partition` (::quartus::design)

The following table displays information for the `design::export_partition` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::design</code> on page 141</th>
</tr>
</thead>
</table>

**Syntax**
```
design::export_partition [-h | -help] [-long_help] [-exclude_pr_subblocks] -file <QDB file name> [-include_sdc_entity_in_partition] [-preserve_sdc] [-quartus_metadata <quartus_metadata>] -snapshot <Snapshot(s) to be exported> [-user_metadata <user_metadata>] [ <Partition to be exported>]
```

**Arguments**
- `-h` | `-help` Short help
- `-long_help` Long help with examples and possible return values
- `-exclude_pr_subblocks` Exclude PR subpartitions
- `-file <QDB file name>` File name of the QDB archive.
- `-include_sdc_entity_in_partition` Preserve SDC/TCL Entity files
- `-preserve_sdc` Deprecated option to Preserve SDC/TCL Entity files
- `-quartus_metadata <quartus_metadata>` A space-separated list of Quartus Metadata to export. Valid Quartus Metadata options include `<none|project_information|resource_utilization|all>`.
- `-snapshot <Snapshot(s) to be exported>` Snapshot(s) to be exported. Valid snapshot options include `<synthesized|final>`.
- `-user_metadata <user_metadata>` The absolute or relative path to the User Metadata configuration file.
- `<Partition to be exported>` Name of the partition to be exported.

**Description**
Export the metadata and IP of the specified partition and snapshot.

**Example Usage**
```
project_open onewire_nf
design::export_partition core_ptn -snapshot synthesized -file ip.qdb
project_close
```

**Return Value**
```
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
```
3.1.6.9. design::extract_metadata (::quartus::design)

The following table displays information for the design::extract_metadata Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>design::extract_metadata [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-dir &lt;dir&gt;</td>
</tr>
<tr>
<td></td>
<td>-file &lt;file&gt;</td>
</tr>
<tr>
<td></td>
<td>-overwrite</td>
</tr>
<tr>
<td></td>
<td>-type &lt;type&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Extracts the specified metadata from the given Partition Database File (.qdb) file to the provided extraction directory.</td>
</tr>
</tbody>
</table>
| Example Usage           | # Create a Partition Database File (.qdb) with Quartus Metadata using the "synthesized" snapshot. 
|                         | project_open onewire_nf 
|                         | design::export_design -file onewire.qdb -snapshot synthesized -quartus_metadata all 
|                         | project_close 
|                         | # Create the extraction directory. 
|                         | file mkdir "extract/dir" 
|                         | # Extract all the Quartus Metadata from "onewire.qdb" to the extraction directory located at "extract/dir". 
|                         | design::extract_metadata -file onewire.qdb -type quartus -dir "extract/dir" |

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>

3.1.6.10. design::get_assignment_info (::quartus::design)

The following table displays information for the design::get_assignment_info Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-from</td>
</tr>
<tr>
<td></td>
<td>-name</td>
</tr>
<tr>
<td></td>
<td>-to</td>
</tr>
</tbody>
</table>

continued...
Return the value of the assignment id

<assignment>

assignment id

Description

Get information about a given assignment ID

Example Usage

project_open onewire_nf
design::load_design -latest_snapshot
foreach asgn_id [design::get_assignments] {
    puts "Found assignment [design::get_assignment_info -name $asgn_id]
    [design::get_assignment_info -to $asgn_id] = [design::get_assignment_info -value $asgn_id]"
}

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The supplied assignment id &lt;string&gt; is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: At least one periphery assignment ID must be supplied, but no assignments IDs were supplied.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: &lt;string&gt; assignment IDs were expected but &lt;string&gt; were supplied.</td>
</tr>
</tbody>
</table>

3.1.6.11. design::get_assignment_names (::quartus::design)

The following table displays information for the design::get_assignment_names Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>design::get_assignment_names [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td>Description</td>
<td>Get a list of valid assignment type names</td>
</tr>
</tbody>
</table>
| Example Usage           | project_open onewire_nf
design::load_design -latest_snapshot
puts "Valid assignment type names:"
foreach asgn_type [lsort [design::get_assignment_names]] {
    puts $asgn_type
}

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.6.12. design::get_assignments (::quartus::design)

The following table displays information for the design::get_assignments Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
</table>

continued...
### Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-deleted` Return only deleted assignments
- `-disabled` Return only disabled assignments
- `-enabled` Return only enabled assignments
- `-ignored` Return only ignored assignments
- `-name <name>` Return only assignments of the provided type name

### Description

Get a list of assignment IDs for the currently loaded design.

### Example Usage

```tcl
project_open onewire_nf
design::load_design -latest_snapshot
foreach asgn_id [design::get_assignments] {
    puts "Found assignment [design::get_assignment_info -name $asgn_id]"
    puts [design::get_assignment_info -to $asgn_id] = [design::get_assignment_info -value $asgn_id]*
}
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The assignment with id &lt;string&gt; is not enabled.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The supplied assignment type name &lt;string&gt; is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: At least one assignment type name must be supplied, but no type names were supplied.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: &lt;string&gt; assignment type names were expected but &lt;string&gt; were supplied.</td>
</tr>
</tbody>
</table>

---

### 3.1.6.13. design::get_entity_names (::quartus::design)

The following table displays information for the `design::get_entity_names` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>design::get_entity_names [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>&lt;filter&gt;</code> Object filter</td>
</tr>
<tr>
<td>Description</td>
<td>Get a list of entity names in the loaded design</td>
</tr>
<tr>
<td>Example Usage</td>
<td>This command currently contains no example usage.</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>
3.1.6.14. design::get_instances (::quartus::design)

The following table displays information for the `design::get_instances` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`design::get_instances [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-entity &lt;entity&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;filter&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Get a list of instances in the loaded design</td>
</tr>
<tr>
<td>Example Usage</td>
<td>This command currently contains no example usage.</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

3.1.6.15. design::import_design (::quartus::design)

The following table displays information for the `design::import_design` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`design::import_design [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-file &lt;file&gt;</td>
</tr>
<tr>
<td></td>
<td>-overwrite</td>
</tr>
<tr>
<td></td>
<td>-timing_analysis_mode</td>
</tr>
<tr>
<td>Description</td>
<td>Import all the databases from the specified &lt;file&gt;.qdb.</td>
</tr>
<tr>
<td></td>
<td>If overwrite is specified then databases will be overwritten in the active qdb directory.</td>
</tr>
<tr>
<td></td>
<td>The database revision in the &lt;file&gt;.qdb must match the active revision.</td>
</tr>
<tr>
<td></td>
<td>This command is available only in the quartus_cdb executable.</td>
</tr>
</tbody>
</table>

-------------
OPTIONS DESCRIPTION
-------------
-timing_analysis_mode

Import the design for Timing Analysis. This option disables legality checks for certain configuration rules which may have changed from prior versions.
of Quartus Prime Pro.
Use this option only if you were unable to successfully import your design
without this option. After a design has been imported in timing analysis mode,
the imported database will not be able to be used to generate programming files.

Example Usage
# For the pro/quartus/sys/dsgn tests we need to export
# a design first so there's a design to import
project_open onewire_nf
design::export_design -file onewire.qdb -snapshot synthesized
project_close

project_open onewire_nf
design::import_design -file onewire.qdb -overwrite
project_close

Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified archive &lt;string&gt; does not exist.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Databases already exist for the specified revision &lt;string&gt;. Use -overwrite to overwrite them.</td>
</tr>
</tbody>
</table>

3.1.6.16. design::import_partition (::quartus::design)
The following table displays information for the design::import_partition Tcl
command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>design::import_partition [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-file &lt;QDB file name&gt;</td>
</tr>
<tr>
<td></td>
<td>-no_overwrite</td>
</tr>
<tr>
<td></td>
<td>&lt;Partition to be imported&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Import a partition into the current design.</td>
</tr>
</tbody>
</table>

Example Usage
# You need to run design::export_partition from a source design
# so that there's a partition to import from
project_open onewire_nf
design::export_partition root_partition -snapshot synthesized -file ip.qdb
project_close

# The imported DB file can be used as root_partition
project_open onewire_nf
design::import_partition root_partition -file ip.qdb
project_close

# Or non-root_partition
project_open onewire_nf
design::import_partition ip_sub -file ip.qdb
project_close

Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified archive &lt;string&gt; does not exist.</td>
</tr>
</tbody>
</table>
3.1.6.17. design::list_valid_snapshot_names (::quartus::design)

The following table displays information for the design::list_valid_snapshot_names Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>design::list_valid_snapshot_names [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td>Description</td>
<td>Returns the list of the valid design snapshot names.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>puts &quot;Valid design snapshot names: [design::list_valid_snapshot_names]&quot;</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

3.1.6.18. design::load_design (::quartus::design)

The following table displays information for the design::load_design Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-flat_only</td>
</tr>
<tr>
<td></td>
<td>-latest_snapshot</td>
</tr>
<tr>
<td></td>
<td>-snapshot &lt;snapshot&gt;</td>
</tr>
<tr>
<td></td>
<td>-writeable</td>
</tr>
<tr>
<td>Description</td>
<td>Load the databases for the currently opened project. The databases are by default loaded in read-only mode and must be loaded with the -writeable option if manipulation to the databases is desired.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>project_open onewire_nf design::load_design -latest_snapshot foreach asgn_id [design::get_assignments] { puts <em>Found assignment [design::get_assignment_info -name $asgn_id] [design::get_assignment_info -to $asgn_id] = [design::get_assignment_info -value $asgn_id]</em> }</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

continued...
### 3.1.6.19. design::report_assignments (::quartus::design)

The following table displays information for the `design::report_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-deleted</code> Report only deleted assignments</td>
</tr>
<tr>
<td></td>
<td><code>-disabled</code> Report only disabled assignments</td>
</tr>
<tr>
<td></td>
<td><code>-enabled</code> Return only enabled assignments</td>
</tr>
<tr>
<td></td>
<td><code>-ignored</code> Report only ignored assignments</td>
</tr>
<tr>
<td></td>
<td><code>-name &lt;name&gt;</code> The type name of the assignments to report</td>
</tr>
<tr>
<td></td>
<td><code>-panel_name &lt;name&gt;</code> Sends the results to the panel and specifies the name of the new panel</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Create a report of all instance assignments in the loaded design</td>
</tr>
</tbody>
</table>
| **Example Usage**        | `project_open onewire_nf`  
`design::load_design -latest_snapshot`  
`design::report_assignments -name location` |
| **Return Value**         | **Code Name** | **Code** | **String Return** |
|                          | TCL_OK | 0 | INFO: Operation successful |

### 3.1.6.20. design::set_assignment_info (::quartus::design)

The following table displays information for the `design::set_assignment_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::design on page 141</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`design::set_assignment_info [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-disable</code> Disable the assignment</td>
</tr>
<tr>
<td></td>
<td><code>-enable</code> Enable the assignment</td>
</tr>
</tbody>
</table>
-value <value>  Set the assignment value
<assignment>  assignment id

Description
Set information for a given assignment ID

Example Usage
project_open onewire_nf
design::load_design -latest_snapshot
set asgn_id [lindex [design::get_assignments -name location] 0]
puts "Setting location of [design::get_assignment_info -to $asgn_id] to PIN_A5"
design::set_assignment_info -value PIN_A5 $asgn_id
puts "New location of [design::get_assignment_info -to $asgn_id] is
[design::get_assignment_info -value $asgn_id]"

Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The supplied assignment id &lt;string&gt; is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The supplied assignment value &lt;string&gt; is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: At least one periphery assignment ID must be supplied, but no assignments IDs were supplied.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Either the -to or -from argument is required.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The value of an assignment cannot be empty.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: &lt;string&gt; assignment IDs were expected but &lt;string&gt; were supplied.</td>
</tr>
</tbody>
</table>

3.1.7. ::quartus::device

The following table displays information for the ::quartus::device Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::device 1.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>This package contains the set of Tcl functions for accessing information from the Quartus Prime device database.</td>
</tr>
<tr>
<td>Availability</td>
<td>This package is loaded by default in the following executables: qpro_sh quartus_cdb quartus_sda quartus_fit quartus_ipgenerate quartus_sh quartus_sim quartus_sts quartus_syn</td>
</tr>
<tr>
<td></td>
<td>This package is available for loading in the following executables: qpro quartus quartus_si</td>

-rohs_grade  Option to get the ROHS grade (ROHS5, ROHS6, Leaded)
-sip_tile    Option to get SiP tile (such as L-tile, H-tile, E-tile)
-speed_grade  Option to get speed grade (such as 5, 6, or 7)
-subdevice_id_code  Option to get the subdevice_id_code
-subdevice_id_mask  Option to get the subdevice_id_mask
-temperature_grade  Option to get temperature grade of the package (such as COMMERCIAL or INDUSTRIAL)

Part
Description
Returns part characteristics for the specified part.
If you use multiple options, the command returns a list in the following order:
-<family>  <device>  <package>  <pin_count>  <speed_grade>  <temperature_grade>  <family_variant>  
-<power_model_status>  <hssi_speed_grade>  <power_model>  <rohs_grade>

Example Usage
tcl> get_part_info -family EP1S25F780C5 
tcl> Stratix 
tcl> get_part_info -family -device EP1S25F780C5 
tcl> Stratix EP1S25 
tcl> get_part_info -device -package -pin_count -speed_grade EP1S25F780C5 
tcl> EP1S25 FBGA 780 5

Return Value
Code Name   Code    String Return
TCL_OK       0    INFO: Operation successful
TCL_ERROR    1    ERROR: Illegal die location name: <string>. Specify a legal die location name.
TCL_ERROR    1    ERROR: Illegal resource name: <string>. Specify a legal resource name.

3.1.7.3. get_part_list (::quartus::device)

#### 3.1.8.1. dni::create_generated_clock (::quartus::dni_sdc)

The following table displays information for the `dni::create_generated_clock` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dni_sdc on page 158</th>
</tr>
</thead>
</table>

**Syntax**

```
```

**Arguments**

- `-h | -help` | Short help
- `-long_help` | Long help with examples and possible return values
- `-add` | Add clock to existing clock node
- `-combinational` | Specifies that the source latency paths for this type of generated clock only includes the logic where the master clock propagates along combinational paths
- `-comment <string>` | Comment string
- `-divide_by <factor>` | Division factor
- `-duty_cycle <percent>` | Specifies the duty cycle as a percentage of the clock period—accepts floating point values
- `-edge_shift <shift_list>` | List of edge shifts
- `-edges <edge_list>` | List of edge values
- `-invert` | Invert the clock waveform
- `-master_clock <clock>` | Specifies clock of the source node
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-multiply_by &lt;factor&gt;</td>
<td>Multiplication factor</td>
</tr>
<tr>
<td>-name &lt;clock_name&gt;</td>
<td>Name of generated clock</td>
</tr>
<tr>
<td>-offset &lt;time&gt;</td>
<td>Specifies the offset as an absolute time shift</td>
</tr>
<tr>
<td>-phase &lt;degrees&gt;</td>
<td>Specifies the phase shift in degrees</td>
</tr>
<tr>
<td>-preinvert</td>
<td>Preinvert the clock waveform</td>
</tr>
<tr>
<td>-source &lt;clock_source&gt;</td>
<td>Source pin for the generated clock</td>
</tr>
<tr>
<td>&lt;targets&gt;</td>
<td>List or collection of targets</td>
</tr>
</tbody>
</table>

### Description

Defines an internally generated clock. If -name is not specified, the clock name is the same as the first target in the list or collection. The clock name is used to refer to the clock in other commands.

If a clock with the same name is already assigned to a given target, the create_generated_clock command overwrites the existing clock. If a clock with a different name exists on the given target, the create_generated_clock command is ignored unless the -add option is used. The -add option can be used to assign multiple clocks to a pin or port, and is recommended be used with -master_clock option.

The master clock must be defined on (or must propagate to) the port or pin specified in -source. The waveform of the generated clock is computed based on the master clock's waveform as observed at that port or pin, including inversions that may occur between the master clock source and that pin.

The source latency of the generated clock is based on the clock network of the generated clock, and not the clock network of the node specified using -source. This latency is added to any source latency of the master clock.

If no target is specified, the clock is treated as a virtual clock. In that case, the source latency of the generated clock will be equal to the source latency of the master clock, plus any added latency specified with set_clock_latency.

The -divide_by, -multiply_by, -invert, -duty_cycle, -edges, and -edge_shift options modify the waveform relative to the waveform at the source node.

Clock division and multiplication, using -divide_by and -multiply_by, is performed relative to the first rising edge. Clock division is based on edges in the master clock waveform, and scaled if the division is an odd number. Use the -duty_cycle option to specify the new duty cycle for clock multiplication. Use the -invert option to invert the generated waveform. The -duty_cycle option may be specified as a decimal value (e.g. 22.5) or as a ratio of two numbers (e.g. 45/2). The latter form may improve Timing Analyzer accuracy when detecting relationships between related clocks.

Clock generation can also be specified with the -edges and -edge_shift options. The -edges option accepts a list of three numbers specifying the master clock edges to use for the first rising edge, the next falling edge, and next rising edge. Edges of the master clock are labeled according to the first rising edge (1), next falling edge (2), next rising edge (3), etc. For example, a basic clock divider can be specified equivalently with -divide_by 2 or -edges {1 3 5}. The -edge_shift option accepts a list of three time values, the amount to shift each of the three edges.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type.

Note -preinvert and -combinational options are not supported.

### Example Usage

```tcl
# Create a clock and a divide-by-2 generated clock
create_clock -period 10 [get_ports clk]
cREATE_GENERATED_CLOCK -divide_by 2 -source [get_ports clk] -name clkdiv [get_cells clkdiv]

# An equivalent generated clock
create_generated_clock -edges {1 3 5} -source [get_ports clk] -name clkdiv [get_cells clkdiv]

# Specify a clock multiplier with a 60% duty cycle
create_generated_clock -multiply_by 2 -source [get_ports clk] -duty_cycle 60 [get_pins clkmult]

# Specify an inverted divide-by-2 clock relative to the output of the source clock
```

---

160
create_generated_clock -divide_by 2 -invert -source [get_ports clk] -name nclkdiv [get_cells clkdiv]

# Specify a divide-by-2 clock
create_generated_clock -divide_by 2 -source [get_ports clk] -name clkdiv [get_cells clkdiv]

# Create a divide-by-2 generated clock generated off the falling edge of the source clock
create_generated_clock -edges {2 4 6} -source [get_ports clk] -name clkfall_div [get_cells clkfall_div]

# Assign two clocks to an input port that are switched externally,
# along with an internal clock divider.
create_clock -period 10.000 -name clk100Mhz [get_ports clk]
create_clock -period 10.000 -name clk150Mhz [get_ports clk]
create_generated_clock -divide_by 2 -name clk50Mhz -source [get_ports clk] -master_clock clk100Mhz -add [get_cells clkdiv]
create_generated_clock -divide_by 2 -name clk75Mhz -source [get_ports clk] -master_clock clk150Mhz -add [get_cells clkdiv]

Return Value | Code Name | Code | String Return
--- | --- | --- | ---
TCL_OK | 0 | INFO: Operation successful

### 3.1.8.2. dni::remove_clock_groups (::quartus::dni_sdc)

The following table displays information for the dni::remove_clock_groups Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dni_sdc on page 158</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::remove_clock_groups [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-all</td>
</tr>
<tr>
<td></td>
<td>-asynchronous</td>

<tr>
<td></td>
<td>-logically_exclusive</td>
</tr>
<tr>
<td></td>
<td>-physically_exclusive</td>
</tr>
<tr>
<td></td>
<td>&lt;name_list&gt;</td>
</tr>
</tbody>
</table>

**Description**

Remove all clock group assignments. This command removes any clock groups that have been previously set. There is no way to remove specific groups yet, therefore the -all option has to be given. All other options are supported.

**Example Usage**

```
project_open top
create_timing_netlist
clock -period 10.000 -name clkA [get_ports sysclk[0]]
clock -period 10.000 -name clkB [get_ports sysclk[1]]

# Set CLKA and CLKB to be mutually exclusive clocks.
set_clock_groups -exclusive -group {clkA} -group {clkB}
set_clock_groups -exclusive -group {clkC} -group {clkD}

# Set clock groups A, B, C, and D. Result is that there are no longer any mutually exclusive clocks.
remove_clock_groups -all
```

Return Value | Code Name | Code | String Return
--- | --- | --- | ---
TCL_OK | 0 | INFO: Operation successful
3.1.8.3. dni::remove_clock_latency (::quartus::dni_sdc)

The following table displays information for the dni::remove_clock_latency Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dni_sdc on page 158</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-early</td>
</tr>
<tr>
<td></td>
<td>-fall</td>

<td>-rise</td>
</tr>
<tr>
<td></td>
<td>-source</td>
</tr>
<tr>
<td>&lt;object_list&gt;</td>
<td>Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

Description

Removes clock latency for a given clock or clock target.

There are two types of latency: network and source. Network latency is the clock network delay between the clock and register clock pins. Source latency is the clock network delay between the clock and its source (e.g., a system clock or a base clock of a generated clock).

The Timing Analyzer automatically computes network latencies for all register and generated clocks. Overriding clock network latencies is not supported by the Timing Analyzer. Therefore, the -source option must always be specified. Remove_clock_latency requires this option as well.

You can apply clock latency to a clock, which affects all targets of the clock, or to a specific clock target. Therefore, you can remove clock latency from a collection of clocks, or from a collection of target nodes. remove_clock_latency removes all latencies from a clock or node, so removing a node's clock latency with respect to a particular clock, or removing only latencies with particular conditions is not supported.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type.

Example Usage

create_clock -name SYSClk -period 10.000 [get_ports inclk]
create_generated_clock -name OUTCLK -divide_by 1 -source [get_ports inclk] [get_ports outclk]
create_generated_clock -name FBKCLK -divide_by 1 -source [get_ports outclk] [get_ports fdbkclk]

# Apply a simple 2.000 ns source latency to the system clock.
set_clock_latency -source 2.000 [get_clocks SYSClk]

# Specify feedback clock latencies between output port OUTclk and the output port FBKclk.
set_clock_latency -source -late -rise 0.400 [get_clocks FBKCLK]
set_clock_latency -source -late -fall 0.500 [get_clocks FBKCLK]
set_clock_latency -source -early -rise 0.500 [get_clocks FBKCLK]
set_clock_latency -source -early -fall 0.460 [get_clocks FBKCLK]

continued...
### Remove all clock latency from FDBKCLK

```
# Remove all clock latency from FDBKCLK
remove_clock_latency -source [get_clocks FDBKCLK]
```

<table>

</tr>
<tr>
<td></td>
<td><code>-rise_to &lt;rise_to_clock&gt;</code> Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
<tr>
<td></td>
<td><code>-setup</code> Only apply the uncertainty value to setup and recovery checks</td>
</tr>
<tr>
<td></td>
<td><code>-to &lt;to_clock&gt;</code> Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

### Description

Removes clock uncertainty from a collection of clocks to a collection of clocks. The source and destination clocks can be any arbitrary collection of clocks. This command removes all uncertainty between two clocks. If there does not exist uncertainty between two clocks specified in `remove_clock_uncertainty`, the command does nothing for those two clocks but continues to attempt to remove uncertainty between other clocks specified.

The values of the `-from` and `-to` options are either collections or a Tcl list of wildcards used to create collections of appropriate types.

Note `-rise` and `-fall` options are not supported yet.

*continued...*
### Example Usage

- `set_clock_uncertainty -setup -rise_from {clk1 clk2} -fall_to {clk3 clk4} 200ps`
- `set_clock_uncertainty -from {clk5 clk6} -to {clk7 clk8} 300ps`
- `remove_clock_uncertainty -from {clk3 clk5} -to {clk4 clk7}`

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.8.5. dni::remove_disable_timing (::quartus::dni_sdc)

The following table displays information for the dni::remove_disable_timing Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dni_sdc on page 158</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dini::remove_disable_timing [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-all_loop_breaking</td>
</tr>
<tr>
<td></td>
<td>-from &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-to &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;cells&gt;</td>
</tr>
</tbody>
</table>

**Description**

Adds a previously disabled edge (arc) back to a given cell(s). If no -from/-to value is specified, the missing value is substituted by a ***.

The values of the -from and -to are valid pin suffixes.

Note -all_loop_breaking option is not supported yet.

*Example Usage*

- `remove_disable_timing -from datain -to combout A|B`
- `remove_disable_timing -from carryin *`

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>

</tbody>
</table>

### 3.1.8.6. dni::remove_input_delay (::quartus::dni_sdc)

The following table displays information for the dni::remove_input_delay Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dni_sdc on page 158</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-clock &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-clock_fall</td>
</tr>
</tbody>
</table>

...continued...
-fall
Specifies the falling input delay at the port

-level-sensitive
Specifies that input delay is relative to a level-sensitive latch

-max
Applies value as maximum data arrival time

-min
Applies value as minimum data arrival time

-rise
Specifies the rising input delay at the port

<targets>
Collection or list of input ports

### Description
Removes input delay from a port. For each input port specified, removes all input delays for that port. This means that rise, fall, max, and min delays for each clock and reference pin on the input port are all removed.
The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type.

### Example Usage

```tcl
# Simple input delay with the same value for min/max and rise/fall
set_input_delay -clock clk 1.5 [get_ports {in1 in2}]
set_input_delay -clock clk2 1.5 [get_ports {in1 in2}]
set_input_delay -clock clk 1.6 [get_ports {in3 in4}]

# Remove input delay on ports in1 and in4,
# for all flags and reference ports and flags
remove_input_delay [get_ports {in1 in4}]
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>

<tr>
<td></td>
<td>&lt;targets&gt;</td>
</tr>
</tbody>
</table>
| Description             | Removes output delay from a port. For each output port specified, removes all output delays for that port. Rise, fall, max, and min delays for each clock and reference pin on the output port are all removed.

*continued...*
The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

### Example Usage

```tcl
# Simple output delay with the same value for min/max and rise/fall
set_output_delay -clock clk 1.5 [get_ports {out1 out2}]
set_output_delay -clock clk2 1.5 [get_ports {out1 out2}]

# Remove input delay on ports out1 and out4,
# for all flags and reference ports and flags
remove_output_delay [get_ports {out1 out4}]
```

<td>-name &lt;name&gt;</td>
<td>Clock group name</td>
</tr>
<tr>
<td>-physically_exclusive</td>
<td>Specify physically exclusive clocks (meaning they are not physically present at the same time)</td>
</tr>
</tbody>
</table>

**Description**

Clock groups provide a quick and convenient way to specify which clocks are not related. Asynchronous clocks are those that are completely unrelated (e.g., have different ideal clock sources). Logically exclusive clocks are not actively used in the design at the same time (e.g., multiplexed clocks), but the clock signals may physically exist on-chip at the same time and therefore may still influence each other through crosstalk effects. Physically exclusive clocks, in contrast, cannot be physically present in the device at the same time (e.g., multiple clocks defined on the same clock pin).

The Timing Analyzer does not currently analyze crosstalk explicitly. Instead, the timing models use extra guard bands to account for any potential crosstalk-induced delays. As a result, the Timing Analyzer
currently treats asynchronous, logically_exclusive, and physically_exclusive clock groups the same. However, different parts of the Timing Analyzer may treat asynchronous and exclusive groups differently. Any commands that are affected by clock groups will say so in their help text. But, no distinction is made between logically and physically exclusive clock groups, since the only difference between them is how they affect crosstalk.

The result of set_clock_groups is that all clocks in any group are cut from all clocks in every other group. The use of a single -group option tells the Timing Analyzer to cut this group of clocks from all other clocks in the design, including clocks that are created in the future. This command is similar to calling set_false_path from each clock in every group to each clock in every other group and vice versa, making set_clock_groups easier to specify for cutting clock domains. However, cutting clocks with set_clock_groups also affects the results of some other commands. Any commands that are affected by clock groups will say so in their help text.

Note -allow_paths is not supported yet.

Example Usage

```tcl
project_open top
create_timing_netlist
create_clock -period 10.000 -name clkA [get_ports sysclk[0]]
create_clock -period 10.000 -name clkB [get_ports sysclk[1]]
# Set clkA and clkB to be mutually exclusive clocks.
dni::set_clock_groups -logically_exclusive -group {clkA} -group {clkB}
# The previous line is equivalent to the following two commands.
set_false_path -from [get_clocks clkA] -to [get_clocks clkB]
set_false_path -from [get_clocks clkB] -to [get_clocks clkA]
```

### Latency delay value

<delay>

**Description**

Specifies clock latency for a given clock or clock target.

There are two types of latency: network and source. Network latency is the clock network delay between the clock and register clock pins. Source latency is the clock network delay between the clock and its source (e.g., the system clock or base clock of a generated clock).

The Timing Analyzer automatically computes network latencies for all register and generated clocks. Overriding clock network latencies is not supported by the Timing Analyzer. Therefore, the -source option must always be specified.

You can apply clock latency to a clock, which affects all targets of the clock, or to a specific clock target. If you specify a specific clock target that is driven by more than one clock, use the -clock option to specify which clock to use. Latencies assigned to a clock target override any latencies assigned to a clock.

Different clock latencies can be specified for early (-early) and late (-late) latencies, as well as for rising edges (-rise) and falling edges (-fall). If only some combinations are specified, the other combinations are used by default. For example, if only a -rise -early latency and a -fall -early latency are specified, then the -rise -late latency is assumed to be the same as the -rise -early latency and the -fall -late latency is assumed to be the same as the -fall -early latency. If neither -rise nor -fall are used or neither -early nor -late are used, then the latency applies to both conditions.

Source latency can also be assigned to generated clocks. This may be useful for specifying board level delays from a clock output port to a clock input port when the clock input port is acting as a feedback clock.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type.

Note -dynamic is not supported yet.

### Example Usage

```tcl
create_clock -name SYSCLK -period 10.000 [get_ports inclk]
create_generated_clock -name OUTCLK -divide_by 1 -source [get_ports inclk] [get_ports outclk]
create_generated_clock -name FDBKCLK -divide_by 1 -source [get_ports outclk] [get_ports fdbkclk]

# Apply a simple 2.000 ns source latency to the system clock.
set_clock_latency -source 2.000 [get_clocks SYSCLK]

# Specify feedback clock latencies between output port outclk
# and the input port fdbkclk.
set_clock_latency -source -late -rise 0.800 [get_clocks FDBKCLK]
set_clock_latency -source -late -fall 0.750 [get_clocks FDBKCLK]
set_clock_latency -source -late -fall 0.460 [get_clocks FDBKCLK]
```

### Return Value

</tbody>
</table>

---

168
-long_help | Long help with examples and possible return values

-add | Specifies that this assignment is an addition to the clock uncertainty derived by derive_clock_uncertainty call

-enable_same_physical_edge | Enable setting uncertainty value for same physical clock edge

-fall | Indicates that the uncertainty applies to only the falling edge of the destination clock

-fall_from <fall_from_clock> | Valid destinations (string patterns are matched using Tcl string matching)

-fall_to <fall_to_clock> | Valid destinations (string patterns are matched using Tcl string matching)

-from <from_clock> | Valid destinations (string patterns are matched using Tcl string matching)

-hold | Only apply the uncertainty value to hold and removal checks

-rise | Indicates that the uncertainty applies to only the rising edge of the destination clock

-rise_from <rise_from_clock> | Valid destinations (string patterns are matched using Tcl string matching)

-rise_to <rise_to_clock> | Valid destinations (string patterns are matched using Tcl string matching)

-setup | Only apply the uncertainty value to setup and recovery checks

-to <to_clock> | Valid destinations (string patterns are matched using Tcl string matching)

<uncertainty> | Uncertainty

Description

Specifies clock uncertainty or skew for clocks for clock-to-clock transfers. You can specify uncertainty separately for setup and hold, and you can specify separate rising and falling clock transitions. If you omit to specify -setup or -hold, the uncertainty value will be applied to both analysis types. Similarly, if you omit to specify rising or falling clock transitions, the uncertainty value will be applied to both transitions. The setup uncertainty is subtracted from the data required time for each applicable path, and the hold uncertainty is added to the data required time for each applicable path.

Intel Quartus Prime software computes clock uncertainty for every clock transfer. For particular transfers, you can use the set_clock_uncertainty assignment to override the automatically derived value. If multiple set_clock_uncertainty assignments apply to the same clock transfer, the later value overrides the earlier ones.

Note: The Timing Analyzer does not apply clock uncertainty to transfers involving the same physical launch and latch edge (that is, the latch and launch edges are the same edge of a clock source and occur at the same time) by default. Such transfers typically occur in hold analysis, but may also occur in setup analysis with a multicycle value of 0. You can use the -enable_same_physical_edge option to override this behavior.

The values for -from, -to, and similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types.

Note -rise and -fall options are not supported yet.

Example Usage

set_clock_uncertainty -setup -rise_from clk1 -fall_to clk2 200ps

</tbody>
</table>

**Description**

Specifies a maximum datapath delay exception for a given path.

The maximum delay analysis includes Tco of the launching register, and Tsu of the latching register. By default, it does not include clock arrival times at the launching or latching register. To include launch clock arrival times, use the -allow_launch_clock option. To include latch clock arrival times, use the -allow_latch_clock option. If the path starts or ends at a port, the analysis does not...
include delays due to set_input_delay or set_output_delay. Use -get_value_from_clock_period to set the delay requirement for each path to be equal to the launching or latching clock period, or whichever of the two has a smaller or larger period. If -value_multiplier is used, the requirement will be multiplied by that value. If there are no clocks clocking the endpoints of the path (such as if the path begins or ends at an unconstrained I/O), the constraint will be ignored.

The datapath delay constraint is applied in addition to other constraints on the given path, including the default constraint. Furthermore, the datapath delay constraint is analyzed independently from other SDC constraints, including set_false_path and set_clock_groups, and cannot be overridden by other SDC constraints. For example, you can use set_data_delay to specify an upper limit on logic and routing delay for paths cut by set_false_path.

To both cut a path for (clock-aware) timing and constrain its datapath delay, the path must be constrained with both set_false_path and set_data_delay. The -from and -to values are collections of clocks, ports, pins, or cells in the design.

Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock.

If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells apply to all registers in the cell or driven by the clock pin.

The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node. The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The -rise_from and -fall_from options can be used in place of the -from destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The "-from" option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.

The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

If the source of a path with a set_data_delay constraint has any time borrowed, the delay budget will be reduced by the time borrowed. By default, the delay budget will not be increased by time borrowed at the destination of a path constrained by a set_data_delay constraint, and negative slack on a set_data_delay constraint will not cause time borrowing to happen. To change this behavior, use the -allow_destination_borrowing option.

continued...
# Example Usage

- **Apply a 10ns max data delay on paths between two unrelated clocks**
  ```tcl```
  
  ```
  set_data_delay -from [get_clocks clkA] -to [get_clocks clkB] 10.000
  ```
  
- **Apply a 2ns max data delay from an input port to any valid destination**
  ```tcl```
  
  ```
  set_data_delay -from [get_ports in[*]] -to * 2.000
  ```
  
- **Require net delay to be at most 90% of the period of the clock driving the inst9 register**
  ```tcl```
  
  ```
  set_data_delay -get_value_from_clock_period dst_clock_period -value_multiplier 0.9 -from [get_clocks clk] -to [get_cells inst9]
  ```
  
- **Apply a 2ns max data delay for an input port only to nodes driven by the rising edge of clock CLK**
  ```tcl```
  
  ```
  set_data_delay -from [get_ports in[*]] -rise_to [get_clocks CLK] 2.000
  ```

**Description**

Specifies a false-path exception, removing (or cutting) paths from timing analysis.

The `-from` and `-to` values are collections of clocks, registers, ports, pins, or cells in the design. If the `-From` or `-to` values are not specified, the collection is converted automatically into `get_keepers *`. It is worth noting that if the counterpart of the unspecified

---

continued...
collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection only if the clock collection also generates the desired assignment.

Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.

If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.

The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node. The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The -rise_from and -fall_from options can be used in place of the -from destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node, taking into consideration any logical inversions along the clock path. The -from option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value, taking into consideration any logical inversions that are along the clock path.

The -setup and -hold options allow the false path to only be applied to the corresponding setup/recovery or hold/removal checks. The default if neither value is specified is to apply the false path to both -setup and -hold.

The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types.

Note -rise, -fall, -rise_through, -fall_through and -reset_path options are not supported yet.

Example Usage

# Set a false-path between two unrelated clocks
set_false_path -from [get_clocks clkA] -to [get_clocks clkB]

# Set a false-path for a specific path
set_false_path -from [get_pins regA|clk] -to [get_pins regB|aclr]

# Set a false-path from a node to a falling clock
set_false_path -from [get_pins regA|clk] -fall_to [get_clocks clkB]

**Description**

Specifies the data arrival times at the specified input ports relative to the clock specified by the -clock option. The clock must refer to a clock name in the design.

Input delays can be specified relative to the rising edge (default) or falling edge (-clock_fall) of the clock.

Input delays can be specified relative to a pin or a port (-reference_pin) in the clock network. Clock arrival times to the reference pin or port are added to data arrival times.

Input delays can already include clock source latency. By default the clock source latency of the related clock is added to the input delay value, but when the -source_latency_included option is specified, the clock source latency is not added because it was factored into the input delay value.

The maximum input delay (-max) is used for clock setup checks or recovery checks and the minimum input delay (-min) is used for clock hold checks or removal checks. If only -min or -max (or neither) is specified for a given port, the same value is used for both.

Separate rising (-rise) and falling (-fall) arrival times at the port can be specified. If only one of -rise and -fall are specified for a given port, the same value is used for both.

By default, set_input_delay removes any other input delays to the port except for those with the same -clock, -clock_fall, and -reference_pin combination. Multiple input delays relative to different clocks, clock edges, or reference pins can be specified using the -add_delay option. Future input delays relative to different clocks, clock edges, or reference pins that do not specify the -add_delay option will still remove previous input delays that specified the -add_delay option.

Note that -level_sensitive and -network_latency_included are not supported yet.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type.

**Example Usage**

```tcl
# Simple input delay with the same value for min/max and rise/fall:
# 1) set on ports with names of the form myin*
set_input_delay -clock clk 1.5 [get_ports myin*]

# 2) set on all input ports
set_input_delay -clock clk 1.5 [all_inputs]

# Input delay with respect to the falling edge of clock
set_input_delay -clock clk -clock_fall 1.5 [get_ports myin*]
```

---

**Send Feedback**

175
# Input delays for different min/max and rise/fall combinations
set_input_delay -clock clk -max -rise 1.4 [get_ports myin*]
set_input_delay -clock clk -max -fall 1.5 [get_ports myin*]
set_input_delay -clock clk -min -rise 0.7 [get_ports myin*]
set_input_delay -clock clk -min -fall 0.8 [get_ports myin*]

# Adding multiple input delays with respect to more than one clock
set_input_delay -clock clkA -min 1.2 [get_ports myin*]
set_input_delay -clock clkA -max 1.8 [get_ports myin*]
set_input_delay -clock clkA -clock_fall 1.6 [get_ports myin*] -add_delay
set_input_delay -clock clkB -min 2.1 [get_ports myin*] -add_delay
set_input_delay -clock clkB -max 2.5 [get_ports myin*] -add_delay

# This is a common mistake where input delays are accidentally removed
set_input_delay -clock clkA -min 0.2 [get_ports myout*]
set_input_delay -clock clkB -min 1.1 [get_ports myout*] -add_delay
# The following removes the clkB entry. You need to always use -add_delay
# when more than one clock, clock_fall or reference_pin exists
set_input_delay -clock clkA -max 0.8 [get_ports myout*]
# The following removes the clkA entry. You need to always use -add_delay
# when more than one clock, clock_fall or reference_pin exists
set_input_delay -clock clkB -max 1.5 [get_ports myout*]

# Specifying an input delay relative to an external clock output port
set_input_delay -clock clkA -reference_pin [get_ports clkout] 0.8 [get_ports myin*]

# Specifying an input delay relative to the clock pin of a register
set_input_delay -clock clkA -reference_pin [get_pins regA|clk] 0.8 [get_ports myin*]

#### Syntax

#### Arguments

- **-h | -help**
  - Short help
- **-long_help**
  - Long help with examples and possible return values
- **-comment <string>**
  - Comment string
- **-fall**
  - Marks falling delays false, as measured on the path endpoint
- **-fall_from <names>**
  - Valid source clocks (string patterns are matched using Tcl string matching)
- **-fall_through <names>**
  - Valid through nodes (string patterns are matched using Tcl string matching)
- **-fall_to <names>**
  - Valid destination clocks (string patterns are matched using Tcl string matching)
- **-from <names>**
  - Valid sources (string patterns are matched using Tcl string matching)
- **-ignore_clock_latency**
  - Indicates that the launch and capture clock latencies are to be ignored when computing slack on the specified paths
- **-reset_path**
  - Removes existing point-to-point exception information on the specified paths
- **-rise**
  - Marks rising delays false, as measured on the path endpoint
- **-rise_from <names>**
  - Valid source clocks (string patterns are matched using Tcl string matching)
- **-rise_through <names>**
  - Valid through nodes (string patterns are matched using Tcl string matching)
- **-rise_to <names>**
  - Valid destination clocks (string patterns are matched using Tcl string matching)
- **-through <names>**
  - Valid through nodes (string patterns are matched using Tcl string matching)
- **-to <names>**
  - Valid destinations (string patterns are matched using Tcl string matching)
- **<value>**
  - Time Value

#### Description

Specifies a maximum delay exception for a given path.

The maximum delay is similar to changing the setup relationship.
(latching clock edge - launching clock edge), except that it can be applied to input or output ports without input or output delays assigned to them. Maximum delays are always relative to any clock network delays (if the source or destination is a register) or any input or output delays (if the source or destination is a port). Therefore, input delays and clock latencies are added to the data arrival times. Clock latencies also added to data required times and output delays are subtracted from data required times.

The -from and -to values are collections of clocks, registers, ports, pins, or cells in the design. If the -from or -to values are not specified, the collection is converted automatically into [get_cells *]. It is worth noting that if the counterpart to the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection but only if the clock collection also generates the desired assignment.

Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.

If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.

The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node. The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The -rise_from and -fall_from options can be used in place of the -from destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The "-from" option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.

The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types.

Note - rise, -fall, -rise_through, -fall_through, -ignore_clock_latency and -reset_path options are not supported yet.

### Example Usage

```tcl
# Apply a 10ns max delay between two unrelated clocks
set_max_delay -from {get_clocks clkA} -to {get_clocks clkB} 10.000

# Apply a 2ns max delay for an input port (TSU)
set_max_delay -from {get_ports in[*]} -to {get_cells *} 2.000

# Apply a 2ns max delay for an output port (TCO)
set_max_delay -from {get_cells *} -to {get_ports out[*]} 2.000

# Apply a 2ns max delay for an input port to an output port (TPD)
set_max_delay -from {get_ports in[*]} -to {get_ports out[*]} 2.000

# Apply a 2ns max delay for an input port only to nodes driven by
# the rising edge of clock CLK
set_max_delay -from {get_ports in[*]} -rise_to {get_clocks CLK} 2.000
```

</tbody>
</table>

**Description**

Use the `set_max_skew` constraint to perform maximum allowable skew analysis between sets of registers or ports. In order to constrain skew across multiple paths, all such paths must be defined within a single `set_max_skew` constraint. The `set_max_skew` timing constraint is not affected by the `set_max_delay`, `set_min_delay`, and `set_multicycle_path` constraints, but is affected by the `set_clock_groups -exclusive` constraint. Paths between exclusive clocks are not analyzed for skew, and so two paths are compared for skew if their clocks are exclusive to each other. However, paths whose clocks are asynchronous are still analyzed for skew.

Legal values for the `-from and -to options are collections of clocks, ports, pins, or cells in a design.

Applying maximum skew constraints between clocks applies the constraint from all register or ports driven by the clock specified with the `-from option to all registers or ports driven by the clock specified with the `-to option.

*continued...*
If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells apply to all registers contained in the cell or driven by the clock pin. Similarly, -to and -from partition specifications apply to all registers in the specified partition.

Max skew analysis includes data arrival times, clock arrival times, register micro parameters, clock uncertainty, on-die variation and ccpp removal.

Use -get_skew_value_from_clock_period to set the skew requirement to be equal to the launching or latching clock period, or whichever of the two has a smaller period.

If -skew_value_multiplier is used, the requirement is multiplied by that value. If this option is used, then the positional skew option may not be set. If the set of skew paths is clocked by more than one clock, the Timing Analyzer will use the one with the smallest period to compute the skew constraint.

When this constraint is used, results of max skew analysis are displayed in the Report Max Skew (report_max_skew) report from the Timing Analyzer.

Since skew is defined between two or more paths, no results are displayed if the -from/-from_clock and -to/-to_clock filters satisfy fewer than two paths.

### Example Usage

```tcl
# Constrain the skew on an input port to all registers it feeds
set_max_skew -from [get_ports din] 0.200

# Constrain the skew on output bus dout[*]
set_max_skew -to [get_ports dout[*]] 0.200

# Constrain skew to be less than 90% of the period of any clock in the source register set
set_max_skew -to [get_cells inst1[*]] -get_skew_value_from_clock_period src_clock_period -skew_value_multiplier 0.900

# Report the results of max skew assignments
report_max_skew -panel_name "Report Max Skew" -npaths 10 -detail path_only
```

### 3.1.8.18. dni::set_max_time_borrow (::quartus::dni_sdc)

The following table displays information for the dni::set_max_time_borrow Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::dni_sdc on page 158</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>dni::set_max_time_borrow [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td>Description</td>
<td>Specifies the maximum borrowed time for level-sensitive latches. The actual borrowed time will be determined automatically, but will never exceed the amount you specify. For any latches without a set_max_time_borrow constraint, no limit will apply (except for the physical limit of what is possible on the device, as described below). Time borrowing is specified with respect to the earliest possible time a signal can be clocked into the latch node. For example, for a positive latch, if the earliest possible arrival time of the rising clock edge is 1.025ns, then a signal that has an arrival time of 1.035ns (where this arrival time already includes the micro-setup time...</td>
</tr>
</tbody>
</table>
of the latch) will require at least 0.010ns of time borrowing.

Regardless of how the borrowed time is determined (automatically without a limit or automatically with a set_max_time_borrow constraint), the borrowed time can never exceed what is physically possible to borrow on the device. The maximum amount that can be borrowed is the period of time when the latch is open (e.g., half the clock period if the clock has a 50% duty cycle), but this time is reduced by clock propagation time spread and clock uncertainty between the latch-opening and latch-closing clock edges, and is further reduced by the closing-edge setup time of the latch. Some of these factors vary from corner to corner, as well as from clock to clock (if multiple clocks drive the latch).

Time borrowing analysis will only occur in the Timing Analysis (Signoff) stage, or when manually running the Timing Analyzer. The Fitter will not utilize time borrowing information and will assume zero time borrowed. Thus, the use of level-sensitive latches with high-speed clocks is not recommended, unless other constraints (such as set_max_delay) are manually set to ensure optimal Fitter behavior.

The targets of this command must be level-sensitive latches (all other targets will be ignored). The targets can be specified as either a collections or a Tcl list of wildcards used to create collections of appropriate types.

Example Usage

```tcl
# Borrow at most 3ns at all "lat*" latches:
set_max_time_borrow 3 [get_cells lat*]
```

**Description**

Specifies a minimum delay exception for a given path.

The minimum delay is similar to changing the hold relationship (launching clock edge - latching clock edge), except that it can be applied to input or output ports without input or output delays assigned to them. Minimum delays are always relative to any clock network delays (if the source or destination is register) or any input or output delays (if the source or destination is a port). Therefore, input delays and clock latencies are added to the data arrival times. Clock latencies also added to data required times and output delays are subtracted from data required times.

The -from and -to values are collections of clocks, registers, ports, pins, or cells in the design. If the -from or -to values are not specified, the collection is converted automatically into [get_cells *]. It is worth noting that if the counterpart of the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection, but only if the clock collection also generates the desired assignment.

Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Also, applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.

If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.

The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node. The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The -rise_from and -fall_from options can be used in place of the destination nodes specified using the -from option. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The -from option is the combination of both rising and falling "from" nodes. If the -from collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.

The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types.

---

**continued...**
Note -rise, -fall, -rise_through, -fall_through, -ignore_clock_latency
and -reset_path options are not supported yet.

Example Usage

# Apply a 0ns min delay between two unrelated clocks
set_min_delay -from [get_clocks clkA] -to [get_clocks clkB] 0.000

# Apply a 0ns min delay for an input port (TH)
set_min_delay -from [get_ports in[*]] -to [get_cells *] -.000

# Apply a 0.5ns min delay for an output port (MIN_TCO)
set_min_delay -from [get_cells *] -to [get_ports out[*]] 0.500

# Apply a 0.5ns min delay for an input port to an output port (MIN_TPD)
set_min_delay -from [get_ports in[*]] -to [get_ports out[*]] 0.500

# Apply a 0.5ns min delay for an input port only to nodes driven by
# the falling edge of clock CLK
set_max_delay -from [get_ports in[*]] -fall_to [get_clocks CLK] 0.500

Specifies that the multicycle is relative to the source clock waveform

-through <names>
Valid through nodes (string patterns are matched using Tcl string matching)

-to <names>
Valid destinations (string patterns are matched using Tcl string matching)

<value>
Number of clock cycles

Description

Specifies a multicycle exception for a given set of paths.

Multicycles can be specified relative to the source clock (-start) or destination clock (-end). This is useful when the source clock and destination clock are operating at different frequencies. For example, if the source clock is twice as fast (half period) as the destination clock, a -start multicycle of 2 is usually required.

Hold multicycles (-hold) are computed relative to setup multicycles (-setup). The value of the hold multicycle represents the number clock edges away from the default hold multicycle. The default hold multicycle value is 0.

The -from and -to values are collections of clocks, registers, ports, pins, or cells in the design. If the -from or -to values are not specified, the collection is converted automatically into [get_cells *]. It is worth noting that if the counterpart of the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection but only if the clock collection also generates the desired assignment.

Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Also, applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.

If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.

The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node. The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The -rise_from and -fall_from options can be used in place of the "-from" destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The "-from" option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignement applies to those nodes that are driven by the respective rising or falling clock edge.

The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.

The values of the -from, -to, -through, and similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types.
Note -rise, -fall, -rise_through, -fall_through and -reset_path options are not supported yet.

Example Usage

```tcl
create_clock -period 10.000 -name CLK [get_ports clk]
create_generated_clock -divide_by 2 -source [get_ports clk] -name CLKDIV2 [get_cells clkdiv]
# Apply a source multicycle of 2 with a hold multicycle of 1 for all paths from the CLK domain to the CLKDIV2 domain.
set_multicycle_path -start -hold -from [get_clocks CLK] -to [get_clocks CLKDIV2] 2
set_multicycle_path -start -hold -from [get_pins rega|clk] -to [get_pins regb*a] 1
# Apply a multicycle constraint of 3 (with a default hold multicycle of 0) for a specific path in the design.
set_multicycle_path -end -setup -from [get_pins rega|clk] -to [get_pins regb[a] 3
# Apply a multicycle constraint of 2 to a given cell, except for the reset pin.
set_multicycle_path -end -setup -to [get_cells regb] 2
set_multicycle_path -end -setup -to [get_pins regb[aclr] 1
# Apply a multicycle constraint of 3 rising from a clock and falling to a node.
set_multicycle_path -end -setup -rise_from [get_clocks CLK] -fall_to [get_pins regb|datab] 3
```

<tr>
<td>Use the set_net_delay command to query the net delays and perform minimum or maximum timing analysis across nets. The -from and -to options can be string patterns or pin, port, or net collections. When a pin or net collection is used, the collection should include output pins or nets.</td>
</tr>
</tbody>
</table>

continued...
If the -to option is unused or if the -to filter is an "*" character, all the output pins and registers on timing netlist become valid destination points.

When you use the -min option, slack is calculated by looking at the minimum delay on the edge. If you use the -max option, slack is calculated with the maximum edge delay.

Use -get_value_from_clock_period to set the net delay requirement to be equal to the launching or latching clock period, or whichever of the two has a smaller or larger period. If -value_multiplier is used, the requirement will be multiplied by that value. If the set of nets is clocked by more than one clock, the Timing Analyzer will use the one with the smallest period to compute the constraint for a -max constraint, and the largest period for a -min constraint. If there are no clocks clocking the endpoints of the net (e.g. if the endpoints of the nets are not registers or constrained ports), then the net delay constraint will be ignored.

### Example Usage

```tcl
project_open my_project
create_timing_netlist
read_sdc
update_timing_netlist

# add min delay constraint
set_net_delay -min 0.160 -from [get_pins inst9|combout] -to [get_pins *|dataf]

# add max delay constraint
set_net_delay -max 0.500 -from [get_pins inst8|combout]

# this is same as the previous call
set_net_delay -max 0.500 -from inst8|combout -to *

# Require net delay to be at most 90% of the period of the clock driving the inst9 register
set_net_delay -max -get_value_from_clock_period dst_clock_period -value_multiplier 0.9 -from [get_pins inst8|combout] -to [get_pins inst9|q]

update_timing_netlist
report_net_delay -panel "Net Delay"
```

<td>list or collection of Operating conditions Tcl objects or names</td>
</tr>
</tbody>
</table>

### Description

Use this command to specify operating conditions different from the initial conditions used to create the timing netlist. When a timing model is not specified, the slow model is used.

Voltage and temperature options must be used together. These two options are not available for all devices. The `get_available_operating_conditions` command returns the list of available operating conditions for your device.

Use the `-speed` option to analyze the design at a different speed grade of the selected device.

Use the `-grade` option to analyze the design at a different temperature grade. This option is provided to support what-if analysis and is not recommended for final sign-off analysis.

By default, delay annotation is skipped if previously performed. Use `-force_dat` to rerun delay annotation.

**Note:** `-analysis_type`, `-min`, `-max`, `-min_library`, `-max_library`, `-min_phys`, `-max_phys`, `-library`, `-object_list` and condition options are not supported yet.

### Example Usage

```tcl
# Do report timing for different operating conditions one by one
foreach_in_collection op [get_available_operating_conditions] {
    set_operating_conditions $op
    update_timing_netlist
    report_timing
}

# Set aggregated report timing for all operating conditions when corner aggregation is enabled
set_operating_conditions [get_available_operating_conditions]
report_timing

# Manually set operating conditions
set_operating_conditions -model fast -temperature 85 -voltage 1200
update_timing_netlist
```

---

**continued...**
# change device speed grade and set operating conditions
set_operating_conditions -speed 3 -model slow -temperature 0 -voltage 1100
update_timing_netlist

<td></td>
</tr>
<tr>
<td>&lt;targets&gt;</td>
<td></td>
</tr>
</tbody>
</table>

Description

Specifies the data required times at the specified output ports relative the clock specified by the -clock option. The clock must refer to a clock name in the design.

Output delays can be specified relative to the rising edge (default) or falling edge (-clock_fall) of the clock.

Output delays can be specified relative to a pin or a port (-reference_pin) in the clock network. Clock arrival times to the reference pin or port are added to the data required time.

Output delays can include clock source latency. By default the clock source latency of the related clock is added to the output delay value, but when the -source_latency_included option is specified, the clock source latency is not added because it was factored into the output delay value.

The maximum output delay (-max) is used for clock setup checks or recovery checks and the minimum output delay (-min) is used for clock hold checks or removal checks. If only one of -min and -max (or

continued...
neither) is specified for a given port, the same value is used for both.

Separate rising (-rise) and falling (-fall) required times at the port can be specified. If only one of -rise and -fall are specified for a given port, the same value is used for both.

By default, set_output_delay removes any other output delays to the port except for those with the same -clock, -clock_fall, and -reference_pin combination. Multiple output delays relative to different clocks, clock edges, or reference pins can be specified using the -add_delay option. Future output delays relative to different clocks, clock edges, or reference pins that do not specify the -add_delay option will still remove previous output delays that specified the -add_delay option.

Note that -network_latency_included is not supported yet.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type.

Example Usage

```tcl
# Simple output delay with the same value for min/max and rise/fall:
# 1) set on ports with names of the form myout*
set_output_delay -clock clk 0.5 [get_ports myout*]
# 2) set on all output ports
set_output_delay -clock clk 0.5 [all_outputs]

# Output delay with respect to the falling edge of clock
set_output_delay -clock clk -clock_fall 0.5 [get_ports myout*]

# Output delays for different min/max and rise/fall combinations
set_output_delay -clock clk -max -rise 0.5 [get_ports myout*]
set_output_delay -clock clk -max -fall 0.4 [get_ports myout*]
set_output_delay -clock clk -min -rise 0.4 [get_ports myout*]
set_output_delay -clock clk -min -fall 0.3 [get_ports myout*]

# Adding multiple output delays with respect to more than one clock
set_output_delay -clock clkA -min 0.2 [get_ports myout*]
set_output_delay -clock clkA -max 0.8 [get_ports myout*]
set_output_delay -clock clkA -clock_fall 0.6 [get_ports myout*] -add_delay
set_output_delay -clock clkB -min 1.1 [get_ports myout*] -add_delay
set_output_delay -clock clkB -max 1.5 [get_ports myout*] -add_delay

# This is a common mistake where output delays are accidentally removed
set_output_delay -clock clkA -min 0.2 [get_ports myout*] -add_delay
set_output_delay -clock clkB -min 1.1 [get_ports myout*] -add_delay
# The following removes the clkB entry. You need to always use -add_delay
# when more than one clock, clock_fall or reference_pin exists
set_output_delay -clock clkA -max 0.8 [get_ports myout*] -add_delay
# The following removes the clkA entry. You need to always use -add_delay
# when more than one clock, clock_fall or reference_pin exists
set_output_delay -clock clkB -max 1.5 [get_ports myout*] -add_delay

# Specifying an output delay relative to an external clock output port
set_output_delay -clock clk -reference_pin [get_ports clkout] 0.8 [get_ports myout*]

# Specifying an output delay relative to the clock pin of a register
set_output_delay -clock clk -reference_pin [get_pins regA|clk] 0.8 [get_ports myout*]
```

continued...
-negative  
Apply negative unate sense
-positive  
Apply positive unate sense
-pulse <pulse_type>  
Specifies the type of pulse clock applied to all pins in the target variable with respect to clock source
-stop_propagation  
Stops the propagation of specified clocks from the specified pins or cell timing arcs
-type <type>  
Specifies whether the type of sense being applied refers to clock networks or data networks
-targets>  
List or collection of targets

Description
Restrict unateness at a pin on a clock path, with respect to the clock source.
If the -clocks option is used, the assignment will only apply to analysis of the specified clock domains. Otherwise, it applies to all clocks passing through the given pins.
If the specified sense does not exist at the given pin, the assignment is ignored.
Note -type, -pulse and -stop_propagation options are not supported.

Example Usage
set_sense -positive Mux|combout
set_sense -negative -clocks [get_clocks clk] XOR|combout

3.1.8.25. dni::set_timing_derate (::quartus::dni_sdc)

The following table displays information for the dni::set_timing_derate Tcl command:

Tcl Package and Version
Belongs to ::quartus::dni_sdc on page 158

Syntax

Arguments
-h | -help  
Short help
-long_help  
Long help with examples and possible return values
-cell_check  
Applies the derating value to the setup and hold time requirements of cells
-cell_delay  
Specifies that derating factors are only to apply to cell delays
-clock  
Applies the derating value only to elements in the clock network
-data  
Applies the derating value only to elements in the data network
-early  
Specifies the minimum derating factor. This factor specifies how early the signal can arrive
-fall  
Applies the derating value only to the delays of paths that have a falling transition at the specified objects

continued...
### -late
Specifies the maximum derating factor. This factor specifies how late the signal can arrive.

### -max
Applies the derating value only to the maximum operating condition.

### -min
Applies the derating value only to the minimum operating condition.

### -net_delay
Specifies that derating factors are only to apply to net delays.

### -operating_conditions
<operating_conditions>
Operating conditions Tcl object.

### -pocvm_coefficient_scale_factor
This option applies only to the parametric on-chip variation (POCV) context.

### -pocvm_guardband
This option applies only to the parametric on-chip variation (POCV) context.

### -rise
Applies the derating value only to the delays of paths that have a rising transition at the specified objects.

### <derate_value>
Timing derate value.

### <cells>
List of cell type objects.

---

**Description**

Sets the global derate factors for the current design. The maximum and minimum delays of all timing arcs in the design are multiplied by the factors specified with the -late and -early options respectively. Only positive derate factors are allowed. If neither the -cell_delay nor -net_delay option is used, the derating factors apply to both cell and net delays. For net delay derates, the derate factor is applied to nets driven by matching cells.

Specifying a derate value of less than 1.0 for the -late option or a derate value of greater than 1.0 for the -early option reduces delay pessimism, which might lead to optimistic results from timing analysis.

The effect of set_timing_derate command is deferred until the next time update_timing_netlist is called. To reset derate factors to original values, use the reset_timing_derate command.

This assignment is for timing analysis only, and is not considered during timing-driven compilation.

Note: -min, -max, -data, -clock, -rise, -fall, -cell_check, -pocvm_guardband and -pocvm_coefficient_scale_factor options are not supported yet.

---

**Example Usage**

```tcl
set_timing_derate -early 0.9 [get_cells *]
set_timing_derate -late 1.1 [get_cells *]
```

---

<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Property '&lt;strings&gt;' already exists. Cannot be added.</td>
</tr>
</tbody>
</table>

### 3.1.9.6. drc::add_rule (::quartus::drc)

The following table displays information for the `drc::add_rule` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to</th>
<th>::quartus::drc on page 191</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| **Arguments**          |            |                            |
|                       |            |                            |
| `-h | -help`            |            | Short help                  |
| `-long_help`           |            | Long help with examples and possible return values |
| `-category <category>` |            | Rule category               |
| `-check_operation <check_operation>` | | Check operation associated |
| `-description <description>` | | Detailed description |
| `-id <id>`             |            | Rule ID                     |
| `-is_default <is_default>` | | Is Default Rule             |
| `-recommendation <recommendation>` | | Detailed recommendation |
| `-severity <severity>` |            | Rule Severity               |
| `-short_description <short_description>` | | Rule title                  |

### Description
Add Check Operation.

### Example Usage
```
add_rule -category {TEST} -id {TEST_ID} -check_operation {TEST_CHECK_OP} -severity {TEST_SEVERITY}
```

### Return Value
```
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
```
3.1.9.7. drc::add_rule_violation (::quartus::drc)

The following table displays information for the drc::add_rule_violation Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::drc on page 191</th>
</tr>
</thead>
</table>

**Arguments**
- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-argument_spec <argument_spec>` Argument specifications {{type name description [sort_method] [order]}}...
- `-category <category>` Rule category for violation
- `-format_msg <format_msg>` Violation message format
- `-id <id>` Rule ID for violation
- `-num_args <num_args>` Number of arguments
- `-object <rule_object>` Rule object for violation

**Description**
Add Rule Violation.

**Example Usage**
```
add_rule_violation
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.9.8. drc::add_violation_record (::quartus::drc)

The following table displays information for the drc::add_violation_record Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::drc on page 191</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>drc::add_violation_record [-h</td>
</tr>
</tbody>
</table>

**Arguments**
- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-parent <parent>` Parent result record for violation

**Description**
Add Violation Record.

**Example Usage**
```
add_violation_record -parent {PARENT_RESULT_RECORD_ID}
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
3.1.9.9. drc::add_waiver (::quartus::drc)

The following table displays information for the `drc::add_waiver` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::drc</code> on page 191</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-description <code>&lt;description&gt;</code></td>
</tr>
<tr>
<td></td>
<td>-no_warn</td>
</tr>
<tr>
<td></td>
<td>-owner <code>&lt;owner&gt;</code></td>
</tr>
<tr>
<td></td>
<td>-query_string <code>&lt;query_string&gt;</code></td>
</tr>
<tr>
<td></td>
<td>-rule_id <code>&lt;rule_id&gt;</code></td>
</tr>
<tr>
<td></td>
<td>-stages <code>&lt;stages&gt;</code></td>
</tr>
<tr>
<td></td>
<td>-tag <code>&lt;tag&gt;</code></td>
</tr>
<tr>
<td></td>
<td>-timestamp <code>&lt;timestamp&gt;</code></td>
</tr>
</tbody>
</table>

**Description**

Creates a waiver for a given rule pattern with a specific query string.

**Example Usage**

```tcl
::drc::add_waiver -description {a waiver} -rule_id {TMC-20004} -query_string {Slack < -5.14 && "Start Point" =~ 'dir'} -stages [list analysis_planned_quartus_sta Plan] -tag {test} -owner {owner}
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.9.10. drc::check_design (::quartus::drc)

The following table displays information for the `drc::check_design` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::drc</code> on page 191</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>drc::check_design [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Run the specified rule set on a snapshot for the open project.</td>
</tr>
</tbody>
</table>

continued...
3.1.9.11. drc::delete_waivers (::quartus::drc)

The following table displays information for the `drc::delete_waivers` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::drc on page 191</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
<td>Short help</td>
<td></td>
</tr>
<tr>
<td>-long_help</td>
<td></td>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-all</td>
<td></td>
<td></td>
<td>The flag needed explicitly for deleting all the waivers without other arguments</td>
</tr>
<tr>
<td>-owner &lt;owner&gt;</td>
<td></td>
<td></td>
<td>User ID of creator. Meant for waiver audit trail.</td>
</tr>
<tr>
<td>-query_string &lt;query_string&gt;</td>
<td></td>
<td></td>
<td>Query string uses one or more violation column arguments to define patterns of violations that should be ignored.</td>
</tr>
<tr>
<td>-rule_id &lt;rule_id&gt;</td>
<td></td>
<td></td>
<td>Alpha-numeric rule ID pattern to define the scope of this waiver.</td>
</tr>
<tr>
<td>-stages &lt;stages&gt;</td>
<td></td>
<td></td>
<td>One or more stage(s) where rules are defined, for which the waiver can be applied to.</td>
</tr>
<tr>
<td>-tag &lt;tag&gt;</td>
<td></td>
<td></td>
<td>User-specified tags for tracking different types of violations across the whole project.</td>
</tr>
</tbody>
</table>

| Description | Delete waivers based on the input arguments |
| Example Usage | # This delete all the waivers. drc::delete_waivers |

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>

3.1.9.12. drc::get_objects (::quartus::drc)

The following table displays information for the `drc::get_objects` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::drc on page 191</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>drc::get_objects [-h</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
<td>Short help</td>
<td></td>
</tr>
<tr>
<td>-long_help</td>
<td></td>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
</tbody>
</table>

---

**Example Usage**

drc::check_design [-rule_set my_ruleset {if missing, the rule set is default}] [-executable quartus_sta {if missing, the default is the current process name}] [-rpt_file <DA DRC ASCII report file path>]

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Fail to complete checks.</td>
</tr>
</tbody>
</table>

---
### drc::get_objects (::quartus::drc)

Get a list of specific existing DRC objects

**Example Usage**
```
drc::get_objects -type rule
```

**Return Value**

<table>
<thead>
<tr>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>ERROR: Fail to get DRC objects.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>ERROR: Parent object is needed for violation record.</td>
</tr>
</tbody>
</table>

### drc::get_option (::quartus::drc)

The following table displays information for the `drc::get_option` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::drc on page 191</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`drc::get_option [-h</td>
</tr>
</tbody>
</table>

**Arguments**

- `-h | -help`: Short help
- `-long_help`: Long help with examples and possible return values
- `-name <name>`: option name.

**Description**

Get option for the DRC system

**Example Usage**
```
drc::get_option -name <option name>
```

**Return Value**

<table>
<thead>
<tr>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>ERROR: DRC option '&lt;string&gt;' is invalid.</td>
</tr>
</tbody>
</table>

### drc::get_property (::quartus::drc)

The following table displays information for the `drc::get_property` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::drc on page 191</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`drc::get_property [-h</td>
</tr>
</tbody>
</table>

**Arguments**

- `-h | -help`: Short help
- `-long_help`: Long help with examples and possible return values
3. TCL Commands and Packages

3.1.9.15. drc::get_property (::quartus::drc)

The following table displays information for the `drc::get_property` Tcl command:

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Invalid DRC object '%s'.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Property '&lt;string&gt;' is invalid.</td>
</tr>
</tbody>
</table>

Example Usage

drc::get_property -object <DRC object> -name <property name>

Return Value

3.1.9.15. drc::get_stage_info (::quartus::drc)

The following table displays information for the `drc::get_stage_info` Tcl command:

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

Example Usage

# Get all the stage names
::drc::get_stage_info

# Get executable and snapshot for a stage
::drc::get_stage_info -stage $stage_name

# Get stages with the input executable name
::drc::get_stage_info -executable $executable_name

# Get stages with the input snapshot name
::drc::get_stage_info -snapshot $snapshot_name

# Get stage with the input snapshot and executable name
::drc::get_stage_info -snapshot $snapshot_name -executable $executable_name

3. TCL Commands and Packages

The following table displays information for the `::quartus::eco` Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th><code>::quartus::eco 1.0</code></th>
</tr>
</thead>
</table>

**Description**

This package contains commands to perform Engineering Change Orders on a Post-Fit netlist.
ECO compilations are supported on Intel Stratix 10 and Intel Agilex device families.

**Availability**

This package is available for loading in the following executable:

```
quartus_fit```

**Tcl Commands**

- `adjust_pll_refclk (::quartus::eco)` on page 207
- `create_new_node (::quartus::eco)` on page 207
- `create_wirelut (::quartus::eco)` on page 208
- `eco::report_partitions (::quartus::eco)` on page 221
- `eco::reroute (::quartus::eco)` on page 209
- `eco::unload_design (::quartus::eco)` on page 209
- `fitter::report_timing (::quartus::eco)` on page 210
- `fitter::timing_summary (::quartus::eco)` on page 211
- `get_available_snapshots (::quartus::eco)` on page 211
- `get_eco_checkpoint (::quartus::eco)` on page 212
- `get_loaded_snapshot (::quartus::eco)` on page 212
- `get_lutmask_equation (::quartus::eco)` on page 212
- `get_node_location (::quartus::eco)` on page 213
- `make_connection (::quartus::eco)` on page 213
- `modify_io_current_strength (::quartus::eco)` on page 215
- `modify_io_delay_chain (::quartus::eco)` on page 215
- `modify_io_slew_rate (::quartus::eco)` on page 216
- `modify_lutmask (::quartus::eco)` on page 216
- `place_node (::quartus::eco)` on page 217
- `remove_connection (::quartus::eco)` on page 218
- `remove_node (::quartus::eco)` on page 219
- `report_connections (::quartus::eco)` on page 219
- `report_legal_locations (::quartus::eco)` on page 220
- `report_nodes_at_location (::quartus::eco)` on page 221
- `report_ports (::quartus::eco)` on page 222
- `report_routing (::quartus::eco)` on page 222
- `report_unplaced_nodes (::quartus::eco)` on page 223
- `restore_eco_checkpoint (::quartus::eco)` on page 223
- `unplace_node (::quartus::eco)` on page 224
- `update_mif_files (::quartus::eco)` on page 224
3.1.10.1. adjust_pll_refclk (::quartus::eco)

The following table displays information for the adjust_pll_refclk Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::eco on page 206</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>adjust_pll_refclk [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-refclk &lt;refclk_freq&gt;</td>
</tr>
<tr>
<td></td>
<td>-to &lt;iopll_name&gt;</td>
</tr>
</tbody>
</table>

**Description**

The adjust_pll_refclk command can change IOPLL frequencies by modifying the input reference clock frequency.

**Assumptions and Limitations:**
- The original refclk/outclk ratios will be maintained.
- None of the IOPLLs being reconfigured can generate IP clocks (the frequencies of the LVDS, PhyLite and EMIF clocks cannot change).
- Cascaded IOPLLs must be connected directly (no clock gates in between them).
- IOPLLs cannot be in 'nondedicated' compensation modes.
- For all IOPLL outclks duty cycle = 50 and phase shift = 0.

**Example Usage**

```tcl
load_package eco
adjust_pll_refclk -to "*pll_main*" -refclk 100
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.10.2. create_new_node (::quartus::eco)

The following table displays information for the create_new_node Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::eco on page 206</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>create_new_node [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-name &lt;node_name&gt;</td>
</tr>
<tr>
<td></td>
<td>-type &lt;lut</td>
</tr>
</tbody>
</table>

**Description**

The create_new_node command will create a new node with the specified type and return its id. The node name is hierarchical based, and the ECO Fitter will try to infer the name hierarchy. For example, if a node a|b|c|d needs to be created, users should make sure that hierarchy a|b|c exists in the netlist. If a|b|c lies under a partition, the new node will be created under that partition.

To connect to the created node, use make_connection command to connect to the LUT's DATAA/B/C/D/E/F input ports, and use modify_lutmask command to change its LUT-mask. The new node needs to be placed with place_node command and then new connections will be routed right after.

**Example Usage**

```tcl
create_new_node -name eco_new_lut -type lut
make_connection -from src_a -to eco_new_lut -port DATAA
make_connection -from src_b -to eco_new_lut -port DATAB
```

*continued...*
3.1.10.3. create_wirelut (::quartus::eco)

The following table displays information for the create_wirelut Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::eco on page 206</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>create_wirelut [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-from &lt;source_output_net_name&gt;</td>
</tr>
<tr>
<td></td>
<td>-from_node &lt;from_node&gt;</td>
</tr>
<tr>
<td></td>
<td>-from_port &lt;from_port&gt;</td>
</tr>
<tr>
<td></td>
<td>-location &lt;location&gt;</td>
</tr>
<tr>
<td></td>
<td>-name &lt;node_name&gt;</td>
</tr>
<tr>
<td></td>
<td>-port &lt;dest_node_port&gt;</td>
</tr>
<tr>
<td></td>
<td>-to &lt;dest_node_name&gt;</td>
</tr>
<tr>
<td></td>
<td>-to_node &lt;to_node&gt;</td>
</tr>
<tr>
<td></td>
<td>-to_port &lt;to_port&gt;</td>
</tr>
</tbody>
</table>

Description

The create_wirelut command will create and insert a wire LUT node in the specified connection. The ECO Fitter will place the newly created LUT and route the modified connections automatically, if -location argument is specified. Otherwise, the new wire LUT should be placed with place_node command.

The name for the new node is hierarchy based, and the ECO Fitter will try to infer the name hierarchy. For example, if a node a|b|c|d needs to be created, users should make sure that hierarchy a|b|c exists in the netlist. If the source or destination node lies under a partition, the new wire LUT will be inserted under that partition.

Example Usage

create_wirelut -name my_wirelut -from src_output -to dest_node -port D -location "X136 Y63 X149 Y82"
create_wirelut -name my_wirelut -from src_output -to dest_node -port D
place_node -name my_wirelut
set to_node_id [get_netlist_node_id -name my_node]
set iports [get_netlist_ports -node $to_node_id -type iport]
set iport 0
foreach i $iports {
    if { $i < 2 } {
        set iport $i
        break
    }
}
3.1.10.4. eco_reroute (::quartus::eco)

The following table displays information for the `eco_reroute` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::eco on page 206</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>

<td>node name</td>
</tr>
<tr>
<td>-port &lt;port&gt;</td>
<td>port name</td>
</tr>
<tr>
<td>-setup_slack &lt;setup_slack&gt;</td>
<td>targeted setup slack (ns)</td>
</tr>
</tbody>
</table>

**Description**

The `eco_reroute` command reroutes the item with user specified slacks.

**Example Usage**

```
eco_reroute -node <node_name> -port <port_name>
eco_reroute -node <node_name> -port <port_name> -setup_slack <setup_slack> -hold_slack <hold_slack> -max_iteration <max_iteration> -keep_best
eco_reroute -node ff -port D -hold_slack 0.3 -setup_slack -2 -max_iteration 10
```

</tr>
<tr>
<td></td>
<td><code>--removal</code> Option to report removal paths</td>
</tr>
<tr>
<td></td>
<td><code>--setup</code> Option to report clock setup paths</td>
</tr>
</tbody>
</table>

Description

Reports the worst-case Clock Setup and Clock Hold slacks and endpoint TNS (total negative slack) per clock domain. Total negative slack is the sum of all slacks less than zero for either destination registers or ports in the clock domain.

Example Usage

This command currently contains no example usage.

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>

3. TCL Commands and Packages

3.1.10.12. get_node_location (::quartus::eco)

The following table displays information for the **get_node_location** Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::eco on page 206</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>get_node_location [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-name &lt;node_name&gt;</td>
</tr>
<tr>
<td></td>
<td>-node &lt;node_id&gt;</td>
</tr>
</tbody>
</table>

**Description**
The `get_node_location` command will print the location of the node in the console and return the location in a tcl object. If the node is not placed, then the string "Unplaced" will be printed and returned.

<table>
<thead>
<tr>
<th>Example Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td># print location of nodes of type FF</td>
</tr>
<tr>
<td>project_open top</td>
</tr>
<tr>
<td>eco_load_design</td>
</tr>
<tr>
<td>set nodes [get_netlist_nodes -type FF]</td>
</tr>
<tr>
<td>foreach_in_collection 1 $nodes</td>
</tr>
<tr>
<td>puts &quot;Location = [get_node_location -node $i]&quot;</td>
</tr>
<tr>
<td>project_close</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>

3.1.10.13. make_connection (::quartus::eco)

The following table displays information for the **make_connection** Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::eco on page 206</th>
</tr>
</thead>
<tbody>
<tr>
<td>continued...</td>
<td></td>
</tr>
</tbody>
</table>
# Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-from &lt;output_net_name&gt;</td>
<td>Source of the connection</td>
</tr>
<tr>
<td>-from_node &lt;from_node&gt;</td>
<td>ID of the source node</td>
</tr>
<tr>
<td>-from_port &lt;from_port&gt;</td>
<td>ID of the source port</td>
</tr>
<tr>
<td>-port &lt;dest_node_port&gt;</td>
<td>Input port name of the destination node</td>
</tr>
<tr>
<td>-tieoff &lt;VCC</td>
<td>GND&gt;</td>
</tr>
<tr>
<td>-to &lt;dest_node_name&gt;</td>
<td>Name of the destination node</td>
</tr>
<tr>
<td>-to_node &lt;to_node&gt;</td>
<td>ID of the destination node</td>
</tr>
<tr>
<td>-to_port &lt;to_port&gt;</td>
<td>ID of the destination port</td>
</tr>
</tbody>
</table>

## Description

The `make_connection` command will connect the source signal to the destination block port. If the port has an existing connection, the command will remove the previous connection and connect it to the specified signal.

`make_connection` expects a source and destination through:
- `from` - output net of the source block of the new connection, OR
- `from_node` AND `from_port` - node ID and output port ID of source, OR
- `tieoff` - tieoff value

- `to` AND `port` - name of the destination node and the input port name, OR
- `to_node` AND `to_port` - node ID and input port ID of the destination

Note that the changed path will be routed immediately. If the path contains a node that is created during ECO compilation, then the paths will be routed after the node is placed with `place_node` command.

## Example Usage

```tcl
make_connection -from top|a_out -to top|x -port D
```

This example will connect `top|a_out` to the `D` input port of node `top|x`.

```tcl
make_connection -tieoff VCC -to top|x -port D
```

This example will tie the `D` port of node `top|x` to `VCC`, either internally or via `lcell`.

```tcl
load_package netlist
load_package eco
project_open top
set from_node [get_netlist_node_id -name my_node]
set oports [get_netlist_ports -node $from_node -type oport]
set oport 0
foreach_in_collection i $oports {
    set oport $i
    break
}
set to_node [get_netlist_node_id -name my_ff]
set iports [get_netlist_ports -node $to_node -type iport]
set iport 0
foreach_in_collection i $iports {
    set iport $i
    break
}
make_connection -ARG(from_node) $from_node -ARG(from_port) $oport -ARG(to_node) $to_node -ARG(to_port) $iport
```

This example iterates over the netlist and node ports, then makes a connection between the first `oport` of `my_node` and the first `iport` of `my_ff`.

## Return Value

</tr>
<tr>
<td>Number of locations to try to place the node</td>
</tr>
<tr>
<td>-timing_driven</td>
</tr>
<tr>
<td>Try to place the node at a location meeting timing</td>
</tr>
</tbody>
</table>

### Description

The `place_node` command will place the specified node either automatically, or within the region if `-location` is specified. If `-sample` is specified, then the command will randomly pick locations and place the node at the first valid location found. If `-timing_driven` is specified then the command will try to place the node at a location that meets timing. If none of the locations meet timing, then the node will be placed at the location with the highest slacks. The `place_node` command can be used on nodes that have been placed.

- `-location` argument takes in an exact location (`-location "X20 Y20"`), a region (`-location "X20 Y20 X30 Y30"`), or an ALM sublocation (`-location "FF_X20_Y20_N10"`).
- `-force` argument will force overwrite existing location constraints on the node, if any.
- `-force` will not overwrite Partial Reconfiguration regions.

### Example Usage

<table>
<thead>
<tr>
<th>Example Usage</th>

<td></td>
<td>Name of the node to remove</td>
</tr>
<tr>
<td></td>
<td>-node &lt;node_id&gt;</td>
</tr>
<tr>
<td></td>
<td>Node ID</td>
</tr>
</tbody>
</table>

**Description**
The remove_node command will remove the specified node from final netlist.
The node’s source and destination signals will be disconnected.

**Example Usage**
```
remove_node -name my_ff
```
```
# remove all nodes of type FF
project_open top
eco_load_design
set nodes [get_netlist_nodes -type FF]
foreach_in_collection i $nodes {
    remove_node -node $i
}
```

**Return Value**

<table>

<td>Name of the destination node</td>
</tr>
<tr>
<td></td>
<td>-to_port &lt;to_port&gt;</td>
</tr>
<tr>
<td></td>
<td>Name of the destination port</td>
</tr>
</tbody>
</table>

**Description**
The report_connections command will report connections between one of the following:
- (-from) report all connections from a node
- (-from -from_port) report connections from a port of a node
- (-to) report all connections to a node

continued...
### 3.1.10.22. report_legal_locations (::quartus::eco)

The following table displays information for the `report_legal_locations` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to: <code>::quartus::eco</code> on page 206</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-check_routing</code></td>
</tr>
<tr>
<td></td>
<td><code>-location &lt;location&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-name &lt;node_name&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-node &lt;node_id&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-patient</code></td>
</tr>
<tr>
<td></td>
<td><code>-report_illegal</code></td>
</tr>
<tr>
<td></td>
<td><code>-return_result</code></td>
</tr>
</tbody>
</table>

**Description**

The `report_legal_locations` command will search for all legal locations within the region specified by `-location` for the specified node to be placed. The command can be used on nodes that have or have not been placed. Specify `-patient` to override the restriction on the search region size. Specify `-report_illegal` to report illegal location reasons. In command-line mode, the result will be posted as info messages to the console. If `-return_result` is specified then the result will also be returned as a tcl object. If `-check_routing` is specified then a location will be determined illegal if the legalization step fails and slacks will be reported for legal locations. Otherwise the legalization step will be skipped. Note that the `-check_routing` option is only supported when all nodes but the target have been placed. The `report_legal_locations` command does not work in `quartus_fit --eco` mode.

**Example Usage**

```
report_legal_locations -name node -location "X136 Y63 X145 Y72"
report_legal_locations -name node -location "X5 Y10 X5 Y10" -report_illegal
report_legal_locations -name node -location "X5 Y10 X5 Y10" -return_result
report_legal_locations -name node -location "X5 Y10 X5 Y10" -check_routing
report_legal_locations -name node -location "X136 Y63 X149 Y82" -patient
report_legal_locations -name node -location "X136 Y63 X149 Y82" -patient -return_result
```
```tcl
# check legal locations of multiple FFs in a specified region
project_open top
eco_load_design
set nodes [get_netlist_nodes -type FF]
foreach_in_collection i $nodes {
    report_legal_locations -node $i -location "X136 Y63 X145 Y72"
}
project_close
```

</tr>
<tr>
<td></td>
<td>-return_result Return the result in a tcl object</td>
</tr>
<tr>
<td></td>
<td>-timing Report the slacks on each port</td>
</tr>
</tbody>
</table>

**Description**

The report_ports command will report all input ports of a node. In command-line mode, the result will be posted as info messages to the console. If -timing is specified then the slacks on each port will be reported. If -return_result is specified then the result will also be returned as a tcl object.

**Example Usage**

report_ports -name my_ff
report_ports -name my_ff -timing
report_ports -name my_ff -return_result

# get input ports of a FF
project_open top
eco_load_design
set node [get_netlist_node_id -name my_ff]
report_ports -node $node
project_close

**Return Value**

3.1.11.1. apply_setting (::quartus::external_memif_toolkit)

The following table displays information for the apply_setting Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::external_memif_toolkit on page 225</th>
</tr>
</thead>
</table>

Syntax

apply_setting [-h | -help] [-long_help] -id <name> [-index <index>] [-rank <rank>] -type <type> -value <value>

Arguments

- **-h | -help** Short help
- **-long_help** Long help with examples and possible return values
- **-id <name>** The connection ID to communicate with
- **-index <index>** Index of the target setting within the connection
- **-rank <rank>** Rank (shadow register) of the target setting within the connection
- **-type <type>** The type of setting on the EMIF interface
- **-value <value>** Value to apply

continued...
### Description
Applies the specified memory interface setting for the specified target connection.

### Example Usage
```tcl
project_open dut
initialize_connections
set hw_name [lindex [get_hardware_names] 0]
set dev_name [lindex [get_device_names -hardware_name $hw_name] 0]
link_project_to_device -hardware_name $hw_name -device_name $dev_name -sof_file dut.sof
foreach conn [get_connections] {
    foreach type [get_setting_types -id $conn] {
        apply_setting -id $conn -type $type -index 0 -value 0
    }
}
terminate_connections
project_close
```

### Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>

<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-id &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-report_type &lt;name&gt;</td>
</tr>
</tbody>
</table>

continued...
### Description

Create a report of the specified type for the connection id.

The resulting report is then available for query using the report TCL package.

### Example Usage

```tcl
load_package external_memif_toolkit
load_package report
project_open dut
initialize_connections
set hw_name [lindex [get_hardware_names] 0]
set dev_name [lindex [get_device_names -hardware_name $hw_name] 0]
link_project_to_device -hardware_name $hw_name -device_name $dev_name -sof_file dut.sof
set conn [lindex [get_connections -type emif] 0]
establish_connection -id $conn
create_connection_report -id $conn -report_type summary
load_report_database -type emit
set report_panel_names [get_report_panel_names]
post_message -type info "Found the following report panels:"
foreach panel_name $report_panel_names {
    postfix panel_name $panel_name
    post_message -type info "$panel_name"
}
unload_report
terminate_connections
project_close
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: An error occurred trying to create the report &lt;string&gt; for the target &lt;string&gt;.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified connection ID &lt;string&gt; is illegal. Please specify a valid connection ID.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified report type &lt;string&gt; is illegal. The legal report types are: &lt;string&gt;.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.</td>
</tr>
</tbody>
</table>

### 3.1.11.5. create_toolkit_report (::quartus::external_memif_toolkit)

The following table displays information for the create_toolkit_report Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::external_memif_toolkit on page 225</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>create_toolkit_report [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-report_type &lt;name&gt;</td>
</tr>
</tbody>
</table>

...continued...
Create a toolkit report of the specified type. These reports are general toolkit reports, not connection specific reports.

The resulting report is then available for query using the report TCL package.

Example Usage

```tcl
load_package external_memif_toolkit
load_package report
project_open dut
initialize_connections
set hw_name [lindex [get_hardware_names] 0]
set dev_name [lindex [get_device_names -hardware_name $hw_name] 0]
link_project_to_device -hardware_name $hw_name -device_name $dev_name -sof_file dut.sof
create_toolkit_report -report_type discovered_connections
create_toolkit_report -report_type detailed_connections
load_report_database -type emit
set report_panel_names [get_report_panel_names]
post_message -type info "Found the following report panels:"
foreach panel_name $report_panel_names {
    post_message -type info "        $panel_name"
}
unload_report
terminate_connections
project_close
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: An error occurred trying to create the report&lt;br/&gt;for the target &lt;string&gt;.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified report type &lt;string&gt; is illegal. The legal report types are: &lt;string&gt;.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.</td>
</tr>
</tbody>
</table>

### 3.11.16. driver_margining (::quartus::external_memif_toolkit)

The following table displays information for the driver_margining Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::external_memif_toolkit on page 225</th>
</tr>
</thead>
</table>

**Syntax**

**Arguments**

- `-h` | `-help`  Short help
- `-long_help`  Long help with examples and possible return values
- `-adjust_delays`  Adjust delays on the interface based on driver margining results
- `-fail_id <fail_id>`  Connection ID of the In-System Probe which controls the fail signal from the driver
- `-id <name>`  The connection ID to communicate with
-pass_id <pass_id>  Connection ID of the In-System Probe which controls the pass signal from the driver

-pnf_ids <pnf_ids>  TCL list of PNF (pass not fail) connection IDs of In-System Probes from the driver

-resetn_id <resetn_id>  Connection ID of the In-System Source which controls the resetn for the driver

-skip_dm  Skip driver margining on dm

-skip_read  Skip driver margining on read

-skip_write  Skip driver margining on write

-step_size <step_size>  Granularity of the driver margining operation, in terms of delay settings. Smaller values are more precise, but consume more time.

**Description**

Performs read and write driver margining on the selected EMIF connection.

**Example Usage**

This command currently contains no example usage.

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified connection ID &lt;string&gt; is illegal. Please specify a valid connection ID.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.</td>
</tr>
</tbody>
</table>

### 3.11.17. establish_connection (::quartus::external_memif_toolkit)

The following table displays information for the establish_connection Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::external_memif_toolkit on page 225</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>establish_connection [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>

<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-connection_name &lt;name&gt; Optional nickname to use for a connection.</td>
</tr>
<tr>
<td></td>
<td>-id &lt;name&gt; The connection ID to communicate with</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Establishes a connection to a connection target.</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td>project_open dut</td>
</tr>
<tr>
<td></td>
<td>initialize_connections</td>
</tr>
<tr>
<td></td>
<td>set hw_name [lindex [get_hardware_names] 0]</td>
</tr>
<tr>
<td></td>
<td>set dev_name [lindex [get_device_names -hardware_name $hw_name] 0]</td>
</tr>
<tr>
<td></td>
<td>link_project_to_device -hardware_name $hw_name -device_name $dev_name -sof_file dut.sof</td>
</tr>
</tbody>
</table>

continued...
```tcl
set conn [lindex [get_connections -type emif] 0]
establish_connection -id $conn
terminate_connections
project_close
```

<table>
<thead>
<tr>
<th>Return Value</th>

<tr>
<td></td>
<td>-hpath Queries the hierarchy name of the connection</td>
</tr>
<tr>
<td></td>
<td>-id &lt;name&gt; The connection ID to communicate with</td>
</tr>
</tbody>
</table>

continued...
### -sld_type

**Description**

Queries SLD type of a connection.

**Example Usage**

```tcl
project_open dut
initialize_connections
set hw_name [lindex [get_hardware_names] 0]
set dev_name [lindex [get_device_names -hardware_name $hw_name] 0]
link_project_to_device -hardware_name $hw_name -device_name $dev_name -sof_file dut.sof
foreach conn [get_connections] {
    puts "Connection : $conn"
    puts "   Hierarchy Path : [get_connection_info -id $conn -hpath]"
}
terminate_connections
project_close
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>

### 3.1.11.22. `read_setting`: (::quartus::external_memif_toolkit)

The following table displays information for the `read_setting` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::external_memif_toolkit on page 225</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`read_setting [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-id &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-index &lt;index&gt;</td>
</tr>
<tr>
<td></td>
<td>-rank &lt;rank&gt;</td>
</tr>
<tr>
<td></td>
<td>-type &lt;type&gt;</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Reads the specified memory interface setting for the specified target connection.</td>
</tr>
</tbody>
</table>

**Example Usage**

```tcl
project_open dut
initialize_connections
set hw_name [lindex [get_hardware_names] 0]
set dev_name [lindex [get_device_names -hardware_name $hw_name] 0]
link_project_to_device -hardware_name $hw_name -device_name $dev_name -sof_file dut.sof
foreach conn [get_connections] {
   foreach type [get_setting_types -id $conn] {
      read_setting -id $conn -type $type -index 0
   }
}
```

*continued...*
### 3.1.11.23. reindex_connections (::quartus::external_memif_toolkit)

The following table displays information for the `reindex_connections` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::external_memif_toolkit on page 225</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`reindex_connections [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`[-h</td>
</tr>
<tr>
<td></td>
<td><code>[-long_help]</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td>Description</td>
<td>Reinitializes the list of known hardware connections.</td>
</tr>
</tbody>
</table>
| Example Usage           | `project_open dut
initialize_connections
foreach hw_name [get_hardware_names] {puts *Found hardware name $hw_name*}
reindex_connections
foreach hw_name [get_hardware_names] {puts *Found hardware name $hw_name*}
terminate_connections
project_close` |

#### Return Value

<table>

### 3.1.11.27. set_stress_pattern (::quartus::external_memif_toolkit)

The following table displays information for the `set_stress_pattern` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::external_memif_toolkit on page 225</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`set_stress_pattern [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-id &lt;name&gt;</code> The connection ID to communicate with</td>
</tr>
<tr>
<td></td>
<td><code>-value &lt;value&gt;</code> 1 to enable stress pattern in calibration, 0 to disable</td>
</tr>
</tbody>
</table>

**Description**

Enable or disable the stress pattern for future calibrations.

**Example Usage**

This command currently contains no example usage.

<table>
<thead>
<tr>
<th><strong>Return Value</strong></th>
<th><strong>Code Name</strong></th>
<th><strong>Code</strong></th>
<th><strong>String Return</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>

### 3.1.11.28. terminate_connection (::quartus::external_memif_toolkit)

The following table displays information for the `terminate_connection` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::external_memif_toolkit on page 225</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`terminate_connection [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-id &lt;name&gt;</code> The connection ID to communicate with</td>
</tr>
</tbody>
</table>

**Description**

Terminates a connection to a connection target.

**continued...**
```tcl
Example Usage

project_open dut
initialize_connections
set hw_name [lindex [get_hardware_names] 0]
set dev_name [lindex [get_device_names -hardware_name $hw_name] 0]
link_project_to_device -hardware_name $hw_name -device_name $dev_name -sof_file dut.sof
set conn [lindex [get_connections -type emif] 0]
establish_connection -id $conn
terminate_connection -id $conn
terminate_connections
project_close
```

<table>
<thead>

### 3.1.11.31. `write_connection_target_report (::quartus::external_memif_toolkit)`

The following table displays information for the `write_connection_target_report` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::external_memif_toolkit on page 225</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`write_connection_target_report [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-file &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-id &lt;name&gt;</td>
</tr>
</tbody>
</table>

*continued...*
Description

Writes the reports for the given connection target to a filename.

Example Usage

```tcl
project_open dut
initialize_connections
set hw_name [lindex [get_hardware_names] 0]
set dev_name [lindex [get_device_names -hardware_name $hw_name] 0]
link_project_to_device -hardware_name $hw_name -device_name $dev_name -sof_file dut.sof
set conn [lindex [get_connections] 0]
write_connection_target_report -id $conn -file report.rpt
terminate_connections
project_close
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified connection ID &lt;string&gt; is illegal. Please specify a valid connection ID.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: No reports for connection ID &lt;string&gt; have been generated. Please run create_report_for_target before writing reports to file.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.</td>
</tr>
</tbody>
</table>

3.1.12. ::quartus::fif

The following table displays information for the ```::quartus::fif``` Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Description</th>
<th>Availability</th>
<th>Tcl Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>::quartus::fif 1.0</td>
<td>This package contains the set of Tcl functions for using the Fault Injection File (FIF) Driver.</td>
<td>This package is loaded by default in the following executable: quartus_fif</td>
<td></td>
</tr>
</tbody>
</table>

3.1.12.1. check (::quartus::fif)

The following table displays information for the check Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Belongs to ::quartus::fif on page 248</td>
<td>check [-h</td>
</tr>
</tbody>
</table>

continued...
### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-frame &lt;frame&gt;</td>
<td>CRAM frame ID</td>
</tr>
<tr>
<td>-index &lt;index&gt;</td>
<td>CRAM frame bit location</td>
</tr>
</tbody>
</table>

### Description

Check if the specified location contains a sensitive bit. Returns 1, if the specified location contains a sensitive bit. Returns 0, otherwise.

### Example Usage

```
check -frame 3 -index 100
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.</td>
</tr>
</tbody>
</table>

### 3.1.12.2. dump (::quartus::fif)

The following table displays information for the `dump` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::fif on page 248</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`dump [-h</td>
</tr>
</tbody>
</table>

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-all</td>
<td>Option to display all information</td>
</tr>
</tbody>
</table>

#### Description

Dump FIF driver contents.

#### Example Usage

```
dump

dump -all
```

#### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: FIF driver operation failed with error &lt;string&gt;.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.</td>
</tr>
</tbody>
</table>

### 3.1.12.3. dump_cram_frame (::quartus::fif)

The following table displays information for the `dump_cram_frame` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::fif on page 248</th>
</tr>
</thead>
</table>

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
</tbody>
</table>

**continued...**
### 3.1.12.4. dump_mem (::quartus::fif)

The following table displays information for the `dump_mem` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::fif</code> on page 248</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`dump_mem [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td>Description</td>
<td>Dump memory usage.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>dump_mem</code></td>
</tr>
<tr>
<td>Return Value</td>
<td><strong>Code Name</strong></td>
</tr>
<tr>
<td>TCL_OK</td>
<td>0</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
</tr>
</tbody>
</table>

### 3.1.12.5. dump_pr_bitstream (::quartus::fif)

The following table displays information for the `dump_pr_bitstream` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::fif</code> on page 248</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`dump_pr_bitstream [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-id &lt;id&gt;</code></td>
</tr>
<tr>
<td>Description</td>
<td>Dump static PR bitstream.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>dump_pr_bitstream -id 3</code></td>
</tr>
<tr>
<td>Return Value</td>
<td><strong>Code Name</strong></td>
</tr>
<tr>
<td>TCL_OK</td>
<td>0</td>
</tr>
</tbody>
</table>

*continued...*
3.1.12.6. generate (::quartus::fif)

The following table displays information for the `generate` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to :quartus::fif on page 248</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-error_count &lt;error_count&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-error_index &lt;error_index&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-frame &lt;frame&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-output &lt;output&gt;</code></td>
</tr>
<tr>
<td>Description</td>
<td>Generates PR RBF file. Specifies the 'error_count' and 'error_index' to generate a PR RBF file with fault injected. Otherwise, the command will generate a PR RBF file without fault for external scrubbing.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>generate -frame 3 -output scrub.rbf</code></td>
</tr>
<tr>
<td></td>
<td><code>generate -frame 3 -output inject.rbf -error_count 1 -error_index 100</code></td>
</tr>
<tr>
<td></td>
<td><code>generate -frame 3 -output inject.rbf -error_count 2 -error_index 100 200</code></td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
</tbody>
</table>

3.1.12.7. get_frame_count (::quartus::fif)

The following table displays information for the `get_frame_count` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to :quartus::fif on page 248</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_frame_count [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>continued...</code></td>
</tr>
</tbody>
</table>

3. TCL Commands and Packages

- **get_frame_count**: Returns total frame count.

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td></td>
<td>ERROR: FIF driver operation failed with error &lt;string&gt;.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td></td>
<td>ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.</td>
</tr>
</tbody>
</table>

3.1.12.8. get_frame_size (::quartus::fif)

The following table displays information for the `get_frame_size` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::fif on page 248</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_frame_size [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-frame &lt;frame&gt;</code></td>
</tr>
<tr>
<td>Description</td>
<td>Returns frame size of the specific frame.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>get_frame_size -frame 3</code></td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
</tbody>
</table>

3.1.12.9. get_sector_information_sdm_based_fpga (::quartus::fif)

The following table displays information for the `get_sector_information_sdm_based_fpga` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::fif on page 248</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_sector_information_sdm_based_fpga [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-sector_index &lt;sector_index&gt;</code></td>
</tr>
</tbody>
</table>

continued...
3. TCL Commands and Packages

<table>
<thead>
<tr>
<th>Description</th>
<th>Query information about sector with given index number.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Example Usage</th>
<th>get_sector_information_sdm_based_fpga -sector_index 25</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>

<td>Short help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
<td></td>
</tr>
</tbody>
</table>

continued...
3. TCL Commands and Packages

3.1.12.12. setup (::quartus::fif)

The following table displays information for the `setup` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::fif on page 248</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`setup [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-fif &lt;fif&gt;</code> FIF filename</td>
</tr>
<tr>
<td></td>
<td><code>-rbf &lt;rbf&gt;</code> RBF filename</td>
</tr>
<tr>
<td>Description</td>
<td>Setup FIF driver.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>setup -fif test.fif -rbf test.rbf</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>

<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: FIF driver has already been setup.</td>
<td></td>
</tr>
</tbody>
</table>

3.1.12.13. setup_sdm_based_fpga (::quartus::fif)

The following table displays information for the `setup_sdm_based_fpga` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::fif on page 248</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`setup_sdm_based_fpga [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
</tbody>
</table>

---

**Description**

Check if the bit is sensitive or not at specific location.

**Example Usage**

```
get_sensitive_location_sdm_based_fpga -sector_index 25 -frame_index 4 -bit_index 3
```
### 3.1.12.14. terminate (::quartus::fif)

The following table displays information for the `terminate` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::fif on page 248</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`terminate [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td>Description</td>
<td>Terminate FIF driver.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>terminate</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: FIF driver operation failed with error &lt;string&gt;.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: FIF driver has already been setup.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: FIF file is not compatible.</td>
</tr>
</tbody>
</table>

### 3.1.13. ::quartus::flng

The following table displays information for the `::quartus::flng` Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::flng 1.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>This package contains no general description.</td>
</tr>
<tr>
<td>Availability</td>
<td>This package is loaded by default in the following executables:</td>
</tr>
<tr>
<td></td>
<td>hdb_debug</td>
</tr>
<tr>
<td></td>
<td>qpro</td>
</tr>
<tr>
<td></td>
<td>qpro_sh</td>

### 3. TCL Commands and Packages

#### 3.1.13.1. flng::add_object (::quartus::flng)

The following table displays information for the flng::add_object Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
</table>

| Syntax | flng::add_object [-h | -help] [-long_help [-name <name>] [-number <number>] -type <type>] |

<table>
<thead>
<tr>
<th>Arguments</th>
<th>-h</th>
<th>-help</th>
<th>Short help</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
<td>The name of the new flow or task object.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-number &lt;number&gt;</td>
<td>The numeric part of the new FLNG object's name.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-type &lt;type&gt;</td>
<td>The type of the new FLNG object.</td>
<td></td>
</tr>
</tbody>
</table>

| Description | This command currently contains no help description. |

| Example Usage | This command currently contains no example usage. |

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>Name</td>
<td></td>
<td>String Return</td>
</tr>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Fail to add object.</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Invalid object type '&lt;string&gt;'.</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Object name is needed.</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Object number is needed.</td>
<td></td>
</tr>
</tbody>
</table>
### 3.1.13.2. flng::add_property (::quartus::flng)

The following table displays information for the flng::add_property Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>flng::add_property [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-object &lt;object&gt;</td>
</tr>
<tr>
<td></td>
<td>-value &lt;value&gt;</td>
</tr>
<tr>
<td></td>
<td>-value_type &lt;value_type&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Add a property (a name/value pair) to a generic object</td>
</tr>
<tr>
<td>Example Usage</td>
<td>flng::add_property -object &lt;object&gt; -name &lt;property name&gt; -value &lt;property value&gt; -value_type &lt;value type&gt;</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
</tbody>
</table>

### 3.1.13.3. flng::bind_flow (::quartus::flng)

The following table displays information for the flng::bind_flow Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>flng::bind_flow [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-end &lt;end&gt;</td>
</tr>
<tr>
<td></td>
<td>-flow &lt;flow&gt;</td>
</tr>
<tr>
<td></td>
<td>-start &lt;start&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>This command currently contains no help description.</td>
</tr>
</tbody>
</table>
### 3.1.13.4. `flng::delete_object (::quartus::flng)`

The following table displays information for the `flng::delete_object` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::flng</code> on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`flng::delete_object [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-object &lt;object&gt;</code> Object to delete</td>
</tr>
<tr>
<td>Description</td>
<td>This command currently contains no help description.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>This command currently contains no example usage.</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
</tbody>
</table>

### 3.1.13.5. `flng::get_default_flow_run_name (::quartus::flng)`

The following table displays information for the `flng::get_default_flow_run_name` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::flng</code> on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`flng::get_default_flow_run_name [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-flow &lt;flow&gt;</code> The flow name</td>
</tr>
<tr>
<td>Description</td>
<td>Get the default flow run name.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>flng::get_default_flow_run</code></td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>
</tr>
</tbody>
</table>
3.1.13.6. flng::get_flow_list (::quartus::flng)

The following table displays information for the flng::get_flow_list Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>flng::get_flow_list [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-project &lt;project&gt;</td>
</tr>
<tr>
<td></td>
<td>-project_path &lt;project_path&gt;</td>
</tr>
<tr>
<td></td>
<td>-revision &lt;revision&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>This command currently contains no help description.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>flng::get_flow_list -project project -revision revision</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td>TCL_OK</td>
<td>0</td>
</tr>
</tbody>
</table>

3.1.13.7. flng::get_next_available_id (::quartus::flng)

The following table displays information for the flng::get_next_available_id Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>flng::get_next_available_id [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-type &lt;type&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>This command currently contains no help description.</td>
</tr>
<tr>
<td>Example Usage</td>
<td>This command currently contains no example usage.</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td>TCL_OK</td>
<td>0</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
</tr>
</tbody>
</table>
3.1.13.8. flng::get_object (::quartus::flng)

The following table displays information for the flng::get_object Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>flng::get_object [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-number &lt;number&gt;</td>
</tr>
<tr>
<td></td>
<td>-properties &lt;properties&gt;</td>
</tr>
<tr>
<td></td>
<td>-type &lt;type&gt;</td>
</tr>
</tbody>
</table>

**Description**

Find a flow engine object matching type and name.

**Example Usage**

flng::get_object -type task -name synthesis

**Return Value**

<table>
<thead>
<tr>
<th>Code</th>
<th>Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Fail to get object.</td>
<td></td>
</tr>
</tbody>
</table>

3.1.13.9. flng::get_objects (::quartus::flng)

The following table displays information for the flng::get_objects Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>flng::get_objects [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-number &lt;number&gt;</td>
</tr>
<tr>
<td></td>
<td>-properties &lt;properties&gt;</td>
</tr>
<tr>
<td></td>
<td>-type &lt;type&gt;</td>
</tr>
</tbody>
</table>

**Description**

Get a list of specific existing Flow Engine objects

**Example Usage**

flng::get_objects -type task

**Return Value**

<table>
<thead>
<tr>
<th>Code</th>
<th>Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Fail to get objects.</td>
<td></td>
</tr>
</tbody>
</table>
### 3.1.13.10. flng::get_option (::quartus::flng)

The following table displays information for the `flng::get_option` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`flng::get_option [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td>Description</td>
<td>Get option for the Flow Engine system</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>flng::get_option -name &lt;option name&gt;</code></td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>TCL_OK</td>
<td>0</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
</tr>
</tbody>
</table>

### 3.1.13.11. flng::get_property (::quartus::flng)

The following table displays information for the `flng::get_property` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`flng::get_property [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td>Description</td>
<td>Get the value of a generic object's property.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>flng::get_property -object &lt;object&gt; -name &lt;property name&gt;</code></td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>TCL_OK</td>
<td>0</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
</tr>
</tbody>
</table>
### 3.1.13.12. flng::get_task_command (::quartus::flng)

The following table displays information for the `flng::get_task_command` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::flng</code> on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`flng::get_task_command [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-task_instance &lt;task_instance&gt;</code> The name of the task_instance</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>This command currently contains no help description.</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td><code>flng::get_task_command -task_instance task_instance</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Return Value</strong></th>
<th><strong>Code Name</strong></th>
<th><strong>Code</strong></th>
<th><strong>String Return</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TCL_OK</strong></td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>

### 3.1.13.13. flng::get_task_status_property (::quartus::flng)

The following table displays information for the `flng::get_task_status_property` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::flng</code> on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`flng::get_task_status_property [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-property_name &lt;property_name&gt;</code> The name of the property to lookup</td>
</tr>
<tr>
<td></td>
<td>`-task_name &lt;ip_generation</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Code Name</strong></th>
<th><strong>Code</strong></th>
<th><strong>String Return</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TCL_OK</strong></td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

*continued...*
## Returns

Returns the task status property of the specified task.

The valid property_name values are:

- **status**: The status the task. The possible status are: no_status, scheduled, running and done.
- **success**: If task status is done, success indicates whether it completed successfully.
- **errors**: Returns the number of error messages.
- **critical_warnings**: Returns the number of critical warning messages.
- **elapsed_time**: Returns number seconds it the task has taken.
- **id**: A internal id for the object
- **run**: The name of the run
- **name**: A user friendly name of the object
- **process_id**: The process id that running the task
- **hostname**: The name of the machine running the task
- **percent**: The percent completed
- **start_time**: The time the task started
- **last_updated**: The time the task posted a progress update.
- **end_time**: The time the task finished
- **result**: The result of the execution.
- **outdated**: Returns true if the task has been updated by either assignments or source file.
- **dni**: Indicates if DNI database engine was active
- **assignment_digest**: Internal hash of all the assignments.
- **checkpoint**: Indicates if a checkpoint has been written out.
- **imported_checkpoint**: Indicates if the checkpoint was imported

### Example Usage

This command currently contains no example usage.

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Invalid status db property name</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: No project is currently open. Open an existing project or create a new project.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: No revision is currently open. Open a revision.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: No task with the specified name exists.</td>
</tr>
</tbody>
</table>

### 3.1.13.14. flng::init_repository (::quartus::flng)

The following table displays information for the flng::init_repository Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>flng::init_repository [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td>Description</td>
<td>This command currently contains no help description.</td>
</tr>
</tbody>
</table>
### 3.1.13.15. `flng::list_properties` (::quartus::flng)

The following table displays information for the `flng::list_properties` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::flng</code> on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`flng::list_properties [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-object &lt;object&gt;</code></td>
</tr>
<tr>
<td>Description</td>
<td>Get the list of property names from a generic object</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>flng::list_properties -object &lt;object&gt;</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Invalid object '%s'.</td>
<td></td>
</tr>
</tbody>
</table>

### 3.1.13.16. `flng::monitor_flow` (::quartus::flng)

The following table displays information for the `flng::monitor_flow` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::flng</code> on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`flng::monitor_flow [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-flow &lt;flow&gt;</code></td>
</tr>
<tr>
<td>Description</td>
<td>This command currently contains no help description.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>flng::monitor_flow -flow flowname</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>
### 3.1.13.17. flng::run_flow (::quartus::flng)

The following table displays information for the `flng::run_flow` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::flng</code> on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-enable_heartbeat &lt;enable_heartbeat&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-end &lt;end&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-flow &lt;flow&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-print_only</code></td>
</tr>
<tr>
<td></td>
<td><code>-resume</code></td>
</tr>
<tr>
<td></td>
<td><code>-start &lt;start&gt;</code></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>This command currently contains no help description.</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td><code>flng::run_flow -flow flowname</code></td>
</tr>
<tr>
<td><strong>Return Value</strong></td>
<td><code>Code Name</code></td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

### 3.1.13.18. flng::run_flow_command (::quartus::flng)

The following table displays information for the `flng::run_flow_command` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::flng</code> on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-command &lt;command&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-end &lt;end&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-flow &lt;flow&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-print_only</code></td>
</tr>
<tr>
<td></td>
<td><code>-resume</code></td>
</tr>
<tr>
<td></td>
<td><code>-start &lt;start&gt;</code></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>This command currently contains no help description.</td>
</tr>
</tbody>
</table>

**continued...**
### Example Usage

```
flng::run_flow_command -flow flowname
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>

<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: run_flow_command with specified flow '&lt;string&gt;' failed: &lt;string&gt;.</td>
</tr>
</tbody>
</table>

### 3.1.13.19. flng::set_option (::quartus::flng)

The following table displays information for the flng::set_option Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>flng::set_option [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-value &lt;value&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Set options for the Flow Engine system</td>
</tr>
<tr>
<td>Example Usage</td>
<td>flng::set_option -name &lt;option name&gt; -value &lt;option value&gt;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: FLOW option '&lt;string&gt;' is invalid.</td>
<td></td>
</tr>
</tbody>
</table>
### 3.1.13.20. flng::set_property (::quartus::flng)

The following table displays information for the `flng::set_property` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flng on page 255</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`flng::set_property [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-name &lt;name&gt;</td>
<td>property name.</td>
</tr>
<tr>
<td>-object &lt;object&gt;</td>
<td>The object to which the property belongs.</td>
</tr>
<tr>
<td>-value &lt;value&gt;</td>
<td>property value.</td>
</tr>
<tr>

### 3.1.14. ::quartus::flow

The following table displays information for the ::quartus::flow Tcl package:

#### Tcl Package and Version

::quartus::flow 1.1

#### Description

This package contains the set of Tcl functions for running flows or command-line executables.

#### Availability

This package is loaded by default in the following executables:

- qpro
- qpro_sh
- quartus
- quartus_cdb
- quartus_sh

This package is available for loading in the following executables:

- hdb_debug
- quartus_drc
- quartus_eda
- quartus_fit
- quartus_ipgenerate
- quartus_map
- quartus_si
- quartus_sim
- quartus_sta
- quartus_stp
- quartus_syn
- quartus_tlg

#### Tcl Commands

- execute_flow (::quartus::flow) on page 272
- execute_module (::quartus::flow) on page 274
- get_flow_templates (::quartus::flow) on page 275
- get_status_db_property (::quartus::flow) on page 276
- write_flow_assignment_digest (::quartus::flow) on page 276
- write_flow_finished (::quartus::flow) on page 277
- write_flow_started (::quartus::flow) on page 277
- write_flow_template (::quartus::flow) on page 278
### 3.1.14.1. `execute_flow (::quartus::flow)`

The following table displays information for the `execute_flow` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::flow</code> on page 271</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Arguments</th>

<tr>
<td>-analysis_and_elaboration</td>
<td>Option to run Analysis &amp; Elaboration</td>
</tr>
<tr>
<td>-check_IOS</td>
<td>Option to run I/O assignment analysis</td>
</tr>
<tr>
<td>-check_netlist</td>
<td>Option to run Check and Save Netlist</td>
</tr>
<tr>
<td>-compile</td>
<td>Option to run a full compilation</td>
</tr>
<tr>
<td>-dni</td>
<td>Option to request flow be executed in DNI mode.</td>
</tr>
<tr>
<td>-dont_export_assignments</td>
<td>Option not to export assignments to file. By default, this command exports assignments before running command-line executables.</td>
</tr>
<tr>
<td>-eco &lt;value&gt;</td>
<td>Option to run a Fitter ECO compilation</td>
</tr>
<tr>
<td>-export_database</td>
<td>Option to export a version-compatible database</td>
</tr>
<tr>
<td>-finalize</td>
<td>Option to run algorithms to prepare design for programming.</td>
</tr>
<tr>
<td>-flow_args &lt;Tcl list of name value pairs args to pass to the flow&gt;</td>
<td>Option to specify flow args</td>
</tr>
<tr>
<td>-generate_functional_sim_netlist</td>
<td>Option to generate a functional simulation netlist</td>
</tr>
<tr>
<td>-implement</td>
<td>Option to run compilation up to route stage and skipping all time intensive algorithms after.</td>
</tr>
<tr>
<td>-import_database</td>
<td>Option to import a version-compatible database</td>
</tr>
<tr>
<td>-incremental_compilation_export</td>
<td>Option to export a design partition into a Quartus Prime Exported Partition (QXP) file</td>
</tr>
<tr>
<td>-incremental_compilation_import</td>
<td>Option to import one or more Quartus Prime Exported Partition (QXP) files into the design partitions of the current project</td>
</tr>
<tr>
<td>-ip_upgrade</td>
<td>Option to run a ip upgrade</td>
</tr>
<tr>
<td>-quick_elaboration</td>
<td>Option to run Quick Elaboration</td>
</tr>
<tr>
<td>-signalprobe</td>
<td>Option to run a Signal Probe compilation</td>
</tr>
<tr>
<td>-simulation</td>
<td>Option to run simulation</td>
</tr>
</tbody>
</table>

*continued...*
Description

Runs one or more of the command-line executables using one of the predefined flows, such as "-compile" or "-signalprobe". You can run only one flow at a time, so you must use only one option.

Some flows have limited device support or other limitations based on the features used. See documentation for the features in question for details.

The "-export_database" and "-import_database" options use the value of the VER_COMPATIBLE_DB_DIR assignment for the version-compatible database files directory, defaulting to "export_db".

The "-incremental_compilation_export" option uses the value of the INCREMENTAL_COMPILATION_EXPORT_FILE global assignment for the path of the Quartus Prime Exported Partition (QXP) file to be created. The value of the INCREMENTAL_COMPILATION_EXPORT_PARTITION_NAME global assignment should specify the name of the partition to be exported. The value of the INCREMENTAL_COMPILATION_EXPORT_NETLIST_TYPE global assignment (which can either have value POST_SYNTH or POST_FIT) determines whether post-synthesis or post-fitting results should be exported. Finally, the value of the INCREMENTAL_COMPILATION_EXPORT_ROUTING global assignment specifies whether routing should be exported when a post-fit netlist is generated.

The "-incremental_compilation_import" option uses the following partition assignments to determine the location of the QXP files, and how importation should be performed, on a per-partition basis:

PARTITION.Import_FILE
PARTITION.Import_PROMOTE_ASSIGNMENTS
PARTITION.Import_NEW_ASSIGNMENTS
PARTITION.Import_EXISTING_ASSIGNMENTS
PARTITION.Import_EXISTING_LOGICLOCK_REGIONS

All assignments are exported first automatically, as if you called the "export_assignments" command first, unless the -dont_export_assignments option is specified.

You must use the Tcl command "catch" to determine whether the predefined flow ran successfully or not, as in the following example:

```tcl
if {[catch {execute_flow -compile} result]} {
    puts \nResult: \$result\n"
    puts "ERROR: Compilation failed. See report files.\\n"
} else {
    puts \nINFO: Compilation was successful.\\n"
}
```

Example Usage

```
# To run quartus_map, quartus_fit, quartus_sta, quartus_asm
# or other executables based on options. (Refer to "Using
# Compilation Flows," "Compiling Designs," and "Specifying
# Compiler Settings" in Quartus Prime online Help for more
# information.)
execute_flow -compile

# To determine if compilation was successful or not
# and print out a personalized message.
if {[catch {execute_flow -compile} result]} {
    puts \nResult: \$result\\n"
    puts "ERROR: Compilation failed. See report files.\\n"
} else {
    puts \nINFO: Compilation was successful.\\n"
}

# To perform a full compilation
execute_flow -compile

# To perform a ip_upgrade with flow_args to specify variation_files
execute_flow -ip_upgrade -flow_args "variation_files="a.ip;b.ip"
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Can't run multiple flows simultaneously. Wait for current flow to complete.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Flow doesn't exist: &lt;string&gt;. Make sure the specified flow exists.</td>
</tr>
</tbody>
</table>
TCL_ERROR 1   ERROR: The flow args are invalid. It should be a legal Tcl list.

TCL_ERROR 1   ERROR: Only one flow option is allowed. Only one flow can be run for a single command call. If multiple flows are required, use multiple commands.

TCL_ERROR 1   ERROR: Can't find active revision. Make sure there is an open, active revision name. Use the -revision option of project_open, project_new, or use set_current_revision.

TCL_ERROR 1   ERROR: No project is currently open. Open an existing project or create a new project.

TCL_ERROR 1   ERROR: Error(s) found while running an executable. See report file(s) for error message(s). Message log indicates which executable was run last.

TCL_ERROR 1   ERROR: Option -<string> is illegal in the Quartus Prime User Interface. Specify a different option or use a similar command from the Processing menu.

TCL_ERROR 1   ERROR: At least one option is required. Specify at least one option.

3.1.14.2. execute_module (::quartus::flow)

The following table displays information for the `execute_module` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::flow on page 271</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-args &lt;arguments&gt;</td>
<td>Option to specify arguments for the executable</td>
</tr>
<tr>
<td>-classic</td>
<td>Option to request flow be executed in Classic mode.</td>
</tr>
<tr>
<td>-dni</td>
<td>Option to request tool option be executed in DNI mode.</td>
</tr>
<tr>
<td>-dont_export_assignments</td>
<td>Option not to export assignments to file. By default, this command exports assignments before running command-line executables.</td>
</tr>
<tr>
<td>-tool &lt;asm</td>
<td>cdb</td>
</tr>
</tbody>
</table>

Runs one of the command-line executables, such as quartus_map or quartus_fit. If the -args option is specified, the arguments are passed to the command-line executable.

All assignments are exported automatically first, as if the "export_assignments" command was called first, unless -dont_export_assignments option is specified.

You must use the Tcl command "catch" to determine whether the command-line executable ran successfully or not, as in the following example:

```tcl
if {[catch {execute_module -tool map} result]} {
    puts "\nResult: $result\n"
    puts "ERROR: Analysis & Synthesis failed. See the report file.\n"
}
```

continued...
Example Usage

```tcl
# Run quartus_map using device family Stratix and device part EP1S10B672C6.
execute_module -tool map -args "--family=Stratix --part=EP1S10B672C6"

# Compile using a set of executables
execute_module -tool map
execute_module -tool fit
execute_module -tool sta
execute_module -tool asm
execute_module -tool eda

# To determine if Analysis & Synthesis was successful or not
# and print out a personalized message.
if { [catch {execute_module -tool map} result] } {  
    puts "\nERROR: Analysis & Synthesis failed. See the report file.\n"  
} else {  
    puts "\nINFO: Analysis & Synthesis was successful.\n"
}
```

### Return Value

<table>
<thead>
<tr>
<th>Code</th>
<th>Code Name</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>

3.1.15.1. begin_memory_edit (::quartus::insystem_memory_edit)

The following table displays information for the `begin_memory_edit` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::insystem_memory_edit on page 278</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`begin_memory_edit [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-device_name &lt;device name&gt;</code> Name of the device that holds the editable memory instances</td>
</tr>
<tr>
<td></td>
<td><code>-hardware_name &lt;hardware name&gt;</code> Name of the hardware that connects to the JTAG chain</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Start the memory editing sequence. The editing sequence should be terminated with <code>end_memory_edit</code>. The sequence does not have to be terminated unless the device configuration is changed or a different device is edited. The hardware and device name can be obtained with the <code>get_hardware_names</code> and <code>get_device_names</code> commands from the <code>jtag</code> package.</td>
</tr>
</tbody>
</table>

**Example Usage**

```tcl
# Instance 0 is configured as [0 1024 8 RW ROM/RAM mem0]
# Initiate a editing sequence
begin_memory_edit -hardware_name "USB-Blaster [USB-0]" -device_name "$1: EP1S25/HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"

# Write memory content using binary string
write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "0000001011011100"

# Read back memory content in binary string written
puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 ]

# Write memory content using hexadecimal string
write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "E2F1" -content_in_hex

# Read back memory content in hexadecimal string written
puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 -content_in_hex]

# End the editing sequence
end_memory_edit
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>

<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: A memory edit sequence has been started. End it first before starting a another one.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified hardware is not found.</td>
</tr>
</tbody>
</table>

3.1.15.2. end_memory_edit (::quartus::insystem_memory_edit)

The following table displays information for the `end_memory_edit` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::insystem_memory_edit on page 278</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`end_memory_edit [-h</td>
</tr>
</tbody>
</table>

```
```
### Arguments

<table>
<thead>
<tr>
<th>Short help</th>
<th>Long help with examples and possible return values</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td></td>
</tr>
</tbody>
</table>

### Description

Terminate the memory editing sequence. The sequence does not have to be terminated unless the device configuration is changed or a different device is edited.

### Example Usage

```bash
# Instance 0 is configured as \{0 1024 8 RW ROM/RAM mem0\}

# Initiate a editing sequence
begin_memory_edit -hardware_name "USB-Blaster \[USB-0\]\ " -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"

# Write memory content using binary string
write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "0000001011011100"

# Read back memory content in binary string written
puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 ]

# Write memory content using hexadecimal string
write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "E2F1" -content_in_hex

# Read back memory content in hexadecimal string written
puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 -content_in_hex]

# End the editing sequence
end_memory_edit
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: A memory edit sequence has not been started.</td>
</tr>
</tbody>
</table>

### 3.1.15.3. `get_editable_mem_instances` (::quartus::insystem_memory_edit)

The following table displays information for the `get_editable_mem_instances` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::insystem_memory_edit on page 278</th>
</tr>
</thead>
</table>

### Syntax

```tcl
get_editable_mem_instances [-h | -help] [-long_help] -device_name <device name> -hardware_name <hardware name>
```

### Arguments

<table>
<thead>
<tr>
<th>Short help</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td></td>
</tr>
<tr>
<td>-device_name &lt;device name&gt;</td>
<td></td>
</tr>
<tr>
<td>-hardware_name &lt;hardware name&gt;</td>
<td></td>
</tr>
</tbody>
</table>

### Description

Retrieve a list of editable memory, ROM, or lpm_constant instances.

A list is returned, each element of which shows the configuration of each instance. This element is another list that specifies the configuration in the following order: `<instance index>` `<depth>` `<width>` `<read/write mode>` `<instance type>` `<instance name>`. The `<read/write mode>` can be either "RW" or "W"; `<instance type>` can be either "ROM/RAM" or "CONSTANT". An example showing a list of two instances of different types is shown below:

```tcl
{0 1024 8 RW ROM/RAM mem0} {1 1 32 RW CONSTANT con0}
```
The hardware and device name can be obtained with the `get_hardware_names` and `get_device_names` commands from the JTAG package.

It is recommended that you call this command before the TCL command, `begin_memory_edit`. Within a memory edit sequence, this command can be applied only to the same device, on which the memory edit sequence has started.

**Example Usage**

```tcl
# List information of all editable memories
puts "Information on all editable memories:
puts "index,depth,width,mode,type,name"
foreach instance [get_editable_mem_instances -hardware_name "USB-Blaster [USB-0]" - device_name "EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"] {
puts "$[lindex $instance 0],$[lindex $instance 1],$[lindex $instance 2],$[lindex $instance 3],
            $[lindex $instance 4],$[lindex $instance 5]"
}
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified device is not found.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified hardware is not found.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The TCL command <code>get_editable_mem_instances</code> is called within a memory edit sequence for a different device. End the memory edit first.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: An internal TCL interpreter error occurred.</td>
</tr>
</tbody>
</table>

### 3.1.15.4. `read_content_from_memory (::quartus::insystem_memory_edit)`

The following table displays information for the `read_content_from_memory` TCL command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to</th>
<th>::quartus::insystem_memory_edit on page 278</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>read_content_from_memory [-h</td>
<td>-help] [-long_help] [-content_in_hex] -instance_index &lt;instance_index&gt; -start_address &lt;starting address&gt; [-timeout &lt;timeout&gt;] -word_count &lt;word_count&gt;</td>
</tr>
</tbody>
</table>

**Arguments**

- `-h | -help`  
  Short help
- `-long_help`  
  Long help with examples and possible return values
- `-content_in_hex`  
  The memory content string is represented in hexadecimal format
- `-instance_index <instance_index>`  
  Index of the editable memory instance to read
- `-start_address <starting address>`  
  The lowest memory address to be read
- `-timeout <timeout>`  
  amount of time in milliseconds allocated before read times out. Defaults to 10 seconds
- `-word_count <word_count>`  
  The number of contiguous memory words to be read

**Description**

Retrieves the memory content represented in the bit stream from the specified editable memory instance starting from the specified address.

The memory content string is in the same format as the input content string in the TCL command `write_content_to_memory`.  

continued...
Example Usage

```tcl
# Initialize a editing sequence
begin_memory_edit -hardware_name "USB-Blaster [USB-0]\" -device_name "@1: EP1S25/ _HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"

# Write memory content using binary string
write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "0000001011011100"

# Read back memory content in binary string written
puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 -timeout 30000]

# Write memory content using hexadecimal string
write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "E2F1" -content_in_hex

# Read back memory content in hexadecimal string written
puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 -content_in_hex]

# End the editing sequence
end_memory_edit
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: A memory edit sequence has not been started.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified word count and the starting address exceeds the specified memory buffer size.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified editable memory instance index is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: JTAG communication error is detected. It can be caused by the hardware failure or poor signal integrity in the JTAG chain.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The device is locked by another application.</td>
</tr>
</tbody>
</table>

3.1.15.5. `save_content_from_memory_to_file` ([::quartus::insystem_memory_edit])

The following table displays information for the `save_content_from_memory_to_file` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to: <code>::quartus::insystem_memory_edit</code> on page 278</th>
</tr>
</thead>
</table>

**Syntax**

```
```

**Arguments**

- `-h | -help` : Short help
- `-long_help` : Long help with examples and possible return values
- `-instance_index <instance_index>` : Index of the editable memory instance to read
- `-mem_file_path <path>` : Path to the memory file in which to save the memory content
- `-mem_file_type <type>` : Type of the memory file such as "mif" or "hex"
- `-timeout <timeout>` : amount of time in milliseconds allocated before read times out. Defaults to 10 seconds
Retrieves the entire memory contents from the specified editable memory instance starting from address 0 and saves it into the specified memory file.

### Example Usage

```tcl
# Initiate a editing sequence
begin_memory_edit -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"

# Write memory content using the hex memory file
update_content_to_memory_from_file -instance_index 0 -mem_file_path "image_8x1024.hex" -mem_file_type hex

# Read memory content and save back to a hex memory file
save_content_from_memory_to_file -instance_index 0 -mem_file_path "exported_image_8x1024.hex" -mem_file_type hex

# Write memory content using the mif memory file
update_content_to_memory_from_file -instance_index 0 -mem_file_path "exported_image_8x1024.mif" -mem_file_type mif

# Read memory content and save back to a mif memory file
save_content_from_memory_to_file -instance_index 0 -mem_file_path "image_8x1024.mif" -mem_file_type mif -timeout 30000

# End the editing sequence
end_memory_edit
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: A memory edit sequence has not been started.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified memory file cannot be written to.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified file type is either invalid or unsupported by this command.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified editable memory instance index is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: JTAG communication error is detected. It can be caused by the hardware failure or poor signal integrity in the JTAG chain.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The device is locked by another application.</td>
</tr>
</tbody>
</table>

3.1.15.6. `update_content_to_memory_from_file` ([::quartus::insystem_memory_edit](#))

The following table displays information for the `update_content_to_memory_from_file` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <a href="#">::quartus::insystem_memory_edit</a> on page 278</th>
</tr>
</thead>
</table>

**Syntax**

```
update_content_to_memory_from_file [-h | -help] [-long_help] -instance_index <instance_index> -mem_file_path <path> -mem_file_type <file_type> [-timeout <timeout>]
```

**Arguments**

- `-h | -help`
  - Short help
- `-long_help`
  - Long help with examples and possible return values
- `-instance_index <instance_index>`
  - Index of the editable memory instance to modify
- `-mem_file_path <path>`
  - Path to the memory file to load the memory content
- `-mem_file_type <file_type>`
  - Type of the memory file such as "mif" or "hex"
# Description

Writes the data stored in the memory file into the specified memory instance starting from address 0.

## Example Usage

```tcl
# Initiate a editing sequence
begin_memory_edit -hardware_name "USB-Blaster \[USB-0\]" -device_name "01: EP1S25/ _HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"

# Write memory content using the hex memory file
update_content_to_memory_from_file -instance_index 0 -mem_file_path "image_8x1024.hex" -mem_file_type hex

# Read memory content and save back to a hex memory file
save_content_from_memory_to_file -instance_index 0 -mem_file_path "exported_image_8x1024.hex" -mem_file_type hex

# Write memory content using the mif memory file
update_content_to_memory_from_file -instance_index 0 -mem_file_path "exported_image_8x1024.mif" -mem_file_type mif -timeout 30000

# Read memory content and save back to a mif memory file
save_content_from_memory_to_file -instance_index 0 -mem_file_path "image_8x1024.mif" -mem_file_type mif

# End the editing sequence
end_memory_edit
```

## Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>

### 3.1.15.7. write_content_to_memory (::quartus::insystem_memory_edit)

The following table displays information for the `write_content_to_memory` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to::quartus::insystem_memory_edit on page 278</th>
</tr>
</thead>
</table>

**Syntax**

```tcl
write_content_to_memory [-h | -help] [-long_help] [-content <content string>] [-content_in_hex] [-instance_index <instance_index> [-start_address <starting address> [-timeout <timeout> ] -word_count <word count>]
```

**Arguments**

- `-h` | `-help`  
  Short help
- `-long_help`  
  Long help with examples and possible return values
- `-content <content string>`  
  A string that represents all word values concatenated together in order in either binary or hexadecimal format

---

3. TCL Commands and Packages

683432 | 2024.04.01

284
### Description

Writes the data represented in the bit stream into the specified editable memory instance starting from the specified address. It returns the number of successful writes.

The bit stream should be ordered by word from high address to low address, contiguously without gaps or delimiters. If the starting address is ADDR, and word count is N, the order is \(<word @ ADDR + N - 1>...<word @ ADDR + 1><word @ ADDR>\). In each word, the MSB is on the left, LSB is on the right. The bit stream can be in either binary or hexadecimal. For example, if the word width is 8, and two words, 1 and 128, are written to address 0 and 1 respectively, the bitstream should be "1000000000000001" in binary or "8001" in hexadecimal. The TCL command is:

```tcl
write_content_to_memory -instance_index 0 -start_address 0 -word_count 2 -content "0000001011011100" -timeout 30000
```

### Example Usage

```tcl
# Instance 0 is configured as (0 1024 8 RW ROM/RAM mem0)
# Initiate a editing sequence
begin_memory_edit -hardware_name "USB-Blaster \[USB-0\]" -device_name @1: EP1S25/HARDCOPY_FPGA_PROTOTYPE (0x020030DD)*

# Write memory content using binary string
write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "0000001011011100" -timeout 30000

# Read back memory content in binary string written
puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 ]

# Write memory content using hexadecimal string
write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "E2F1" -content_in_hex

# Read back memory content in hexadecimal string written
puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 -content_in_hex]

# End the editing sequence
end_memory_edit
```

### Return Value

3.1.16.3. read_probe_data (::quartus::insystem_source_probe)

The following table displays information for the read_probe_data Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::insystem_source_probe on page 286</th>
</tr>
</thead>
</table>

**Syntax**

```
read_probe_data [-h | -help] [-long_help] -instance_index <instance_index> [-value_in_hex]
```

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-instance_index <instance_index>` Index of the In-System Sources and Probes instance to communicate with
- `-value_in_hex` Specifies that the value string is represented in hexadecimal format

**Description**

Retrieves the current value of the probes.

A string is returned specifying the status of each probe, with the MSB on the left and LSB on the right. By default, the value is represented as a binary string. Optionally, the option `-value_in_hex` makes the value a hex string.

**Example Usage**

```
#List probe data of instance 0
start_insystem_sourc_probe -hardware_name "USB-Blaster \[USB-0\]" -device_name "81: EP1S25/ _HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"
puts "probe data of instance 0"
puts [read_probe_data -instance_index 0]
end_insystem_source_probe
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>

<td>ERROR: The specified hardware is not found.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: An internal Tcl interpreter error occurred.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The specified In-System Sources and Probes instance index is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: No In-System Sources and Probes instance was found.</td>
</tr>
</tbody>
</table>

3.1.16.4. read_source_data (::quartus::insystem_source_probe)

The following table displays information for the read_source_data Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::insystem_source_probe on page 286</th>
</tr>
</thead>
</table>

**Syntax**

```
read_source_data [-h | -help] [-long_help] -instance_index <instance_index> [-value_in_hex]
```

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-instance_index <instance_index>` Index of the In-System Sources and Probes instance to communicate with

continued...
Specifies that the value string is represented in hexadecimal format.

Description

Retrieves the current value of the sources.

A string is returned specifying the status of each source, with the MSB on the left and LSB on the right. By default, the value is represented as a binary string. Optionally, the option -value_in_hex makes the value a hex string.

Example Usage

```tcl
#List source data of instance 0
start_insystem_source_probe -hardware_name "USB-Blaster [USB-0]" -device_name "/dev/EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"
puts "source data of instance 0"
puts [read_source_data -instance_index 0]
end_insystem_source_probe
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>

3.1.16.5. `start_insystem_source_probe` (::quartus::insystem_source_probe)

The following table displays information for the `start_insystem_source_probe` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to</th>
<th>on page 286</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>start_insystem_source_probe</code></td>
<td><code>::quartus::insystem_source_probe</code></td>
<td>286</td>
</tr>
</tbody>
</table>

Syntax

`start_insystem_source_probe` [-h | -help] [-long_help] -device_name `<device name>` -hardware_name `<hardware name>`

Arguments

- `-h` | `-help`  
  Short help
- `-long_help`  
  Long help with examples and possible return values
- `-device_name `<device name>`  
  Name of the device that holds the In-System Sources and Probes instances
- `-hardware_name `<hardware name>`  
  Name of programming hardware connected to the JTAG chain

Description

Use this command before beginning any In-System Sources and Probes transactions.

Example Usage

```tcl
#List probe data of instance 0
start_insystem_source_probe -hardware_name "USB-Blaster [USB-0]" -device_name "/dev/EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"
puts "probe data of instance 0"
puts [read_probe_data -instance_index 0]
end_insystem_source_probe
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
</tr>
</tbody>
</table>
### 3.1.17.4. dynamic_report (::quartus::interactive_synthesis)

The following table displays information for the `dynamic_report` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::interactive_synthesis</code> on page 291</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-dump_all</td>
<td>Dump the entire target report</td>
</tr>
<tr>
<td>-dump_lines &lt;dumplines_value&gt;</td>
<td>Dump first # of lines of the target report</td>
</tr>
<tr>
<td>-filename &lt;filename_value&gt;</td>
<td>Name of output file to be generated</td>
</tr>
<tr>
<td>-html</td>
<td>Option to generate output file in HTML format</td>
</tr>
<tr>
<td>-query &lt;query_value&gt;</td>
<td>Specifies the SQLite query</td>
</tr>
<tr>
<td>-report &lt;report_value&gt;</td>
<td>Specifies a target report to begin action with</td>
</tr>
<tr>
<td>-summary</td>
<td>Give a summary of the target report</td>
</tr>
<tr>
<td>-xml</td>
<td>Option to generate output file in XML format</td>
</tr>
</tbody>
</table>

**Description**

API that allows user to act with a full report which is limited on showing items in GUI. The report is a dynamic reporting infrastructure from SQLite report database, independent of synthesis compilation.

Use `-report` to target a report. This option is mandatory as further action depends on a certain report.

Current available `report` values are:

```
<table>
<thead>
<tr>
<th>Value</th>
<th>Report name in compilation</th>
<th>Database stored</th>
</tr>
</thead>
<tbody>
<tr>
<td>registers removed</td>
<td>Registers Removed During Synthesis</td>
<td>./dynamic_report/ registers_removed.sqlite</td>
</tr>
</tbody>
</table>
```

Use `-summary` to get a summary of the target report such as table name, column name that can be used in query.

The format of the summary would be shown as:

```
===================================================================
Database name: <name of the database that the target report is saved>
Table name: <table in the database that target report content locates>
Total size: <total size of the report>
Columns: <column name of the report>
...  
===================================================================
```

Use `-query` to take a whole SQLite query as an argument.

For example: `-query "SELECT * FROM <table> WHERE <column> = <...>"` to get SELECT result from the database.

If query command is incorrect, an error message with details will be issued.

Use `-dump_all` to dump all content in the report.

The result of `-query`, `-dump_all` and `-dump_lines` will be sent to an output file stored in local design directory.

Use `-filename` to specify output filename. If no filename entered, output file will be named as report value.

If the `-html` option is specified, the output file is generated in HTML format.

Otherwise, the output file is generated in ASCII format.

`-html` option and `-xml` option are mutually exclusive. Please only specify one option.

**Example Usage**

```
dynamic_report -report <report name> -query <SQLite query> -filename <output file name> -xml
dynamic_report -report <report name> -dump_all -filename <output file name>
dynamic_report -report <report name> -dump_lines <number of lines> -filename <output file name> -html
dynamic_report -report <report name> -summary
```

</table>
3.1.17.19. synthesize (::quartus::interactive_synthesis)

The following table displays information for the *synthesize* Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::interactive_synthesis on page 291</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>synthesize [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-partition &lt;partition_value&gt;</td>
</tr>
<tr>
<td></td>
<td>-recompile</td>
</tr>
</tbody>
</table>

**Description**
This command currently contains no help description.

**Example Usage**

# Run synthesis on Top partition
synthesize -partition |

# Run a re-synthesis on Top partition
synthesize -partition | -recompile |

# Run a synthesis on ocs partition
synthesize -partition | -techmap |

# Run high-level synthesis on Top partition
synthesize -partition | -flow hls |

# Run post-high-level synthesis on Top partition
synthesize -partition | -flow post_hls |

# This is the default and is equivalent to "synthesize -partition |
synthesize -partition | -flow full |

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: You must open a project before you can use this command</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Partition &lt;string&gt; not found</td>
</tr>
</tbody>
</table>

3.1.17.20. uniquify (::quartus::interactive_synthesis)

The following table displays information for the *uniquify* Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::interactive_synthesis on page 291</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-analysis_and_elab_report</td>
</tr>
<tr>
<td></td>
<td>-recompile</td>
</tr>
</tbody>
</table>

**Description**
This command currently contains no help description.

**Example Usage**

# Run uniquify on all partitions as required
uniquify |

# Run uniquify on one specific partition
uniquify -partition cpu_left |

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>

3.1.18.1. `ipdrc::get_device_speed (::quartus::ipdrc)`

The following table displays information for the `ipdrc::get_device_speed` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::ipdrc on page 302</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`ipdrc::get_device_speed [-h</td>
</tr>
</tbody>
</table>

**Arguments**
- `-h | -help`  
  Short help
- `-long_help`  
  Long help with examples and possible return values
- `-core <core>`  
  Core speed grade of the target device
- `-hpath <hpath>`  
  Hierarchical path of an instance
- `-xcvr <xcvr>`  
  Transceiver speed grade of the target device

**Description**
IPDRC get device speed --This command returns the max speed of a device given core grade (1-4) and transceiver grade (1-3)

**Example Usage**
```
ipdrc::get_device_speed -hpath $hpath -core $core -xcvr $xcvr
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>

3.1.18.2. `ipdrc::get_ip_hpaths (::quartus::ipdrc)`

The following table displays information for the `ipdrc::get_ip_hpaths` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::ipdrc on page 302</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`ipdrc::get_ip_hpaths [-h</td>
</tr>
</tbody>
</table>

**Arguments**
- `-h | -help`  
  Short help
- `-long_help`  
  Long help with examples and possible return values
- `-filter <filter>`  
  Filter searches against parameters stored in the JSON file. Format: `{param_id value} 2 strings connected by 1 space`  
- `-ip_name <ip_name>`  
  IP name to search for

**Description**
IPDRC get IP hpaths --This command returns a list of IP hpaths based on prescribed filterings; by default returns every existing hpath

<tr>
<td>Availability</td>
<td>This package is loaded by default in the following executable: <code>quartus_ipgenerate</code></td>
</tr>
<tr>
<td>Tcl Commands</td>
<td><code>clear_ip_generation_dirs</code>, <code>generate_ip_file</code>, <code>generate_project_ip_files</code>, <code>get_project_ip_files</code></td>
</tr>
</tbody>
</table>

---

**Description**

IPDRC get IP XCVR type --This command returns the XCVR type of an IP instance

**Example Usage**

`ipdrc::get_ip_xcvr_type -hpath $hpath`

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.18.8. `ipdrc::set_ip_info` (::quartus::ipdrc)

The following table displays information for the `ipdrc::set_ip_info` Tcl command:
### 3.1.19.1. clear_ip_generation_dirs (::quartus::ipgen)

The following table displays information for the `clear_ip_generation_dirs` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to</th>
<th>::quartus::ipgen on page 306</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>clear_ip_generation_dirs [-h</td>
<td>-help] [-long_help]</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
</tbody>
</table>

**Description**

This command removes all the generation directories for the Platform Designer IP files in the opened project. All the content in the generation directories will be removed.

**Example Usage**

```
# Remove all the generation directories for the Platform Designer IP files in the opened project
project_open my_project
clear_ip_generation_dirs
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>

<td>ERROR: You must open a project before you can use this command.</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The command failed with an unknown error.</td>
<td></td>
</tr>
</tbody>
</table>

### 3.1.19.2. generate_ip_file (::quartus::ipgen)

The following table displays information for the `generate_ip_file` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to</th>
<th>::quartus::ipgen on page 306</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-clean</td>
<td>Specify whether pre-existing generation directories should be cleared before generation.</td>
</tr>
<tr>
<td></td>
<td>-clear_ip_generation_dirs</td>
<td>Specify whether pre-existing generation directories should be cleared before generation.</td>
</tr>
<tr>
<td></td>
<td>-modelsim_flow &lt;qrun</td>
<td>traditional&gt;</td>
</tr>
<tr>
<td></td>
<td>-simulation &lt;verilog</td>
<td>vhdl&gt;</td>
</tr>
<tr>
<td></td>
<td>-simulator &lt;modelsim</td>
<td>vcs</td>
</tr>
<tr>
<td></td>
<td>-synthesis &lt;verilog</td>
<td>vhdl&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;file&gt;</td>
<td>A Platform Designer IP file path. -file=&quot;path1;path2&quot;</td>
</tr>
</tbody>
</table>

**continued...**
This command generates the files for a specified Platform Designer IP in the opened project.

```
--synthesis <value>: Specify the synthesis target type. Valid values are verilog
or vhdl. This is not a required option. When not specified, it
defaults to verilog.

--simulation <value>: Specify the simulation target type. Valid values are
verilog or vhdl. This is not a required option. When not specified, no
simulation files are generated.

--simulator <value>: Specify the simulator target type. Valid values are
modelsim, vcs, vcsmx, riviera, xcelium. This is not a required option. When not specified,
simulation files for all simulators are generated.

--modelsim_flow <value>: Specify the Modelsim flow used for simulation script
generation. Valid values are qrun or traditional. This is not a required option. When not specified, it
defaults to qrun.

--clear_ip_generation_dirs: Specify whether pre-existing generation directories should
be cleared before generation. This is not a required option. When not specified, the
generation directories will not be cleared.

--clean: Specify whether pre-existing generation directories should
be cleared before generation. This option is a short version of the
clear_ip_generation_dirs option. This is not a required option. When not specified, the
generation directories will not be cleared.
```

### Example Usage

```
# generate the specified Platform Designer IP in the project with the specified targets. Clear any pre-existing
generation directories before performing the generation.
project_open my_project
generate_ip_file my_ip_file.qsys -synthesis verilog -simulation verilog -simulator modelsim -
clear_ip_generation_dirs
```

### Return Value

### 3.1.19.3. generate_project_ip_files (::quartus::ipgen)

The following table displays information for the `generate_project_ip_files` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::ipgen on page 306</th>
</tr>
</thead>
</table>
| Syntax                  | generate_project_ip_files [-h | -help] [-long_help] [-clean] [-
clear_ip_generation_dirs] [-modelsim_flow <qrun|traditional>] [-parallel <on|off>] [-
simulation <verilog|vhdl>] [-simulator <modelsim|vcs|vcsmx|riviera|xcelium>] [-
synthesis <verilog|vhdl>] |
| Arguments               | -h | -help | Short help |
|                         | -long_help | Long help with examples and possible return values |
|                         | -clean | Specify whether pre-existing generation directories should be cleared before generation. |
### --clear_ip_generation_dirs
Specify whether pre-existing generation directories should be cleared before generation.

### --modelsim_flow <qrun|traditional>
Specifies the Modelsim flow used for simulation script generation. Valid values are qrun or traditional.

### --parallel <on|off>
Specify whether to allow parallel IP generation. Specify off to disable parallel

### --simulation <verilog|vhdl>
Set the simulation target type. Valid values are verilog or vhdl.

### --simulator <modelsim|vcs|vcsmx|riviera|xcelium>
Set the simulator target type. Valid values are modelsim, vcs, vcsmx, riviera, and/or xcelium.

### --synthesis <verilog|vhdl>
Set the synthesis target type. Valid values are verilog or vhdl.

#### Description
This command generates the files for all Platform Designer IP in the opened project. If no option is specified, this command generates the verilog synthesis target only.

- **--synthesis <value>:** Specify the synthesis target type. Valid values are verilog or vhdl. This is not a required option. When not specified, it defaults to verilog.

- **--simulation <value>:** Specify the simulation target type. Valid values are verilog or vhdl. This is not a required option. When not specified, no simulation files are generated.

- **--simulator <value>:** Specify the simulator target type. Valid values are modelsim, vcs, vcsmx, riviera, and/or xcelium. This is not a required option. When not specified, simulation files for all simulators are generated.

- **--modelsim_flow <value>:** Specify the Modelsim flow used for simulation script generation. Valid values are qrun or traditional. This is not a required option. When not specified, it defaults to qrun.

- **--clear_ip_generation_dirs:** Specify whether pre-existing generation directories should be cleared before generation. This is not a required option. When not specified, the generation directories will not be cleared.

- **--clean:** Specify whether pre-existing generation directories should be cleared before generation. This option is a short version of the clear_ip_generation_dirs option. This is not a required option. When not specified, the generation directories will not be cleared.

- **--parallel <on,off>:** Specify whether to allow parallel IP generation. When this setting is on, parallel processing will be enable if project or global Quartus settings.

#### Example Usage
```bash
# generate all the Platform Designer IP in the project with the specified targets. Clear any pre-existing generation directories before performing the generation.
project_open my_project
generate_project_ip_files --synthesis verilog --simulation verilog --simulator modelsim --clear_ip_generation_dirs
```

#### Return Value

#### 3.1.20.2. generate_vhdl_simgen_model (::quartus::iptclgen)

The following table displays information for the `generate_vhdl_simgen_model` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::iptclgen on page 310</th>
</tr>
</thead>
</table>

**Syntax**

```
generate_vhdl_simgen_model [-h | -help] [-long_help] [-blackbox <blackbox>] -family <family> -files <files> -result_dir <result_dir> -temp_dir <temp_dir> -top_level_name <top_level_name>
```

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-blackbox &lt;blackbox&gt;</td>
<td>comma-separated list of modules that should be blackboxed</td>
</tr>
<tr>
<td>-family &lt;family&gt;</td>
<td>family name</td>
</tr>
<tr>
<td>-files &lt;files&gt;</td>
<td>comma separated list of files</td>
</tr>
<tr>
<td>-result_dir &lt;result_dir&gt;</td>
<td>result directory for .vho file. Must already exist</td>
</tr>
<tr>
<td>-temp_dir &lt;temp_dir&gt;</td>
<td>temp_dir</td>
</tr>
<tr>
<td>-top_level_name &lt;top_level_name&gt;</td>
<td>top level entity name</td>
</tr>
</tbody>
</table>

*continued...*
### Create a temporary project in the temporary directory, creates the simgen model and copies the model to result_dir.

**Example Usage**
```bash
gen_sim VHDL_simgen_model -family "stratix iii" -files "mycore.v,subcore.v" -top_level_name "mycore.v" -temp_dir "c:/temp" -result_dir "c:/outdir" -blackbox "blackboxme"
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: No open project. Open an existing project or create a new project.</td>
</tr>
</tbody>
</table>

### 3.1.20.3. parse_hdl (::quartus::iptclgen)

The following table displays information for the `parse_hdl` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to: ::quartus::iptclgen on page 310</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>parse_hdl [-h</td>

</tbody>
</table>

3.1.21. ::quartus::jtag

The following table displays information for the ::quartus::jtag Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::jtag 1.0</th>
</tr>
</thead>
</table>

**Description**

This package contains the set of Tcl functions for controlling the JTAG chain using Intel programming hardware.

**Availability**

This package is loaded by default in the following executables:

- quartus_stp
- quartus_stp_tcl

**Tcl Commands**

- `close_device (::quartus::jtag)` on page 314
- `device_dr_shift (::quartus::jtag)` on page 315
- `device_ir_shift (::quartus::jtag)` on page 316
- `device_lock (::quartus::jtag)` on page 317

**continued...**
3.1.21.1. close_device (::quartus::jtag)

The following table displays information for the close_device Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::jtag on page 313</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>close_device [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td>Description</td>
<td>End the shared communication with the opened device.</td>
</tr>
</tbody>
</table>

Example Usage

```tcl
# List all available programming hardwares, and select the USBBlaster.
# (Note: this example assumes only one USBBlaster connected.)
puts "Programming Hardwares:
foreach hardware_name [get_hardware_names] {
    puts $hardware_name
    if { [string match "USB-Blaster*" $hardware_name] } {
        set usbblaster_name $hardware_name
    }
}"
puts "\nSelect JTAG chain connected to $usbblaster_name."

# List all devices on the chain, and select the first device on the chain.
puts "\nDevices on the JTAG chain:
foreach device_name [get_device_names -hardware_name $usbblaster_name] {
    puts $device_name
    if { [string match '@1*' $device_name] } {
        set test_device $device_name
    }
}"
puts "\nSelect device: $test_device."

# Open device
open_device -hardware_name $usbblaster_name -device_name $test_device

# Retrieve device id code.
# IDCODE instruction value is 6; The ID code is 32 bits long.
# IR and DR shift should be locked together to ensure that other applications
# will not change the instruction register before the id code value is shifted
# out while the instruction register is still holding the IDCODE instruction.
device_lock -timeout 10000
device_ir_shift -ir_value 6 -no_captured_ir_value
puts "IDCODE: 0x\[device_dr_shift -length 32 -value_in_hex\]"
device_unlock

# Close device
close_device
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: No device has been opened.</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: A device was locked.</td>
<td></td>
</tr>
</tbody>
</table>
3.1.21.2. device_dr_shift (::quartus::jtag)

The following table displays information for the device_dr_shift Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::jtag on page 313</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-dr_value &lt;data register value&gt;</td>
</tr>
<tr>
<td></td>
<td>-length &lt;data register length&gt;</td>
</tr>
<tr>
<td></td>
<td>-no_captured_dr_value</td>
</tr>
<tr>
<td></td>
<td>-value_in_hex</td>
</tr>
</tbody>
</table>

**Description**

Writes the specified value into the data register of the JTAG tap controller of the open device. Returns the captured data register value. The captured value return can be disabled to improve the JTAG communication speed by packing multiple IR or DR scans together.

The value is specified using either a binary string or a hexadecimal string. The bit on the left most side is the first bit shifted in. For example, using binary string "010001", the first bit shifted into the dr register is 1; the last bit is 0. The same string can be represented in hexadecimal as "11".

The device must be locked before you can perform this operation.

**Example Usage**

```tcl
# List all available programming hardware, and select the USB-Blaster.
# (Note: this example assumes only one USB-Blaster is connected.)
puts "Programming Hardware:"
foreach hardware_name [get_hardware_names] {
    puts $hardware_name
    if { [string match "USB-Blaster*" $hardware_name] } {
        set usbblaster_name $hardware_name
    }
}
puts "Select JTAG chain connected to $usbblaster_name."

# List all devices on the chain, and select the first device on the chain.
puts "Devices on the JTAG chain:"
foreach device_name [get_device_names -hardware_name $usbblaster_name] {
    puts $device_name
    if { [string match "@1*" $device_name] } {
        set test_device $device_name
    }
}
puts "Select device: $test_device."

# Open device
open_device -hardware_name $usbblaster_name -device_name $test_device

# Retrieve device id code.
# IDCODE instruction value is 6; The ID code is 32 bits long.
# IR and DR shift should be locked together to ensure that other applications
# will not change the instruction register before the id code value is shifted
# out while the instruction register is still holding the IDCODE instruction.
device_lock -timeout 10000
```

continued...
device_ir_shift -ir_value 6 -no_captured_ir_value
puts "IDCODE: 0x\[device_dr_shift -length 32 -value_in_hex\]"
device_unlock

# Close device
close_device

### Return Value

<table>

</tr>
</tbody>
</table>

### 3.1.21.3. device_ir_shift (::quartus::jtag)

The following table displays information for the `device_ir_shift` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::jtag on page 313</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>device_ir_shift [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-ir_value</td>
</tr>
<tr>
<td></td>
<td>-no_captured_ir_value</td>
</tr>
</tbody>
</table>

**Description**

Writes the specified value into the instruction register of the JTAG tap controller of the open device. Returns the captured instruction register value. The captured value return can be disabled to improve the JTAG communication speed by packing multiple IR or DR scans together.

The instruction register length is determined automatically by the Quartus Prime JTAG server. The device must be locked first before this operation.

**Example Usage**

```tcl
# List all available programming hardware, and select the USB-Blaster.
puts "Programming Hardware:"
foreach hardware_name [get_hardware_names] {
    puts $hardware_name
    if { [string match "USB-Blaster*" $hardware_name] } {
        set usbblaster_name $hardware_name
    }
}
puts "Select JTAG chain connected to $usbblaster_name."
# List all devices on the chain, and select the first device on the chain.
```
puts "\nDevices on the JTAG chain:\" 
foreach device_name [get_device_names -hardware_name $usbblaster_name] {
    puts $device_name 
    if { [string match '@1*' $device_name] } {
        set test_device $device_name 
    }
} 
puts \nSelect device: $test_device.\n; 
# Open device 
open_device -hardware_name $usbblaster_name -device_name $test_device 
# Retrieve device id code. 
# IDCODE instruction value is 6; The ID code is 32 bits long. 
# IR and DR shift should be locked together to ensure that other applications 
# will not change the instruction register before the id code value is shifted 
# out while the instruction register is still holding the IDCODE instruction. 
device_lock -timeout 10000 
device_ir_shift -ir_value 6 -no_captured_ir_value 
puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]" 
device_unlock 
# Close device 
close_device 

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: A device has not been locked; exclusive communication must be obtained first.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: A device has been locked by another application; exclusive communication cannot be granted within the specified timeout period.</td>
</tr>
</tbody>
</table>

#### 3.1.21.4. device_lock (::quartus::jtag)

The following table displays information for the `device_lock` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::jtag on page 313</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`device_lock [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-timeout &lt;timeout&gt;</code> The amount of time in millisecond to wait for the access to the device.</td>
</tr>
<tr>
<td>Description</td>
<td>Obtain an exclusive JTAG communication to the device for the subsequent IR and DR shift operations. The device must be locked before any instruction and/or data register shift operation.</td>
</tr>
<tr>
<td></td>
<td>This should be used as little time as possible as it denies the access of other applications to this chain. The command, unlock, should be called as soon as possible to allow other applications to access the device.</td>
</tr>
</tbody>
</table>

#### Example Usage

```tcl
# List all available programming hardwares, and select the USBBlaster. 
# (Note: this example assumes only one USBBlaster connected.) 
puts "\nProgramming Hardwares:" 
foreach hardware_name [get_hardware_names] {
    puts $hardware_name 
    if { [string match "USB-Blaster*" $hardware_name] } {
        set usbblaster_name $hardware_name 
    }
} 
puts \nSelect JTAG chain connected to $usbblaster_name.\n; 
# List all devices on the chain, and select the first device on the chain.
```
puts "Devices on the JTAG chain:"
foreach device_name [get_device_names -hardware_name $usbblaster_name] {
    puts $device_name
    if { [string match '@1*' $device_name] } {
        set test_device $device_name
    }
}
puts "Select device: $test_device."

# Open device
open_device -hardware_name $usbblaster_name -device_name $test_device

# Retrieve device id code.
# IDCODE instruction value is 6; The ID code is 32 bits long.
# IR and DR shift should be locked together to ensure that other applications
# will not change the instruction register before the id code value is shifted
# out while the instruction register is still holding the IDCODE instruction.
device_lock -timeout 10000
device_ir_shift -ir_value 6 -no_captured_ir_value
puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]"

device_unlock

# Close device
close_device

### 3.1.21.5. device_run_test_idle (::quartus::jtag)

The following table displays information for the `device_run_test_idle` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::jtag on page 313</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`device_run_test_idle [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-num_clocks &lt;state cycle count&gt;</code></td>
</tr>
</tbody>
</table>

**Description**

Drive the JTAG controller into the Run_Test_Idle state for a number cycles specified with the `-num_clocks` option.

The device must be locked before you can perform this operation.

**Example Usage**

# List all available programming hardware, and select the USB-Blaster.
# (Note: this example assumes only one USB-Blaster is connected.)
puts "Programming Hardware:
foreach hardware_name [get_hardware_names] {
    puts $hardware_name
    if { [string match "USB-Blaster*" $hardware_name] } {
        set usblaster_name $hardware_name
    }
}
puts "\nSelect JTAG chain connected to $usbblaster_name.\n"
#
puts "\nDevices on the JTAG chain:"
foreach device_name [get_device_names -hardware_name $usbblaster_name] {
    puts $device_name
    if { [string match '@1*' $device_name] } {
        set test_device $device_name
    }
}
puts "\nSelect device: $test_device.\n"
#
open_device -hardware_name $usbblaster_name -device_name $test_device
#
IDCODE instruction value is 6; The ID code is 32 bits long.
#
IR and DR shift should be locked together to ensure that other applications
#
will not change the instruction register before the id code value is shifted.
#
out while the instruction register is still holding the IDCODE instruction.
#
device_lock -timeout 10000
device_ir_shift -ir_value 6 -no_captured_ir_value
puts "IDCODE: 0x\[device_dr_shift -length 32 -value_in_hex\]"
#
Goto the Run_Test_Idle state and stay there for 8 cycles.
device_run_test_idle -num_clocks 8
device_unlock
#
close_device

3.1.21.6. device_unlock (::quartus::jtag)

The following table displays information for the device_unlock Tcl command:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>

</tr>
<tr>
<td></td>
<td>-show_equivalent_device_ir_dr_shift</td>
</tr>
<tr>
<td></td>
<td>-value_in_hex</td>
</tr>
</tbody>
</table>

| Description | Writes the specified value into the data register of the JTAG tap controller of the open device. Returns the captured data register value. The captured value return can be disabled to improve the JTAG communication speed by packing multiple IR or DR scans |

continued...
The value is specified using either a binary string or a hexadecimal string. The bit on the left most side is the first bit shifted in. For example, using the binary string "010001", the first bit shifted into the dr register is 1; the last bit is 0. The same string can be represented in hexadecimal as "11".

The device must be locked first, and the target instance must be activated using the device_virtual_ir_shift command before this operation. Moreover, the device should be locked before the virtual IR shift operation to prevent another application from activating another instance.

Example Usage

```tcl
# List all available programming hardware, and select the USB-Blaster.
puts "Programming Hardware:
foreach hardware_name [get_hardware_names] {
    puts $hardware_name
    if { [string match "USB-Blaster*" $hardware_name] } {
        set usbblaster_name $hardware_name
    }
}
puts "Select JTAG chain connected to $usbblaster_name.

# List all devices on the chain, and select the first device on the chain.
puts "\nDevices on the JTAG chain:
foreach device_name [get_device_names -hardware_name $usbblaster_name] {
    puts $device_name
    if { [string match "@1*" $device_name] } {
        set test_device $device_name
    }
}
puts "Select device: $test_device."

# Open device
open_device -hardware_name $usbblaster_name -device_name $test_device

# The follow virtual JTAG IR and DR shift sequence engage with
# the example virtual JTAG instance.

# Two instructions: SAMPLE (1) FEED (2)
# SAMPLE instruction samples a 8-bit bus; the captured value shows the number of sample performed.
# FEED instruction supplies a 8-bit value to the logic connected to this instance.
# Both data registers corresponding to the IR are 8 bit wide.

# Send SAMPLE instruction to IR, read captured IR for the sampling number.
puts "Current LED Value (sample #[device_virtual_ir_shift -instance_index 0 -ir_value 1]):
[device_virtual_dr_shift -instance_index 0 -length 8 -value_in_hex]

# Capture the DR register for the current sampled value.
device_lock -timeout 10000
puts "Type in 2 digits in hexadecimal to update the LED:"
gets stdin update_value
device_lock -timeout 10000
device_virtual_ir_shift -instance_index 0 -ir_value 2 -no_captured_ir_value
device_virtual_dr_shift -instance_index 0 -length 8 -dr_value $update_value -value_in_hex -no_captured_dr_value
device_unlock

# Close device
close_device
```

</tr>
<tr>
<td>-no_captured_ir_value</td>
<td>Option to not return the captured instruction register value. If this is specified, this IR scan may be packed together with the subsequent IR or DR scan until the device is unlocked or a captured value is requested</td>
</tr>
<tr>
<td>-show_equivalent_device_ir_dr_shift</td>
<td>Option to show equivalent device ir and dr shifts performed by this command</td>
</tr>
</tbody>
</table>

**Description**

Writes the specified value into the instruction register of the specified virtual JTAG instance in the open device. Returns the captured instruction register value. You can disable the captured value return to improve the JTAG communication speed by packing multiple IR or DR scans together.

The command also activates the target instance such that the consequent virtual DR shift operations are applied to this instance before the device is unlocked. Before any virtual DR shift operation, this command must be executed first to activate the instance. The device must be locked first before this operation.

**Example Usage**

```tcl
# List all available programming hardwares, and select the USBBlaster.
# (Note: this example assumes only one USBBlaster connected.)
puts "Programming Hardwares:"
foreach hardware_name [get_hardware_names] {
    puts $hardware_name
    if { [string match "USB-Blaster*" $hardware_name] } { 
        set usbblaster_name $hardware_name
    } 
} 
puts "Select JTAG chain connected to $usbblaster_name."

# List all devices on the chain, and select the first device on the chain.
puts "Devices on the JTAG chain:"
foreach device_name [get_device_names -hardware_name $usbblaster_name] {
    puts $device_name
```
if { [string match '@1*' $device_name] } {
    set test_device $device_name
}

puts "Select device: $test_device."

# Open device
open_device -hardware_name $usbblaster_name -device_name $test_device

# The following virtual JTAG IR and DR shift sequence engage with
# the example virtual JTAG instance.
# Two instructions: SAMPLE (1) FEED (2)

### 3.1.21.9. get_device_names (::quartus::jtag)

The following table displays information for the get_device_names Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::jtag on page 313</th>
</tr>
</thead>
</table>

**Syntax**

get_device_names [-h | -help] [-long_help] -hardware_name <hardware name>

**Arguments**

- **-h | -help**
  - Short help
- **-long_help**
  - Long help with examples and possible return values
- **-hardware_name <hardware name>**
  - The name of the programming hardware that connects to the JTAG chain. The name can be obtained from command: get_hardware_names.

**Description**

Retrieves a list of names of the devices on the JTAG chain to which the specified programming hardware is connected.

The name of the device is in the following format:
<number on circuit board>: <JTAG ID code>: <device name>. For example, in the device name @1: $@082000DD: EP20K200C, @1 indicates that it is the...
first device on the circuit board, 0x082000DD is the JTAG ID code for the device, and EP20K200C is the device name.

Example Usage

```tcl
# List all available programming hardwares, and select the USBBlaster.
# (Note: this example assumes only one USBBlaster connected.)
puts "Programming Hardwares:">
foreach hardware_name [get_hardware_names] {
    puts $hardware_name
    if { [string match "USB-Blaster*" $hardware_name] } {
        set usbblaster_name $hardware_name
    }
}
puts "Select JTAG chain connected to $usbblaster_name."

# List all devices on the chain, and select the first device on the chain.
puts "Devices on the JTAG chain:"
foreach device_name [get_device_names -hardware_name $usbblaster_name] {
    puts $device_name
    if { [string match "@1*" $device_name] } {
        set test_device $device_name
    }
}
puts "Select device: $test_device."

# Open device
open_device -hardware_name $usbblaster_name -device_name $test_device

# Retrieve device id code.
# IDCODE instruction value is 6; The ID code is 32 bits long.
# IR and DR shift should be locked together to ensure that other applications will not change the instruction register before the id code value is shifted out while the instruction register is still holding the IDCODE instruction.
device_lock -timeout 10000
device_ir_shift -ir_value 6 -no_captured_ir_value
puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]"
device_unlock

# Close device
close_device
```

Return Value

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### 3.1.21.11. open_device (::quartus::jtag)

The following table displays information for the open_device Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::jtag on page 313</th>
</tr>
</thead>
</table>

**Syntax**

```tcl
open_device [-h | -help] [-long_help] -device_name <device name> -hardware_name <hardware name>
```

**Arguments**

- `-h | -help`  
  Short help

- `-long_help`  
  Long help with examples and possible return values

- `-device_name <device name>`  
  The name of the device on the JTAG chain. The name can be obtained from command: get_device_names

- `-hardware_name <hardware name>`  
  The name of the programming hardware that connects to the JTAG chain. The name can be obtained from command: get_hardware_names

**Description**

Initiate a shared JTAG communication with the device. The command, close_device, is called to end the communication with the device.

Only one device can be opened per process. Multiple devices can be opened in multiple processes.
Example Usage

```tcl
# List all available programming hardwares, and select the USBBlaster.
puts "Programming Hardwares:
foreach hardware_name [get_hardware_names] {
    puts $hardware_name
    if { ![string match "USB-Blaster*" $hardware_name] } {
        set usbblaster_name $hardware_name
    }
}
puts "Select JTAG chain connected to $usbblaster_name."

# List all devices on the chain, and select the first device on the chain.
puts "Devices on the JTAG chain:"
foreach device_name [get_device_names -hardware_name $usbblaster_name] {
    puts $device_name
    if { ![string match '@1*' $device_name] } {
        set test_device $device_name
    }
}
puts "Select device: $test_device."

# Open device
open_device -hardware_name $usbblaster_name -device_name $test_device
# Retrieve device id code.
# IDCODE instruction value is 6; The ID code is 32 bits long.
# IR and DR shift should be locked together to ensure that other applications
# will not change the instruction register before the id code value is shifted
# out while the instruction register is still holding the IDCODE instruction.
device_lock -timeout 10000
device_ir_shift -ir_value 6 -no_captured_ir_value
puts "IDCODE: 0x\[device_dr_shift -length 32 -value_in_hex\]
device_unlock

# Close device
close_device
```

Return Value

<table>

<td>This package is loaded by default in the following executables: quartus_stp quartus_stp_tcl</td>
</tr>
<tr>
<td>Tcl Commands</td>
<td>begin_logic_analyzer_interface_control (::quartus::logic_analyzer_interface) on page 327 change_bank_to_output_pin (::quartus::logic_analyzer_interface) on page 328 end_logic_analyzer_interface_control (::quartus::logic_analyzer_interface) on page 329 get_current_state_of_output_pin (::quartus::logic_analyzer_interface) on page 330 tristate_output_pin (::quartus::logic_analyzer_interface) on page 331</td>
</tr>
</tbody>
</table>
### begin_logic_analyzer_interface_control

The following table displays information for the `begin_logic_analyzer_interface_control` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::logic_analyzer_interface</code> on page 326</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`begin_logic_analyzer_interface_control [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-device_name &lt;device name&gt;</td>
<td>Name of the device to be controlled</td>
</tr>
<tr>
<td>-file_path &lt;file path&gt;</td>
<td>Path of the Logic Analyzer Interface (.lai) file</td>
</tr>
<tr>
<td>-hardware_name &lt;hardware name&gt;</td>
<td>Name of the hardware that connects to the JTAG chain</td>
</tr>
</tbody>
</table>

**Description**

Starts the Logic Analyzer Interface control sequence to query the Logic Analyzer Interface output pin state and change output pins state. The control sequence should be terminated with `end_logic_analyzer_interface_control`. The hardware and device name can be obtained by using `get_hardware_names` and `get_device_names` respectively from the Jtag package.

**Example Usage**

```tcl
# Start a new control sequence.
begin_logic_analyzer_interface_control -hardware_name "USB-Blaster \([USB-0]\)" -device_name "81: EPIC20 (0x020840DD)" -file_path "lai_demo.lai"

# Query the output pin state.
puts "Current output pin state of instance auto_lai_0:"
puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]

# Change input bank source to the output pins
change_bank_to_output_pin -instance_name "auto_lai_0" -bank_name "Bank 1"

# Query the output pin state.
puts "Current output pin state of instance auto_lai_0:"
puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]

# Change input bank source to the output pins
change_bank_to_output_pin -instance_name "auto_lai_0" -bank_index 0

# Query the output pin state.
puts "Current output pin state of instance auto_lai_0:"
puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]

# Tristate the output pins
tristate_output_pin -instance_name "auto_lai_0"

# Query the output pin state.
puts "Current output pin state of instance auto_lai_0:"
puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]

# End the control sequence.
end_logic_analyzer_interface_control
```

**Return Value**

</tr>
</tbody>
</table>

### TCL Package and Version
Belongs to ::quartus::logic_analyzer_interface on page 326

### Syntax
get_current_state_of_output_pin [-h | -help] [-long_help] -instance_name <instance name>

### Arguments
- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-instance_name <instance name>` Name of the Logic Analyzer Interface instance to change

### Description
Query the device to get the current state of the output pins of the specified instance. The result is either the bank name or "tristated".

### Example Usage
```tcl
# Start a new control sequence.
begin_logic_analyzer_interface_control -hardware_name "USB-Blaster \[USB-0\]" -device_name "01: EP1C20 (0x020840DD)" -file_path "lai_demo.lai"

# Query the output pin state.
puts "Current output pin state of instance auto_lai_0:"
puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]

# Change input bank source to the output pins
change_bank_to_output_pin -instance_name "auto_lai_0" -bank_name "Bank 1"

# Query the output pin state.
puts "Current output pin state of instance auto_lai_0:"
puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]

# Change input bank source to the output pins
change_bank_to_output_pin -instance_name "auto_lai_0" -bank_index 0

# Query the output pin state.
puts "Current output pin state of instance auto_lai_0:"
puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]

# Tristate the output pins
tristate_output_pin -instance_name "auto_lai_0"

# Query the output pin state.
puts "Current output pin state of instance auto_lai_0:"
puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]

# End the control sequence.
end_logic_analyzer_interface_control
```

### Return Value

### 3.1.23.3. enable_natural_bus_naming (::quartus::misc)

The following table displays information for the `enable_natural_bus_naming` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::misc on page 332</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`enable_natural_bus_naming [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
</tbody>
</table>
| **Description**         | Enables natural bus naming so that square brackets for bus names do not have to be escaped to prevent Tcl from interpreting them as sub-commands. Bus names have the following format: `<bus name>[<bus index>]` or `<bus name>[*]`. The `<bus name>` portion is a string of alphanumeric characters. The `<bus index>` portion is an integer greater than or equal to zero or it can be the character `*` used for string matching. Notice that the `<bus index>` is enclosed by the square brackets `[` and `]`. For example, "a[0]" and "a[*]" are supported bus names. Many Quartus Prime Tcl commands allow bus names in their arguments, such as:

```
set_location_assignment -to address[10] Pin_M20
```

If natural bus naming is enabled, you can just use `address[10]` instead of having to escape the square brackets into `address\[10\]`. There are also Quartus Prime Tcl commands that take Tcl string match patterns in their arguments, such as:

```
get_all_instance_assignments -name location -to address[10]
```

Since Tcl string matching take string patterns containing special characters from the set "\*?\[\]" as values, address[10] would be interpreted incorrectly. By enabling natural bus naming, these Tcl commands will automatically detect address[10] as a bus name so that you don't have to doubly escape the brackets into `address\\[10\\]`. To disable natural bus naming, type "disable_natural_bus_naming". For more information on the effects of disabling natural bus naming, type "disable_natural_bus_naming -h".

<table>
<thead>
<tr>
<th>Example Usage</th>
<th># Enables natural bus naming enable_natural_bus_naming</th>
</tr>
</thead>
</table>

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
3.1.23.4. escape_brackets (::quartus::misc)

The following table displays information for the escape_brackets Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::misc on page 332</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>escape_brackets [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td></td>
</tr>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>&lt;str&gt;</td>
<td>String to escape</td>
</tr>
</tbody>
</table>

**Description**

Escapes square brackets in bus name patterns for use in string matching. Also escapes the escape character; for example, the string "\" is escaped into \\".

Note that natural bus naming is supported by default. This means that bus names, not bus name patterns, are automatically detected and do not need to be escaped by using this command. Bus names have the following format:

<bus name>[:<bus index>] or <bus name>*</n>

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the <bus index> is enclosed by the square brackets "[" and "]". For example, "a[0]*" and "a[*]" are supported bus names.

All other uses of square brackets must be escaped if you do not intend to use the brackets as part of a string pattern in a string match. For example, the bus name pattern "a\[0-2]\" must be escaped using this "escape_brackets" command since the "0-2" does not satisfy the <bus index> requirement to be a bus name.

Many Quartus Prime Tcl commands allow string matching in option arguments. A common error is using bus name patterns in these arguments, such as:

```
address[0-2]
```

Square brackets for bus name patterns must already be preceded by an escape character (\ or \) to prevent Tcl from interpreting them as sub-commands. String matching, however, also uses square brackets to match any character between the brackets. The previous example, when used as a string match pattern, searches for the string patterns address0, address1, and address2. It does not search for address[0], address[1], and address[2].

Therefore, for arguments that support string matching, square brackets must be escaped twice (\\ or \\) so that the strings are interpreted as bus name patterns. For example, to search for address[0], address[0], and address[2], type the following string match pattern:

```
string match [escape_brackets $bus_name]
```

Quartus Prime Tcl commands do not convert bus name patterns automatically, since they cannot determine if the string is intended as a bus name pattern or a regular string match pattern. Therefore, "escape_brackets" is provided for your convenience.

You may choose to disable natural bus naming in order to string match patterns such as "in\[024]\". In this example, you are string matching the names "in0", "in2", and "in4".

To disable natural bus naming, type

```
*disable_natural_bus_naming*
```

Note that if you disable natural bus naming, then square brackets must be escaped twice (\\ or \\) so that the strings are interpreted as bus names during a string match, such as:

```
set bus_name "address[0]"
string match [escape_brackets $bus_name] $bus_name
```
The "escape_brackets" command escapes "address\[0\]" into "address\\[0\\]".

To enable natural bus naming again, type "enable_natural_bus_naming".

For more information about natural bus naming, type "enable_natural_bus_naming -h".

**Example Usage**

```tcl
# Get all location assignments for bus address[]
set address_names address[*]
set address_locations [get_all_instance_assignments -to $address_names] -name LOCATION

# Get location assignment for bus address[0]
set address_names address[0]
set address_locations [get_all_instance_assignments -to $address_names] -name LOCATION

# Get location assignments for bus address[0], address[1], and address[2]
set address_names address[0-2]
set address_locations [get_all_instance_assignments -to [escape_brackets $address_names]] -name LOCATION
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.23.5. foreach_in_collection (::quartus::misc)

The following table displays information for the `foreach_in_collection` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::misc on page 332</th>
</tr>
</thead>
</table>

**Syntax**

`foreach_in_collection [-h | -help] [-long_help] <variable_name> <collection> <body>`

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `<variable_name>` Variable name
- `<collection>` Collection
- `<body>` Body

**Description**

Accesses each element of a collection.

Some Tcl commands return a collection. The following table shows examples of commands that return a collection:

<table>
<thead>
<tr>
<th>Tcl package</th>
<th>Tcl commands (returning a collection)</th>
</tr>
</thead>
</table>
| ::quartus::project | get_all_quartus_defaults  
get_all_global_assignments  
get_all_instance_assignments  
get_all_parameters  
get_names  
assignment_group (only for the "-get_members" and "-get_exceptions" options) |
| ::quartus::chip_editor | get_nodes  
get_iports  
get_oports |

The command is used in the following format:

```tcl
foreach_in_collection <variable name> <collection> {
    # This is the body of "foreach_in_collection"
    ...
}
```

...
Unlike a Tcl list, a collection is a container specific to the Quartus II software, whose elements can be accessed by using the "foreach_in_collection" command.

### Example Usage

```tcl
## Get a collection of global assignments
set collection_of_global_assignments [get_all_global_assignments -name *]
## Display the collection string representation

3.1.23.6. get_collection_size (::quartus::misc)

The following table displays information for the get_collection_size Tcl command:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>

### Tcl Package and Version

Belongs to ::quartus::misc on page 332

### Syntax

get_collection_size [-h | -help] [-long_help] [ <collection> ]

### Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `<collection>` Collection

### Description

Returns the size of a collection.

Unlike a Tcl list, a collection is a container specific to the Quartus Prime software, whose elements can be accessed by using the `foreach_in_collection` command.

### Example Usage

```tcl
## Displays the number of global assignments
project_open chiptrip
set num_global_asgn [get_collection_size [get_all_global_assignments -name {*}]]
puts $num_global_asgn
project_close
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>
| TCL_ERROR    | 1         | ERROR: Collection does not exist with name: <string>. Specify the collection name returned by a Tcl command that supports foreach_in_collection. Note a valid collection name can become invalid if the variable holding the collection goes out of scope, as well as a result of some built-in TCL commands, for example 'string length'.
| TCL_ERROR    | 1         | ERROR: Nested calls to foreach_in_collection with the same collection name <string> are not allowed. Specify a different collection name for the other collection. |
### 3.1.23.7. `get_environment_info` (::quartus::misc)

The following table displays information for the `get_environment_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::misc on page 332</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>get_environment_info [-h</td>

<td>ERROR: You specified &lt;string&gt; arguments to the -args option. However, you can pass a maximum of &lt;string&gt; arguments.</td>
</tr>
</tbody>
</table>

### 3.1.23.9. `init_tk` (::quartus::misc)

The following table displays information for the `init_tk` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::misc on page 332</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`init_tk [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td></td>
</tr>
<tr>
<td>`-h</td>
<td>-help`</td>
</tr>
<tr>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
</tbody>
</table>

**Description**

Initializes a Tk window. If you are using Tk functionality in Tcl, you must run this command first before running any Tcl scripts.

**Example Usage**

```tcl
# Initialize the Tk library
init_tk

# Create a top level and add a title
toplevel .top
wm title .top "Hello World"

# Add widgets
button .top.hello -text Hello -command {puts stdout "Hello, World!")
pack .top.hello -padx 20 -pady 10

# Without "tkwait", the script finishes at this point and the window is destroyed. The "tkwait" command prevents the script from finishing until the you close the window.
tkwait window .top
```

### 3.1.23.10. `load` (::quartus::misc)

The following table displays information for the `load` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::misc on page 332</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`load [-h</td>
</tr>
<tr>

### Arguments to load

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loads machine code and initializes new commands. This command works exactly like Tcl's native &quot;load&quot; command.</td>
</tr>
</tbody>
</table>

### Example Usage

Refer to documentation for Tcl's native "load" command at the Tcl/Tk web site at www.tcl.tk.

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Can't load library: &lt;string&gt;. The operating system reports the following error: &lt;string&gt;</td>
</tr>
</tbody>
</table>

### 3.1.23.11. load_package (::quartus::misc)

The following table displays information for the `load_package` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::misc on page 332</th>
</tr>
</thead>
</table>

| Syntax | `load_package [-h | -help] [-long_help] [-version <version number>] <package name>` |
|--------|-------------------------------------------------------------------|

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-version &lt;version number&gt;</td>
<td>Option to specify the Quartus Prime Tcl package version to load</td>
</tr>
<tr>
<td>&lt;package name&gt;</td>
<td>Name of Quartus Prime Tcl package to load</td>
</tr>
</tbody>
</table>

**Description**

Loads the specified Quartus Prime Tcl package with the specified version number. If you do not specify the "-version" option, the latest version is loaded by default.

The Quartus Prime Tcl package names have the "::quartus::" prefix, such as "::quartus::project". For convenience, you can omit the "::quartus::" prefix when you use the <package name> argument.

This command is similar to the "package require" command. The advantage of using "load_package" is that you can alternate freely between different versions of the same package.

For example, if you loaded version 2.0, and now want to load version 1.0, you can type:

```
load_package -version 1.0 <package name>.
```

**Example Usage**

```
# Load version 1.0 of the ::quartus::project package
load_package project -version 1.0

# Load version 2.0 of the ::quartus::project package
load_package project -version 2.0
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Tcl package &lt;string&gt; does not exist. Specify an available Quartus Prime Tcl package. Type help for a list of available Quartus Prime Tcl packages.</td>
</tr>
</tbody>
</table>

...continued...
<table>
<thead>
<tr>
<th>TCL Package and Version</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TCL_ERROR</strong></td>
<td>1</td>

### 3.123.12. `post_message` (::quartus::misc)

The following table displays information for the `post_message` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::misc on page 332</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>post_message [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>-h</td>
<td>Short help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-type &lt;info</td>
<td>extra_info</td>
</tr>
<tr>
<td>&lt;string&gt;</td>
<td>Message to be displayed</td>
</tr>
</tbody>
</table>

**Description**

Displays messages and sub-messages of the specified type. The message type can be "info", "warning", "critical_warning", or "error". If you do not use the -type option, the default message type is "info".

The "extra_info" type is deprecated. Messages with this type will not be displayed. Use the "info" type instead. Use the -submsgs option to group messages indented under a message. The -submsgs option posts each string in a Tcl list of strings as a sub-message. The sub-messages have the same message type as the main message.

**Example Usage**

```tcl
# Display an error message
post_message -type error "Can't open file test.tcl"

# Display an info message
post_message "Generated output file: test.out"
# OR
post_message -type info "Generated output file: test.out"

# Display an info message with a sub-message
post_message "Generated output file: test.out" -submsgs [list "Output file saved in project directory"]

# Display a warning message
post_message -type warning "Defaulting fmax to 155.55mhz"

# Display a critical warning message
post_message -type critical_warning "Invalid fmax was specified - defaulting to 155.55mhz"
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TCL_OK</strong></td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td><strong>TCL_ERROR</strong></td>
<td>1</td>
<td>ERROR: Error(s) found while processing handle: <code>&lt;string&gt;</code>. Make sure you specified a valid Quartus Prime message handle for the <code>-&lt;string&gt;</code> option and passed the correct</td>
</tr>
</tbody>
</table>
number of arguments to the -<string> option. Also check that you passed the correct message type to the -<string> option.

<table>

3.1.23.15. `qexit (::quartus::misc)`

The following table displays information for the `qexit` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::misc on page 332</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Option to exit with an equivalent Quartus Prime error code</td>
</tr>
<tr>
<td></td>
<td><code>-error</code> Option to exit with an equivalent Quartus Prime success code</td>
</tr>
<tr>
<td>Description</td>
<td>Exits the Quartus Prime software. The Quartus Prime Tcl command &quot;qexit&quot; is equivalent to the Tcl command &quot;exit&quot;. When used with a particular option, this command exits the Quartus Prime software with the corresponding Quartus Prime exit code. For example, typing &quot;qexit -success&quot; is equivalent to typing &quot;exit 0&quot;. When the &quot;-success&quot; option is specified, the corresponding Quartus Prime exit code is &quot;0&quot;. If no option is specified, the default exit code is the same as for the &quot;-success&quot; option.</td>
</tr>
</tbody>
</table>

Example Usage

1) To exit the Quartus Prime software with an equivalent Quartus Prime success code, type:

   `qexit -success`

2) To exit the Quartus Prime software with an equivalent Quartus Prime error code, type:

   `qexit -error`

<table>

3. TCL Commands and Packages

3.1.24.1. get_assignment (::quartus::names)

The following table displays information for the `get_assignment` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::names on page 345</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_assignment [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-dict</code> Indicates this command should return it's result as a Tcl dict object.</td>
</tr>
<tr>
<td></td>
<td><code>-name &lt;ASSIGNMENT_NAME&gt;</code> The assignment name to get the value of.</td>
</tr>
<tr>
<td></td>
<td><code>-to &lt;ASSIGNMENT_TO&gt;</code> The node to retrieve the assignment value from (omitting this will retrieve the global assignment value, if any).</td>
</tr>
</tbody>
</table>

**Description**

Gets the assignment's value. If `-to` is specified, tries to get the assignment value on the given node, as long as the assignment targeted the node using it's `-to` field. If `-to` is not specified, the global value is returned (if any).

If the assignment is not found, a Tcl error is produced. If the assignment is found and the `-dict` option is given, a Tcl dict object is returned with the assignment 'name' (the given input), and the 'value' retrieved from the found assignment. In addition, if the assignment has a 'to' or 'from' field, those fields will also exist in the returned dict.

**Example Usage**

```
# Returns fitter seed
get_assignment SEED
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>

<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-name &lt;ASSIGNMENT_NAME&gt;</code> The assignment name to set.</td>
</tr>
</tbody>
</table>

**Argument**

- `-h` / `-help` Short help
- `-long_help` Long help with examples and possible return values
- `-name <ASSIGNMENT_NAME>` The assignment name to set.

**Return Value**

- `TCL_OK` Code 0 INFO: Operation successful
- `TCL_ERROR` Code 1 ERROR: No assignment matching the name `<string>` was found.
The node to which the assignment should be applied.

-value \(<VALUE>\)
The value to set the assignment to.

Description
Sets the assignment to the given value. If -to is specified, tries to set the assignment value to the given node. If -to is not specified, this applies to global assignments.

Example Usage
set_assignment SEED 9

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>

3.1.25. ::quartus::periph

The following table displays information for the ::quartus::periph Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::periph 1.0</th>
</tr>
</thead>
</table>

Description
This package contains the set of Tcl functions for interacting with the Interface Planner plans.

Availability
This package is available for loading in the following executable:
quartus_fit

</tbody>
</table>

### 3.1.25.2. periph::get_cell_info (::quartus::periph)

The following table displays information for the periph::get_cell_info Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::periph on page 347</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-children Return the the cell id of the children cells</td>
</tr>
<tr>
<td></td>
<td>-guide_cell_id Returns the guide cell's elem_id</td>
</tr>
<tr>
<td></td>
<td>-ip_type Returns the IP type if the cell is an IP cell or an empty string otherwise</td>
</tr>
<tr>
<td></td>
<td>-links Returns the given design element's connections to other cells</td>
</tr>
<tr>
<td></td>
<td>-location Returns the location ID if the cell is placed or an empty string otherwise</td>
</tr>
<tr>
<td></td>
<td>-name Return the cell name of the cell id</td>
</tr>
<tr>
<td></td>
<td>-parent Return the the cell id of the parent cells</td>
</tr>
<tr>
<td></td>
<td>-type Return the the type of the cell</td>
</tr>
<tr>
<td></td>
<td>&lt;cell_id&gt; Single cell id</td>
</tr>
<tr>
<td>Description</td>
<td>Gets information about the specified cell (referenced by cell ID). You can obtain cell using the periph::get_cells Tcl command.</td>
</tr>
</tbody>
</table>

continued...
Example Usage

```
project_open onewire_nf
blueprint::initialize
periph::update_plan
foreach cell [periph::get_cells -type IO_CLUSTER] {
  puts "Found cell ID $cell named [periph::get_cell_info -name $cell]"
}
blueprint::shutdown
project_close
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The supplied cell id &lt;string&gt; is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: At least one cell ID must be supplied, but no cell IDs were supplied</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: &lt;string&gt; cell IDs were expected but &lt;string&gt; were supplied</td>
</tr>
</tbody>
</table>

3.1.25.3. `periph::get_cells` (::quartus::periph)

The following table displays information for the `periph::get_cells` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::periph</code> on page 347</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`periph::get_cells [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-atom_only</code></td>
</tr>
<tr>
<td></td>
<td><code>-instance_only</code></td>
</tr>
<tr>
<td></td>
<td><code>-ip_only</code></td>
</tr>
<tr>
<td></td>
<td><code>-num_location &lt;num_location&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-physical_only</code></td>
</tr>
<tr>
<td></td>
<td><code>-placed</code></td>
</tr>
<tr>
<td></td>
<td><code>-toplevel_only</code></td>
</tr>
<tr>
<td></td>
<td><code>-type &lt;type&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-unplaced</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;filter&gt;</code></td>
</tr>
</tbody>
</table>

Description

Returns a list of cells IDs in the design. All cell names in the collection match the specified pattern. Wildcards can be used to select multiple cells at once.

When you use the wildcard matching, use pipe characters to separate one hierarchy level from the next. They are treated as special characters and are taken into account when string matching with wildcards is performed. When this matching scheme is enabled, the specified pattern is matched against absolute cell names: the names that include the entire hierarchical path. A full cell name can contain multiple pipe characters in it to reflect the hierarchy. All
hierarchy levels in the pattern are matched level by level. Any included wildcards refer to only one hierarchical level. For example, "**" and "**|**" produce different collections since they refer to the highest hierarchical level and second highest hierarchical level respectively.

### Example Usage

```tcl
project_open onewire_nf
blueprint::initialize
periph::update_plan
foreach cell [periph::get_cells -type IO_CLUSTER] {
    puts "Found cell ID $cell named [periph::get_cell_info -name $cell]"
}
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The supplied number of locations &lt;string&gt; is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: &lt;string&gt; number of locations were expected but &lt;string&gt; were supplied</td>
</tr>
</tbody>
</table>

### 3.1.25.4. periph::get_location_info (::quartus::periph)

The following table displays information for the `periph::get_location_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::periph on page 347</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-children</td>
</tr>
<tr>
<td></td>
<td>-gid</td>
</tr>
<tr>
<td></td>
<td>-name</td>
</tr>
<tr>
<td></td>
<td>-parents</td>
</tr>
<tr>
<td></td>
<td>-placed_cells</td>
</tr>
<tr>
<td></td>
<td>-properties</td>
</tr>
<tr>
<td></td>
<td>-type</td>
</tr>
<tr>
<td>&lt;location_id&gt;</td>
<td>location id</td>
</tr>
</tbody>
</table>

**Description**

Gets information about the specified location (referenced by location ID). You can obtain location using the `periph::get_locations Tcl command or using the `periph::get_cell_info -location Tcl command`.

**Example Usage**

```tcl
project_open onewire_nf
blueprint::initialize
periph::update_plan
foreach cell [periph::get_cells -placed] {
    puts "Found cell ID $cell named [periph::get_cell_info -name $cell] placed in location" |
```
### Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The supplied location id &lt;string&gt; is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The supplied type &lt;string&gt; is invalid.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: At least one device location ID must be supplied, but no location IDs were supplied</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: At least one type must be supplied, but no types were supplied</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: &lt;string&gt; location IDs were expected but &lt;string&gt; were supplied</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: &lt;string&gt; types were expected but &lt;string&gt; were supplied</td>
</tr>
</tbody>
</table>

### 3.1.25.5. periph::get_placement_info (::quartus::periph)

The following table displays information for the periph::get_placement_info Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::periph on page 347</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>periph::get_placement_info [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-placement</td>
</tr>
<tr>
<td>&lt;placement_id&gt;</td>
<td>Single placement id</td>
</tr>
</tbody>
</table>

### Description
Return information about a given placement

### Example Usage
This command currently contains no example usage.

### Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>

</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: <code>&lt;string&gt;</code> cell IDs were expected but <code>&lt;string&gt;</code> were supplied</td>
<td></td>
</tr>
</tbody>
</table>

3.1.25.7. blueprint::initialize (::quartus::periph)

The following table displays information for the `blueprint::initialize` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::periph</code> on page 347</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`blueprint::initialize [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-load_compiler_snapshot</code> Initialize the Interface Planner placement state with the latest compiler snapshot. Use <code>periph::compiler_snapshot_exists</code> to check if a compiler snapshot can be loaded</td>
</tr>
<tr>
<td></td>
<td>`-read_settings_files &lt;on</td>
</tr>
<tr>
<td>Description</td>
<td>Initialize the Interface Planner planning engine. Initialization consists of loading all required databases from disk for the design and device. Once initialization is complete, the construalts have not yet been applied and must be done before placement can begin.</td>
</tr>
<tr>
<td></td>
<td>After the assignments have been created, they can be applied to the project by running the <code>plan::update_platform</code> Tcl command.</td>
</tr>
</tbody>
</table>

continued...
3. TCL Commands and Packages

3.1.25.8. periph::load_floorplan (::quartus::periph)

The following table displays information for the **periph::load_floorplan** Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::periph on page 347</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>periph::load_floorplan [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-filename &lt;filename&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Load the floorplan from a Interface Planner floorplan file</td>
</tr>
<tr>
<td>Example Usage</td>
<td>project_open onewire_nf</td>
</tr>
<tr>
<td></td>
<td>blueprint::initialize</td>
</tr>
<tr>
<td></td>
<td>periph::update_plan</td>
</tr>
<tr>
<td></td>
<td>periph::place_cells -unplaced_cells</td>
</tr>
<tr>
<td></td>
<td>periph::save_floorplan -filename onewire_blueprint_floorplan.plan</td>
</tr>
<tr>
<td></td>
<td>periph::load_floorplan -filename onewire_blueprint_floorplan.plan</td>
</tr>
<tr>
<td></td>
<td>project_close</td>
</tr>
</tbody>
</table>

### Return Value
- **TCL_OK**
- **Code**: 0
- **String Return**: INFO: Operation successful

3.1.25.9. periph::place_cells (::quartus::periph)

The following table displays information for the **periph::place_cells** Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::periph on page 347</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-cell_location &lt;cell_location&gt;</td>
</tr>
<tr>
<td></td>
<td>-cells &lt;cells&gt;</td>
</tr>
</tbody>
</table>

### Return Value
- **TCL_OK**
- **Code**: 0
- **String Return**: INFO: Operation successful

continued...
Option to specify that the best partial placement should be saved on the undo stack upon a placement failure.

- **fixed_cells**
  Place all unplaced cells.

- **placement <placement>**
  Place cells according to a placement. A placement is a special object that comes from the `periph::get_placements` Tcl command.

- **unplaced_cells**
  Place all unplaced cells.

### Description
Performs a placement on the supplied cells.

### Example Usage
```
project_open onewire_nf
blueprint::initialize
periph::update_plan
periph::place_cells -unplaced_cells
periph::check_plan
project_close
```

### Return Value

<tr>
<td></td>
<td><code>-panel_name &lt;name&gt;</code></td>
</tr>
</tbody>
</table>

**Description**

This command currently contains no help description.

**Example Usage**

This command currently contains no example usage.

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.25.22. periph::reset_plan (::quartus::periph)

The following table displays information for the `periph::reset_plan` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::periph on page 347</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`periph::reset_plan [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
</tbody>
</table>

**Description**

Reverts the current design to be unplaced and without assignments applied.

**Example Usage**

```
project_open onewire_nf
blueprint::initialize
periph::update_plan
periph::reset_plan
blueprint::shutdown
project_close
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
### 3.1.25.23. periph::save_floorplan (::quartus::periph)

The following table displays information for the `periph::save_floorplan` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::periph on page 347</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`periph::save_floorplan [-h</td>

3.1.26. ::quartus::pfg

The following table displays information for the ::quartus::pfg Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::pfg 1.0</th>
</tr>
</thead>
</table>

**Description**

This package contains the set of Tcl functions for using the Programming File Generator (PFG).

**Availability**

This package is loaded by default in the following executable:

quartus_pfg

**Tcl Commands**

`test (::quartus::pfg)` on page 365

3.1.26.1. test (::quartus::pfg)

The following table displays information for the test Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::pfg on page 365</th>
</tr>
</thead>
</table>

**Syntax**

`test [-h | -help] [-long_help]`

**Arguments**

- `-h` | `-help` Short help
- `-long_help` Long help with examples and possible return values

**Description**

Display general information

**Example Usage**

`test`

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.27. ::quartus::proj_asgn

The following table displays information for the ::quartus::proj_asgn Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::proj_asgn 1.0</th>
</tr>
</thead>
</table>

**Description**

This package contains the set of Tcl functions for making project-wide assignments.

In versions before 4.0 of this package, the full path of the source file assignment was returned when you accessed the assignment through the "get_global_assignment" or "get_all_global_assignments" command.

In version 4.0 of this package, the actual value of the source file assignment stored in the Quartus Prime Settings File (.qsf) is returned. To get the resolved full path of the file, use

...
the "resolve_file_path" command. For more information about resolving file names and view an example, type "resolve_file_path -long_help".

In version 5.0 of this package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the following commands:

- get_all_quartus_defaults
- get_all_global_assignments
- get_all_instance_assignments
- get_all_parameters

These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) and Quartus Prime Default Settings File (.qdf) assignments.

In addition, the new "assignment_group" command replaces the deprecated "timegroup" command.

In version 6.0, all Tcl commands designed to process Timing Analyzer assignments have been moved to the ::quartus::timing_assignment package.

### Availability

This package is loaded by default in the following executables:

- qpro
- quartus

### Tcl Commands

The following table displays information for the `create_revision` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::proj_asgn</code> on page 365</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>**-h</td>
</tr>
<tr>
<td></td>
<td><strong>-long_help</strong> Revision name on which new revision bases its settings</td>
</tr>
<tr>
<td></td>
<td><strong>-based_on &lt;revision_name&gt;</strong> Option to copy results from &quot;based_on&quot; revision</td>
</tr>
<tr>
<td></td>
<td><strong>-new_rev_type &lt;revision_type&gt;</strong> The type of the newly created revision</td>
</tr>
<tr>
<td></td>
<td><strong>-root_partition_qdb_file &lt;qdb_file&gt;</strong> The Partition Database (.qdb) file for the root partition</td>
</tr>
<tr>
<td></td>
<td><strong>-set_current</strong> Option to set new revision as current revision</td>
</tr>
<tr>
<td></td>
<td><strong>&lt;revision_name&gt;</strong> Revision name</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Creates the specified revision. If the revision is not included in the current project, a new revision is created in the project with default settings.</td>
</tr>
<tr>
<td></td>
<td>If you specify the &quot;-set_current&quot; option, this command sets the newly created revision as the current revision.</td>
</tr>
</tbody>
</table>

---

**continued...**
If you specify the "-based_on" option, the command creates a new revision in the project based on the settings of the based-on revision specified by the option.

### Example Usage

```tcl
## Create a new revision called "tmp"
create_revision tmp

## Create a new revision called "tmp"
## and set it as the current revision
create_revision tmp -set_current

## This method is the same as
create_revision tmp
set_current_revision tmp

## Create a new revision called "speed_ch"
## with settings based on "chiptrip"
## and set it as the current revision
create_revision speed_ch -based_on chiptrip -set_current
```

### Return Value

### 3.1.27.3. get_name_info (::quartus::proj_asgn)

The following table displays information for the `get_name_info` Tcl command:

<table>
<thead>
<tr>
<th>Tc Package and Version</th>
<th>Belongs to ::quartus::proj_asgn on page 365</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_name_info [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>`-info &lt;parent_name_id</td>
</tr>
<tr>
<td></td>
<td>`-observable_type &lt;all</td>
</tr>
<tr>
<td></td>
<td><code>&lt;name_id&gt;</code> Option to specify the node name ID</td>
</tr>
<tr>
<td>Description</td>
<td>Displays the specified type of information for the specified node name id. Type &quot;get_names -long help&quot; to view how to get a collection of node name IDs.</td>
</tr>
</tbody>
</table>

continued...
If the "-observable_type" option is not specified, the default value is "all". The specified observable type must have the same observable type as specified in the "get_names" Tcl command which returned the currently specified node name id.

The value for "-observable_type" option can be one of the following:

<table>
<thead>
<tr>
<th>Observable Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Use post-Fitter information. If it is not available, post-synthesis information is used. Otherwise, pre-synthesis information is used if it exists.</td>
</tr>
<tr>
<td>pre_synthesis</td>
<td>Use pre-synthesis information.</td>
</tr>
<tr>
<td>post_synthesis</td>
<td>Use post-synthesis information.</td>
</tr>
<tr>
<td>post_fitter</td>
<td>Use post-Fitter information.</td>
</tr>
<tr>
<td>post_asm</td>
<td>Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.</td>
</tr>
<tr>
<td>stp_pre_synthesis</td>
<td>Use Signal Tap pre-synthesis information.</td>
</tr>
</tbody>
</table>

The info type for the "-info" option can be one of the following:

<table>
<thead>
<tr>
<th>Info Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parent_name_id</td>
<td>The name id for the node's parent.</td>
</tr>
<tr>
<td>base_name</td>
<td>The node name, which consists of an entity name and/or an instance name separated by a colon if necessary.</td>
</tr>
<tr>
<td>entity_name</td>
<td>The entity name.</td>
</tr>
<tr>
<td>entity_definition</td>
<td>The entity definition.</td>
</tr>
<tr>
<td>instance_name</td>
<td>The instance name.</td>
</tr>
<tr>
<td>full_path</td>
<td>The full hierarchy path name, which consists of entity name(s) and/or the instance name(s). This path name excludes the current focus entity. If there is nothing shown, the name id is the current focus entity's name id.</td>
</tr>
<tr>
<td>short_full_path</td>
<td>The short full hierarchy path name, which consists of the instance name(s). This path name excludes the current focus entity. If nothing is shown, the name id is the current focus entity's name id.</td>
</tr>
<tr>
<td>node_type</td>
<td>The node type, which can be one of the types supported by &quot;get_names&quot;, namely, &quot;input&quot;, &quot;output&quot;, &quot;bidirectional&quot;, &quot;register&quot;, &quot;combinational&quot;, &quot;hierarchy&quot;, &quot;memory&quot;, or &quot;bus&quot;. If &quot;pin&quot; type was specified for &quot;get_names&quot; command, the node type shown here is expanded to be &quot;input&quot;, &quot;output&quot;, or &quot;bidirectional&quot;. Node type value of &quot;qsf&quot; indicates name originates from qsf settings file.</td>
</tr>
<tr>
<td>creator</td>
<td>The creator of the node, which is either &quot;user_entered&quot; or &quot;compiler_generated&quot;.</td>
</tr>
<tr>
<td>signaltapii</td>
<td>If this node can be connected to a Signal Tap embedded logic analyzer, 1 is shown. Otherwise, 0 is shown.</td>
</tr>
<tr>
<td>file_location</td>
<td>The source file location. For example, the source file location for the entity chiptrip is &quot;chiptrip.v&quot;. To get the full path to the source file, use the command &quot;resolve_file_path&quot; which exists only in version 4.0 or later of ::quartus::project package.</td>
</tr>
<tr>
<td>library</td>
<td>Library associated with the instance name.</td>
</tr>
<tr>
<td>children</td>
<td>Collection of all the children names of the specified name. The children will include all the names in the specified hierarchy.</td>
</tr>
<tr>
<td>parameters</td>
<td>Collection of parameters associated with the name. Each element of the collection is a triplet that contains the name, value and the type of the parameter.</td>
</tr>
</tbody>
</table>

Example Usage

```tcl
# Get the name id of the current focus entity
set current_focus_entity_id [get_top_level_entity]

# The full path name of the current focus entity
# is empty because the full path excludes the current focus entity
set msg "Full path of the current focus entity => ("
```

continued...
append msg [get_name_info -info full_path $current_focus_entity_id]
append msg "*
puts $msg
puts "*
#
# Get the node type of the current focus entity
# The node type should be a hierarchy type
set msg "Node type of the current focus entity => "*
append msg [get_name_info -info node_type $current_focus_entity_id]
append msg "*
puts $msg

</tbody>
</table>

3.1.27.4. get_names (::quartus::proj_asgn)

The following table displays information for the get_names Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::proj_asgn on page 365</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-entity &lt;wildcard&gt;</td>
</tr>
<tr>
<td></td>
<td>-filter &lt;wildcard&gt;</td>
</tr>
<tr>
<td></td>
<td>-library &lt;wildcard&gt;</td>
</tr>
</tbody>
</table>

continued...
Description

Returns a filtered output collection of all matching node name IDs found in a compiled Quartus Prime project.

To access each element of the output collection, use the Tcl command "foreach_in_collection". To see example usage, type "get_names -long_help" or "foreach_in_collection -long_help".

If the "-node_type" option is not specified, the default value is "all". Similarly, if the "-observable_type" option is not specified, the default value is "all".

The node type "pin" includes "input", "output", "bidir", "assigned" and "unassigned".

The node type "qsf" include names from qsf settings file.

The node type "all" includes all node types.

The node type "all_reg" includes all node types and register post-fitting.

The value for "-observable_type" option can be one of the following:

<table>
<thead>
<tr>
<th>Observable Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Use post-Fitter information. If it is not available, post-Synthesis information is used. Otherwise, pre-synthesis information is used if it exists.</td>
</tr>
<tr>
<td>pre_synthesis</td>
<td>Use pre-synthesis information.</td>
</tr>
<tr>
<td>post_synthesis</td>
<td>Use post-synthesis information.</td>
</tr>
<tr>
<td>post_fitter</td>
<td>Use post-Fitter information.</td>
</tr>
<tr>
<td>post_asm</td>
<td>Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.</td>
</tr>
<tr>
<td>stp_pre_synthesis</td>
<td>Use Signal Tap pre-synthesis information.</td>
</tr>
</tbody>
</table>

Example Usage

```tcl
# Search for a single post-Fitter pin with the name accel and make assignments
set accel_name_id [get_names -filter accel -node_type pin -observable_type post_fitter]
foreach_in_collection name_id $accel_name_id {
    # Get the full path name of the node
    set target [get_name_info -info full_path $name_id]
    # Set multicycle assignment
    set_multicycle_assignment -to $target 2
    # Set location assignment
    set_location_assignment -to $target Pin_E22
}
# Search for nodes of any post-Fitter node type with name length <= 5
# The default node type is "all"
set name_ids [get_names -filter *???? -observable_type post_fitter]
foreach_in_collection name_id $name_ids {
    # Print the name id
    puts $name_id
    # Print the node type
    puts [get_name_info -info node_type $name_id]
    # Print the full path (which excludes the current focus entity from the path)
    puts [get_name_info -info full_path $name_id]
}
# Search for nodes of any post-Fitter node type that end in "eed".
# The default node type is "all"
set name_ids [get_names -filter *eed -observable_type post_fitter]
foreach_in_collection name_id $name_ids {
    # Print the name id
    puts $name_id
    # Print the node type
    puts [get_name_info -info node_type $name_id]
```

continued...
The following table displays information for the `get_top_level_entity` Tcl command:

<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
</tbody>
</table>

### 3.1.28. ::quartus::project

The following table displays information for the `::quartus::project` Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::project 7.0</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>This package contains the set of Tcl functions for making project-wide assignments.</td>
</tr>
</tbody>
</table>

In versions before 4.0 of this package, the full path of the source file assignment was returned when you accessed the assignment through the "get_global_assignment" or "get_all_global_assignments" command.

In version 4.0 of this package, the actual value of the source file assignment stored in the Quartus Prime Settings File (.qsf) is returned. To get the resolved full path of the file, use the "resolve_file_path" command. For more information about resolving file names and view an example, type "resolve_file_path -long_help".

In version 5.0 of this package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the following commands:

- `get_all_quartus_defaults`
- `get_all_global_assignments`
- `get_all_instance_assignments`
- `get_all_parameters`

These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) and Quartus Prime Default Settings File (.qdf) assignments.

In addition, the new "assignment_group" command replaces the deprecated "timegroup" command.

---

Send Feedback

373
In version 6.0, all Tcl commands designed to process Timing Analyzer assignments have been moved to the `::quartus::timing_assignment` package.

### Availability

This package is loaded by default in the following executables:

- `hdb_debug`
- `gqro_sh`
- `quartus_asm`
- `quartus_bpps`
- `quartus_cdb`
- `quartus_design`
- `quartus_ed`
- `quartus_fit`
- `quartus_idb`
- `quartus_ipd`
- `quartus_ipgenerate`
- `quartus_map`
- `quartus_sh`
- `quartus_si`
- `quartus_sim`
- `quartus_sta`
- `quartus_stp`
- `quartus_syn`
- `quartus_tlg`

continued...
## Description

Creates the specified revision. If the revision is not included in the current project, a new revision is created in the project with default settings.

If you specify the "-set_current" option, this command sets the newly created revision as the current revision.

If you specify the "-based_on" option, the command creates a new revision in the project based on the settings of the based-on revision specified by the option.

## Example Usage

```
## Create a new revision called "tmp"
create_revision tmp

## Create a new revision called "tmp"
## and set it as the current revision
create_revision tmp -set_current

## This method is the same as
create_revision tmp
set_current_revision tmp

## Create a new revision called "speed_ch"
## with settings based on "chiptrip"
## and set it as the current revision
create_revision speed_ch -based_on chiptrip -set_current
```

## Return Value

3.1.28.4. execute_assignment_batch (::quartus::project)

The following table displays information for the execute_assignment_batch Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>execute_assignment_batch [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>&lt;tcl commands&gt; Tcl list of Tcl commands</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Iterates through the specified Tcl list of Tcl commands and executes each command sequentially in batch mode.</td>
</tr>
</tbody>
</table>

In batch mode, Tcl commands that set Quartus Prime Settings File (.qsf) assignments are optimized to prevent them from repeatedly write-locking and write-unlocking the QSF during consecutive calls, thereby slowing down the execution.

Currently, only the following commands are supported:

- assignment_group
- remove_all_global_assignments
- remove_all_instance_assignments
- remove_all_parameters
- set_global_assignment

continued...
Example Usage:

```tcl
project_open one_wire
set tcl_cmds [list [list set_global_assignment -name FAMILY StratixII] \
[list set_global_assignment -name DEVICE AUTO] \
[list set_global_assignment -name SAVE_DISK_SPACE OFF] \
[list set_location_assignment PIN_1 -to in1] \
[list set_instance_assignment -name MULTICYCLE 4 -from in1 -to out1] \
[list set_parameter -name STYLE FAST]]
execute_assignment_batch $tcl_cmds
project_close
```

Return Value:

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Unsupported Tcl command: &lt;string&gt;. Specify one of the supported Tcl commands listed in the help description for &lt;string&gt; -h.</td>
</tr>
</tbody>
</table>

3.1.28.5. export_assignments (::quartus::project)

The following table displays information for the `export_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-reorganize</code> Option to reorganize the Quartus Prime Settings File (.qsf)</td>
</tr>
<tr>
<td></td>
<td><code>-report_write_failure</code> Option to report error if write fail</td>
</tr>
</tbody>
</table>

Description:

Exports assignments for the current revision to the Quartus Prime Settings File (.qsf).

Assignments created or modified during an open project are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) `export_assignments`
2) `project_close` (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the `::quartus::project` Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the `::quartus::flow` Tcl package) automatically call "export_assignments" before they run command-line executables.

Example Usage:

```tcl
project_open $project_name
set_global_assignment -name FAMILY Stratix

Before calling quartus_map,
write out the FAMILY assignment
export_assignments

Now, call quartus_map
qexec "[file join $::quartus(binpath) quartus_map] $project_name"
```
3. TCL Commands and Packages

3.1.28.6. generate_project_tcl (::quartus::project)

The following table displays information for the `generate_project_tcl` Tcl command:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>-</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>-</td>
<td>ERROR: Failed when attempting to read qsf file.</td>
</tr>
<tr>
<td>TCL_ERROR</td>

<td>-</td>
<td>ERROR: Failed when attempting to write tcl file.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>-</td>
<td>ERROR: Project is not open, and path and project name was not specified.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>-</td>
<td>ERROR: Tcl file already exist. Please use -overwrite option to overwrite</td>
</tr>
</tbody>
</table>

3. TCL Commands and Packages

Belongs to ::quartus::project on page 373

Syntax

generate_project_tcl [-h | -help] [-long_help] -filename <filename> [-include_default_assignments] [-overwrite]

Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-filename <filename>` Tcl Filename
- `-include_default_assignments` Option to include default assignments in the tcl file.
- `-overwrite` Option to overwrite an existing tcl file

Description

With currently opened, write a tcl file that can create the project and populate it current set of assignments in the qsf.

Example Usage

```tcl
# Generate a tcl file to create the current project.
generate_project_tcl -filename create_project.tcl

# Generate a tcl file to create the current project and
# also include the default assignments.
generate_project_tcl -filename create_project.tcl -include_default_assignments
```
### 3.1.28.7. get_all_assignment_names (::quartus::project)

The following table displays information for the `get_all_assignment_names` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::project</code> on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`get_all_assignment_names [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>`-h</td>
<td>-help`</td>
</tr>
<tr>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td><code>-family &lt;family&gt;</code></td>
<td>Option to filter based on the specified device family. Defaults to all families.</td>
</tr>
<tr>
<td>`-module &lt;all</td>
<td>ip_generate</td>
</tr>
<tr>
<td>`-type all</td>
<td>global</td>
</tr>
</tbody>
</table>

**Description**

Returns a filtered output list of all available, matching assignment names.

The module option takes one of the following values:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip_generate</td>
<td>IP Generation assignment names</td>
</tr>
<tr>
<td>tlg</td>
<td>Support Logic Generation assignment names</td>
</tr>
<tr>
<td>map</td>
<td>Analysis &amp; Synthesis assignment names</td>
</tr>
<tr>
<td>fit</td>
<td>Fitter assignment names</td>

<td>Power Analyzer assignment names</td>
</tr>
<tr>
<td>generic</td>
<td>Other assignment names not included in any of the above flow modules</td>
</tr>
<tr>
<td>all</td>
<td>All assignment names</td>
</tr>
</tbody>
</table>

**Example Usage**

```tcl
foreach i [get_all_assignment_names] {
    puts $i
}
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Assignment <code>&lt;string&gt;</code> is not supported in this edition of the Quartus Prime software.</td>
</tr>
</tbody>
</table>

*continued...*
### 3.1.28.8. get_all_assignments (::quartus::project)

The following table displays information for the `get_all_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-entity &lt;entity_name&gt;</td>
<td>Entity name</td>
</tr>
<tr>
<td>-fall</td>
<td>Option applies to falling edge</td>
</tr>
<tr>
<td>-from &lt;source&gt;</td>
<td>Source name (string pattern is matched using Tcl string matching)</td>
</tr>
<tr>
<td>-name &lt;name&gt;</td>
<td>Assignment name (string pattern is matched using Tcl string matching)</td>
</tr>
<tr>
<td>-rise</td>
<td>Option applies to rising edge</td>
</tr>
<tr>
<td>-section_id &lt;section_id&gt;</td>
<td>Section id</td>
</tr>
<tr>
<td>-tag &lt;data&gt;</td>
<td>Option to tag data to this assignment</td>
</tr>
<tr>
<td>-to &lt;destination&gt;</td>
<td>Destination name (string pattern is matched using Tcl string matching)</td>
</tr>
<tr>
<td>-type &lt;global</td>
<td>instance</td>
</tr>
</tbody>
</table>

**Description**

Returns a collection of all matching global, instance, parameter, or default assignment ids. To iterate through each assignment id in this collection, use the Tcl command "foreach_in_collection".

To view details for the assignment that is associated with the assignment id, use the Tcl command "get_assignment_info".

The "get_all_assignments" command is easier to use than the deprecated commands listed in Table 1.

- Table 1. The -type Option

<table>
<thead>
<tr>
<th>Value for -type Option</th>
<th>Deprecated Tcl command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td><code>get_all_quartus_defaults</code></td>
<td>Returns only default assignments.</td>
</tr>
<tr>
<td>global</td>
<td><code>get_all_global_assignments</code></td>
<td>Returns only global assignments.</td>
</tr>
<tr>
<td>instance</td>
<td><code>get_all_instance_assignments</code></td>
<td>Returns only instance assignments.</td>
</tr>
<tr>
<td>parameter</td>
<td><code>get_all_parameters</code></td>
<td>Returns only parameter assignments.</td>
</tr>
</tbody>
</table>

The "-name" option is not case sensitive.

---

*continued...*
The "-to" and "-from" options are case sensitive.

These options can take string patterns containing special characters from the set "*?\\[]" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

<bus name><bus index>] or <bus name>[*]

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the <bus index> is enclosed by the square brackets "[]". For example, "a[0]" and "a[*]" are supported bus names and can be used as follows:

# To match index 0 of bus "a", type:
get_all_assignments -type instance -name LOCATION -to a[0]

# To match all indices of bus "a", type:
get_all_assignments -type instance -name LOCATION -to a[*]

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

get_all_assignments -type instance LOCATION -to "a[escape_brackets \[\]\[0-2\][escape_brackets \]\]"

For more information about escaping square brackets, type "escape_brackets -h".

This Tcl command reads in the global, instance, and parameter assignments found in the Quartus Prime Settings File (.qsf) and reads in the default assignments found inside the Quartus Prime Default Settings File (.qdf).

If you tagged data by making assignments with the -tag option, then the information can be searched using the -tag option.

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one clock section each containing its own set of clock assignments. To uniquely identify sections of this type, use the -section_id option.

For entity-specific assignments, use the "-entity" option to retrieve assignments from a specific entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

### Example Usage

```tcl
## View all the timing requirements using wildcards
## to match TSU_REQUIREMENT, TCO_REQUIREMENT,
## and others.
foreach_in_collection asgn_id [get_all_assignments -type instance -name *_REQUIREMENT] {
    set from   [get_assignment_info $asgn_id -from]
    set to     [get_assignment_info $asgn_id -to]
    set name   [get_assignment_info $asgn_id -name]
    set value  [get_assignment_info $asgn_id -value]
    set entity [get_assignment_info $asgn_id -entity]
    set sid    [get_assignment_info $asgn_id -section_id]
    set tag    [get_assignment_info $asgn_id -tag]
    puts "$entity: $name ($from -> $to) = $value"
}

## View all global assignments
foreach_in_collection asgn_id [get_all_assignments -type global -name *] {
    set name   [get_assignment_info $asgn_id -name]
    set value  [get_assignment_info $asgn_id -value]
    set entity [get_assignment_info $asgn_id -entity]
    set sid    [get_assignment_info $asgn_id -section_id]
    set tag    [get_assignment_info $asgn_id -tag]
    puts "$entity: $name = $value"
}

## View all project-wide default parameter values
foreach_in_collection asgn_id [get_all_assignments -type parameter -name *] {
    set name   [get_assignment_info $asgn_id -name]
    set value  [get_assignment_info $asgn_id -value]
}
```

continued...
## View all entity-specific parameter values

```tcl
foreach_in_collection asgn_id [get_all_assignments -type parameter -name * -to *] {
    set dest [get_assignment_info $asgn_id -to]
    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    set tag [get_assignment_info $asgn_id -tag]
    puts "$name (-> $dest) = $value"
}
```

## View all default assignments

```tcl
foreach_in_collection asgn_id [get_all_assignments -type default -name * -to *] {
    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    puts "$name = $value"
}
```

</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-rise</td>
</tr>
<tr>
<td></td>
<td>-section_id &lt;section_id&gt;</td>
</tr>
<tr>
<td></td>
<td>-tag &lt;data&gt;</td>
</tr>
</tbody>
</table>

**Description**

Returns a filtered output collection of all matching global assignment values. To access each element of the output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".

In version 5.0 of the ::quartus::project package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the "get_all_global_assignments" command. These new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) assignments. The "get_all_global_assignments" command is still supported for backward compatibility.

The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set "*?\[]" as the value. The value is matched using Tcl string matching.

This Tcl command reads the global assignments found in the Quartus Prime Settings File (.qsf). This Tcl command filters the assignment data in the .qsf and outputs the data based on the values given by the "-name" option.

Each element of the collection is a list with the following format:

```
{ {<Section Id>} {<Assignment name>} {<Assignment value>} {<Entity name>} {<Tag data>} }
```

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a <Section Id> is used. <Section Id> can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a <Section Id> and the associated <Section Id> description:

<table>
<thead>
<tr>
<th>Section Id</th>
<th>Description</th>
</tr>
</thead>
</table>

continued...
If you tagged data by making assignments with the -tag option, then the information will be displayed in the <Tag data> field.

For entity-specific assignments, use the "-entity" option to retrieve the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Example Usage

```tcl
## Print out all the registered source files
set file_asgn_col [get_all_global_assignments -name SOURCE_FILE]
foreach_in_collection file_asgn $file_asgn_col {
    ## Each element in the collection has the following
    ## format: {} {SOURCE_FILE} {<file_name>} {} {}
    puts [lindex $file_asgn 2]
}

## Print out all global assignments
set asgn_col [get_all_global_assignments -name *]
foreach_in_collection asgn $asgn_col {
    ## Each element in the collection has the following
    ## format: { {} {<Assignment name>} {<Assignment value>} {<Entity name>} {<Tag data>} }
    set name   [lindex $asgn 1]
    set value  [lindex $asgn 2]
    set entity [lindex $asgn 3]
    set tag    [lindex $asgn 4]
    puts "$entity: $name = $value"
}
```

Return Value

</tr>
</tbody>
</table>

**Description**

Returns a filtered output collection of all matching instance assignment values. To access each element of this output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".

In version 5.0 of the ::quartus::project package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the "get_all_instance_assignments" command. These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) assignments. The "get_all_instance_assignments" command is still supported for backward compatibility.

---

Send Feedback
The "-name" option is not case sensitive. The "-to" and "-from" options are case sensitive.

These options can take string patterns containing special characters from the set "*?\["] as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

<bus name>[<bus index>] or <bus name>[*]

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character '*' used for string matching. Notice that the <bus index> is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[*]" are supported bus names and can be used as follows:

# To match index 0 of bus "a", type:
get_all_instance_assignments -name LOCATION -to a[0]

# To match all indices of bus "a", type:
get_all_instance_assignments -name LOCATION -to a[*]

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

get_all_instance_assignments -name LOCATION -to "a[escape_brackets \[0-2\]]"

For more information about escaping square brackets, type "escape_brackets -h".

This Tcl command reads in the instance assignments found in the Quartus Prime Settings File (.qsf). The command filters the assignments data found in the .qsf and outputs the data based on the values specified by the "-name", "-from", and "-to" options.

Each element of the collection is a list with the following format:

{ {} {} {} {} {} {} {} }

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a <Section Id> is used. 

<Section Id> can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a <Section Id> and the associated <Section Id> description:

<table>
<thead>
<tr>
<th>Section Id</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIP</td>
<td>Same as revision name</td>
</tr>
<tr>
<td>LOGICCLOCK_REGION</td>
<td>A unique name</td>
</tr>
<tr>
<td>EDA_TOOL_SETTINGS</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLIQUE</td>
<td>A unique name</td>
</tr>
<tr>
<td>BREAKPOINT</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLOCK</td>
<td>A unique name</td>
</tr>
<tr>
<td>AUTO_INSERT_SLD_NODE_ENTITY</td>
<td>A unique name</td>
</tr>
</tbody>
</table>

If you tagged data by making assignments with the -tag option, then the information will be displayed in the <Tag data> field. For entity-specific assignments, use the "-entity" option to retrieve the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Example Usage

## Print out all the timing requirements 
## using the foreach_in_collection method.
## Use wildcards to catch TSU_REQUIREMENT, TCO_REQUIREMENT, 
## and others.
set asgn_col [get_all_instance_assignments -name *_REQUIREMENT]
foreach_in_collection asgn $asgn_col {

## Each element in the collection has the following 
## format: {} {} {} {} {} {} {} 
set from [lindex $asgn 1]
set to  [lindex $asgn 2] 
set name  [lindex $asgn 3] 
set entity  [lindex $asgn 4] 
set tag  [lindex $asgn 5] 
set value  [lindex $asgn 6] 

puts "$entity: $name ($from -> $to) = $value"
}

## Get all the location assignments with
## the destination bus name "timeo".
set bus_name "timeo"
set location_asgns [get_all_instance_assignments -name LOCATION -to $bus_name[*]]

<tr>
<td>-tag &lt;data&gt;</td>
<td>Option to tag data to this assignment</td>
</tr>
<tr>
<td>-to &lt;destination&gt;</td>
<td>Destination of the parameter (string pattern is matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

**Description**

Returns a filtered output collection of all matching parameter values. To access each element of this output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".

In version 5.0 of ::quartus::project package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the "get_all_parameters" command. These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) assignments.

The "get_all_parameters" command is still supported for backward compatibility.

The "-name" option is not case sensitive. The "-to" option is case sensitive.

If the "-to" argument is specified, the function returns the parameter values for the current entity. The values are retrieved from the PARAMETERS section of the entity. Otherwise, the function returns the project-wide default parameter values obtained from the DEFAULT_PARAMETERS section.

This Tcl command filters the parameter data found in the Quartus Prime Settings File (.qsf) and outputs the data based on the values specified by the "-name" and "-to" options. These options can take string patterns containing special characters from the set "**\[\]^\{\}" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

<bus name>[<bus index>]] or <bus name>[*]

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the <bus index> is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[*]" are supported bus names and can be used as follows:

```
# To match index 0 of bus "a", type:
get_all_parameters -name " -to a[0]

# To match all indices of bus "a", type:
get_all_parameters -name " -to a[*]
```

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

```
get_all_parameters -name " -to a[escape_brackets \\
0-2][\escape_brackets ]"
```

---

`continued...`
For more information about escaping square brackets, type "escape_brackets -h".

Each element of the collection is a list with the following format:

{ {<Destination>} {<Parameter name>} {<Parameter value>} {<Entity name>} {<Tag data>} }

If you tagged data by making assignments with the -tag option, then the information will be displayed in the <Tag data> field.

Use the "-entity" option to retrieve the parameter values from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Example Usage

```tcl
# Display all project-wide default parameter values
foreach_in_collection parameter $parameter_col {
    ## Each element in the collection has the following format: { {} {<Parameter name>} {<Parameter value>} {} {} }
    set name [lindex $parameter 1]
    set value [lindex $parameter 2]
    ## Now, display the content of the parameter
    puts "Parameter Name ($name)"
    puts "Parameter Value ($value)"
}

# Display all entity-specific parameter values
foreach_in_collection parameter [get_all_parameters -name * -to *] {
    ## Each element in the collection has the following format: { {Destination} {<Parameter name>} {<Parameter value>} {} {} }
    set dest [lindex $parameter 0]
    set name [lindex $parameter 1]
    set value [lindex $parameter 2]
    ## Now, display the content of the parameter
    puts "Destination ($dest)"
    puts "Parameter Name ($name)"
    puts "Parameter Value ($value)"
}
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>

</tbody>
</table>
The following table displays information for the `get_all_quartus_defaults` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::project</code> on page 373</th>
</tr>
</thead>
</table>

**Syntax**

```
```

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-fall` Option applies to falling edge
- `-name <name>` Assignment name (string pattern is matched using Tcl string matching)
- `-rise` Option applies to rising edge
- `-section_id <section_id>` Section id
- `-tag <data>` Option to tag data to this assignment

**Description**

Returns a filtered output collection of all matching default assignment values. To access each element of the output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".

In version 5.0 of `::quartus::project` package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the "get_all_quartus_defaults" command. These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) assignments. The "get_all_quartus_defaults" command is still supported for backward compatibility.

The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set "*?\[]" as the value. The value is matched using Tcl string matching.

This Tcl command reads in the default assignments found inside the Quartus Prime Default Settings File (.qdf). It filters the assignments data found inside the .qdf and outputs the data based on the values specified by the "-name" option.

Each element of the collection is a list with the following format:
```
{ {<Section Id>} {<Assignment name>} {<Assignment value}> }
```

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a "<Section Id>" is used. "<Section Id>" can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a "<Section Id>" and the associated "<Section Id>" description:

<table>
<thead>
<tr>
<th>Section Id</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIP</td>
<td>Same as revision name</td>
</tr>
<tr>
<td>LOGICLOCK_REGION</td>
<td>A unique name</td>
</tr>
<tr>
<td>EDA_TOOL_SETTINGS</td>
<td>A unique name</td>

<tr>
<td>CLIQUE</td>
<td>A unique name</td>
</tr>
<tr>
<td>BREAKPOINT</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLOCK</td>
<td>A unique name</td>
</tr>
<tr>
<td>AUTO_INSERT_SLD_NODE_ENTITY</td>
<td>A unique name</td>
</tr>
</tbody>
</table>

**Example Usage**

```bash
## Print out all the default assignments using
## the foreach_in_collection method
set default_asgs_col [get_all_quartus_defaults]
foreach_in_collection default $default_asgns_col {
```

*continued...*
```tcl
set sect_id [lindex $default 0]
set name [lindex $default 1]
set value [lindex $default 2]

## Now, display the content of the assignment
puts "Section ID ($sect_id)"
puts "Assignment Name ($name)"
puts "Assignment Value ($value)"
}

## Using wildcards
set default_asgns_col [get_all_quartus_defaults -name *]
foreach_in_collection default $default_asgns_col {
    set sect_id [lindex $default 0]
    set name [lindex $default 1]
    set value [lindex $default 2]

    ## Now, display the content of the assignment
    puts "Section ID ($sect_id)"
    puts "Assignment Name ($name)"
    puts "Assignment Value ($value)"
}
```

<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
</tbody>
</table>

**Description**

Returns a filtered output list of all available, matching user option names.

If the "-name" option is not specified, all available user option names are returned. Otherwise, only the matching user option names are returned.

The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set "*?\[" as the value. The value is matched using Tcl string matching.

**Example Usage**

```tcl
## Print out all available user option names
foreach i [get_all_user_option_names] {
   puts $i
}
## Display all user option names that contain the word "talkback" and also display the value for each of the user option names
foreach i [get_all_user_option_names -name *talkback*] {
   set name $i
   set value [get_user_option -name $i]
   puts "$name = $value"
}
```

### Options

- **-name**: Option to get the assignment name
- **-section_id**: Option to get the assignment section id
- **-tag**: Option to get the assignment tag
- **-to**: Option to get the assignment destination
- **-value**: Option to get the assignment value
- **<asgn_id>**: Assignment id

### Description

Returns information for the assignment id based on the specified option.

The assignment id is obtained from the "get_all_assignments" Tcl command.

### Example Usage

```tcl
# View all the instance assignments
foreach_in_collection asgn_id [get_all_assignments -type instance -name *] {
    set from   [get_assignment_info $asgn_id -from]
    set to     [get_assignment_info $asgn_id -to]
    set name   [get_assignment_info $asgn_id -name]
    set value  [get_assignment_info $asgn_id -value]
    set entity [get_assignment_info $asgn_id -entity]
    set tag    [get_assignment_info $asgn_id -tag]
    puts "$entity: $name ($from -> $to) = $value"
}
```

### Return Value

<tr>
<td><code>&lt;project_name&gt;</code></td>
<td>Project name</td>
</tr>
<tr>
<td>Description</td>
<td>Returns the name of the current revision for the specified project. If the project name is not specified, the current project name is used.</td>
</tr>
</tbody>
</table>

#### Example Usage

```tcl
# Get the current revision name for
# the currently open project "chiptrip"
project_open chiptrip
set revision_name [get_current_revision]
project_close

# Get the current revision name for
# a project that is not currently open
set revision_name [get_current_revision chiptrip]
```
3.1.28.18. get_database_version (:quartus::project)

The following table displays information for the get_database_version Tcl command:

<table>
<thead>
<tr>
<th>Tensor</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>

<td>1</td>
<td></td>
<td>ERROR: Project name was not specified or open project does not exist. Open an existing project or specify the project name.</td>
</tr>
</tbody>
</table>

3.1.28.19. get_global_assignment (:quartus::project)

The following table displays information for the get_global_assignment Tcl command:

<table>
<thead>
<tr>
<th>Tensor</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td></td>
<td>ERROR: The input project &lt;string&gt; is not found.</td>
</tr>
</tbody>
</table>
### Description

Returns the value of the global assignment. The "-name" option is not case sensitive.

For entity-specific assignments, use the "-entity" option to retrieve the assignment from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

### Example Usage

```bash
# Get the value of the FAMILY assignment
get_global_assignment -name FAMILY
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>

<tr>
<td></td>
<td>-rise</td>
</tr>
<tr>
<td></td>
<td>-section_id &lt;section_id&gt;</td>
</tr>
<tr>
<td></td>
<td>-tag &lt;data&gt;</td>
</tr>
<tr>
<td></td>
<td>-to &lt;destination&gt;</td>
</tr>
</tbody>
</table>

**Description**

Returns the value of the instance assignment.

The `-name` option is not case sensitive. The `-entity`, `-to`, and `-from` options are case sensitive.

For entity-specific assignments, use the `-entity` option to retrieve the assignment from the specified entity. If the `-entity` option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

**Example Usage**

```tcl
## Get the TSU_REQUIREMENT from mypin to any register
set value [get_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT]
puts "TSU_REQUIREMENT(mypin->*) = $value"
```

**Return Value**

<table>

### 3.1.28.21. `get_location_assignment (::quartus::project)`

The following table displays information for the `get_location_assignment` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::project</code> on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`get_location_assignment [-h</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Arguments</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>`-h</td>
<td>-help`</td>
</tr>
<tr>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td><code>-fall</code></td>
<td>Option applies to falling edge</td>
</tr>
<tr>
<td><code>-rise</code></td>
<td>Option applies to rising edge</td>
</tr>
<tr>
<td><code>-tag &lt;data&gt;</code></td>
<td>Option to tag data to this assignment</td>
</tr>
<tr>
<td><code>-to &lt;destination&gt;</code></td>
<td>Destination of assignment</td>
</tr>
</tbody>
</table>

**Description**
- Returns the value of a location assignment.
- The `-chip` option is not case sensitive.
- The `-to` option is case sensitive.

**Example Usage**
- `get_location_assignment -to dst`

<table>
<thead>
<tr>
<th><strong>Return Value</strong></th>

### 3.1.28.22. `get_name_info (::quartus::project)`

The following table displays information for the `get_name_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::project</code> on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>get_name_info [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-info &lt;parent_name_id</td>
</tr>
<tr>
<td></td>
<td>-observable_type &lt;all</td>
</tr>
<tr>
<td></td>
<td>&lt;name_id&gt;</td>
</tr>
</tbody>
</table>

**Description**

Displays the specified type of information for the specified node name id. Type "get_names -long_help" to view how to get a collection of node name IDs.

If the "-observable_type" option is not specified, the default value is "all". The specified observable type must have the same observable type as specified in the "get_names" Tcl command which returned the currently specified node name id.

The value for "-observable_type" option can be one of the following:

<table>
<thead>
<tr>
<th>Observable Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Use post-Fitter information. If it is not available, post-synthesis information is used. Otherwise, pre-synthesis information is used if it exists.</td>
</tr>
<tr>
<td>pre_synthesis</td>
<td>Use pre-synthesis information.</td>
</tr>
<tr>
<td>post_synthesis</td>
<td>Use post-synthesis information.</td>
</tr>
<tr>
<td>post_fitter</td>
<td>Use post-Fitter information.</td>
</tr>
<tr>
<td>post_asm</td>
<td>Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.</td>
</tr>
<tr>
<td>stp_pre_synthesis</td>
<td>Use Signal Tap pre-synthesis information.</td>
</tr>
</tbody>
</table>

The info type for the "-info" option can be one of the following:

<table>
<thead>
<tr>
<th>Info Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parent_name_id</td>
<td>The name id for the node's parent.</td>
</tr>
<tr>
<td>base_name</td>
<td>The node name, which consists of an entity name and/or an instance name</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>entity_name</td>
<td>The entity name.</td>
</tr>
<tr>
<td>entity_definition</td>
<td>The entity definition.</td>
</tr>
<tr>
<td>instance_name</td>
<td>The instance name.</td>
</tr>
<tr>
<td>full_path</td>
<td>The full hierarchy path name, which consists of entity name(s) and/or the instance name(s). This path name excludes the current focus entity. If there is nothing shown, the name id is the current focus entity's name id.</td>
</tr>
<tr>
<td>short_full_path</td>
<td>The short full hierarchy path name, which consists of the instance name(s). This path name excludes the current focus entity. If nothing is shown, the name id is the current focus entity's name id.</td>
</tr>
<tr>
<td>node_type</td>
<td>The node type, which can be one of the types supported by &quot;get_names&quot;, namely, &quot;input&quot;, &quot;output&quot;, &quot;bidirectional&quot;, &quot;register&quot;, &quot;combinational&quot;, &quot;hierarchy&quot;, &quot;memory&quot;, or &quot;bus&quot;. If &quot;pin&quot; type was specified for &quot;get_names&quot; command, the node type shown here is expanded to be &quot;input&quot;, &quot;output&quot;, or &quot;bidirectional&quot;. Node type value of &quot;qsf&quot; indicates name originates from qsf settings file.</td>
</tr>
<tr>
<td>creator</td>
<td>The creator of the node, which is either &quot;user_entered&quot; or &quot;compiler_generated&quot;.</td>
</tr>
<tr>
<td>signaltapii</td>
<td>If this node can be connected to a Signal Tap embedded logic analyzer, 1 is shown. Otherwise, 0 is shown.</td>
</tr>
<tr>
<td>file_location</td>
<td>The source file location. For example, the source file location for the entity chiptrip is &quot;chiptrip.v&quot;. To get the full path to the source file, use the command &quot;resolve_file_path&quot; which exists only in version 4.0 or later of ::quartus::project package.</td>
</tr>
<tr>
<td>library</td>
<td>Library associated with the instance name.</td>
</tr>
<tr>
<td>children</td>
<td>Collection of all the children names of the specified name. The children will include all the names in the specified hierarchy.</td>
</tr>
<tr>
<td>parameters</td>
<td>Collection of parameters associated with the name. Each element of the collection is a triplet that contains the name, value and the type of the parameter.</td>
</tr>
</tbody>
</table>

**Example Usage**

```tcl
# Get the name id of the current focus entity
set current_focus_entity_id [get_top_level_entity]

# The full path name of the current focus entity
# is empty because the full path excludes the
# current focus entity
set msg "Full path of the current focus entity => (*
append msg [get_name_info -info full_path $current_focus_entity_id]
append msg ")"
puts $msg
puts 

# Get the node type of the current focus entity
# The node type should be a hierarchy type
set msg "Node type of the current focus entity => (*
append msg [get_name_info -info node_type $current_focus_entity_id]
append msg ")"
puts $msg
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>

<td>1</td>
<td>ERROR: Can't find active revision name. Make sure there is an open, active revision name.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Compiler database does not exist for revision name: &lt;string&gt;. At the minimum, run Analysis &amp; Synthesis (quartus_map) with the specified revision name before using this Tcl command.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Illegal info type: &lt;string&gt;. Specify parent_name_id, base_name, entity_name, instance_name, full_path, short_full_path, node_type, creator, or signaltapii.</td>
</tr>
</tbody>
</table>

*continued...*
3.1.28.23. get_names (::quartus::project)

The following table displays information for the get_names Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>get_names [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-entity &lt;wildcard&gt;</td>
</tr>
<tr>
<td></td>
<td>-filter &lt;wildcard&gt;</td>
</tr>
<tr>
<td></td>
<td>-library &lt;wildcard&gt;</td>
</tr>
<tr>
<td></td>
<td>-node_type &lt;all</td>
</tr>
<tr>
<td></td>
<td>-observable_type &lt;all</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Returns a filtered output collection of all matching node name IDs found in a compiled Quartus Prime project. To access each element of the output collection, use the Tcl command &quot;foreach_in_collection&quot;. To see example usage, type &quot;get_names -long_help&quot; or &quot;foreach_in_collection -long_help&quot;.</td>
</tr>
</tbody>
</table>

If the "-node_type" option is not specified, the default value is "all". Similarly, if the "-observable_type" option is not specified, the default value is "all".

The node type "pin" includes "input", "output", "bidir", "assigned" and "unassigned".
The node type "qsf" include names from qsf settings file.
The node type "all" includes all node types.
The node type "all_reg" includes all node types and register post-fitting.

The value for "-observable_type" option can be one of

**continued...**
### Observable Type Description

- **all**: Use post-Fitter information. If it is not available, post-Synthesis information is used. Otherwise, pre-synthesis information is used if it exists.
- **pre_synthesis**: Use pre-synthesis information.
- **post_synthesis**: Use post-synthesis information.
- **post_fitter**: Use post-Fitter information.
- **post_asm**: Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.
- **stp_pre_synthesis**: Use Signal Tap pre-synthesis information.

### Example Usage

```tcl
# Search for a single post-Fitter pin with the name accel and make assignments
set accel_name_id [get_names -filter accel -node_type pin -observable_type post_fitter]
foreach_in_collection name_id $accel_name_id {
    # Get the full path name of the node
    set target [get_name_info -info full_path $name_id]
    # Set multicycle assignment
    set_multicycle_assignment -to $target 2
    # Set location assignment
    set_location_assignment -to $target Pin_E22
}

# Search for nodes of any post-Fitter node type with name length <= 5
# The default node type is "all"
set name_ids [get_names -filter ????? -observable_type post_fitter]
foreach_in_collection name_id $name_ids {
    # Print the name id
    puts $name_id
    # Print the node type
    puts [get_name_info -info node_type $name_id]
    # Print the full path (which excludes the current focus entity from the path)
    puts [get_name_info -info full_path $name_id]
}

# Search for nodes of any post-Fitter node type that end in "eed".
# The default node type is "all"
set name_ids [get_names -filter *eed -observable_type post_fitter]
foreach_in_collection name_id $name_ids {
    # Print the name id
    puts $name_id
    # Print the node type
    puts [get_name_info -info node_type $name_id]
    # Print the full path (which excludes the current focus entity from the path)
    puts [get_name_info -info full_path $name_id]
}
```

### Return Value

<table>

<td></td>
<td>-fall</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-rise</td>
</tr>
<tr>
<td></td>
<td>-tag &lt;data&gt;</td>
</tr>
<tr>
<td></td>
<td>-to &lt;destination&gt;</td>
</tr>
</tbody>
</table>

**Description**

Returns the value of the parameter. The "-name" option is not case sensitive. If the "-to" option is case sensitive.

If the "-to" argument is specified, the function returns the parameter value for the current entity. The value is retrieved from the PARAMETERS section of the entity. Otherwise, the function returns the project-wide default parameter value obtained from the DEFAULT_PARAMETERS section.

Use the "-entity" option to retrieve the parameter from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

**Example Usage**

```tcl
## Get project-wide, default parameter value
get_parameter -name WIDTH

## Get entity-specific parameter value
get_parameter -name inst1 -to SIZE
```

**Return Value**

<table>
<thead>
<tr>

### 3.1.28.30. `is_database_version_compatible (::quartus::project)`

The following table displays information for the `is_database_version_compatible` Tcl command:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>1</td>
<td>ERROR: Illegal user option name: <code>&lt;string&gt;</code>. Specify a legal user option name. To get a list of legal names, use the <code>get_all_user_option_names</code> command.</td>
</tr>
</tbody>
</table>

**Syntax**

```
is_database_version_compatible [-h | -help] [-long_help] <project_name>
```

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `<project_name>` Project name

**Description**

Checks whether a project’s database is compatible with current version of the software. Returns 1, if the database is compatible; returns 0, otherwise. Mainly this check is for databases that are restored from another version of the software.

**Example Usage**

```tcl
# Check project database version compatibility
if [is_database_version_compatible chiptrip] {
    # proceed if compatible
}
```

### 3.1.28.31. `is_fitter_in_qhd_mode (::quartus::project)`

The following table displays information for the `is_fitter_in_qhd_mode` Tcl command:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

**Syntax**

```
is_fitter_in_qhd_mode [-h | -help] [-long_help]
```

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values

**Description**

Returns true if we’re running in QHD mode

**Example Usage**

This command currently contains no example usage.

**Return Value**

```
TCL_OK
```

**String Return**

```
INFO: Operation successful
```
### 3.1.28.32. is_project_open (::quartus::project)

The following table displays information for the `is_project_open` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`is_project_open [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td>Description</td>
<td>Checks whether a project is currently open. Returns 1, if a project is currently open; returns 0, otherwise.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>## Close the project if open</code></td>
</tr>
<tr>
<td></td>
<td><code>if [is_project_open] { project_close }</code></td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name:</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

### 3.1.28.33. open_side_revision (::quartus::project)

The following table displays information for the `open_side_revision` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`open_side_revision [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;revision_name&gt;</code></td>
</tr>
<tr>
<td>Description</td>
<td>Loads the specified revision name into memory, without making it the current revision. Required step before assignments can be modified on the side with the use of the -revision option in get/set/remove assignments. Changes are not saved until close_side_revision is called. The specified revision cannot be the current revision, and once opened, cannot be made the current revision until it is closed.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>## Create and open &quot;new_rev&quot; as a side revision. Apply an assignment and close the revision.</code></td>
</tr>
<tr>
<td></td>
<td><code>create_revision new_rev -based_on my_rev -copy_results</code></td>
</tr>
<tr>
<td></td>
<td><code>open_side_revision new_rev</code></td>
</tr>
<tr>
<td></td>
<td><code>set_global_assignment -name OPTIMIZATION_TECHNIQUE &quot;Area&quot; -revision new_rev</code></td>
</tr>
<tr>
<td></td>
<td><code>close_side_revision new_rev</code></td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name:</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
<tr>
<td></td>
<td>TCL_ERROR</td>

3.1.28.34. project_archive (::quartus::project)

The following table displays information for the `project_archive` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>`-h</td>
<td>-help`</td>
</tr>
<tr>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td><code>-all_revisions</code></td>
<td>Option to archive all revisions</td>
</tr>
<tr>
<td><code>-include_libraries</code></td>
<td>Option to include related system libraries</td>
</tr>
<tr>
<td><code>-include_outputs</code></td>
<td>Option to include output files in archive</td>
</tr>
<tr>
<td><code>-overwrite</code></td>
<td>Option to overwrite any currently existing archive file</td>
</tr>
<tr>
<td><code>-use_file_set &lt;file_set&gt;</code></td>
<td>Option to create the archive using the specified file set</td>
</tr>
<tr>
<td><code>-version_compatible_database</code></td>
<td>Option to include version-compatible database if supported</td>
</tr>
<tr>
<td><code>&lt;archive_name&gt;</code></td>
<td>Archive file name</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Archives an open project and its related files into a Quartus Prime Archive File (.qar). The description of operations is as follows:</td>
</tr>
</tbody>
</table>
## 3.1.28.35. project_clean (::quartus::project)

The following table displays information for the `project_clean` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`project_clean [-h</td>
</tr>
</tbody>
</table>

### Arguments

- `-h | -help` 
  Short help
- `-long_help` 
  Long help with examples and possible return values
- `-current_version` 
  Only clean project files for the current Quartus version.
- `-revision <revision_name>` 
  Revision to clean (if omitted, all revisions of the open project are cleaned). Revision name can contain wildcards (i.e., `*`).

### Description

Cleans database and compiler-generated output for the specified revision (or all revisions if no revision is specified). Cleaning revisions removes database and other files generated by the Quartus Prime software, including report and programming files.

This command closes the currently open project before cleaning.

Specifically, this cleans all of the following files/folders (for all matching revisions):

- `<revision>.*.rpt`
- `<revision>.*.rpt.htm`
- `<revision>.*.rpt.htm_files`
- `<revision>.*.msf`
- `<revision>.*.smsg`
- `<revision>.*.summary`
- `<revision>.*.jdi`
- `<revision>.*.pin`
- `<revision>.*.pof`
- `<revision>.*.sof`
- `<revision>.*.done`
- `<revision>.*.sld`
(all revision files in the qdb and persona directories)

</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-dont_export_assignments</td>
</tr>
</tbody>
</table>

**Description**

Closes an open project.

The assignments created or modified during an open project are committed to the Quartus Prime Settings File (.qsf) during a "project_close", unless you use the "-dont_export_assignments" option.

**Example Usage**

```tcl
## Close the project if open
if [is_project_open] {
    project_close
}
## Close the project if open
## and do not export the assignments
if [is_project_open] {
    project_close -dont_export_assignments
}
```

<tr>
<td></td>
<td>-part &lt;part&gt; Part name</td>
</tr>
<tr>
<td></td>
<td>-revision &lt;revision_name&gt; Revision name</td>
</tr>
<tr>
<td></td>
<td>&lt;project_name&gt; Project name</td>
</tr>
</tbody>
</table>

continued...
**Description**

Creates and opens a new project with the specified project name. If the "-revision" option is not specified, the project name is used to create the revision.

Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

**Example Usage**

```tcl
## Create project "chiptrip" and revision "chiptrip"
project_new chiptrip

## Create project "chiptrip" and revision "auto_max"
project_new -revision auto_max chiptrip

## Create project "chiptrip" and revision "chiptrip"
## Overwrite any Quartus Prime Settings File (.qsf) if it exists
project_new chiptrip -overwrite

## Create project "chiptrip" and revision "chiptrip"
## Set the FAMILY assignment to Stratix
project_new chiptrip -family Stratix
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>

### 3. TCL Commands and Packages

#### 3.1.28.40. `project_restore (::quartus::project)`

The following table displays information for the `project_restore` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::project</code> on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-destination &lt;directory&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-overwrite</code></td>
</tr>
<tr>
<td></td>
<td><code>-update_included_file_info</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;archive_file&gt;</code></td>
</tr>
</tbody>
</table>

**Description**

Restores a Quartus Prime Archive File (.qar) that contains the project and its related files.

By default, the archive is restored into the current directory. Use the "-destination" option to restore the files into a new directory.

By default, the command fails if the archive already contains files in the destination directory. Use the "-overwrite" option to overwrite any existing files in the destination directory.

**Example Usage**

```bash
# Restore archive and expand files into current directory
project_restore chiptrip.qar
# or
project_restore chiptrip.qar -destination

# Restore archive. Expand files into current directory, but overwrite any existing files in "."
project_restore chiptrip.qar -destination . -overwrite

# Restore project into a "restored" sub-directory
project_restore chiptrip.qar -destination "restored" -overwrite
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*continued*...
3. TCL Commands and Packages

### 3.1.28.41. remove_all_global_assignments (::quartus::project)

The following table displays information for the `remove_all_global_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>remove_all_global_assignments [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-entity &lt;entity_name&gt;</td>
<td>Entity to which assignment belongs</td>
</tr>
<tr>
<td>-fall</td>
<td>Option applies to falling edge</td>
</tr>
<tr>
<td>-name &lt;name&gt;</td>
<td>Assignment name (string pattern is matched using Tcl string matching)</td>
</tr>
<tr>
<td>-rise</td>
<td>Option applies to rising edge</td>
</tr>
<tr>
<td>-section_id &lt;section_id&gt;</td>
<td>Section id</td>
</tr>
<tr>
<td>-tag &lt;data&gt;</td>
<td>Option to tag data to this assignment</td>
</tr>
</tbody>
</table>

**Description**

Removes all matching global assignments.

The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set "*?\[" as the value. The value is matched using Tcl string matching.

This Tcl command reads the global assignments found in the Quartus Prime Settings File (.qsf). This Tcl command filters the assignments data found in the .qsf and removes the data based on the values specified by the "-name" option.

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one `CLOCK` section each containing its own set of clock assignments. To uniquely identify sections of this type, a `<Section Id>` is used. `<Section Id>` can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a `<Section Id>` and the associated `<Section Id>` description:

<table>
<thead>
<tr>
<th>Section Id</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIP</td>
<td>Same as revision name</td>
</tr>
<tr>
<td>LOGICLOCK_REGION</td>
<td>A unique name</td>
</tr>
<tr>
<td>EDA_TOOL_SETTINGS</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLIQUE</td>
<td>A unique name</td>
</tr>
<tr>
<td>BREAKPOINT</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLOCK</td>
<td>A unique name</td>
</tr>
<tr>
<td>AUTO_INSERT_SLD_NODE_ENTITY</td>
<td>A unique name</td>
</tr>
</tbody>
</table>

For entity-specific assignments, use the "-entity" option to remove the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the
FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Assignments removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

Example Usage

```tcl
## Remove all the registered source files
remove_all_global_assignments -name SOURCE_FILE

# Using wildcards
remove_all_global_assignments -name SOURCE*
```

</tr>
</tbody>
</table>

**Description**

Removes all matching instance assignment values.

The `-name` option is not case sensitive.

The `-to` and `-from` options are case sensitive.

These options can take string patterns containing special characters from the set "*?\[\]" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

`<bus name>[<bus index>]` or `<bus name>[*]`

The `<bus name>` portion is a string of alphanumeric characters.

The `<bus index>` portion is an integer greater than or equal to zero or it can be the character `*` used for string matching. Notice that the `<bus index>` is enclosed by the square brackets `[*]` and `[*]`. For example, `a[0]` and `a[*]` are supported bus names and can be used as follows:

- To match index 0 of bus `a`, type:
  `remove_all_instance_assignments -name LOCATION -to a[0]`

- To match all indices of bus `a`, type:
  `remove_all_instance_assignments -name LOCATION -to a[*]`

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus `a`, type:
remove_all_instance_assignments -name LOCATION -to "a[\escape_brackets \[\][0-2]\]\[\escape_brackets
|\]]"

For more information about escaping square brackets, type "escape_brackets -h".

This Tcl command reads the instance assignments found in the Quartus Prime Settings File (.qsf) and removes this data based on the values specified by the "-name", "-from", and "-to" options.

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a <Section Id> is used. <Section Id> can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a <Section Id> and the associated <Section Id> description:

<table>
<thead>
<tr>
<th>Section Id</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIP</td>
<td>Same as revision name</td>
</tr>
<tr>
<td>LOGICLOCK_REGION</td>
<td>A unique name</td>
</tr>
<tr>
<td>EDA_TOOL_SETTINGS</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLIQUE</td>
<td>A unique name</td>
</tr>
<tr>
<td>BREAKPOINT</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLOCK</td>
<td>A unique name</td>
</tr>
<tr>
<td>AUTO_INSERT_SLD_NODE_ENTITY</td>
<td>A unique name</td>
</tr>
</tbody>
</table>

For entity-specific assignments, use the "-entity" option to remove the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Assignments removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus:flow Tcl package) automatically call "export_assignments" before they run command-line executables.

### Example Usage

```
## Remove all the timing requirements
## Use wildcards to catch TSU_REQUIREMENT, TCO_REQUIREMENT, and others
remove_all_instance_assignments -name _REQUIREMENT

## Remove all the location assignments with
## the destination bus name "timeo".
set bus_name "timeo"
remove_all_instance_assignments -name LOCATION -to $bus_name[*]
```

### Return Value

### 3.1.28.43. remove_all_parameters (::quartus::project)

The following table displays information for the remove_all_parameters Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>remove_all_parameters [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-entity &lt;entity_name&gt; Entity to which parameter belongs</td>
</tr>
<tr>
<td></td>
<td>-fall Option applies to falling edge</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt; Parameter name (string pattern is matched using Tcl string matching)</td>
</tr>
<tr>
<td></td>
<td>-rise Option applies to rising edge</td>
</tr>
<tr>
<td></td>
<td>-tag &lt;data&gt; Option to tag data to this assignment</td>
</tr>
<tr>
<td></td>
<td>-to &lt;destination&gt; Destination of the parameter (string pattern is matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

**Description**

Removes all matching parameters.

The "-name" option is not case sensitive.

The "-to" option is case sensitive.

If the "-to" argument is specified, the function removes the parameters from the current entity. The parameters are...
removed from the PARAMETERS section of the entity. Otherwise, the function removes the project-wide default parameters obtained from the DEFAULT_PARAMETERS section.

This Tcl command filters the parameter data found in the Quartus Prime Settings File (.qsf) and removes the data based on the values specified by the "-name" and "-to" options. These options can take string patterns containing special characters from the set "::*\\[]" as values. The values are matched using Tcl string matching. Notice that the "bus index" is enclosed by the square brackets "[*]". For example, "[0]" and "[*]" are supported bus names and can be used as follows:

```tcl
remove_all_parameters -name <bus name> -to <bus index> or <bus name>[*]
```

The "bus name" portion is a string of alphanumeric characters. The "bus index" portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the "bus index" is enclosed by the square brackets "[*]". For example, "[0]" and "[*]" are supported bus names and can be used as follows:

```tcl
# To match index 0 of bus "a", type:
remove_all_parameters -name "a" -to a[0]
# To match all indices of bus "a", type:
remove_all_parameters -name "a" -to a[*]
```

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

```tcl
remove_all_parameters -name "a" -to "a\[[0-2]\]"
```

For more information about escaping square brackets, type "escape_brackets -h".

Use the "-entity" option to remove the parameters from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

The parameters removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) `export_assignments`
2) `project_close` (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

### Example Usage

```tcl
## The following 3 examples remove project-wide,
## default parameter values
remove_all_parameters -name WIDTH
remove_all_parameters -name ID
remove_all_parameters -name *

## The following 3 examples remove entity-specific
## parameter values
remove_all_parameters -name inst1 -to SIZE
remove_all_parameters -name inst1 -to "ID"
remove_all_parameters -name inst1 -to "*
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_OK</td>
<td>0</td>

<td>INFO: Removed parameter: &lt;string&gt;</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Can't find active revision name. Make sure there is an open, active revision name.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Entity does not exist or uses illegal name characters: &lt;string&gt;. Specify a legal entity name.</td>
</tr>
</tbody>
</table>

```
continued...
```
### 3.1.28.44. `resolve_file_path (::quartus::project)`

The following table displays information for the `resolve_file_path` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`resolve_file_path [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td>`-long_help</td>
</tr>
<tr>
<td></td>
<td>`&lt;file_name&gt;</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Returns the resolved full path of the specified file name. If the file does not exist, the original file name is returned.</td>
</tr>
</tbody>
</table>

The Quartus Prime software resolves relative paths by searching for the file in the following directories in the following order:

1) Project directory, which is the directory where the Quartus Prime Settings File (.qsf) is found.
2) Project database directory, which is the "db" directory found under the project directory.
3) Project library directories, which are the directories containing the user-specified libraries that are used only by the current project.
4) User library directories, which are the directories containing the user-specified libraries that are used by all Quartus Prime projects.
5) Quartus Prime library directory, which is the directory containing Quartus Prime libraries.

**Example Usage**

```tcl
project_new chiptrip -overwrite

# Set one Verilog source file assignment
set_global_assignment -name VERILOG_FILE chiptrip.v

# Display the resolved full path of the Verilog
# source file assignment
set_filename [get_global_assignment -name VERILOG_FILE]
set resolved_fullpath [resolve_file_path $filename]
puts "Full Path: $resolved_fullpath"

# Set more Verilog source file assignments
set_global_assignment -name VERILOG_FILE auto_max.v
set_global_assignment -name VERILOG_FILE speed_ch.v
set_global_assignment -name VERILOG_FILE tick_cnt.v
set_global_assignment -name VERILOG_FILE time_cnt.v

# Display the resolved full path of all the Verilog
# source file assignments
foreach file_asgn [get_all_global_assignments -name VERILOG_FILE] {
    foreach_in_collection file_asgn $file_asgns {
        # continued...
    }
```

---

### 3. TCL Commands and Packages

[Send Feedback](#)
## Each element in the collection has the following format: {}

set filename [lindex $file_asgn 2]
set resolved_fullpath [resolve_file_path $filename]
puts "Full Path: $resolved_fullpath"

3. TCL Commands and Packages

### 3.1.28.45. revision_exists (::quartus::project)

The following table displays information for the revision_exists Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>revision_exists [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>

<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-project &lt;project_name&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;revision_name&gt;</td>
</tr>
</tbody>
</table>

**Description**

Checks whether the revision exists for the specified project or currently open project.

Returns 1, if the revision exists; returns 0, otherwise.

### Example Usage

```tcl
## Check if the specified revision exists
## in the specified project
if [revision_exists -ARG(project) chiptrip speed_ch] {
    puts "Revision exists"
} else {
    puts "Revision does not exist"
}

## Create revision for the currently open project if it does not exist
## Set the current revision otherwise
project_open chiptrip
if [revision_exists speed_ch] {
    set_current_revision speed_ch
} else {
    create_revision speed_ch
}
project_close
```

|                         | TCL_ERROR | 1 | ERROR: Revision is not included in the current project: `<string>`. Use the `create_revision` command to create the revision. |

3.1.28.47. set_global_assignment (::quartus::project)

The following table displays information for the `set_global_assignment` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
</tbody>
</table>
### Description
Sets or removes a global assignment.

Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands (from the ::quartus::project Tcl package):

1) export_assignments
2) project_close (unless -dont_export_assignments is specified as an argument to project_close)

You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands execute_flow and execute_module (from the ::quartus::flow Tcl package) call "export_assignments" before they run command-line executables.

For entity-specific assignments, use the -entity option to force the assignment to specified entity. If the -entity option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

If the Quartus Prime Settings File contains a USER_LIBRARIES assignment and you call set_global_assignment to set a SEARCH_PATH or USER_LIBRARIES assignment, the existing USER_LIBRARIES assignment expands into one or more SEARCH_PATH assignments.

Note that values that begin with a dash "(-)" should be enclosed in a backslash followed by a quote. In the following example, -O2 is enclosed by " at the beginning and the end.

```
set_global_assignment -name ARM_CPP_COMMAND_LINE "-O2"
```

#### Example Usage

```
## Specify Stratix as the family to use when compiling
set_global_assignment -name FAMILY Stratix

## If the family name has empty spaces, use quotes
set_global_assignment -name FAMILY "Stratix GX"

## or remove any empty space
set_global_assignment -name FAMILY StratixGX
```

### Return Value

### Description

Sets or removes an instance assignment.

Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

For entity-specific assignments, use the "-entity" option to force the assignment to specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

### Example Usage

```tcl
# Specify a TSU_REQUIREMENT of 2ns from mypin to any register
set_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT 2ns

# Remove the TSU_REQUIREMENT from mypin to all registers
set_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT -remove

# Specify the entity to which the assignment is added,
# use the -entity option
# This is needed if the top level entity name is other than
# that of the project name
# The following command generates a top_level entity
set_instance_assignment -from "mypin" -to * -entity top_level -name TSU_REQUIREMENT 2ns
```

3.1.28.50. set_io_assignment (::quartus::project)

The following table displays information for the set_io_assignment Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
</table>

**Syntax**

```tcl
```

**Arguments**

- **-h | -help**  
  Short help

- **-long_help**  
  Long help with examples and possible return values

- **-comment <comment>**  
  Comment

- **-disable**  
  Option to disable assignment

- **-fall**  
  Option applies to falling edge

- **-io_standard <io_standard>**  
  Option to specify the io standard

---

Send Feedback  
430
Sets or removes an IO assignment.

Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

### Example Usage

```tcl
## Specify LVTTL as the IO Standard for OUTPUT_PIN_LOAD assignment
set_io_assignment 30 -name OUTPUT_PIN_LOAD -io_standard LVTTL
```

### Return Value

<tr>
<td><strong>Description</strong></td>
<td>Sets or remove a location assignment.</td>
</tr>
</tbody>
</table>

Valid location assignments, and settings for those assignments for your design are determined by the target device, package type, and pin count.

To explore possible assignments and settings for your design and device, in the Quartus Prime Assignment Editor, specify Location for Assignment Name, and then click Browse in the Value column. In the Location dialog box, explore assignable device resources in the Element list, and then use the lists that appear (based on the element selected) to determine locations.
Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

Example Usage

```tcl
set_location_assignment -to dst LOC
```

<table>

### 3.1.28.52. set_parameter (::quartus::project)

The following table displays information for the `set_parameter` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-comment &lt;comment&gt;</td>
</tr>
<tr>
<td></td>
<td>-disable</td>
</tr>
<tr>
<td></td>
<td>-fall</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-remove</td>
</tr>
<tr>
<td></td>
<td>-rise</td>
</tr>
</tbody>
</table>

continued...
### Description

Sets or removes the specified parameter name.

The "-name" option is not case sensitive.

The parameters created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

set_parameter can be used to overwrite the parameters in the top-level entity of the design. A warning will be given if the parameter can not be applied.

set_parameter assignments with "-entity" and "-to" are ignored and a critical warning is given if they are used.

### Example Usage

```tcl
## Set project-wide, default WIDTH parameter value
set_parameter -name WIDTH 8
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>

<td>ERROR: Missing &lt;&lt;string&gt;&gt; for &lt;string&gt; assignment. Specify the required &lt;string&gt;.</td>
</tr>
</tbody>
</table>
### 3.1.28.53. set_power_file_assignment (::quartus::project)

The following table displays information for the `set_power_file_assignment` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project on page 373</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td><strong>Description</strong></td>
</tr>
</tbody>
</table>
| `set_power_file_assignment [-h | -help] [-long_help] [-remove] [-saf_file <saf_file>] [-section_id <section_id>] [-to <to>] [-vcd_end_time <vcd_end_time>] [-vcd_file <vcd_file>] [-vcd_start_time <vcd_start_time>]` | Sets or removes a power input file assignment. Power input file assignments are specified using multiple global assignments, and a single instance assignment as illustrated in the following example:

- `set_global_assignment -name POWER_INPUT_FILE_NAME "test.vcd" -section_id test.vcd`
- `set_global_assignment -name POWER_INPUT_FILE_TYPE VCD -section_id test.vcd`
- `set_global_assignment -name POWER_VCD_FILE_START_TIME "10 ns" -section_id test.vcd`
- `set_instance_assignment -name POWER_READ_INPUT_FILE test.vcd -to test_design`

The power input file assignment serves as a wrapper for all of the above assignments. If the "-remove" setting is not set, the `set_power_file_assignment` will also make the following assignment to enable the use of input files:

- `set_global_assignment -name POWER_USE_INPUT_FILES ON`

If you do not specify a "-section_id", a new section identifier is created for the input file assignment. If a "-section_id" is specified and it does not already exist, it is used as the new section identifier. If a "-section_id" is specified and it does exist, the existing input file assignments are removed and a new input file assignment is created using the given parameters and section identifier.

If an entity name given by "-to" is not specified, the input file assignment applies to the top level design entity.

If the "-remove" setting is used, the input file assignment given by the "-section_id", "-vcd_file", or "-saf_file" is removed from the project.

Assignments created or modified by using this Tcl command are saved to the Quartus Prime Settings File (.qsf).

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`-h</td>
<td>-help`</td>
</tr>
<tr>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td><code>-remove</code></td>
<td>Option to remove assignment</td>
</tr>
<tr>
<td><code>-saf_file &lt;saf_file&gt;</code></td>
<td>SAF file name</td>
</tr>
<tr>
<td><code>-section_id &lt;section_id&gt;</code></td>
<td>Section id</td>
</tr>
<tr>
<td><code>-to &lt;to&gt;</code></td>
<td>Entity to which to apply power input file</td>
</tr>
<tr>
<td><code>-vcd_end_time &lt;vcd_end_time&gt;</code></td>
<td>End time for VCD file parsing</td>
</tr>
<tr>
<td><code>-vcd_file &lt;vcd_file&gt;</code></td>
<td>VCD file name</td>
</tr>
<tr>
<td><code>-vcd_start_time &lt;vcd_start_time&gt;</code></td>
<td>Start time for VCD file parsing</td>
</tr>
</tbody>
</table>

### Example Usage

```tcl
## Specify an input SAF file applied to the top level entity
## A default section will be created
set_power_file_assignment -saf_file test.saf

## Specify an input VCD file applied to design_top|counter1
## Use the given section_id to create a new section
set_power_file_assignment -vcd_file test.vcd -to design_top|counter1 -section_id test.vcd

## Update the previous input VCD file assignment to specify a start and end time
```

continued...
### Return Value

<table>

3.1.29.2. quartus::open_project (::quartus::project2)

The following table displays information for the quartus::open_project Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project2 on page 438</th>
</tr>
</thead>
</table>

continued...
### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-current_revision</td>
<td>Option to open the current revision automatically</td>
</tr>
<tr>
<td>-force</td>
<td>Option to open the project and overwrite the compilation database if the database version is incompatible.</td>
</tr>
<tr>
<td>-preserve_revision_order</td>
<td>Option to not move the revision to top in the qpf file and preserve existing revision ordering</td>
</tr>
<tr>
<td>-revision &lt;revision_name&gt;</td>
<td>Revision name</td>
</tr>
<tr>
<td>&lt;project_name&gt;</td>
<td>Project name</td>
</tr>
</tbody>
</table>

### Description

Opens an existing project. To create a new project, use the "project_new" command.

If the "-revision" option is not specified, the project name is used to open the revision.

The project_open command gives an error when the compilation database version is not compatible with the current version of Quartus Prime software. You may specify the "-force" option to avoid the error and overwrite the database.

### Example Usage

```tcl
# Open project "chiptrip" and revision "chiptrip"
quartus::open_project chiptrip

# Open project "chiptrip" and revision "auto_max"
quartus::open_project -revision auto_max chiptrip

# Get the current revision before opening
# the project with the current revision
set project_name chiptrip
set current_revision [get_current_revision $project_name]
quartus::open_project -revision $current_revision $project_name
puts [get_global_assignment -name FAMILY]
project_close
```

### Return Value

<td>-rise Option applies to rising edge</td>
</tr>
<tr>
<td></td>
<td>-tag &lt;data&gt; Option to tag data to this assignment</td>
</tr>
<tr>
<td></td>
<td>&lt;group_name&gt; Assignment group name</td>
</tr>
</tbody>
</table>

**Description**

Adds, removes, gets members of, or gets exceptions to an assignment group.

The "assignment_group" command replaces the deprecated "timegroup" command.

An assignment group is a custom group of registers and pins. You can use the "-add_member" option to specify register or pin names you want to include in the assignment group. You can use the "-add_exception" option to specify names you want to exclude from the assignment group.

You can specify the names using wildcards, that is, using "?" or "*". For example, to add all registers and pins that start with a "b" except those that start with "b|c|" to a particular assignment group named "group_b", type:

```
assignment_group *group_b* -add_member "b*" -add_exception "b|c|*
```

To remove members or exceptions from an assignment group, use the "-remove_member" or "-remove_exception" options respectively.

The "-get_members" option returns a collection of members in the assignment group. The "-get_exceptions" option returns a collection of exceptions to the assignment group. To access each element of the collection, use the Tcl command "foreach_in_collection". To see example usage, type "assignment_group -long_help" or "foreach_in_collection -long_help".

continued...
Specifying registers and pins in terms of an assignment group allows you to set timing constraints easily. For example, to make a multicycle assignment from nodes "a1" and "a2" to nodes "b1", "b2", and "b3", type the following:

```tcl
assignment_group "group_a" -add_member [list "a1" "a2"]
assignment_group "group_b" -add_member [list "b1" "b2" "b3"]
set_multicycle_assignment -from "group_a" -to "group_b" 2
```

This command sets a multicycle assignment from every member of "group_a" to every member of "group_b". Quartus Prime timing analysis is optimized to use assignment groups in handling timing constraints.

To disable assignment group assignments for the entire group, use the "-disable" option, for example:

```tcl
assignment_group "group_a" -disable
```

To disable a particular assignment group assignment, use the "-disable" option with the "-add_member" or "-add_exception" options, for example:

```tcl
assignment_group "group_a" -add_member "m1" -disable
assignment_group "group_a" -add_exception "e1" -disable
```

Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

Example Usage

```tcl
# Make timing cut assignment from nodes starting # with "r" except those starting with "r|s|" # and except those starting with "r|t|"
# to nodes "t1", "t2", and "t3"
assignment_group "tg1" -add_member "r*" -add_exception "r|s|*"
assignment_group "tg2" -add_exception "r|t|*"
assignment_group "tg2" -add_member [list "t1" "t2" "t3"]
set_timing_cut_assignment -from "group_a" -to "group_b" 2

# Remove the "t1" from a particular assignment group named "tg2"
assignment_group "tg2" -remove_member "t1"

# Display the members of a particular assignment group named "tg1"
foreach_in_collection member [assignment_group "tg1" -get_members] {
    # Print the name of the member
    puts $member
}

# Display the exceptions to a particular assignment group named "tg1"
foreach_in_collection exception [assignment_group "tg1" -get_exceptions] {
    # Print the name of the exception
    puts $exception
}
```

Return Value

</tr>
<tr>
<td></td>
<td>&lt;tcl commands&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Iterates through the specified Tcl list of Tcl commands and executes each command sequentially in batch mode. In batch mode, Tcl commands that set Quartus Prime Settings File (.qsf) assignments are optimized to prevent them from repeatedly...</td>
</tr>
</tbody>
</table>
write-locking and write-unlocking the QSF during consecutive calls, thereby slowing down the execution.

Currently, only the following commands are supported:

- assignment_group
- remove_all_global_assignments
- remove_all_instance_assignments
- remove_all_parameters
- set_global_assignment
- set_instance_assignment
- set_io_assignment
- set_location_assignment
- set_parameter
- set_power_file_assignment

Example Usage

```tcl
project_open one_wire
set tcl_cmds [list [list set_global_assignment -name FAMILY StratixII] \[list set_global_assignment -name DEVICE AUTO] \[list set_global_assignment -name TOP_LEVEL_ENTITY one_wire] \[list set_global_assignment -name SAVE_DISK_SPACE OFF] \[list set_location_assignment PIN_1 -to in1] \[list set_instance_assignment -name MULTICYCLE 4 -from in1 -to out1] \[list set_parameter -name STYLE FAST]]
execute_assignment_batch $tcl_cmds
project_close
```

### Return Value

<td>1</td>
<td>ERROR: You must open a project before you can use this command.</td>
<td></td>
</tr>
</tbody>
</table>

### 3.1.30.5. get_all_assignment_names (::quartus::project_ui)

The following table displays information for the `get_all_assignment_names` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to</th>
<th>::quartus::project_ui on page 441</th>
</tr>
</thead>
</table>

**Syntax**

`get_all_assignment_names [-h | -help] [-long_help] [-family <family>] [-module <all|ip_generate|map|tlg|fit|tan|asm|eda|drc|power|generic>] [-type <all|global|instance>]`

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-family <family>` Option to filter based on the specified device family. Defaults to all families.
- `-module <all|ip_generate|map|tlg|fit|tan|asm|eda|drc|power|generic>` Option to filter based on the specified flow module. Defaults to all.
- `-type <all|global|instance>` Option to filter based on the specified assignment type. Defaults to all.

**Description**

Returns a filtered output list of all available, matching assignment names.

The module option takes one of the following values:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip_generate</td>
<td>IP Generation assignment names</td>
</tr>
<tr>
<td>tlg</td>
<td>Support Logic Generation assignment names</td>
</tr>
<tr>
<td>map</td>
<td>Analysis &amp; Synthesis assignment names</td>
</tr>
<tr>
<td>fit</td>
<td>Fitter assignment names</td>
</tr>
<tr>
<td>asm</td>
<td>Assembler assignment names</td>
</tr>
<tr>
<td>eda</td>
<td>EDA Netlist Writer assignment names</td>
</tr>
<tr>
<td>drc</td>
<td>Design Assistant assignment names</td>
</tr>
<tr>
<td>power</td>
<td>Power Analyzer assignment names</td>
</tr>
<tr>
<td>generic</td>
<td>Other assignment names not included in any of the above flow modules</td>
</tr>
<tr>
<td>tan</td>
<td>Classic Timing Analyzer assignment names</td>
</tr>
<tr>
<td>all</td>
<td>All assignment names</td>
</tr>
</tbody>
</table>

**Example Usage**

```bash
## Print out all available global assignments
foreach i [get_all_assignment_names -type global] {
    puts $i
}
```
## Print out all available global assignments for the Stratix family

```tcl
foreach i [get_all_assignment_names -type global -family Stratix]
    puts $i
}
```

## Print out all available global assignments required by the Analysis & Synthesis module for the Stratix family

```tcl
foreach i [get_all_assignment_names -type global -family Stratix -module map]
    puts $i
}
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>

<td>Returns only instance assignments.</td>
</tr>
<tr>
<td>parameter</td>
<td>get_all_parameters</td>
<td>Returns only parameter assignments.</td>
</tr>
</tbody>
</table>

The "-name" option is not case sensitive.

The "-to" and "-from" options are case sensitive.

These options can take string patterns containing special characters from the set "*?\[]" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

<bus name>[<bus index>] or <bus name>[*]

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the <bus index> is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[*]" are supported bus names and can be used as follows:

# To match index 0 of bus "a", type:
get_all_assignments -type instance -name LOCATION -to a[0]

# To match all indices of bus "a", type:
get_all_assignments -type instance -name LOCATION -to a[*]

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

get_all_assignments -type instance LOCATION -to a[escape_brackets \[\]|\[0-2\]|escape_brackets \[\]]

For more information about escaping square brackets, type "escape_brackets -h".

This Tcl command reads in the global, instance, and parameter assignments found in the Quartus Prime Settings File (.qsf) and reads in the default assignments found inside the Quartus Prime Default Settings File (.qdf).

If you tagged data by making assignments with the -tag option, then the information can be searched using the -tag option.

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one clock section each containing its own set of clock assignments. To uniquely identify sections of this type, use the -section_id option.

For entity-specific assignments, use the "-entity" option to retrieve assignments from a specific entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Example Usage

```tcl
# View all the timing requirements using wildcards
# to match TSU_REQUIREMENT, TCO_REQUIREMENT,
# and others.
foreach_in_collection asgn_id [get_all_assignments -type instance -name *_REQUIREMENT] {
    set from   [get_assignment_info $asgn_id -from]
    set to     [get_assignment_info $asgn_id -to]
    set name   [get_assignment_info $asgn_id -name]
    set value  [get_assignment_info $asgn_id -value]
    set entity [get_assignment_info $asgn_id -entity]
    set sid    [get_assignment_info $asgn_id -section_id]
    set tag    [get_assignment_info $asgn_id -tag]
    # Other code...
}
```
puts "$entity: $name ($from -> $to) = $value"
}

## View all global assignments
foreach_in_collection asgn_id [get_all_assignments -type global -name *] {
    set name   [get_assignment_info $asgn_id -name]
    set value  [get_assignment_info $asgn_id -value]
    set entity [get_assignment_info $asgn_id -entity]
    set tag    [get_assignment_info $asgn_id -tag]
    puts "$entity: $name = $value"
}

## View all project-wide default parameter values
foreach_in_collection asgn_id [get_all_assignments -type parameter -name *] {
    set name  [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    set tag    [get_assignment_info $asgn_id -tag]
    puts "$name = $value"
}

## View all entity-specific parameter values
foreach_in_collection asgn_id [get_all_assignments -type parameter -name * -to *] {
    set dest  [get_assignment_info $asgn_id -to]
    set name  [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    set tag    [get_assignment_info $asgn_id -tag]
    puts "$name (-> $dest) = $value"
}

## View all default assignments
foreach_in_collection asgn_id [get_all_assignments -type default -name * -to *] {
    set name    [get_assignment_info $asgn_id -name]
    set value   [get_assignment_info $asgn_id -value]
    puts "$name = $value"
}

</tbody>
</table>

**Description**

Returns a filtered output collection of all matching global assignment values. To access each element of the output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".

The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set "*?\[]" as the value. The value is matched using Tcl string matching.

This Tcl command reads the global assignments found in the Quartus Prime Settings File (.qsf). This Tcl command filters the assignment data in the .qsf and outputs the data based on the values given by the "-name" option.

Each element of the collection is a list with the following format:
```
{ {<Section Id>} {<Assignment name>} {<Assignment value>} }
```

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a <Section Id> is used. <Section Id> can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a <Section Id> and

<td>A unique name</td>
</tr>
<tr>
<td>CLOCK</td>
<td>A unique name</td>
</tr>
<tr>
<td>AUTO_INSERT_SLD_NODE_ENTITY</td>
<td>A unique name</td>
</tr>
</tbody>
</table>

For entity-specific assignments, use the "-entity" option to retrieve the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Example Usage

```tcl
# Print out all the registered source files
set file_asgn_col [get_all_global_assignments -name SOURCE_FILE]
foreach_in_collection file_asgn $file_asgn_col {
    # Each element in the collection has the following format: {} {SOURCE_FILE} {<file_name>}
    puts [lindex $file_asgn 2]
} # Using wildcards
get_all_global_assignments -name SOURCE*
```

### 3.1.30.8. get_all_instance_assignments (::quartus::project_ui)

The following table displays information for the `get_all_instance_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project_ui on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-entity &lt;entity_name&gt;</td>
</tr>
<tr>
<td></td>
<td>-from &lt;source&gt;</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-section_id &lt;section_id&gt;</td>
</tr>
<tr>
<td></td>
<td>-tag &lt;data&gt;</td>
</tr>
<tr>
<td></td>
<td>-to &lt;destination&gt;</td>
</tr>
</tbody>
</table>

**Description**

Returns a filtered output collection of all matching instance assignment values. To access each element of this output collection, use the Tcl command “foreach_in_collection”. To see example usage, type “foreach_in_collection -long_help”.

The “-name” option is not case sensitive.

The “-to” and “-from” options are case sensitive.

These options can take string patterns containing special characters from the set ‘\*?\[\]’ as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

- `<bus name>[<bus index>]` or `<bus name>[*]`
- The `<bus name>` portion is a string of alphanumeric characters.
- The `<bus index>` portion is an integer greater than or equal to zero or it can be the character ‘*’ used for string matching.
- Notice that the `<bus index>` is enclosed by the square brackets ‘[‘ and ‘]’. For example, ‘a[0]’ and ‘a[*]’ are supported bus names and can be used as follows:

```
# To match index 0 of bus "a", type:
get_all_instance_assignments -name LOCATION -to a[0]
```

```
# To match all indices of bus "a", type:
get_all_instance_assignments -name LOCATION -to a[*]
```

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus “a”, type:

```
get_all_instance_assignments -name LOCATION -to "a[escape_brackets \[\]\[0-2]\]" escape_brackets
```
For more information about escaping square brackets, type "escape_brackets -h".

This Tcl command reads in the instance assignments found in the Quartus Prime Settings File (.qsf). This Tcl command filters the assignments data found in the .qsf and outputs the data based on the values specified by the "-name", "-from", and "-to" options.

Each element of the collection is a list with the following format:

\[\{ \langle Section Id\rangle \} \{ \langle Source\rangle \} \{ \langle Destination\rangle \} \{ \langle Assignment name\rangle \} \{ \langle Assignment value\rangle \} \]

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a <Section Id> is used. <Section Id> can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a <Section Id> and the associated <Section Id> description:

<table>
<thead>
<tr>
<th>Section Id</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIP</td>
<td>Same as revision name</td>
</tr>
<tr>
<td>LOGICLOCK_REGION</td>
<td>A unique name</td>
</tr>
<tr>
<td>EDA_TOOL_SETTINGS</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLIQUE</td>
<td>A unique name</td>
</tr>
<tr>
<td>BREAKPOINT</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLOCK</td>
<td>A unique name</td>
</tr>
<tr>
<td>AUTO_INSERT_SLD_NODE_ENTITY</td>
<td>A unique name</td>
</tr>
</tbody>
</table>

For entity-specific assignments, use the "-entity" option to retrieve the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Example Usage

```tcl
## Print out all the timing requirements
## using the foreach_in_collection method
## and others
set asgn_col [get_all_instance_assignments -name *_REQUIREMENT]
foreach_in_collection asgn $asgn_col {
    ## Each element in the collection has the following
    ## format: [{ ()} {<Source>} {<Destination>} {<Assignment name>} {<Assignment value>}] |
    set from [lindex $asgn 1]
    set to [lindex $asgn 2]
    set name [lindex $asgn 3]
    set value [lindex $asgn 4]
    puts "$name ($from -> $to) = $value"
}
```

| Arguments               | -h | -help                                     |
|                         | Short help                                 |
|                         | -long_help                                 |
|                         | Long help with examples and possible return values |
| -entity <entity_name>   | Entity to which parameter belongs           |
| -name <name>            | Parameter name (string pattern is matched using Tcl string matching) |
| -tag <data>             | Option to tag data to this assignment       |
| -to <destination>       | Destination of the parameter (string pattern is matched using Tcl string matching) |
| Description             | Returns a filtered output collection of all matching parameter values. To access each element of this output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".                        |
|                         | The "-name" option is not case sensitive.   |
|                         | The "-to" option is case sensitive.         |
|                         | If the "-to" argument is specified, the function returns the parameter values for the current entity. The values are retrieved from the PARAMETERS section of the entity. Otherwise, the function returns the project-wide default parameter values obtained from the DEFAULT_PARAMETERS section. |
|                         | This Tcl command filters the parameter data found in the Quartus Prime Settings File (.qsf) and outputs the data based on the values specified by the "-name" and "-to" options. These |

continued...
options can take string patterns containing special characters from the set "**?\[]" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

<bus name>[<bus index>] or <bus name>[*]

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character '*' used for string matching. Notice that the <bus index> is enclosed by the square brackets "["] and "]". For example, "a[0]" and "a[*]" are supported bus names and can be used as follows:

# To match index 0 of bus "a", type:
get_all_parameters -name * -to a[0]

# To match all indices of bus "a", type:
get_all_parameters -name * -to a[*]

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

get_all_parameters -name * -to "a[escape_brackets \[\]|0-2|]escape_brackets \]"

For more information about escaping square brackets, type "escape_brackets -h".

Each element of the collection is a list with the following format:

| (<Destination>) | (<Parameter name>) | (<Parameter value>) |

Use the "-entity" option to retrieve the parameter values from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Example Usage

```tcl
## Display all project-wide default parameter values
foreach_in_collection parameter [get_all_parameters -name *] {
    set name [lindex $parameter 1]
    set value [lindex $parameter 2]
    ## Now, display the content of the parameter
    puts "Parameter Name ($name)"
    puts "Parameter Value ($value)"
}

## Display all entity-specific parameter values
foreach_in_collection parameter [get_all_parameters -name * -to *] {
    set dest [lindex $parameter 0]
    set name [lindex $parameter 1]
    set value [lindex $parameter 2]
    ## Now, display the content of the parameter
    puts "Destination ($dest)"
    puts "Parameter Name ($name)"
    puts "Parameter Value ($value)"
}
```

</tbody>
</table>

**Description**

Returns a filtered output collection of all matching default assignment values. To access each element of the output collection, use the Tcl command `foreach_in_collection`. To see example usage, type `foreach_in_collection -long_help`.

The `-name` option is not case sensitive. This option can take string patterns containing special characters from the set `"*?\[]"` as the value. The value is matched using Tcl string matching.

This Tcl command reads in the default assignments found inside the Quartus Prime Default Settings File (.qdf). It filters the assignments data found inside the .qdf and outputs the data based on the values specified by the `-name` option.

Each element of the collection is a list with the following format:

```
{ {<Section Id>} {<Assignment name>} {<Assignment value>} }
```

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a `<Section Id>` is used. `<Section Id>` can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a `<Section Id>` and the associated `<Section Id>` description:

<table>

<tr>
<td>CLOCK</td>
<td>A unique name</td>
</tr>
<tr>
<td>AUTO_INSERT_SLD_NODE_ENTITY</td>
<td>A unique name</td>
</tr>
</tbody>
</table>

**Example Usage**

```tcl
## Print out all the default assignments using
## the foreach_in_collection method
set default_asgns_col [get_all_quartus_defaults]
foreach_in_collection default $default_asgns_col {
    set sect_id [lindex $default 0]
    continued...
```
set name [lindex $default 1]
set value [lindex $default 2]

## Now, display the content of the assignment
puts "Section ID ($sect_id)"
puts "Assignment Name ($name)"
puts "Assignment Value ($value)"
}

## Using wildcards
set default_asgns_col [get_all_quartus_defaults -name *]
foreach_in_collection default $default_asgns_col {
    set sect_id [lindex $default 0]
    set name [lindex $default 1]
    set value [lindex $default 2]
    ## Now, display the content of the assignment
    puts "Section ID ($sect_id)"
    puts "Assignment Name ($name)"
    puts "Assignment Value ($value)"
}

<td>-get_tcl_command: Option to get the tcl command that sets the assignment</td>
</tr>
</tbody>
</table>

continued...
### get_assignment_info

**Description**

Returns information for the assignment id based on the specified option.

The assignment id is obtained from the "get_all_assignments" Tcl command.

**Example Usage**

```tcl
foreach_in_collection asgn_id [get_all_assignments -type instance -name *] {
    set from   [get_assignment_info $asgn_id -from]
    set to     [get_assignment_info $asgn_id -to]
    set name   [get_assignment_info $asgn_id -name]
    set value  [get_assignment_info $asgn_id -value]
    set entity [get_assignment_info $asgn_id -entity]
    set tag    [get_assignment_info $asgn_id -tag]
    puts "$entity: $name ($from -> $to) = $value"
}
```

### Return Value

<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Illegal assignment id: &lt;string&gt;. Specify a legal assignment id that was retrieved from the Tcl command get_all_assignments.</td>
</tr>
</tbody>
</table>

### get_assignment_name_info

**Tcl Package and Version**

Belongs to ::quartus::project_ui on page 441

**Syntax**

get_assignment_name_info [-h | -help] [-long_help] <name>

**Arguments**

- `-h` | `-help`: Short help
- `-long_help`: Long help with examples and possible return values
- `<name>`: Assignment name

**Description**

Returns information for the specified assignment name.

**Example Usage**

```tcl
## View information for all assignment names
foreach name [get_all_assignment_names] {
    puts [get_assignment_name_info $name]
}
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>

<tr>
<td></td>
<td><strong>-name &lt;name&gt;</strong></td>
</tr>
<tr>
<td></td>
<td><strong>-section_id &lt;section_id&gt;</strong></td>
</tr>
<tr>
<td></td>
<td><strong>-tag &lt;data&gt;</strong></td>
</tr>
</tbody>
</table>

**Description**

Returns the value of the global assignment.

The "-name" option is not case sensitive.

For entity-specific assignments, use the "-entity" option to retrieve the assignment from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

**Example Usage**

```tcl
## Get the value of the FAMILY assignment
get_global_assignment -name FAMILY
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>

### 3.1.30.17. get_instance_assignment (::quartus::project_ui)

The following table displays information for the `get_instance_assignment` Tcl command:

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Arguments</th>
</tr>
</thead>
<tbody>
<tr>
<td>`-h</td>
</tr>
<tr>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td><code>-entity &lt;entity_name&gt;</code> Entity to which assignment belongs</td>
</tr>
<tr>
<td><code>-from &lt;source&gt;</code> Source of assignment</td>
</tr>
<tr>
<td><code>-front</code> Option to return the first assignment if there is more than one assignment found</td>
</tr>
<tr>
<td><code>-name &lt;name&gt;</code> Assignment name</td>
</tr>
<tr>
<td><code>-section_id &lt;section_id&gt;</code> Section id</td>
</tr>
<tr>
<td><code>-tag &lt;data&gt;</code> Option to tag data to this assignment</td>
</tr>
<tr>
<td><code>-to &lt;destination&gt;</code> Destination of assignment</td>
</tr>
</tbody>
</table>

**Description**

Returns the value of the instance assignment.

The `-name` option is not case sensitive. The `-entity`, `-to`, and `-from` options are case sensitive.

For entity-specific assignments, use the `-entity` option to retrieve the assignment from the specified entity. If the `-entity` option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.
Example Usage

```tcl
## Get the TSU_REQUIREMENT from mypin to any register
set value [get_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT]
puts "TSU_REQUIREMENT(mypin->*) = $value"
```

<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help: Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-tag &lt;data&gt;: Option to tag data to this assignment</td>
</tr>
</tbody>
</table>

3. TCL Commands and Packages
### Description

Returns the value of a location assignment.

The "-chip" option is not case sensitive.

The "-to" option is case sensitive.

### Example Usage

```bash
get_location_assignment -to dst
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>

<td>ERROR: Missing destination for assignment. Specify the destination for the assignment.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: You must open a project before you can use this command.</td>
</tr>
</tbody>
</table>

### 3.1.30.19. get_parameter (::quartus::project_ui)

The following table displays information for the `get_parameter` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to: <code>::quartus::project_ui</code> on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_parameter [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>`-long_help</td>
</tr>
<tr>
<td></td>
<td>Entity to which parameter belongs</td>
</tr>
<tr>
<td></td>
<td><code>-entity &lt;entity_name&gt;</code></td>
</tr>
<tr>
<td></td>
<td>Parameter name</td>
</tr>
<tr>
<td></td>
<td><code>-name &lt;name&gt;</code></td>
</tr>
<tr>
<td></td>
<td>Option to tag data to this assignment</td>
</tr>
<tr>
<td></td>
<td><code>-tag &lt;data&gt;</code></td>
</tr>
<tr>
<td></td>
<td>Destination of parameter</td>
</tr>
<tr>
<td></td>
<td><code>-to &lt;destination&gt;</code></td>
</tr>
</tbody>
</table>

### Description

Returns the value of the parameter.

The "-name" option is not case sensitive.

The "-to" option is case sensitive.

If the "-to" argument is specified, the function returns the parameter value for the current entity. The value is retrieved from the PARAMETERS section of the entity. Otherwise, the function returns the project-wide default parameter value obtained from the DEFAULT_PARAMETERS section.

If the "-entity" option is specified, the function returns the parameter value for the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

### Example Usage

```bash
## Get project-wide, default parameter value
get_parameter -name WIDTH

## Get entity-specific parameter value
get_parameter -name inst1 -to SIZE
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: You must open a project before you can use this command.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Can't find active revision name. Make sure there is an open, active revision name.</td>
</tr>
</tbody>
</table>
TCL_OK 0 INFO: Operation successful
TCL_ERROR 1 ERROR: Can't find active revision name. Make sure there is an open, active revision name.
TCL_ERROR 1 ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
TCL_ERROR 1 ERROR: You must open a project before you can use this command.
TCL_ERROR 1 ERROR: Illegal default parameter: <string>. Specify a legal default parameter name.
TCL_ERROR 1 ERROR: Illegal parameter: <string>. Specify a legal parameter name.
TCL_ERROR 1 ERROR: An unknown error has occured.

### 3.1.30.20. get_project_directory (::quartus::project_ui)

The following table displays information for the `get_project_directory` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project_ui on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_project_directory [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`[-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td>Description</td>
<td>Returns the project directory for currently open project.</td>
</tr>
<tr>
<td>Example Usage</td>
<td><code>project_open one_wire</code></td>
</tr>
<tr>
<td></td>
<td><code># Print the current project directory</code></td>
</tr>
<tr>
<td></td>
<td><code>puts [get_project_directory]</code></td>
</tr>
<tr>
<td></td>
<td><code>project_close</code></td>
</tr>
</tbody>
</table>

<table>
<thead>

### 3.1.30.21. get_project_revisions (::quartus::project_ui)

The following table displays information for the `get_project_revisions` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project_ui on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_project_revisions [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>&lt;project_name&gt;</code> Project name</td>
</tr>
</tbody>
</table>

**continued...**
Returns a list of revisions included in the specified project. If the project name is not specified, the current project name is used by default.

The first element in the list of revisions is the current revision and is the same as the return value for the "get_current_revision" command.

Example Usage

```tcl
# Set the device family assignment to Stratix for all revisions
project_open chiptrip
set original_revision [get_current_revision]
foreach revision [get_project_revisions] {
  puts "$revision"
  set_current_revision $revision
  set_global_assignment -name FAMILY Stratix
  export_assignments
}
set_current_revision $original_revision
project_close

# Open the project with the first available revision and set the device family assignment to Stratix
set revision [lindex [get_project_revisions chiptrip] 0]
open_project -revision $revision chiptrip
set_global_assignment -name FAMILY Stratix
project_close
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>

</table>

Example Usage

```tcl
## Get the value for the user option
## *TALKBACK_ENABLED*
set value [get_user_option -name TALKBACK_ENABLED]
puts *TALKBACK_ENABLED = $value* continued...```
3.1.30.23. `is_project_open` (::quartus::project_ui)

The following table displays information for the `is_project_open` Tcl command:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td></td>
<td>ERROR: Illegal user option name: <code>&lt;string&gt;</code>. Specify a legal user option name. To get a list of legal names, use the get_all_user_option_names command.</td>
</tr>
</tbody>
</table>

### Example Usage

```tcl
## Close the project if open
if [is_project_open] {
    project_close
}
```

3.1.30.24. `project_archive` (::quartus::project_ui)

The following table displays information for the `project_archive` Tcl command:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### Description

Archives an open project and its related files into a Quartus Prime Archive File (.qar). 

### Arguments

- `-h | -help` - Short help
- `-long_help` - Long help with examples and possible return values
- `-all_revisions` - Option to archive all revisions
- `-include_libraries` - Option to include related system libraries
- `-include_outputs` - Option to include output files in archive
- `-overwrite` - Option to overwrite any currently existing archive file
- `-use_file_set <file_set>` - Option to create the archive using the specified file set
- `-version_compatible_database <archive_name>` - Option to include version-compatible database if supported
- `<archive_name>` - Archive file name
The description of operations is as follows:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>use_file_set</td>
<td>Creates the archive using the specified file set. By default, the 'basic' file set is used. For more information about file sets, type: quartus_sh --archive -list_file_sets</td>
</tr>
<tr>
<td>all_revisions</td>
<td>Archives all revisions.</td>
</tr>
<tr>
<td>overwrite</td>
<td>Overwrites existing archive file.</td>
</tr>
<tr>
<td>include_outputs</td>
<td>Includes output files in archive.</td>
</tr>
<tr>
<td>include_libraries</td>
<td>Includes related Megafunction and IP library files.</td>
</tr>
<tr>
<td>version_compatible_database</td>
<td>Includes version-compatible database if supported.</td>
</tr>
</tbody>
</table>

Example Usage

```plaintext
## Default mode: Archive current revisions without output files or libraries
project_archive chiptrip.qar

## Archive all revisions without output files or libraries
project_archive chiptrip.qar -all_revisions

## Archive current revision with version-compatible database if supported
project_archive chiptrip.qar -version_compatible_database

## Same as first one, but overwrite any existing archive file
project_archive chiptrip.qar -overwrite

## Include output files and libraries
project_archive chiptrip.qar -include_outputs -include_libraries
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>

<tr>
<td></td>
<td>-dont_export_assignments</td>
</tr>
<tr>
<td>Description</td>
<td>Closes an open project. The assignments created or modified during an open project</td>
</tr>
</tbody>
</table>

continued...
are committed to the Quartus Prime Settings File (.qsf) during a
"project_close", unless you use the "-dont_export_assignments" option.

Example Usage

```tcl
## Close the project if open
if [is_project_open] {
    project_close
}
## Close the project if open
## and do not export the assignments
if [is_project_open] {
    project_close -dont_export_assignments
}
```

Return Value

<table>
<thead>

<td><code>&lt;project_name&gt;</code> Project name</td>
</tr>
<tr>
<td>Description</td>
<td>Checks whether a project exists. Returns 1, if a project exists; returns 0, otherwise.</td>
</tr>
</tbody>
</table>

Example Usage

```tcl
## Create project if one does not exist.
## Open existing project otherwise.
if [project_exists chiptrip] {
    project_open chiptrip
} else {
    project_new chiptrip
}
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
### 3.1.30.27. `project_new (::quartus::project_ui)`

The following table displays information for the `project_new` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::project_ui</code> on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`project_new [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-family &lt;family&gt;</td>
<td>Family name</td>
</tr>
<tr>
<td>-overwrite</td>
<td>Option to overwrite existing project and revision</td>
</tr>
<tr>
<td>-part &lt;part&gt;</td>
<td>Part name</td>
</tr>
<tr>
<td>-revision &lt;revision_name&gt;</td>
<td>Revision name</td>
</tr>
<tr>
<td>&lt;project_name&gt;</td>
<td>Project name</td>
</tr>
</tbody>
</table>

**Description**

Creates and opens a new project with the specified project name.

If the "-revision" option is not specified, the project name is used to create the revision.

Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) `export_assignments`
2) `project_close` (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the `::quartus::project` Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the `::quartus::flow` Tcl package) automatically call "export_assignments" before they run command-line executables.

**Example Usage**

```tcl
# Create project "chiptrip" and revision "chiptrip"
project_new chiptrip

# Create project "chiptrip" and revision "auto_max"
project_new -revision auto_max chiptrip

# Create project "chiptrip" and revision "chiptrip" and overwrite any Quartus Prime Settings File (.qsf) if it exists
project_new chiptrip -overwrite

# Create project "chiptrip" and revision "chiptrip" and set the FAMILY assignment to Stratix
project_new chiptrip -family Stratix
```

**Return Value**

<table>
<thead>
<tr>
<th>Code</th>
<th>Code Name</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>TCL_OK</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>1</td>
<td>TCL_ERROR</td>
<td>ERROR: The <code>-&lt;string&gt;</code> option must also be used when you use the <code>-&lt;string&gt;</code> option. Specify both options.</td>
</tr>
<tr>
<td>1</td>
<td>TCL_ERROR</td>
<td>ERROR: Can't create project because device and family are mismatch: <code>&lt;string&gt;</code> and <code>&lt;string&gt;</code>.</td>
</tr>
<tr>
<td>1</td>
<td>TCL_ERROR</td>
<td>ERROR: Can't create project because device is not installed: <code>&lt;string&gt;</code>.</td>
</tr>
<tr>
<td>1</td>
<td>TCL_ERROR</td>
<td>ERROR: Can't create project because family requires specifying the part: <code>&lt;string&gt;</code>.</td>
</tr>
</tbody>
</table>

*continued...*
The following table displays information for the `project_open` Tcl command:

<table>
<thead>
<tr>
<th>Tc Package and Version</th>
<th>Belongs to <code>::quartus::project_ui</code> on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`project_open [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>`-h</td>
<td>-help`</td>
</tr>
<tr>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td><code>-current_revision</code></td>
<td>Option to open the current revision automatically</td>
</tr>
<tr>
<td><code>-error_on_incompatible_database</code></td>
<td>Option not to open the project and issue and error if the database version is incompatible</td>
</tr>
<tr>
<td><code>-revision &lt;revision_name&gt;</code></td>
<td>Revision name</td>
</tr>
<tr>
<td><code>&lt;project_name&gt;</code></td>
<td>Project name</td>
</tr>
</tbody>
</table>

**Description**

Opens an existing project. To create a new project, use the "project_new" command.

If the "-revision" option is not specified, the project name is used to open the revision.

By default, opening the project overwrites the database created in a different version of the Quartus Prime software. However, if the "-error_on_incompatible_database" option is
specified, instead of opening the project, an error is issued
when the database version differs from the current version of the
Quartus Prime software.

Example Usage

```tcl
# Open project "chiptrip" and revision "chiptrip"
project_open chiptrip

# Open project "chiptrip" and revision "auto_max"
project_open -revision auto_max chiptrip

# Get the current revision before opening
# the project with the current revision
set project_name chiptrip
set current_revision [get_current_revision $project_name]
project_open -revision $current_revision $project_name
puts [get_global_assignment -name FAMILY]
project_close
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

3.1.30.29. `project_restore (::quartus::project_ui)`

The following table displays information for the `project_restore` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::project_ui</code> on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
</tbody>
</table>
### Description

Restores a Quartus Prime Archive File (.qar) that contains the project and its related files.

By default, the archive is restored into the current directory. Use the "-destination" option to restore the files into a new directory.

By default, the command fails if the archive already contains files in the destination directory. Use the "-overwrite" option to overwrite any existing files in the destination directory.

### Example Usage

```bash
## Restore archive and expand files into current directory
project_restore chiptrip.qar
## or
project_restore chiptrip.qar -destination
## Restore archive. Expand files into current directory, but overwrite any existing files in ".".
project_restore chiptrip.qar -destination . -overwrite
## Restore project into a "restored" subdirectory
project_restore chiptrip.qar -destination "restored" -overwrite
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Can't run Tcl command while a process is in progress: <code>&lt;string&gt;</code>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Error(s) found while restoring the archive. See error message(s) for details.</td>
</tr>
</tbody>
</table>

### 3.1.30.30. remove_all_global_assignments (::quartus::project_ui)

The following table displays information for the `remove_all_global_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project_ui on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>remove_all_global_assignments [-h</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-entity &lt;entity_name&gt;</td>
<td>Entity to which assignment belongs</td>
</tr>
<tr>
<td>-name &lt;name&gt;</td>
<td>Assignment name (string pattern is matched using Tcl string matching)</td>
</tr>
<tr>
<td>-section_id &lt;section_id&gt;</td>
<td>Section id</td>
</tr>
<tr>
<td>-tag &lt;data&gt;</td>
<td>Option to tag data to this assignment</td>
</tr>
</tbody>
</table>
Removes all matching global assignments.

The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set "*?\[]" as the value. The value is matched using Tcl string matching.

This Tcl command reads the global assignments found in the Quartus Prime Settings File (.qsf). This Tcl command filters the assignments data found in the .qsf and removes the data based on the values specified by the "-name" option.

Certain sections in the .qsf can appear more than once. For example, because there may be more than one CLOCK section used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a <Section Id> is used. A <Section Id> can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a <Section Id> and the associated <Section Id> description:

<table>
<thead>
<tr>
<th>Section Id</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIP</td>
<td>Same as revision name</td>
</tr>
<tr>
<td>LOGICLOCK_REGION</td>
<td>A unique name</td>
</tr>
<tr>
<td>EDA_TOOL_SETTINGS</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLIQUE</td>
<td>A unique name</td>
</tr>
<tr>
<td>BREAKPOINT</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLOCK</td>
<td>A unique name</td>
</tr>
<tr>
<td>AUTO_INSERT_SLD_NODE_ENTITY</td>
<td>A unique name</td>
</tr>
</tbody>
</table>

For entity-specific assignments, use the "-entity" option to remove the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Assignments removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

### Example Usage

```tcl
## Remove all the registered source files
remove_all_global_assignments -name SOURCE_FILE

# Using wildcards
remove_all_global_assignments -name SOURCE*
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_OK</td>

| TCL_ERROR | 1  | ERROR: An unknown error has occured. |

### 3.1.30.31. remove_all_instance_assignments (::quartus::project_ui)

The following table displays information for the `remove_all_instance_assignments` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project_ui on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`remove_all_instance_assignments [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help: Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-entity &lt;entity_name&gt;: Entity to which assignment belongs</td>
</tr>
<tr>
<td></td>
<td>-from &lt;source&gt;: Source of the assignment (string pattern is matched using Tcl string matching)</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;: Assignment name (string pattern is matched using Tcl string matching)</td>
</tr>
<tr>
<td></td>
<td>-section_id &lt;section_id&gt;: Section id</td>
</tr>
<tr>
<td></td>
<td>-tag &lt;data&gt;: Option to tag data to this assignment</td>
</tr>
<tr>
<td></td>
<td>-to &lt;destination&gt;: Destination of the assignment (string pattern is matched using Tcl string matching)</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Removes all matching instance assignment values.</td>
</tr>
</tbody>
</table>

The "-name" option is not case sensitive.  
The "-to" and "-from" options are case sensitive.

*continued...*
These options can take string patterns containing special characters from the set "*?\[]" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

<bus name>[<bus index>] or <bus name>[*]

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the <bus index> is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[*]" are supported bus names and can be used as follows:

# To match index 0 of bus "a", type:
remove_all_instance_assignments -name LOCATION -to a[0]

# To match all indices of bus "a", type:
remove_all_instance_assignments -name LOCATION -to a[*]

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

remove_all_instance_assignments -name LOCATION -to "a[escape_brackets \[\]\[0-2\]\]escape_brackets \[\]]"

For more information about escaping square brackets, type "escape_brackets -h".

This Tcl command reads the instance assignments found in the Quartus Prime Settings File (.qsf) and removes this data based on the values specified by the "-name", "-from", and "-to" options.

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a <Section Id> is used. A <Section Id> can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a <Section Id> and the associated <Section Id> description:

<table>
<thead>
<tr>
<th>Section Id</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIP</td>
<td>Same as revision name</td>
</tr>
<tr>
<td>LOGICLOCK_REGION</td>
<td>A unique name</td>
</tr>
<tr>
<td>EDA_TOOL_SETTINGS</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLIQUE</td>
<td>A unique name</td>
</tr>
<tr>
<td>BREAKPOINT</td>
<td>A unique name</td>
</tr>
<tr>
<td>CLOCK</td>
<td>A unique name</td>
</tr>
<tr>
<td>AUTO_INSERT_SLD_NODE_ENTITY</td>
<td>A unique name</td>
</tr>
</tbody>
</table>

For entity-specific assignments, use the "-entity" option to remove the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

Assignments removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

### Example Usage

```tcl
# Remove all the timing requirements
# Use wildcards to catch TSU_REQUIREMENT, TCO_REQUIREMENT, and others
remove_all_instance_assignments -name *_REQUIREMENT

# Remove all the location assignments with the destination bus name "timeo".
# set bus_name "timeo"
# set bus_name "timeo"
remove_all_instance_assignments -name LOCATION -to "$bus_name[*]"

### 3.1.30.32. remove_all_parameters (::quartus::project_ui)

The following table displays information for the `remove_all_parameters` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project_ui on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>remove_all_parameters [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-entity &lt;entity_name&gt; Entity to which parameter belongs</td>
</tr>
</tbody>
</table>
-name <name> 
Parameter name (string pattern is matched using Tcl string matching)

-tag <data> 
Option to tag data to this assignment

-to <destination> 
Destination of the parameter (string pattern is matched using Tcl string matching)

Description

Removes all matching parameters.

The "-name" option is not case sensitive.

The "-to" option is case sensitive.

If the "-to" argument is specified, the function removes the parameters from the current entity. The parameters are removed from the PARAMETERS section of the entity. Otherwise, the function removes the project-wide default parameters obtained from the DEFAULT_PARAMETERS section.

This Tcl command filters the parameter data found in the Quartus Prime Settings File (.qsf) and removes the data based on the values specified by the "-name" and "-to" options. These options can take string patterns containing special characters from the set "*?\[\]" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

<bus name> or <bus name>[*]

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the <bus index> is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[*]" are supported bus names and can be used as follows:

# To match index 0 of bus "a", type:
remove_all_parameters -name "*" -to a[0]

# To match all indices of bus "a", type:
remove_all_parameters -name "*" -to a[*]

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

remove_all_parameters -name "*" -to "a[escape_brackets \[\[0-2\]\[escape_brackets \]]]"

For more information about escaping square brackets, type "escape_brackets -h".

Use the "-entity" option to remove the parameters from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

The parameters removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

Example Usage

## The following 3 examples remove project-wide,
## default parameter values
remove_all_parameters -name WIDTH
remove_all_parameters -name *ID*
remove_all_parameters -name *

## The following 3 examples remove entity-specific
## parameter values
remove_all_parameters -name inst1 -to SIZE
remove_all_parameters -name inst1 -to *IE*
remove_all_parameters -name inst1 -to *
### 3.1.30.33. `resolve_file_path (::quartus::project_ui)`

</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td></td>
<td>ERROR: An unknown error has occured.</td>
</tr>
</tbody>
</table>

#### Syntax

```tcl
resolve_file_path [-h | -help] [-long_help] <file_name>
```

#### Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `<file_name>` Option to specify the file name

#### Description

Returns the resolved full path of the specified file name. If the file does not exist, the original file name is returned.

The Quartus Prime software resolves relative paths by searching for the file in the following directories in the following order:

1) Project directory, which is the directory where the Quartus Prime Settings File (.qsf) is found.
2) Project database directory, which is the "db" directory found under the project directory.
3) Project library directories, which are the directories containing the user-specified libraries that are used only by the current project.
4) User library directories, which are the directories containing the user-specified libraries that are used by all Quartz Prime projects.
5) Quartus Prime library directory, which is the directory containing Quartus Prime libraries.

#### Example Usage

```tcl
project_new chiptrip -overwrite
# Set one Verilog source file assignment
set_global_assignment -name VERILOG_FILE chiptrip.v
# Display the resolved full path of the Verilog
```
# source file assignment
set filename [get_global_assignment -name VERILOG_FILE]
set resolved_fullpath [resolve_file_path $filename]
puts "Full Path: $resolved_fullpath"

# Set more Verilog source file assignments
set_global_assignment -name VERILOG_FILE auto_max.v
set_global_assignment -name VERILOG_FILE speed_ch.v
set_global_assignment -name VERILOG_FILE tick_cnt.v
set_global_assignment -name VERILOG_FILE time_cnt.v

# Display the resolved full path of all the Verilog source file assignments
set file_asgns [get_all_global_assignments -name VERILOG_FILE]
foreach_in_collection file_asgn $file_asgns {
    ## Each element in the collection has the following format: {} {VERILOG_FILE} {<file_name>}
    set filename [lindex $file_asgn 2]
    set resolved_fullpath [resolve_file_path $filename]
    puts "Full Path: $resolved_fullpath"
}
project_close

---

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Can't find active revision name. Make sure there is an open, active revision name.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: You must open a project before you can use this command.</td>
</tr>
</tbody>
</table>

---

#### 3.1.30.34. revision_exists (::quartus::project_ui)

The following table displays information for the revision_exists Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project_ui on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>revision_exists [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help - Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-project &lt;project_name&gt; - Project name</td>
</tr>
<tr>
<td></td>
<td>&lt;revision_name&gt; - Revision name</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Checks whether the revision exists for the specified project or currently open project.</td>
</tr>
<tr>
<td></td>
<td>Returns 1, if the revision exists; returns 0, otherwise.</td>
</tr>
</tbody>
</table>

#### Example Usage

```tcl
## Check if the specified revision exists
## in the specified project
if [revision_exists -ARG(project) chiptrip speed_ch] {
    puts "Revision exists"
} else {
    puts "Revision does not exist"
}

## Create revision for the currently open project if it does not exist
## Set the current revision otherwise
project_open chiptrip
if [revision_exists speed_ch] {
    set_current_revision speed_ch
} else {
```

continued...
3.1.30.35. set_current_revision (::quartus::project_ui)

The following table displays information for the `set_current_revision` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project_ui on page 441</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`set_current_revision [-h</td>
</tr>
</tbody>
</table>

### Arguments

- **-h | -help**
  - Short help
- **-long_help**
  - Long help with examples and possible return values
- **-force**
  - Option to open the revision and overwrite the compilation database if the database version is incompatible.
- `<revision_name>`
  - Revision name

### Description

Sets the specified revision name as the current revision. All assignments created or modified during an open project will also be saved to the Quartus Prime Settings File (.qsf).

In 8.1 or later versions of Quartus Prime software, `set_current_revision` gives an error when the compilation database version is not compatible with the current version of Quartus Prime software. You may specify the "-force" option to avoid the error and overwrite the database.

### Example Usage

```tcl
## Sets "auto_max" as the current revision
set_current_revision auto_max
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td></td>
<td>-rise</td>
</tr>
<tr>
<td></td>
<td>-section_id &lt;section_id&gt;</td>
</tr>
<tr>
<td></td>
<td>-tag &lt;data&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;value&gt;</td>
</tr>
</tbody>
</table>

Description

Sets or removes a global assignment.

Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands (from the ::quartus::project Tcl package):

1) export_assignments
2) project_close (unless -dont_export_assignments is specified as an argument to project_close)

You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands execute_flow and execute_module (from the ::quartus::flow Tcl package) call "export_assignments" before they run command-line executables.

For entity-specific assignments, use the -entity option to force the assignment to specified entity. If the -entity option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

If the Quartus Prime Settings File contains a USER_LIBRARIES assignment and you call set_global_assignment to set a SEARCH_PATH or USER_LIBRARIES assignment, the existing USER_LIBRARIES assignment expands into one or more SEARCH_PATH assignments.

Note that values that begin with a dash ("-"), should be enclosed in a backslash followed by a quote. In the following example, "-O2" is enclosed by \" at the beginning and the end.

set_global_assignment -name ARM_CPP_COMMAND_LINE \"-O2\"
## Example Usage

```tcl
# Specify Stratix as the family to use when compiling
set_global_assignment -name FAMILY Stratix

# If the family name has empty spaces, use quotes
set_global_assignment -name FAMILY "Stratix GX"

# or remove any empty space
set_global_assignment -name FAMILY StratixGX
```

</tbody>
</table>

Description

Sets or removes an instance assignment.

Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.

For entity-specific assignments, use the "-entity" option to force the assignment to specified entity. If the "-entity"
option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.

### Example Usage

```
## Specify a TSU_REQUIREMENT of 2ns from mypin to any register
set_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT 2ns

## Remove the TSU_REQUIREMENT from mypin to all registers
set_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT -remove

## Specify the entity to which the assignment is added,
## use the -entity option
## This is needed if the top-level entity name is other than
## that of the project name
## The following command generates a top_level entity
set_instance_assignment -from "mypin" -to * -entity top_level -name TSU_REQUIREMENT 2ns
```

### Return Value

3.1.30.39. set_location_assignment (::quartus::project_ui)

The following table displays information for the set_location_assignment Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project_ui on page 441</th>
</tr>
</thead>
</table>

### Syntax

```
```

### Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-comment <comment>` Comment
- `-disable` Option to disable assignment
- `-remove` Option to remove assignment
- `-tag <data>` Option to tag data to this assignment
- `-to <destination>` Destination of assignment
- `<value>` Assignment value

### Description

Sets or removes a location assignment.

Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

1) `export_assignments`
2) `project_close` (unless `-dont_export_assignments` is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands `execute_flow` and `execute_module` (part of the ::quartus::flow Tcl package) automatically call `export_assignments` before they run command-line executables.

### Example Usage

```
set_location_assignment -to dst LOC
```

### Return Value

<tr>
<td></td>
<td>* You cannot assign a value to the predefined Intel(R) parameter DEVICE_FAMILY, which represents the device family assigned for the project. However, you can use the parameter value in comparisons.</td>
</tr>
<tr>
<td></td>
<td>* The predefined Intel LPM_PIPELINE and LATENCY parameters can be assigned to an instance of a megafunction or</td>
</tr>
</tbody>
</table>

continued...
macrofunction. However, the parameter applies only to that instance, and is not inherited by the subdesigns of that instance.

* All logic options can be assigned as parameters for individual megafunctions or macrofunctions. However, logic options cannot be assigned global, project-wide default parameter values.

### Example Usage

```tcl
## Set project-wide, default WIDTH parameter value
set_parameter -name WIDTH 8

## Set entity-specific SIZE parameter value
## to "my_ram" entity
set_parameter -entity my_ram -name SIZE 16

## Specify the same parameter to my_ram
## but inside "top_level" entity
set_parameter -entity top_level -to my_ram -name SIZE 16
```

<td>End time for VCD file parsing</td>
</tr>
<tr>
<td>-vcd_file &lt;vcd_file&gt;</td>
<td>VCD file name</td>
</tr>
<tr>
<td>-vcd_start_time &lt;vcd_start_time&gt;</td>
<td>Start time for VCD file parsing</td>
</tr>
</tbody>
</table>

### Description

Sets or removes a power input file assignment. Power input file assignments are specified using multiple global assignments, and a single instance assignment as illustrated in the following example:

```tcl
set_global_assignment -name POWER_INPUT_FILE_NAME "test.vcd" -section_id test.vcd
set_global_assignment -name POWER_INPUT_FILE_TYPE VCD -section_id test.vcd
set_global_assignment -name POWER_VCD_FILE_START_TIME "10 ns" -section_id test.vcd
set_global_assignment -name POWER_VCD_FILE_END_TIME "1000 ns" -section_id test.vcd
set_instance_assignment -name POWER_READ_INPUT_FILE test.vcd -to test_design
```

The power input file assignment serves as a wrapper for all of the above assignments. If the "-remove" setting is not set, the `set_power_file_assignment` will also make the following assignment to enable the use of input files:

```tcl
set_global_assignment -name POWER_USE_INPUT_FILES ON
```

If you do not specify a "-section_id", a new section identifier is created for the input file assignment. If a "-section_id" is specified and it does not already exist, it is used as the new section identifier. If a "-section_id" is specified and it does exist, the existing input file assignments are removed and a new input file assignment is created using the given parameters and section identifier.

If an entity name given by "-to" is not specified, the input file assignment applies to the top level design entity.

If the "-remove" setting is used, the input file assignment given by the "-section_id", "-saf_file", or "-vcd_file" is removed from the project.

Assignments created or modified by using this Tcl command are saved to the Quartus Prime Settings File (.qsf).

### Example Usage

```tcl
## Specify an input SAF file applied to the top level entity
## A default section will be created
set_power_file_assignment -saf_file test.saf

## Specify an input VCD file applied to design_top|counter1
## Use the given section_id to create a new section
set_power_file_assignment -vcd_file test.vcd -to design_top|counter1 -section_id test.vcd

## Update the previous input VCD file assignment to specify a start and end time
set_power_file_assignment -vcd_file test.vcd -to design_top|counter1 -vcd_start_time 10ns -vcd_end_time 1000ns -section_id test.vcd

## Remove the input SAF file assignment using the file name
set_power_file_assignment -saf_file test.saf -remove

## Remove the input VCD file assignment using the section identifier
set_power_file_assignment -section_id test.vcd -remove
```

### Return Value

<table>

3.1.30.43. test_assignment_trait (::quartus::project_ui)

The following table displays information for the test_assignment_trait Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::project_ui on page 441</th>
</tr>
</thead>
</table>

**Syntax**

test_assignment_trait [-h | -help] [-long_help] -name <name> -trait <trait_name>

**Arguments**

- **-h | -help**  
  Short help
- **-long_help**  
  Long help with examples and possible return values
- **-name <name>**  
  Assignment name
- **-trait <trait_name>**  
  Trait name

**Description**

Checks whether the assignment name has the specified trait. Returns 1, if the assignment name has the trait; returns 0, otherwise.

**Example Usage**

```tcl
# Test if the assignment name is case-sensitive
if { [test_assignment_trait -name VHDL_FILE -trait CASE_SENSITIVE] } {
  puts "VHDL_FILE assignment is case-sensitive."
} else {
  puts "VHDL_FILE assignment is not case-sensitive."
}
```

3.1.31. ::quartus::qed

The following table displays information for the ::quartus::qed Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::qed 1.0</th>
</tr>
</thead>
</table>

**Description**

This package contains Tcl commands to work in the Quartus Exploration Dashboard. Commands perform workspace operations, create and manipulate project and project group objects, control execution of background Quartus Prime software instances, and import data from Quartus Prime projects.

**Availability**

This package is available for loading in the following executable:

quartus_sta

<th>Belongs to</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>::quartus::qed</td>
<td>::quartus::qed</td>
<td>on page 493</td>
</tr>
</tbody>
</table>

### Syntax

```tcl
```

### Arguments

- **-h | -help**
  - Short help

- **-long_help**
  - Long help with examples and possible return values

- **-subdir <subdir>**
  - Directory name to create and restore the archive into. If specified, the directory must not yet exist. If unspecified, a sub-directory named after the archive will be created within the current directory.

- **-num_seeds <num_seeds>**
  - Number of new seeds to create. Each seed will have its own associated project in a separate subdirectory.

- **-id_pattern <id_pattern>**
  - Pattern used to generate revision names. "\%BASE_ID%" will be replaced with the ID the first project found inside the archive. "\%SEED%" will be replaced with the seed value being assigned to the new revision.

---

**3.1.31.1. qed::add_projects_from_archive (::quartus::qed)**

Description

Restores a Quartus Prime Pro archive file (.qar) into a fresh directory and connects the created project to an opened workspace.

Since this command launches remote connections before completing, the newly created projects must have access to a valid inherited compute specification, either via the workspace or a group object that is provided by "-group". See qed::get_inherited_compute_spec_args and qed::launch_connection for more details.

The "-subdir" argument specifies the name of the fresh directory to create during the restoration process. If specified, the directory must not yet exist. If unspecified, a sub-directory named after the archive will be created within the current directory.

The "-num_seeds" argument controls how many times the archive is restored. If the value of the "-num_seeds" argument is greater than 1, a separate directory will be created for each restored project and the SEED global assignment value will be set to a different value in each project before this command completes.

The "-id_pattern" option controls each "id" property of the project objects which are created when this command completes. These IDs must be unique within the workspace. In order to guarantee this uniqueness, the seed value may be incorporated into the generated ID by including the substring "%SEED%" into the -id_pattern value. This substring will be replaced with the unique seed that will be set once the revision is created. For example, if the original project had a seed value of 4, -num_seeds 3 is specified, and the -id_pattern argument is set to "seed_%SEED%", the resulting projects will have IDs of "seed_5", "seed_6" and "seed_7" respectively. To derive the IDs of the new projects after the archive project's name, include the substring "%BASE_ID%" in the -id_pattern argument.

Example Usage

```
qed::workspace_new my_workspace
qed::configure_local_compute_spec my_workspace
qed::add_projects_from_archive my_archive.qar -num_seeds 3
```

Return Value

<table>

3.1.31.2. qed::check_properties (::quartus::qed)

The following table displays information for the qed::check_properties Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
</table>

**Syntax**

```
qed::check_properties [-h | -help] [-long_help] [-checks <checks>] | <object>
```

**Arguments**

- `-h | -help`
  
  Short help

- `-long_help`
  
  Long help with examples and possible return values

- `-checks <checks>`
  
  List of Tcl expressions that evaluate to true for objects to retrieve. Expressions may use properties as variables of the same name during the check.

- `<object>`
  
  Identifier associated with the object, must be unique

**Description**

Evaluates a series of expressions that operate on values of object properties and returns a boolean expression of the result of the evaluation.

The "qed::check_properties" command simplifies the process of performing a conditional check on an object for a set of parameter values. The "-checks" option requires a list of Tcl expressions, even if you specify only one expression. If you specify only one expression, make the one expression a list itself as shown in the examples below.

continued...
Each expression uses semantics of the Tcl "expr" command. Within each expression, access object properties with variables named according to the desired properties. Accessing object properties within expressions follows semantics of the Tcl "dict with" command.

Example Usage

```tcl
qed::create_object -type project project_A -user_data {this is some data!}
qed::create_object -type group group_one -projects {project_A}

# Checks for the string "this is " appearing in the user_data property of the project_A object.
# Returns: 1
qed::check_properties project_A -checks [list {"this is " in $user_data}]

# Checks for the project group with ID "group_one" existing in the groups property of the project_A object.
# Returns: 1
qed::check_properties project_A -checks [list {group_one in $groups}]

# Checks that the project with ID project_A does not appear in the projects property of the group_one object.
# Returns: 0
qed::check_properties group_one -checks [list {project_A ni $projects}]
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>

### 3.1.3.1.3. `qed::check_properties_of_projects` (::quartus::qed)

The following table displays information for the `qed::check_properties_of_projects` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>--help</td>
<td>Short help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Identifier associated with the object, must be unique</td>
</tr>
<tr>
<td>--checks &lt;checks&gt;</td>
<td>List of Tcl expressions that evaluate to true for objects to retrieve. Expressions may use properties as variables of the same name during the check.</td>
</tr>
</tbody>
</table>

**Description**

Evaluates a series of expressions that operate on values of object properties for all projects in a project group, and returns the information in a Tcl dict.

The keys of the Tcl dict are the IDs of the projects in the group.
The values are two element lists of the form `{ <code> <value> }`.

If the `<code>` value is 1, an error occurred checking the property expression. The `<result>` contains the received error message.

If the `<code>` value is 0, the `<result>` value contains the boolean expression that is the result of the evaluation.

Refer to help for "qed::check_properties" command for more information.

**Example Usage**

```tcl
qed::create_object -type project project_A -user_data {this is some data!}
qed::create_object -type group group_one -projects {project_A}

# Returns: {project_A {0 1}}
qed::check_properties_of_projects group_one -checks [list {"this is " in $user_data}]
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
# 3.1.31.4. `qed::compile` (::quartus::qed)

The following table displays information for the `qed::compile` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-async</td>
</tr>
<tr>
<td></td>
<td>-load_db_state</td>
</tr>
<tr>
<td></td>
<td>-timeout &lt;timeout&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;object&gt;</td>
</tr>
</tbody>
</table>

**Description**

Launches a compile on a connected project or group of connected projects.

Use the "-load_db_state" option to prepare the project for deeper analysis after it opens. The specific operations performed will depend on the executable used to access the project. For example, if the project is accessed with "quartus_sta", timing analysis preparation follows the initialization procedure in the Quartus Prime Pro Timing Analyzer: creating the timing netlist, reading any SDC files, and updating the timing netlist.

**Example Usage**

```tcl
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf -revision rev_A
qed::launch_connection project_A -open_project
qed::compile project_A
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

# 3.1.31.5. `qed::configure_local_compute_spec` (::quartus::qed)

The following table displays information for the `qed::configure_local_compute_spec` Tcl command:

<table>

</tbody>
</table>

**continued...**
### Description

Sets properties on the specified object to cause background Quartus Prime Pro software instances to execute on the same (local) machine as the Quartus Exploration Dashboard is running on.

The "-exe" option specifies the Quartus Prime Pro executable to run. The supported options are quartus_sta, quartus_cdb, and quartus_sh.

The "-exe_options" option specifies any options passed to the executable that is specified with the "-exe" option.

The "-quartus_rootdir" option specifies the directory location of the desired Quartus Prime Pro software installation. This is the root directory of the software installation, not the bin directory. If you do not specify a value, the root directory associated with the Quartus Exploration Dashboard is used.

The "-lm_license_file" option specifies the LM_LICENSE_FILE value that will be passed to the Quartus Prime Pro software executable. If you don't know the value, look in the Tools > License Setup dialog in the Quartus Prime Pro software GUI.

### Example Usage

```bash
qed::configure_local_compute_spec workspace_id -exe quartus_sta -quartus_rootdir /path/to/acds/quartus
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>

<tr>
<td>-queue</td>
<td>One or more comma-separated queues. Check with your administrator for a list of valid queues for your LSF farm</td>
</tr>
<tr>
<td>-resource_requirements</td>
<td>Required resources. Used to restrict to machines with specific memory requirements</td>
</tr>
<tr>
<td>&lt;object&gt;</td>
<td>Identifier associated with the object, must be unique</td>
</tr>
</tbody>
</table>

### Description

Sets properties on the specified object to cause background Quartus Prime Pro software instances to execute through the LSF workload management platform.

Use the following options to configure the LSF settings:

- -resource_requirements
- -queue
- -initial_work_dir
- -env
- -local_remote_path_map
- -priority
- -output_file
- -error_file
- -processor_limit

The "-exe" option specifies the Quartus Prime Pro executable to run. The supported options are quartus_sta, quartus_cdb, and quartus_sh.

The "-exe_options" option specifies any options passed to the executable that is specified with the "-exe" option.

The "-quartus_rootdir" option specifies the directory location of the Quartus Prime Pro installation. This is the root directory of the software installation, not the bin directory.

The "-lm_license_file" option specifies the LM_LICENSE_FILE value that will be passed to the Quartus Prime Pro software executable. If you don't know the value, look in the Tools > License Setup dialog in the Quartus Prime Pro software GUI.

### Example Usage

```
qed::configure_lsf_compute_spec workspace_id -exe quartus_sta
```

### Return Value

### 3.1.31.8. qed::configure_slurm_compute_spec (::quartus::qed)

The following table displays information for the `qed::configure_slurm_compute_spec` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
</table>

**Syntax**
```
```

**Arguments**
- `-h | -help`  
  Short help
- `-long_help`  
  Long help with examples and possible return values
- `-exe <quartus_sta|quartus_cdb|quartus_sh>`  
  Executable to open the project with. Dictates the packages and commands that will be available to run.
- `-exe_options <exe_options>`  
  List of options to pass to executable.
- `-additional_args <additional_args>`  
  Additional arguments to pass to the slurm client when connecting to remote host
- `-cluster <cluster>`  
  Comma separated list of clusters to use
- `-constraint <constraint>`  
  Node features required as defined by Slurm administrator
- `-cores_per_socket <cores_per_socket>`  
  Number of CPU cores per socket
- `-email <email>`  
  Email address to receive job status updates. Defaults to submitting user.
- `-env <env>`  
  Comma-separated list of environment variables to pass to job
- `-initial_work_dir <initial_work_dir>`  
  Initial working directory on remote host. The remote host will start in this directory.
- `-licenses <licenses>`  
  Licenses that need to be allocated for this job
- `-lm_license_file <lm_license_file>`  
  LM_LICENSE_FILE environment setting
- `-memory <memory>`  
  Memory requirement per node. Default unit is megabytes
- `-output <output>`  
  Filename to store standard output
- `-partition <partition>`  
  Comma separated list of partitions to use

...continued...
-priority <priority>  Job priority. The higher the number, the higher the priority
-quartus_rootdir <quartus_rootdir>  Appropriate Quartus Prime Pro installation folder to access the project
-resources <resources>  Architecture, license, and/or memory requirement
-sockets_per_node <sockets_per_node>  Number of CPUs per node
<object>  Identifier associated with the object, must be unique

Description
Sets properties on the specified object to cause background Quartus Prime Pro software instances to execute through the SLURM workload management platform.

Use the following options to configure the SLURM settings:
* -cluster
* -partition
* -memory
* -sockets_per_node
* -cores_per_socket
* -priority
* -resources
* -constraint
* -email
* -additional_args
* -env
* -initial_work_dir
* -output
* -licenses

The "-exe" option specifies the Quartus Prime Pro executable to run. The supported options are quartus_sta, quartus_cdb, and quartus_sh.

The "-exe_options" option specifies any options passed to the executable that is specified with the "-exe" option.

The "-quartus_rootdir" option specifies the directory location of the desired Quartus Prime Pro software installation. This is the root directory of the software installation, not the bin directory.

The "-lm_license_file" option specifies the LM_LICENSE_FILE value that will be passed to the Quartus Prime Pro software executable. If you don't know the value, look in the Tools > License Setup dialog in the Quartus Prime Pro software GUI.

Example Usage
qed::configure_slurm_compute_spec workspace_id -exe quartus_sta

Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>

3.1.31.9. qed::configure_ssh_compute_spec (::quartus::qed)

The following table displays information for the qed::configure_ssh_compute_spec Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
</tbody>
</table>

continued...
Sets properties on the specified object to cause background Quartus Prime software instances to connect through the ssh protocol.

The "-hostnames" option specifies a list of hostnames that can be connected to through the ssh protocol that will execute the background Quartus Prime software instances. Entries in the list must be comma-separated and may be formatted as "file:filename", where each file contains a list of newline separated hostnames to consider alongside any other entries specified.

The "-jobs_per_host" option limits the number of jobs a given host can be assigned.

The "-custom_ssh_port" option overrides the port to use when making the SSH connection. Only required if the remote host(s) uses a port other than port 22 for SSH.

The "-private_key" option specifies the private SSH key file to authenticate and log in to remote host. Use this option if the remote host prompts user for password when connecting using the ssh client. The corresponding public key should have been appended to the remote host's "/.ssh/authorized_keys" or "/.ssh/authorized_keys2" files.

The "private_key" option specifies a private key that is associated with the remote host. The corresponding public key should have been associated with the remote host through the use of the "-private_key" option.

</tr>
</tbody>
</table>

continued...
appending to the remote host's ~/.ssh/authorized_keys or ~/.ssh/authorized_keys2 files.

The "-user" option specifies the user or login name to use when logging in to remote host. Use this option if the user name on remote host is different from the current user.

The "-ssh_client" option specifies the path to the SSH client to use when launching the connection. On Linux, it defaults to 'ssh'. On Windows, it defaults to Cygwin ssh. Windows also supports plink from the PuTTY package.

The "-additional_arguments" option specifies additional commandline arguments to pass to the SSH client.

The "-local_remote_path_map" specifies the shared directory mapping between local and remote host. Format is local_path;remote_path.

Windows to Linux Example:

\[drive:\text{windows path}];\[\text{linux path}\]

\s:\designs\two_reg;\data\usr\designs\two_reg

Linux to Windows Example:

\/data\usr\;\data\usr

The "-ssh_server" option specifies the server used by the remote host. Examples include openssh or cygwin.

The "-initial_work_dir" option specifies the directory that the remote job should start in.

The "-reverse_tunnel_port" option Enables port forwarding and specifies a port on the remote host to be forwarded to the local host. Use this if there is a firewall that separates the local host and the remote host. Remote host will connect to QED server using local port: <reverse_tunnel_port> over the secured ssh channel. The port can be any ephemeral port that is not used by another process. Set value to 'auto' to let QED to automatically find a free network port on remote host. Omit this setting to disable port forwarding.

The "-exe" option specifies the Quartus Prime Pro executable to run. The supported options are quartus_sta, quartus_cdb, and quartus_sh.

The "-exe_options" option specifies any options passed to the executable that is specified with the "-exe" option.

The "-quartus_rootdir" option specifies the directory location of the desired Quartus Prime Pro software installation. This is the root directory of the software installation, not the bin directory.

The "-lm_license_file" option specifies the LM_LICENSE_FILE value that will be passed to the Quartus Prime software executable. If you don't know the value, look in the Tools > License Setup dialog in the Quartus Prime Pro software GUI.

---

### Example Usage

```
qed::configure_ssh_compute_spec workspace_id -exe quartus_sta -hostnames hostname -quartus_rootdir /path/to/acds/quartus
qed::configure_ssh_compute_spec workspace_id -exe quartus_sta -hostnames file:/path/to/hostnames.txt -quartus_rootdir /path/to/acds/quartus
qed::configure_ssh_compute_spec workspace_id -exe quartus_sta -hostnames host1,host2 -quartus_rootdir /path/to/acds/quartus
qed::configure_ssh_compute_spec workspace_id -exe quartus_sta -hostnames hostname -quartus_rootdir /path/to/acds/quartus -user username -private_key ~/.ssh/id_rsa
```

---

-long_help | Long help with examples and possible return values
-type <project|group> | Type of QED Workspace object
-user_data <user_data> | Freetext field to store any interesting metadata on the object. Use qed::set_user_data and qed::get_user_data to interact with the value as a dict instead of a string.
-groups <groups> | Set of group IDs this project is a member of (Valid only for -type project)
-qpf_path <qpf_path> | Full path to a .qpf file to open (Valid only for -type project)
-revision <revision> | Name of the revision to open (Valid only for -type project)
-projects <projects> | Set of projects belonging to the group (Valid only for -type group)
-default_group_id <default_group_id> | Identifier used for the 'default group' that's created to house ungrouped projects during sanitize_workspace (Valid only for -type workspace)
</id> | Identifier associated with the object, must be unique

**Description**

Creates project or project group objects. The command returns the ID of the newly created object.

The "-type" option is required, and must specify one of project or group.

Other supported options depend on the type of object you are creating. The options correspond to property names that are valid for the type of object you are creating.

**Example Usage**

```
qed::create_object -type project project_A -qpf_path /path/to/project_A/project.qpf -revision project_A
qed::create_object -type project project_B -qpf_path /path/to/project_B/project.qpf -revision project_B
qed::create_object -type group both_projects -projects {project_A project_B}
```

</tbody>
</table>

**Description**

Deletes project or project group objects.

The most common reason to delete an object is if you have created it by mistake. If you added the wrong Quartus Prime Pro project to the workspace, you can edit its properties to point to the correct project, or delete the wrong one and add the right one.

Deleting a project object also removes any and all reports you imported from the project.

Deleting a project group object also removes any and all reports...
you created for that project group. Typically those reports combine or compare data from project reports.

Deleting a project group object does not delete the project objects that were part of the project group.

Example Usage

```
set id [qed:create_object -type project]
qed:delete_object $id
```

</tr>
</tbody>
</table>

continued...
### Description

Closes background instances of the Quartus Prime Pro software associated with a project object, or projects in a project group.

If you invoke the `qed::disconnect` command and want to extract more data from remote projects, or execute commands in them, you must use the `qed::launch_connection` command to re-initiate the connection.

### Example Usage

```
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf
qed::launch_connection project_A
qed::disconnect project_A
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.31.14. qed::find_projects_under_directory (::quartus::qed)

The following table displays information for the `qed::find_projects_under_directory` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-project_match &lt;project_match&gt;</code> Pattern to match against the QPF file basenames</td>
</tr>
<tr>
<td></td>
<td><code>-directory_match &lt;directory_match&gt;</code> Pattern to match against the QPF file directories</td>
</tr>
<tr>
<td></td>
<td><code>-include_all_revisions</code> Flag to return all revisions of detected projects instead of the first</td>
</tr>
<tr>
<td></td>
<td><code>&lt;search_dir&gt;</code> Directory to search</td>
</tr>
<tr>
<td>Description</td>
<td>Recursively searches a directory for Quartus Prime Pro projects and returns a list of Tcl dicts, where each dict contains metadata about the projects that were found. The metadata is typically used when you add projects to the workspace.</td>
</tr>
<tr>
<td></td>
<td>If no Quartus Prime Pro projects are found, the command returns an empty list.</td>
</tr>
<tr>
<td></td>
<td>A Quartus Prime Pro project is considered to be a file with a .qpf extension.</td>
</tr>
<tr>
<td></td>
<td>The <code>-project_match</code> and <code>-directory_match</code> options use Tcl glob-style name matching semantics. Supported wildcard characters include * and ?. The default value of the <code>-project_match</code> and <code>-directory_match</code> options is *.</td>
</tr>
<tr>
<td></td>
<td>The command recursively finds all files with names matching *.qpf, starting in the directory specified with the <code>-search_dir</code> option. You must specify a directory with the <code>-search_dir</code> option, even if it is &quot;.&quot; (the current directory); there is no default value. The command applies the directory_match wildcard to the name of each directory containing a .qpf file, and it applies the project_match wildcard to the file name of the .qpf file.</td>
</tr>
</tbody>
</table>

**continued...**
The command extracts metadata for any Quartus Prime Pro projects that match the "-project_match" and "-directory_match" options. If you specify the "-include_all_revisions" option, metadata is extracted for all revisions of each project. If you do not specify the option, metadata is extracted for only the active revision of each project.

The dict that is returned for each project includes the following properties: qpf_path is the absolute path of the Quartus Prime Pro project file, revision is the name of the project revision, version is the version of the Quartus Prime Pro software last used to open the project, and id is an automatically-generated unique name for the combination of that project and revision.

Example Usage

```
qed::find_projects_under_directory "." 
```

<table>

<td></td>
</tr>
<tr>
<td><code>&lt;object&gt;</code></td>
<td>Identifier associated with the object, must be unique</td>
<td></td>
</tr>
</tbody>
</table>

**Description**

Creates a new revision within a connected project and initializes a new project object that may be used to connect to that revision.

Revisions within a Quartus Prime Pro project may be used to isolate and interact in parallel with multiple different versions of a design. These differences may include settings or assignments, which includes referencing different versions of source files to use during compilation.

The project object returned by this utility will not yet be connected to the remote revision, and the database associated with the revision will not be complete. Use "qed::launch_connection" and "qed::compile" to generate a complete database for the new revision.

continued...
The "-revision" option must specify a unique and new name for a revision to generate within the remote project. This command will return an error if the revision cannot be created successfully. The new revision will be based on the revision that the connected project is accessing, which means it inherits all settings and assignments from that source revision and with no further changes will produce identical compilation results as compared to that source revision.

The "-id" option controls the "id" property of the project object which is created when this command completes. If unspecified, a unique ID will be generated and assigned to the new project.

The "-add_to_groups" option will initialize the new project object's "groups" property to be a list of pre-existing group(s). If unspecified, the forked project object will inherit its 'groups' property from the source project object.

The "-copy_results" option initiates a file copy of the compilation results from the source revision into the new revision. This means the new revision appears as being fully compiled and prepared for analysis but identical to the source revision until some future change is made and the revision is recompiled.

### Example Usage

```tcl
qed::create_object -type group my_group
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf -revision rev_A -groups my_group
qed::launch_connection project_A -open_project
qed::fork_new_revision project_A -revision rev_B -id project_B -inherit_groups
qed::launch_connection project_B -open_project
qed::run project_B -cmd "set_global_assignment -name SEED 2"
# Returns: {project_A 1 project_B 2}
qed::run my_group -cmd "get_global_assignment -name SEED"
```

### Return Value

<tr>
<td></td>
<td><code>-num_seeds &lt;num_seeds&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-revision_pattern &lt;revision_pattern&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;object&gt;</code></td>
</tr>
</tbody>
</table>
Description

Creates a set of new revisions within a connected project and initializes a new project object for each one. The new objects are then connected and the value of the "SEED" global assignment is modified accordingly. Each new object will inherit its "groups" property from the source project object.

The "-num_seeds" argument dictates how many revisions to create and connect. The seed values will be the next in line after the value of the source project's seed. For example, if the source project used a seed of 4 and -num_seeds 3 is specified, the returned projects will have seeds 5, 6, and 7 set, respectively.

The compilation database associated with the returned projects will not be complete. Run "qed::compile" to generate a complete database for each new revision.

The "-revision_pattern" option must specify a unique and new name for each revision to generate within the remote project. This command will return an error if a revision cannot be created successfully. In order to guarantee this uniqueness, the seed value may be incorporated into the generated revision by including the substring "%SEED%" into the -revision_pattern value. This substring will be replaced with the unique seed that will be set once the revision is created. For example, if the original project had a seed value of 4, -num_seeds 3 is specified, and the -revision_pattern argument is set to "seed_%SEED%", the resulting revisions will be named "seed_5", "seed_6" and "seed_7" respectively. Note that the revision names are visible via the returned project objects' "revision" property. To name the new revisions after the original project's revision, include the substring "ORIGINAL_REVISION%" in the -revision_pattern argument.

Each new revision will be based on the revision that the connected project is accessing, which means it inherits all settings and assignments from that source revision except that it will have a different value set for the "SEED" global assignment.

The "-id_pattern" option controls each "id" property of the project objects which are created when this command completes. These IDs must be unique within the workspace. In order to guarantee this uniqueness, the seed value may be incorporated into the generated ID by including the substring "%SEED%" into the -id_pattern value. This substring will be replaced with the unique seed that will be set once the revision is created. For example, if the original project had a seed value of 4, -num_seeds 3 is specified, and the -id_pattern argument is set to "seed_%SEED%", the resulting projects will have IDs of "seed_5", "seed_6" and "seed_7" respectively. To derive the IDs of the new projects after the original project's revision, include the substring "ORIGINAL_ID%" in the -id_pattern argument.

The "-launch_compiles" option will automatically launch Quartus Prime Pro compiles on just the forked seeds after their "SEED" global assignments have been updated. This is equivalent to creating a new group that just contains the new project objects and running qed::compile on that group.

Example Usage

```tcl
qed::create_object -type group my_group
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf -revision rev_A -groups my_group
qed::launch_connection project_A -open_project
qed::run project_A -cmd "set_global_assignment -name SEED 1"
# Fork one new seed with a specific ID and revision name
qed::fork_new_seeds project_A -num_seeds 1 -revision_pattern rev_B -id project_B -inherit_groups
qed::launch_connection project_B -open_project
# Fork several new seeds and derive IDs and revision names from patterns
qed::fork_new_seeds project_B -num_seeds 3 -revision_pattern rev_B %SEED%-id -inherit_groups
# Returns: (project_A 1 project_B 2 project_B_seed_3 3 project_B_seed_4 4 project_B_seed_5)
qed::run_command my_group -cmd "get_global_assignment -name SEED"
```

<td>Flag indicating that read-only property names should be filtered out.</td>
</tr>
<tr>
<td><code>&lt;object&gt;</code></td>
<td>Identifier associated with the object, must be unique</td>
</tr>
</tbody>
</table>

**Attendance:**

- TCL_OK
- TCL_OK 0
- TCL_OK 0 INFO: Operation successful
**Description**

Returns a Tcl dict representing the properties of the given object.

Keys of the Tcl dict represent the property names valid for the given object, and values of the Tcl dict represent the associated values of each property.

When you create an object, some of its properties may not be set; they may have no value and no default value.

When you use the `-set_only` option, the list of properties returned is limited to properties that are set.

Some object properties are read-only, and the rest are read/write.

When you use the `-writeable_only` option, the list of properties returned is limited to properties that are read/write.

**Example Usage**

```tcl
qed::create_object -type project project_A -user_data {this is some data!}
qed::get_all_properties_dict project_A -writeable_only
qed::create_object -type group group_one -projects {project_A}
qed::get_all_properties_dict group_one -set_only
```

</tr>
<tr>
<td></td>
<td>The <code>&quot;-regexp_match&quot;</code> option supports Tcl regexp pattern matching. You should enclose your regular expression in curly braces.</td>
</tr>
<tr>
<td></td>
<td>The <code>&quot;-include_generated_panels&quot;</code> option control whether report panels that were generated by the Quartus Exploration dashboard are included</td>
</tr>
</tbody>
</table>

continued...
in the list. If you call the "qed::get_object_report_panel_names" command with the ID of a project, and do not specify the "-include_generated_panels" option, the list of names includes only report panels that were imported from the project.

Typically, report panels associated with a project group are generated by the Quartus Exploration Dashboard, so you should use the "-include_generated_panels" option when you run the command with a project group ID.

**Example Usage**

```tcl
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf
qed::launch_connection project_A -open_project
qed::import_report_panel project_A -panel_name "Timing Analyzer||Setup Summary"
qed::import_report_panel project_A -panel_name "Timing Analyzer||Hold Summary"
```

<tr>
<td><code>-user_data &lt;user_data&gt;</code></td>
<td>Freetext field to store any interesting metadata on the object. Use <code>qed::set_user_data</code> and <code>qed::get_user_data</code> to interact with the value as a dict instead of a string.</td>
</tr>
<tr>
<td><code>-groups &lt;groups&gt;</code></td>
<td>Set of group IDs this project is a member of (Valid only for -type project)</td>
</tr>
<tr>
<td><code>-qpf_path &lt;qpf_path&gt;</code></td>
<td>Full path to a .qpf file to open (Valid only for -type project)</td>
</tr>
<tr>
<td><code>-revision &lt;revision&gt;</code></td>
<td>Name of the revision to open (Valid only for -type project)</td>
</tr>
<tr>
<td><code>-projects &lt;projects&gt;</code></td>
<td>Set of projects belonging to the group (Valid only for -type group)</td>
</tr>
<tr>
<td><code>-default_group_id &lt;default_group_id&gt;</code></td>
<td>Identifier used for the 'default group' that's created to house ungrouped projects during sanitize_workspace (Valid only for -type workspace)</td>
</tr>
<tr>
<td><code>-checks &lt;checks&gt;</code></td>
<td>List of Tcl expressions that evaluate to true for objects to retrieve. Expressions may use properties as variables of the same name during the check.</td>
</tr>
<tr>
<td><code>&lt;id&gt;</code></td>
<td>Identifier associated with the object, must be unique</td>
</tr>
</tbody>
</table>

**Description**

Returns a Tcl list of project or project group objects that match the options you specify.

If no objects match, the command returns an empty list.

*continued...*
Example Usage:

```plaintext
qed::get_objects -type project project_A -user_data "hello world!" -qpf_path /path/to/project_A/project_A/project.qpf -revision project_A
```

```
# Returns: {project_A my_group}
```

```plaintext
qed::get_objects -type group my_group -user_data "hello neighbour!" -projects project_A
```

```
# Returns: {project_A my_group}
```

```plaintext
# Returns: {project_A}
```

```plaintext
qed::get_objects -type project
```

```
# Returns: {my_group}
```

```plaintext
qed::get_objects -projects project_A
```

```
# Returns: {project_A my_group}
```

```plaintext
qed::get_objects -checks [list ["hello" in $user_data]]
```

---

### Return Value

<table>
<thead>
<tr>
<th>Code</th>
<th>Name</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>Code</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

---

3.1.31.23. `qed::get_project_report_panel_names` (::quartus::qed)  
The following table displays information for the `qed::get_project_report_panel_names` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::qed</code> on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-include_generated_panels</code></td>
</tr>
<tr>
<td></td>
<td><code>-regexp_match &lt;regexp_match&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-string_match &lt;string_match&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;object&gt;</code></td>
</tr>
</tbody>
</table>

**Description:**

Returns a multi-level Tcl dict of report panel names associated with the projects of the given group object. In the event that certain project report panels across the group only differ by seed-dependent values (e.g. slack values, Design Assistant violation counts, etc.) they will be grouped together in the returned dictionary based on a sanitized version of the panel names.

The primary keys in the returned dictionary correspond to these sanitized names, and each sanitized name maps to a sub-dictionary where the key is a project that maps to the original, un-sanitized name of the panel associated with that project. If a panel was imported or generated on some of the group’s projects but not others, only the projects with that panel will appear in the values associated with that panel’s name.

Each un-sanitized panel name associated with a project can be passed to the "qed::get_object_report_panel_contents" command alongside the project ID the panel name maps to.

There are several ways to control the panel names which are returned by this command.

The "-string_match" option supports Tcl glob-style pattern matching.

The "-regexp_match" option supports Tcl regexp pattern matching. You should enclose your regular expression in curly braces.

The "-include_generated_panels" option control whether report panels that were generated by the Quartus Exploration Dashboard are included.

---

continued...
in the list. If you call the "qed::get_project_report_panel_names" command, and do not specify the "-include_generated_panels" option, the dict returned includes only report panels that were imported from each project.

Example Usage

```tcl
qed::create_object -type project project_A -qpf_path /file/path/to/A/project.qpf
qed::launch_connection project_A -open_project
qed::create_object -type project project_B -qpf_path /file/path/to/B/project.qpf
qed::launch_connection project_B -open_project
qed::create_object -type group both_projects -projects {project_A project_B}
qed::import_report_panel both_projects -panel_name "Timing Analyzer||Setup Summary"
qed::import_report_panel project_A     -panel_name "Timing Analyzer||Hold Summary"

# Returns:
# {
#   "Timing Analyzer||Setup Summary" {
#       project_A "Timing Analyzer||Setup Summary"
#       project_B "Timing Analyzer||Setup Summary"
#   }
#   "Timing Analyzer||Hold Summary" {
#       project_B "Timing Analyzer||Hold Summary"
#   }
# }
qed::get_project_report_panel_names both_projects
```

<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-property &lt;property&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;object&gt;</td>
</tr>
</tbody>
</table>

Description

Gets the value of the given property for all projects in the given project group and returns the information in a Tcl dict. The keys of the Tcl dict are the IDs of the projects in the group. The values are two element lists of the form { <code> <value> }. If the <code> value is 1, an error occurred reading the property. The <result> contains the received error message. If the <code> value is 0, the <result> value contains the value of the property.

Example Usage

```tcl
qed::create_object -type project project_A -user_data {this is some data!}
qed::create_object -type group group_one -projects {project_A}
# Returns: {project_A {0 {this is some data!}}}  
qed::get_property_of_projects group_one -property user_data
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.31.26. qed::get_return_value (::quartus::qed)

The following table displays information for the qed::get_return_value Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-return_token &lt;return_token&gt;</td>
</tr>
<tr>
<td></td>
<td>-timeout &lt;timeout&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;object&gt;</td>
</tr>
</tbody>
</table>

Description

Returns data from a command that was run without blocking (using the "-async" option). You must specify the token returned from another command such as "qed::launch_connection" or "qed::run_command". Tokens are not interchangeable between objects. The "qed::get_return_value" continued...
command returns a Tcl error if the given token was not issued by the
given object. The "qed:get_return_value" command blocks until the return
value

Example Usage

```tcl
qed:create_object -type project project_A -qpf_path /file/path/to/project.qpf
qed:launch_connection project_A
set tok [qed:run_command project_A -cmd "after 1000; expr {100 * 100}"
# Waits for ~1 second and returns 10000
qed:get_return_value project_A -return_token $tok
```

Return Value

<table>
<thead>
<tr>
<th>Code</th>
<th>Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td></td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.31.27. qed::get_user_data (::quartus::qed)

The following table displays information for the qed::get_user_data Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to: ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>qed::get_user_data [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-key &lt;key&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;object&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Reads the &quot;user_data&quot; property of an object as if it is a dict, and looks up the value stored at the given key.</td>
</tr>
</tbody>
</table>

It is possible to use this command in conjunction with "qed::set_property -property user_data", but whenever this method is invoked, any existing value must be a legal Tcl dictionary (which includes the empty string). "qed::get_property -property user_data" returns the entire value of the property instead of looking up a single key.

Example Usage

```tcl
qed:create_object -type project project_A
qed:set_property -property user_data -value [dict create key_one value_1] project_A
qed:set_user_data -key key_two -value value_2 project_A
# Returns: {key_one value_1 key_two value_2}
qed:get_property -property user_data project_A
# Returns: value_1
qed:get_user_data -key key_one project_A
# Returns: value_2
qed:get_user_data -key key_two project_A
```

Return Value

<table>
<thead>
<tr>
<th>Code</th>
<th>Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td></td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.31.28. qed::has_property (::quartus::qed)

The following table displays information for the qed::has_property Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to: ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>qed::has_property [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
</tbody>
</table>

continued...
3.1.31.29. qed::import_report_panel (::quartus::qed)

The following table displays information for the qed::import_report_panel Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
</table>

**Syntax**

```
```

**Arguments**

- `-h | -help`
  - Short help
- `-long_help`
  - Long help with examples and possible return values
- `-async`
  - Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to qed::get_return_value. By default, the return value of the remote command is reproduced (including any errors)
- `-panel_name <panel_name>`
  - Name of the panel to retrieve
- `-regexp_match <regexp_match>`
  - Regex to match against all panels (first match is selected)
- `-string_match <string_match>`
  - Pattern to match against all panels (first match is selected)
- `-timeout <timeout>`
  - Optional timeout for waiting for a return value in ms (default = 0 = no timeout)
- `<object>`
  - Identifier associated with the object, must be unique
Throws a report panel from a project or projects in a project group into the workspace.

When you use the "-panel_name" option, you must specify the path to the report panel, separating report folder names with the "||" separator. For example, the panel name of the RAM summary report panel is "Fitter||Place Stage||Fitter RAM Summary".

The "-string_match" option supports Tcl glob-style pattern matching. When multiple report panels match the "-string_match" pattern, only the first matching report panel is imported.

The "-regexp_match" option supports Tcl regexp pattern matching. You should enclose your regular expression in curly braces. When multiple report panels match the "-regexp_match" option, only the first matching report panel is imported.

Before you import a report panel, you must have successfully used the "qed::launch_connection" command to initiate background instances of the Quartus Prime Pro software, and you must have opened the projects.

Example Usage

```tcl
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf
qed::launch_connection project_A -open_project
qed::import_report_panel project_A -panel_name "Timing Analyzer||Setup Summary"
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.31.30. qed::import_report_panel_names (::quartus::qed)

The following table displays information for the **qed::import_report_panel_names** Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <strong>::quartus::qed</strong> on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-async</td>
</tr>
<tr>
<td></td>
<td>-folders &lt;folders&gt;</td>
</tr>
<tr>
<td></td>
<td>-regexp_match &lt;regexp_match&gt;</td>
</tr>
<tr>
<td></td>
<td>-string_match &lt;string_match&gt;</td>
</tr>
<tr>
<td></td>
<td>-timeout &lt;timeout&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;object&gt;</td>
</tr>
</tbody>
</table>

**Description**

Imports a list of report panel names from a project or projects in a project group.

By default, all report panel names are imported.

The "-string_match" option limits the panel names that are imported to continued...
panel names that match a Tcl glob-style pattern.

The "-regexp_match" option limits the panel names that are imported to panel names that match the given regular expression. Enclose the regular expression in curly braces.

The "-folders" option limits the panel names that are imported to panel names that are contained in the given top-level folder names. Top-level folder names correspond to the folder names in the compilation report, such as Synthesis, Fitter, and Timing Analyzer. Specify multiple folder names as a Tcl list, such as [Synthesis Fitter "Timing Analyzer"].

When you call `import_report_panel_names` with a project object, the command returns a list of report panel names that match the filters or folder names. Any errors that occur are returned with standard Tcl error semantics.

Before you import a report panel, you must have successfully used the "qed::launch_connection" command to initiate background instances of the Quartus Prime Pro software, and you must have opened the projects.

### Example Usage

```tcl
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf
qed::launch_connection project_A -open_project
qed::import_report_panel_names project_A
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.31.31. `qed::is_connected` (::quartus::qed)

The following table displays information for the `qed::is_connected` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::qed</code> on page 493</th>
</tr>
</thead>
</table>

#### Syntax

`qed::is_connected [-h | -help] [-long_help] <object>`

#### Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `<object>` Identifier associated with the object, must be unique

#### Description

When you call the command with a project object, the return value is a boolean value indicating whether the given project is open in a background Quartus Prime Pro software instance.

When you call the command with a project group object, the return value is a Tcl dict where the keys are IDs of the projects in the project group, and the values are the boolean values indicating whether each separate project is open in a background Quartus Prime Pro software instance. To determine whether the project group is connected, you must iterate through the Tcl dict and check each value.

#### Example Usage

```tcl
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf
# Returns: false
qed::is_connected project_A
qed::launch_connection project_A
# Returns: true
qed::is_connected project_A
```

### Return Value

<td></td>
<td>-timeout &lt;timeout&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;object&gt;</td>
</tr>
</tbody>
</table>

continued...
Description

Starts one or more instances of the Quartus Prime Pro software running in the background, to receive commands from the shell where the workspace is open.

In most cases, you should use the "-open_project" option so that the Quartus Prime Pro project is opened automatically after the instance has started. By default, the command does not open the Quartus Prime Pro project after starting the instance of the software.

Use the "-timeout" option to specify the maximum time to wait for the background instance of the Quartus Prime Pro software to start. The timeout value is specified in seconds, and its default is 0, which means to wait forever. Specifying "-timeout 0" is equivalent to not using the "-timeout" option.

Use the "-load_db_state" option to prepare the project for analysis after it opens. This option has no effect if you do not also use the "-open_project" option, or if the project has no complete compilation database. The initialization steps depend on the executable that is started.

For example, when you use the Timing Analyzer executable (quartus_sta), loading the compilation database follows the initialization procedure in the Quartus Prime Timing Analyzer GUI:

* create the timing netlist
* read SDC files
* update the timing netlist

The "-async" option causes the command to returns a token for use with the "qed::get_return_value" command. By default, the command will wait, or block, until the background instances of the Quartus Prime software have started, and any project opening or timing initialization options have completed.

When you call "qed::launch_connection" with a project object without the "-async" option, the command returns the value of whatever parts of the initialization flow you have specified. Any errors that occur starting the background software instance, opening the project, and initializing timing, are returned with standard Tcl error semantics.

When you call "qed::launch_connection" with a project group object without specifying the "-async" option, the command returns a dict where keys are IDs of the projects in the project group, and the values are two-element lists of the form { <code> <result> }. If the <code> value is 1, the "launch_connection" command received an error starting the background software instance, opening the project, or initializing timing. When the <code> value is 1, the <result> contains the received error message. If the <code> value is 0, the "launch_connection" command was successful for the project, and the <result> value contains the return value of whatever parts of the initialization flow you have specified.

Information needed to start the Quartus Prime Pro background software instances is set through the compute spec, which is stored in an object property called compute_spec_args. See "qed::get_inherited_compute_spec_args" for more details.

You can set the compute spec on the workspace object, on a project group object, and on individual project objects. The "qed::launch_connection" command reads the compute specs with a defined priority to determine how to start the background software instances. First the workspace compute spec is read, then a project group compute spec, then a project compute spec.

If a conflict of compute specs occurs, the compute spec of a project object overrides the compute spec of the project group. It is in, and the compute spec of a project group overrides the compute spec of the workspace. This priority allows you to specify a default compute spec at the workspace level and override or customize it if necessary for project groups or projects.

Because the Quartus Exploration Dashboard supports a variety of compute farms, and each type of compute farm has unique, related requirements, you must use a command unique to each type of compute farm to configure it. Refer to help for the appropriate commands described below for details.

* To execute on the local machine running the Quartus Exploration Dashboard, use the "qed::configure_local_compute_spec" command
* To execute through the LSF workload management software, use the "qed::configure_lsf_compute_spec" command
* To execute by connecting to remote machines with the ssh command, use the "qed::configure_ssh_compute_spec" command

continued...
Example Usage

```tcl
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf
qed::launch_connection project_A
```

## Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>

</table>

### 3.1.31.34. `qed::list_properties (::quartus::qed)`

The following table displays information for the `qed::list_properties` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::qed</code> on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`qed::list_properties [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-set_only</code></td>
</tr>
<tr>
<td></td>
<td><code>-writeable_only</code></td>
</tr>
<tr>
<td>&lt;object&gt;</td>
<td>Identifier associated with the object, must be unique</td>
</tr>
<tr>
<td>Description</td>
<td>Returns a list of valid properties for the given object.</td>
</tr>
<tr>
<td></td>
<td>When you create an object, some of its properties may not be set; they may have no value and no default value.</td>
</tr>
<tr>
<td></td>
<td>When you use the &quot;-set_only&quot; option, the list of properties returned is limited to properties that are set.</td>
</tr>
<tr>
<td></td>
<td>Some object properties are read-only, and the rest are read/write. When you use the &quot;-writeable_only&quot; option, the list of properties returned is limited to properties that are read/write.</td>

### 3.1.31.35. `qed::load_db_state (::quartus::qed)`

The following table displays information for the `qed::load_db_state` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::qed</code> on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
</tbody>
</table>

continued...
**Description**

Prepares an open project for deeper analysis. The specific operations performed will depend on the executable used to access the project. For example, if the project is accessed with "quartus_sta", timing analysis preparation follows the initialization procedure in the Quartus Prime Pro Timing Analyzer: creating the timing netlist, reading any SDC files, and updating the timing netlist.

If the opened project does not have a completed compilation database, this will return an error.

Use the "-timeout" option to specify the maximum time to wait for the background instance of the Quartus Prime Pro software to initialize the executable state on the opened project. The timeout value is specified in seconds, and its default is 0, which means to wait forever. Specifying "-timeout 0" is equivalent to not using the "-timeout" option.

The "-async" option causes the command to returns a token for use with the "get_return_value" command. By default the command will wait, or block, until the background instances of the Quartus Prime software have started, and any project opening or timing initialization options have completed.

When you call "qed::load_db_state" with a project group object, without specifying the "-async" option, the command returns a Tcl dict where keys are IDs of the projects in the project group, and the values are two-element lists of the form {<code> <result>}. If the <code> value is 1, the "load_db_state" command received an error loading the compilation database state. When the <code> value is 1, the <result> contains the received error message. If the <code> value is 0, the "load_db_state" command was successful for the project, and the <result> value contains a message describing that the process succeeded.

**Example Usage**

```tcl
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf
qed::launch_connection project_A
qed::open_project project_A
qed::load_db_state project_A
```

**Return Value**

### Description

Use the "-timeout" option to specify the maximum time to wait for the background instance of the Quartus Prime Pro software to open the project. The timeout value is specified in seconds, and its default is 0, which means to wait forever. Specifying "-timeout 0" is equivalent to not using the "-timeout" option.

Use the "-load_db_state" option to prepare the project for deeper analysis after it opens. The specific operations performed will depend on the executable used to access the project. For example, if the project is accessed with "quartus_sta", timing analysis preparation follows the initialization procedure in the Quartus Prime Pro Timing Analyzer: creating the timing netlist, reading any SDC files, and updating the timing netlist.

The "-async" option causes the command to returns a token for use with the "get_return_value" command. By default the command will wait, or block, until the background instances of the Quartus Prime software have started, and any project opening or timing initialization options have completed.

When you call "qed::open_project" with a project group object without specifying the "-async" option, the command returns a Tcl dict where keys are IDs of the projects in the project group, and the values are two-element lists of the form { <code> <result> }. If the <code> value is 1, the "open_project" command received an error opening the project or initializing the executable state. When the <code> value is 1, the <result> contains the received error message. If the <code> value is 0, the "open_project" command was successful for the project, and the <result> value contains the return value of whatever parts of the initialization flow you have specified.

### Example Usage

```tcl
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf
qed::launch_connection project_A
qed::open_project project_A
```

### Return Value

<table>

</tr>
</tbody>
</table>

continued...
Description

Specialized version of the "qed::set_property" command to modify properties that have list values.

It is equivalent to retrieving the existing property value with the "qed::get_property" command, removing the value from the returned list, then calling "qed::set_property" to update the entire list value.

The "-all" argument removes all instances of the value from the list. Without this flag, only the first instance of a potentially repeated value will be removed.

The "-allow_missing" argument bypasses the error which is normally thrown if the value to pop is not present in the list.

The command returns the updated value of the property.

The command returns a Tcl error if the given property does not exist.

Example Usage

```tcl
qed::create_object -type group   group_one
qed::create_object -type group   group_two
# Result: project_A is in groups {group_one}
quartus::qed::push_to_property project_A -property groups -value group_two
# Result: project_A is in groups {group_one group_two}
quartus::qed::pop_from_property project_A -property groups -value group_one
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.31.38. qed::push_to_property (::quartus::qed)

The following table displays information for the `qed::push_to_property` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>

</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-property &lt;property&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-value &lt;value&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-unique</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;object&gt;</code></td>
</tr>
<tr>
<td>Description</td>
<td>Specialized version of the &quot;qed::set_property&quot; command to modify properties that have list values.</td>
</tr>
</tbody>
</table>
It is equivalent to retrieving the existing property value with the "qed::get_property" command, appending the value to the returned list, then calling "qed::set_property" to update the entire list value.

The "-unique" argument prevents the value from being added to the list if it is already present. Without this flag, the value will be added to the end of the list regardless of the other values already present.

The command returns the updated value of the property.

The command returns a Tcl error if the given property does not exist.

### Example Usage

```
qed::create_object -type group   group_one
qed::create_object -type group   group_two

# Result: project_A is in groups {group_one}
qed::create_object -type project project_A -groups {group_one}

# Result: project_A is in groups {group_one group_two}
qed::push_to_property project_A -property groups -value group_two

# Result: project_A is in groups {group_two}
qed::pop_from_property project_A -property groups -value group_one
```

### Return Value

<td>-timeout &lt;timeout&gt;</td>
</tr>
<tr>
<td></td>
<td>-cmd &lt;cmd&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;object&gt;</td>
</tr>
</tbody>
</table>

**Description**

Communicates with background instances of the Quartus Prime Pro software to run commands and receive return values.

When you call the "qed::run_command" command with a project object, the command is evaluated by the background instance of the Quartus Prime Pro software associated with that project. When you call the "qed::run_command" command with a project group object, the command is evaluated by the background instances of the Quartus Prime Pro software for all projects that are in the project group.

Remember Tcl evaluation and variable substitution rules when you specify the value of the "-cmd" option. Enclosing the command value in quotes ("<command value>" ) allows the command to be interpreted by the Tcl interpreter of the workspace before it is sent to the background software instances. Enclosing the command value in curly braces ({<command value>}) delays interpretation until it is received by the background software instances.
### 3. TCL Commands and Packages

**Example Usage**

```bash
eqd::create_object -type project project_A -qpf_path /file/path/to/project.qpf
eqd::launch_connection project_A
eqd::run_command project_A -cmd "info hostname"
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

#### 3.1.31.42. qed::sanitize_workspace (::quartus::qed)

The following table displays information for the `qed::sanitize_workspace` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`qed::sanitize_workspace [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
</tbody>
</table>
| **Description**         | Runs a variety of checks on projects and project groups to ensure they are in a "clean" state. After you run the "qed::sanitize_workspace" command, the following conditions will be true:
* Every project will be part of at least one project group. If you have not created a project group, a default project group is created.
* If any project objects exist in the workspace, at least one project group will exist. If you have not created a project group object, a default project group will be created.
* No empty project groups will exist. Any project group that does not contain any projects will be deleted.
You should use the "qed::sanitize_workspace" command after you add projects to the workspace, create a project group, edit properties of projects or project groups, or delete objects. |

**Example Usage**

```
eqd::sanitize_workspace
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

#### 3.1.31.43. qed::set_properties (::quartus::qed)

The following table displays information for the `qed::set_properties` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-user_data &lt;user_data&gt;</code> Freetext field to store any interesting metadata on the object. Use <code>qed::set_user_data</code> and <code>qed::get_user_data</code> to interact with the value as a dict instead of a string.</td>
</tr>
</tbody>
</table>

*continued...*
-groups <groups>  Set of group IDs this project is a member of (Valid only for -type project)
-qpf_path <qpf_path>  Full path to a .qpf file to open (Valid only for -type project)
-revision <revision>  Name of the revision to open (Valid only for -type project)
-projects <projects>  Set of projects belonging to the group (Valid only for -type group)
-default_group_id <default_group_id>  Identifier used for the 'default group' that's created to house ungrouped projects during sanitize_workspace (Valid only for -type workspace)
-id <id>  New identifier to associate with the object, must be unique
-from_dict <from_dict>  Dictionary used to set the properties (key = property name, value = property value)
-object <object>  Identifier associated with the object, must be unique

Description
Allows you to modify multiple properties of an object, with a single command, after the object has been created.
You must specify the multiple properties and new values in a Tcl dict.
Valid property and value strings depend on the type of object you are updating.
Calling the "qed::set_properties" command with a dict of size 1 is equivalent to calling the "qed::set_property" command.
The command returns a Tcl error if any of the dictionary keys do not exist as properties of the given object.

Example Usage
qed::create_object -type project project_A
qed::set_properties project_A -qpf_path /path/to/project_B/project.qpf -revision project_B

Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.31.44. qed::set_property (::quartus::qed)

The following table displays information for the qed::set_property Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>qed::set_property [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-property &lt;property&gt;</td>
</tr>
<tr>
<td></td>
<td>-value &lt;value&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;object&gt;</td>
</tr>
</tbody>
</table>

Description
Allows you to modify a property of an object after it is created.
Valid property and value strings depend on the type of object you are updating.
The "qed::set_properties" command supports setting multiple properties of one object in a single command.

continued...
The command returns the updated value of the property. The command returns a Tcl error if the given property does not exist.

**Example Usage**
```
qed::create_object -type project project_A
qed::set_property project_A -property qpf_path -value /path/to/project_B/project.qpf
```

<table>

<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-timeout &lt;timeout&gt;</code> Optional timeout for waiting for a return value in ms (default = 0 = no timeout)</td>
</tr>
</tbody>
</table>

*continued...*
blocks further script execution until all commands associated with the given object have completed or timed out.

**Example Usage**
```
qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf
qed::launch_connection project_A
qed::run_command project_A -cmd "after 1000; expr {100 * 100}"
# Waits for ~1 second
qed::wait_for_ready project_A
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.31.47. qed::workspace_close (::quartus::qed)

The following table displays information for the `qed::workspace_close` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`qed::workspace_close [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Closes an open QED workspace. Data in the workspace, such as projects, groups, and imported report panels is automatically saved in a database when the workspace closes.</td>

<tr>
<td><strong>Example Usage</strong></td>
<td><code>qed::workspace_close</code></td>
</tr>
<tr>
<td><strong>Return Value</strong></td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

### 3.1.31.48. qed::workspace_new (::quartus::qed)

The following table displays information for the `qed::workspace_new` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`qed::workspace_new [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-directory &lt;directory&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-overwrite</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;id&gt;</code></td>
</tr>
</tbody>
</table>

*continued...*
**Description**

Creates and opens a new QED workspace with the specified workspace name. The command returns the ID of the new QED workspace object.

The "qed::workspace_new" command returns an error if a QED workspace with the same name exists in the directory. Use the "-overwrite" option to overwrite the existing workspace.

No QED workspace can be open when you create a new QED workspace; it is an error if a QED workspace is open when you use the "qed::workspace_new" command.

**Example Usage**

```tcl
if { ![qed::is_workspace_open] } {
    qed::workspace_new my_workspace
}
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.31.49. qed::workspace_open (::quartus::qed)

The following table displays information for the qed::workspace_open Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qed on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>qed::workspace_open [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-force</td>
</tr>
<tr>
<td></td>
<td>&lt;id&gt;</td>
</tr>
</tbody>
</table>

**Description**

Opens an existing QED workspace. To create a new QED workspace, use the workspace_new command.

A QED workspace is built on a Quartus Prime Pro project, so the workspace_open command gives an error when the compilation database version is not compatible with the current version of the Quartus Prime software. Use the "-force" option to overwrite the compilation database.

If the specified workspace does not exist, the "qed::workspace_open" command returns a Tcl error.

**Example Usage**

```tcl
# my_workspace must exist
qed::workspace_open my_workspace
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
### 3.1.31.50. `qed::write_object_reports_to_file` (::quartus::qed)

The following table displays information for the `qed::write_object_reports_to_file` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::qed</code> on page 493</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>

<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-append</code> If output is sent to an ASCII file, this option appends the result to that file. Otherwise, the file will be overwritten.</td>
</tr>
<tr>
<td></td>
<td><code>-file &lt;output file name&gt;</code> Name of output file to be generated</td>
</tr>
<tr>
<td></td>
<td><code>-include_generated_panels</code> Flag to include QED-generated panels in the output</td>
</tr>
<tr>
<td></td>
<td><code>&lt;object&gt;</code> Identifier associated with the object, must be unique</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Writes all the report panels associated with the given object to an ASCII file.</td>
</tr>
<tr>
<td></td>
<td>If you specify a project object, and do not use the <code>-include_generated_panels</code> option, only the report panels you imported from the project are written to the file.</td>
</tr>
<tr>
<td></td>
<td>If you have created any new report panels based on any analysis in the Quartus Exploration Dashboard, you should use the <code>-include_generated_panels</code> option so those generated panels are written to the file.</td>
</tr>
<tr>
<td><strong>Example Usage</strong></td>
<td><code>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf</code></td>
</tr>
<tr>
<td></td>
<td><code>qed::launch_connection project_A -open_project</code></td>
</tr>
<tr>
<td></td>
<td>`qed::import_report_panel project_A -panel_name &quot;Timing Analyzer</td>
</tr>

<tr>
<td></td>
<td>-hub_key_prefix &lt;hub_key_prefix&gt;</td>
</tr>
</tbody>
</table>

continued...
Connects a client with the provided name to a Quartus Prime hub and returns the key of the dedicated server created by the hub for that client.

Example Usage

```bash
# Connect a client with name client1 to a Quarts Prime hub with hub key prefix hub1
qshm_connect_to_quartus -name client1 -hub_key_prefix hub1 -project <project> -revision <revision>
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.33.2. qshm_disconnect_from_quartus (::quartus::qshm)

The following table displays information for the `qshm_disconnect_from_quartus` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qshm on page 536</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`qshm_disconnect_from_quartus [-h</td>

</tbody>
</table>
| Example Usage           | `## Disconnect a client with name client1 from the Quarts Prime
qshm_disconnect_from_quartus -name client1` |
| Return Value            | Code Name | Code | String Return |
|                         | TCL_OK    | 0    | INFO: Operation successful |

### 3.1.33.3. qshm_dispose_client (::quartus::qshm)

The following table displays information for the `qshm_dispose_client` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qshm on page 536</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`qshm_dispose_client [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-name &lt;name&gt;</code> Client name</td>
</tr>
<tr>
<td>Description</td>
<td>Dispose and reclaim resources by the client with the specified name.</td>
</tr>
</tbody>
</table>

---

3. TCL Commands and Packages

537
Example Usage

```bash
## Dispose of a client with name client1
qshm_dispose_client -name client1
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>

3.1.33.6. qshm_obtain_client (::quartus::qshm)

The following table displays information for the qshm_obtain_client Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qshm on page 536</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>qshm_obtain_client [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-name &lt;name&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Creates and returns a client for the specified client name.</td>
</tr>
<tr>
<td>Example Usage</td>
<td># Create an SHM-based client type socket with the name &quot;client1&quot;</td>
</tr>
<tr>
<td></td>
<td>qshm_obtain_client -name client1</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

3.1.33.7. qshm_send_request (::quartus::qshm)

The following table displays information for the qshm_send_request Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qshm on page 536</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>qshm_send_request [-h</td>

<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-cmd &lt;cmd&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Sends the a request to the client with the specified name and waits to receive a response from the dedicated server the client is connected to.</td>
</tr>
<tr>
<td>Example Usage</td>
<td># Send a Tcl command to the client with the specified name. The context should have been set to include the request_type=tcl key value pair.</td>
</tr>
<tr>
<td></td>
<td>qshm_send_request -name client1 -cmd &quot;set x 3&quot;</td>
</tr>
<tr>
<td>Return Value</td>
<td>Code Name</td>
</tr>
<tr>
<td></td>
<td>TCL_OK</td>
</tr>
</tbody>
</table>

3.1.33.8. qshm_send_server_state_query (::quartus::qshm)

The following table displays information for the qshm_send_server_state_query Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qshm on page 536</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>qshm_send_server_state_query [-h</td>
</tr>
</tbody>
</table>

continued...
### Arguments

- **-h | -help**  
  Short help
- **-long_help**  
  Long help with examples and possible return values
- **-name <name>**  
  client name
- **-state_key <state_key>**  
  state key string

### Description

Sends the server state request to the client with the specified name and waits to receive a response from the state socket of the dedicated server the client is connected to.

### Example Usage

```bash
## Send a server state command using the client with specified name.
qushm_send_server_state_query -name client1 -state_key device_family
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.33. qshm_set_context (::quartus::qshm)

The following table displays information for the `qshm_set_context` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::qshm on page 536</th>
</tr>
</thead>
</table>

**Syntax**

```
qushm_set_context [-h | -help] [-long_help] -key <key> -name <name> -value <value>
```

- **-h | -help**  
  Short help
- **-long_help**  
  Long help with examples and possible return values
- **-key <key>**  
  A context key
- **-name <name>**  
  client name
- **-value <value>**  
  A context value

### Description

Sets the a context key value pair for the client with the specified name.

### Example Usage

```bash
## Set a key value pair request_type=tcl for the client with the specified name.
qushm_set_context -name client1 -key request_type -value tcl
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.34. ::quartus::report

The following table displays information for the `::quartus::report` Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::report 2.1</th>
</tr>
</thead>
</table>

**Description**

This package contains a set of Tcl functions for accessing and updating information in the report database.

**Availability**

This package is loaded by default in the following executables:

- qacv
- quartus_fit
- quartus_ipgenerate
- quartus_sim

---

Continued...
This package is available for loading in the following executables:
- qpro
- qpro_sh
- quartus
- quartus_cdb
- quartus_drc
- quartus_edb
- quartus_map
- quartus_sh
- quartus_si
- quartus_sta
- quartus_syn

**Tcl Commands**

- `add_row_to_table (::quartus::report)` on page 541
- `create_report_panel (::quartus::report)` on page 542
- `delete_report_panel (::quartus::report)` on page 544
- `get_fitter_resource_usage (::quartus::report)` on page 545
- `get_number_of_columns (::quartus::report)` on page 547
- `get_number_of_rows (::quartus::report)` on page 548
- `get_report_panel_column_index (::quartus::report)` on page 549
- `get_report_panel_data (::quartus::report)` on page 550
- `get_report_panel_id (::quartus::report)` on page 552
- `get_report_panel_names (::quartus::report)` on page 553
- `get_report_panel_row (::quartus::report)` on page 554
- `get_report_panel_row_index (::quartus::report)` on page 555
- `load_report (::quartus::report)` on page 556
- `read_xml_report (::quartus::report)` on page 557
- `refresh_report_window (::quartus::report)` on page 558
- `save_report_database (::quartus::report)` on page 558
- `unload_report (::quartus::report)` on page 559
- `write_report_panel (::quartus::report)` on page 560
- `write_xml_report (::quartus::report)` on page 561

### 3.1.34.1. `add_row_to_table (::quartus::report)`

The following table displays information for the `add_row_to_table` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to</th>
<th>::quartus::report on page 540</th>
</tr>
</thead>
<tbody>
<tr>

### 3.1.34.2. create_report_panel (::quartus::report)

The following table displays information for the `create_report_panel` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::report on page 540</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
</tbody>
</table>

Continued...
**Description**

Creates a new report panel with the specified name. If the -folder option is specified, a folder is created. If the -table option is specified, a table is created. The name must be the full path to the new report panel, such as "Fitter||My Table". If the specified panel is created successfully, the corresponding panel id is returned.

The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis & Synthesis||Summary". However, the corresponding full path used by this Tcl command is "Analysis & Synthesis||Analysis & Synthesis Summary".

**Example Usage**

```tcl
load_package report
project_open chiptrip
load_report

# Set folder name and id
set folder_id [create_report_panel -folder $folder]
set folder_id [get_report_panel_id $folder]

# Check if specified folder exists. If not, create it.
if {$folder_id == -1} {
    create_report_panel -folder $folder
}

# Set table name and id
set table_id [create_report_panel -table $table]
set table_id [get_report_panel_id $table]

# Check if specified table exists. If so, delete it.
if {$table_id != -1} {
    delete_report_panel -id $table_id
}

# Create the specified table and get its id
set table_id [create_report_panel -table $table]
set table_id [get_report_panel_id $table]

# Add Timing Analyzer Summary to the table
add_row_to_table -id $table_id {Name} {Value}
add_row_to_table -id $table_id {Name} {Value}

# Save the changes to the report database
save_report_database

unload_report
project_close
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The database file was not found at: &lt;string&gt;.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Report folder &lt;string&gt; already exists -- specify a different report folder name.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Can't find folder: &lt;string&gt;. Specify an existing report folder name.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Illegal color: &lt;string&gt;. Specify a color that is currently supported by add_row_to_table.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: The input report object is not a table to be the master table of master details object</td>
</tr>
</tbody>
</table>

**continued...**
### 3.1.34.3. delete_report_panel (::quartus::report)

The following table displays information for the `delete_report_panel` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::report on page 540</th>
</tr>
</thead>
</table>

**Syntax**

```tcl
delete_report_panel [-h | -help] [-long_help] [-id <panel_id>] [-name <panel_name>]
```

**Arguments**

- `-h | -help`  
  Short help

- `-long_help`  
  Long help with examples and possible return values

- `-id <panel_id>`  
  Id of panel to delete

- `-name <panel_name>`  
  Name of panel to delete

**Description**

Deletes the report panel with the specified id or name. The panel can either be a report table or report folder.

Using the panel id provides faster data access than using the panel name.

Panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.

Panel names support wildcards.

The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis & Synthesis||Summary". However, the corresponding full path used by this Tcl command is "Analysis & Synthesis||Analysis & Synthesis Summary".

**Example Usage**

```tcl
load_package report  
project_open chiptrip  
load_report
```
```tcl
# Set table name and id
set table    "Fitter||My Table"
set table_id [get_report_panel_id $table]

# Delete the table if it already exists
if {$table_id != -1} {
    delete_report_panel -id $table_id
}

# Re-create the table
create_report_panel -table $table
add_row_to_table -name $table {{Name} {Value}}
add_row_to_table -name $table {{Number of Registers} {100}}

# This time, use table name instead of table id to delete it.
delete_report_panel -name $table

# Now, delete a folder
set folder    "My Folder"
set folder_id [get_report_panel_id $folder]

# Delete it if the specified folder already exists
if {$folder_id != -1} {
    delete_report_panel -id $folder_id
}

# Save the changes to the report database
save_report_database

unload_report
project_close
```

### 3.1.34.4. `get_fitter_resource_usage` (::quartus::report)

The following table displays information for the `get_fitter_resource_usage` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::report on page 540</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
</tbody>
</table>
-alm  Get total adaptive logic modules
-alut Get total Combinational ALUTs
-available Get available resource summary
-io_pin Get total I/O pins
-lab Get total logic array blocks
-le Get total logic elements
-mem_bit Get total memory bits
-percentage Get used resource summary in percentage
-reg Get total registers
-used Get used resource summary
-utilization Get total logic utilization

Description

Gets the Fitter resource usage results.

You must use one of the following options: "-alut", "-reg", "-le", "-alm", "-lab", "-io_pin", "-mem_bit" or "-resource".

If the above option is not "-resource", you may also optionally use one of the following options: "-used", "-available" or "-percentage".

Option "-resource" takes resource name as parameter, which supports wildcards.

Example Usage

load_package report
project_open chiptrip
load_report

# Shortcut of get_fitter_resource_usage command
set cmd     get_fitter_resource_usage

# Get total registers, logic elements, and DSP block 9-bit elements.
set registers [\$cmd -reg]
set alms     [\$cmd -alm]
set io_pin   [\$cmd -io_pin -available]
set mem_bit  [\$cmd -mem_bit -percentage]
set dsp      [\$cmd -resource "DSP block 9*"]
puts "Registers usage: $registers"
puts "Total used ALMs: $alms"
puts "Total available I/O pins: $io_pin"
puts "Total used memory bits in percentage: $mem_bit%"
puts "DSP block 9-bit elements: $dsp"

unload_report
project_close

Return Value

</tr>
</tbody>
</table>
3.1.34.5. `get_number_of_columns` (::quartus::report)

The following table displays information for the `get_number_of_columns` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::report on page 540</th>
</tr>
</thead>
</table>

**Syntax**

`get_number_of_columns [-h | -help] [-long_help] [-id <table_id>] [-name <table_name>]`

**Arguments**

- `-h | -help`  
  Short help
- `-long_help`  
  Long help with examples and possible return values
- `-id <table_id>`  
  Id of panel from which to get data
- `-name <table_name>`  
  Name of panel from which to get data

**Description**

Returns the number of columns for the specified panel.

Using the panel id provides faster data access than using the panel name.

Panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.

Panel names support wildcards.

The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis & Synthesis||Summary". However, the corresponding full path used by this Tcl command is "Analysis & Synthesis||Analysis & Synthesis Summary".

**Example Usage**

```tcl
## Loop through a panel row and print out all its element information
load_package report
project_open chiptrip
load_report

# Set panel name and id
set panel {*Input Pins}  
set id [get_report_panel_id $panel]  
if {$id == -1} {
    error( "Panel not found")
}

# Get the number of columns
set col_cnt [get_number_of_columns -id $id]

# Set row name and get row index
set rname {*clk1*}
set rindex [get_report_panel_row_index -id $id $rname]  
set rname [get_report_panel_data -row $rindex -col 0 -id $id]

puts "\[Input Pins - $rname\]"
for {set i 1} {$i < $col_cnt} {incr i} {
    set result [get_report_panel_data -row 0 -col $i -id $id]
    puts $result
}

unload_report
project_close
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>

### 3.1.34.7. get_report_panel_column_index (::quartus::report)

The following table displays information for the `get_report_panel_column_index` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::report on page 540</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>get_report_panel_column_index [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-id &lt;table_id&gt;</td>
</tr>
<tr>
<td></td>
<td>-name &lt;table_name&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;col_name&gt;</td>
</tr>
</tbody>
</table>

### Description

Gets the column index of the specified panel column name.

Column name refers to the specified name in the header row. The column index is a non-negative integer for an existing column. The column index is -1 if the column name is not found in the panel.

Using the column index and panel id provides faster data access than using column name and panel name.

Column indices and panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.

Column and panel names support wildcards.

The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of content shows the path "Analysis & Synthesis||Summary". However, the corresponding full path used by this Tcl command is "Analysis & Synthesis||Analysis & Synthesis Summary".

549
Example Usage

```tcl
load_package report
project_open chiptrip
load_report

# Set panel name and id
set panel {*Input Pins}
set id [get_report_panel_id $panel]

# Set column name and index
set cname {Pin #}
set cindex [get_report_panel_column_index -id $id $cname]

# Get data out of the specified panel
set clock [get_report_panel_data -id $id -row_name clk1 -col $cindex]
set enable [get_report_panel_data -id $id -row_name enable -col $cindex]

# Output results
puts "$cname of clock: $clock"
puts "$cname of enable: $enable"

unload_report
project_close
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

3.1.34.8. `get_report_panel_data` (::quartus::report)

The following table displays information for the `get_report_panel_data` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::report on page 540</th>
</tr>
</thead>
</table>
Panel, row, and panel names support wildcards.

The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis & Synthesis||Summary". However, the corresponding full path used by this Tcl command is "Analysis & Synthesis||Analysis & Synthesis Summary".

Example Usage

```
load_package report
project_open chiptrip
load_report
# Set panel name and id
set panel {Flow Settings}
set id [get_report_panel_id $panel]
# Set row name
set rname {Revision Name}
# Get row 2 - column 1 data
get_report_panel_data -row 2 -col 1 -id $id
# Get row (Revision Name) - column 1 data
get_report_panel_data -row_name $rname -col 1 -id $id
# Get row (Revision Name) - column (Setting) data
get_report_panel_data -row_name $rname -col_name Setting -id $id
# If unsure the case of a row or column name, use glob-style pattern
get_report_panel_data -row_name [Rr]evision* -col_name [Ss]etting -id $id
unload_report
project_close
```

3.1.34.9. *get_report_panel_id* (::quartus::report)

The following table displays information for the *get_report_panel_id* Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Depends on ::quartus::report on page 540</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`get_report_panel_id [-h</td>

<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>&lt;name&gt;</code> Name of panel for which to get id</td>
</tr>
</tbody>
</table>

**Description**

Gets the id of a panel with the specified name.

The panel id is a non-negative integer for an existing panel. If the specified panel cannot be found, the id is -1.

Using the panel id provides faster data access than using the panel name.

You can use the "*get_report_panel_id*" command to check for the existence of a panel. (Refer to the example under the "*get_report_panel_id*" command.)

Panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.

Panel names support wildcards.

The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis & Synthesis||Summary". However, the corresponding full path used by this Tcl command is "Analysis & Synthesis||Analysis & Synthesis Summary".

**Example Usage**

```
load_package report
project_open chiptrip
load_report

# Set panel name
set panel {Fitter||Fitter Settings}
# Get the panel id
set id [get_report_panel_id $panel]
if {$id != -1} {
    # If panel exists, add a row to it
    add_row_to_table -id $id [New Field] Yes No
    # Save the changes to the report database
    save_report_database
} else {
    # Otherwise print an error message
    puts "Error: Table $panel does not exist."
}
unload_report
project_close
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>

3.1.34.10. `get_report_panel_names (::quartus::report)`

The following table displays information for the `get_report_panel_names` TCL command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::report</code> on page 540</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`get_report_panel_names [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help: Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>-filter_name &lt;filter_name&gt;: filter the returned list to match the specified panel names</td>
</tr>
</tbody>
</table>

**Description**

Returns a list of panel names for the current report.

The table of contents portion of the Compilation Report window shows short panel names for better readability. However, each panel name returned by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis & Synthesis||Summary". However, the corresponding full path returned by this TCL command is "Analysis & Synthesis||Analysis & Synthesis Summary".

**Example Usage**

```tcl
## Load report database and write Timing Analyzer Summary
## panel to file in HTML format
load_package report
project_open chiptrip
load_report

# Set panel name
set fmax_panel "Timing Analyzer Summary"

# Iterate through all the accessible panels
foreach panel [get_report_panel_names] {
    # If find the panel '*Timing Analyzer Summary',
    # write its content to file fmax.htm
    if {([string match '*$fmax_panel*' $panel] == 1) { write_report_panel -file fmax.htm -html $panel
        break
    }
}

unload_report
project_close
```

</tr>
<tr>
<td></td>
<td>-row &lt;row&gt;</td>
</tr>
<tr>
<td></td>
<td>-row_name &lt;row_name&gt;</td>
</tr>
</tbody>
</table>

**Description**

Reports data of the specified panel row.

Using the panel id and row index provides faster data access than using panel name and row name, respectively.

Panel ids and row indices that you have cached may become outdated or invalid if the report gets unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.

Panel and row names support wildcards.

The table of content portion of the UI Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the UI Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of content shows the path "Analysis & Synthesis||Summary". However, the corresponding full path used by this Tcl command is "Analysis & Synthesis||Analysis & Synthesis Summary".

**Example Usage**

```tcl
load_package report
project_open chiptrip
load_report
# Set panel name and id
set panel (Flow Settings)
set id    [get_report_panel_id $panel]
# Set row name
set rname (Revision Name)
# Get row (Revision Name) data (use panel id)
get_report_panel_row -row_name $rname -id $id
# Get row 2 data (use panel id)
get_report_panel_row -row 2 -id $id
# Get row 3 data (use panel name)
get_report_panel_row -row 3 -name $panel

## Get the last row data
set row_cnt   [get_number_of_rows -id $id]
set last_rindex [expr $row_cnt - 1]
get_report_panel_row -row $last_rindex -id $id

unload_report
project_close
```

Example Usage

```tcl
load_package report
project_open chiptrip
load_report

# Set panel name and id
set panel {*Input Pins}
set id [get_report_panel_id $panel]

# Set row name and index
set rname {CLK1}
set rindex [get_report_panel_row_index -id $id $rname]

# Get data out of the specified panel
set pcstr [get_report_panel_data -id $id -row 0 -col 1]
set pin_cnt [get_report_panel_data -id $id -row $rindex -col 1]
set iobstr [get_report_panel_data -id $id -row 0 -col 2]
set io_bank [get_report_panel_data -id $id -row $rindex -col 2]

# Output results
puts "$pc_str: $pin_cnt"
puts "$iob_str: $io_bank"

unload_report
project_close
```

<table>
<thead>

3.1.34.13. load_report (::quartus::report)

The following table displays information for the `load_report` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::report on page 540</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>load_report [-h</td>
</tr>
</tbody>
</table>

Arguments

- `-h | -help` | Short help
- `-long_help` | Long help with examples and possible return values
- `-simulator` | Option to load the Simulation Report. If this option isn't specified, the Compilation Report is loaded instead.

Description

By default, loads the Compilation Report for the current revision or the specified revision name. If the `-simulator` option is specified, loads the Simulation Report instead.

After the report is loaded or reloaded, the cached panel ids, and row and column indices may become outdated or invalid. Intel recommends that you update them before using them.

Example Usage

```tcl
# Load report package
load_package report
# Open chiptrip project
project_open chiptrip
# Load the current revision report
load_report

# Set panel name and id
set panel {Fitter||Fitter Summary}
set id [get_report_panel_id $panel]

# Get total registers
set name [Total [Rr]egisters]
set rindex [get_report_panel_row_index -id $id $name]
set name [get_report_panel_data -id $id -row $rindex -col 0]
set data [get_report_panel_data -id $id -row $rindex -col 1]
puts "$name: $data"

# Get total pins
set name [Total [Pp]ins]
set rindex [get_report_panel_row_index -id $id $name]
set name [get_report_panel_data -id $id -row $rindex -col 0]
set data [get_report_panel_data -id $id -row $rindex -col 1]
puts "$name: $data"
```

### 3.134.18. write_report_panel (::quartus::report)

The following table displays information for the `write_report_panel` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::report</code> on page 540</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-append</td>
<td>If output is sent to an ASCII file, this option appends the result to that file. Otherwise, the file will be overwritten. This option is not supported for HTML or XML files.</td>
</tr>
<tr>
<td>-file &lt;output file name&gt;</td>
<td>Name of output file to be generated</td>
</tr>
<tr>
<td>-html</td>
<td>Option to generate output file in HTML format</td>
</tr>
<tr>
<td>-id &lt;table_id&gt;</td>
<td>id of panel from which to get data</td>
</tr>
<tr>
<td>-name &lt;table_name&gt;</td>
<td>Name of panel from which to get data</td>
</tr>
<tr>
<td>-xml</td>
<td>Option to generate output file in XML format</td>
</tr>
<tr>
<td>&lt;name&gt;</td>
<td>Name of panel from which to get data</td>
</tr>
</tbody>
</table>

#### Description

Writes data from the specified report panel to the specified output file. If the "-html" option is specified, the output file is generated in HTML format. If the "-xml" option is specified, the output file is generated in XML format. Otherwise, the output file is generated in ASCII format.

For ASCII formatted files, "-append" preserves the existing file and adds the panel to the end. Otherwise, the file is overwritten. HTML and XML files are always overwritten.

Using the panel id provides faster data access than using the panel name.

Panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.

Panel names support wildcards.

The table of contents portion of the Compilation Report window shows short panel names for better readibility. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis & Synthesis|Summary". However, the corresponding full path used by this Tcl command is "Analysis & Synthesis|Analysis & Synthesis Summary".

---

**continued...**
Example Usage

```tcl
## Load report database and write Timing Analyzer Summary
## panel to file in HTML format
load_package report
project_open chiptrip
load_report
# Set panel name and id
set panel "*Timing Analyzer Summary"
set id [get_report_panel_id $panel]
# If the specified panel exists, write it to
# fmax.htm and fmax.xml.
# Otherwise, print out an error message
if {$id != -1} {
    write_report_panel -file fmax.htm -html -id $id
    write_report_panel -file fmax.xml -xml -id $id
} else {
    puts "Error: report panel could not be found."
}
unload_report
project_close
```

### Return Value

3.1.35. ::quartus::sdc

The following table displays information for the ::quartus::sdc Tcl package:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>::quartus::sdc 1.5</th>
</tr>
</thead>
</table>
| Description             | Synopsys Design Constraint (SDC) format is used to specify the design intent, including the timing and area constraints of the design. The Timing Analyzer only implements the set of SDC commands required to specify the timing constraints of the design. For area constraints, the QSF file should be used. This package implements the SDC Spec Version 1.5 (June 2005).
|                         | Any command in this package can be specified in a Timing Analyzer SDC file. |
| Availability            | This package is loaded by default in the following executable:
                          | quartus_sta |
                          | This package is available for loading in the following executable:
                          | quartus_fit |
| Tcl Commands            | all_clocks (::quartus::sdc) on page 563 |

<tr>
<td>-name &lt;clock_name&gt;</td>
<td>Clock name of the created clock</td>
</tr>
<tr>
<td>-period &lt;value&gt;</td>
<td>Speed of the clock in terms of clock period</td>
</tr>
<tr>
<td>-waveform &lt;edge_list&gt;</td>
<td>List of edge values</td>
</tr>
<tr>
<td>&lt;targets&gt;</td>
<td>List or collection of targets / wildcards</td>
</tr>
</tbody>
</table>

#### Description

Defines a clock. If the -name option is not used, the clock name is the same as the first target in the list or collection. The clock name is used to refer to the clock in other commands.

The -period option specifies the clock period. It is also possible to use this option to specify a frequency to define the clock period. This can be done by using -period option followed by either <frequency>MHz or "<frequency> MHz". However, this is a Timing Analyzer-only extension and makes the SDC syntax non-standard.

The -waveform option specifies the rising and falling edges (duty cycle) of the clock, and is specified as a list of two time values: the first rising edge and the next falling edge. The rising edge must be within the range [0, period). The falling edge must be within one clock period of the rising edge. The waveform defaults to (0, period/2).

If a clock with the same name is already assigned to a given target, the create_clock command will overwrite the existing clock. If a clock with a different name exists on the given target, the create_clock command will be ignored unless the -add option is used. The -add option can be used to assign multiple clocks to a pin or port.

If the target of the clock is internal (i.e. not an input port), the source latency is zero by default.

If a clock is on a path after another clock, then it blocks or overwrites the previous clock from that point forward.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

#### Example Usage

```tcl
# Create a simple 10ns with clock with a 60% duty cycle
create_clock -period 10 -waveform (0 6) -name clk [get_ports clk]

# Create a clock with a falling edge at 2ns, rising edge at 8ns, falling at 12ns, etc.
create_clock -period 10 -waveform (8 12) -name clk [get_ports clk]

# Assign two clocks to an input port that are switched externally
create_clock -period 10 -name clk100MHz [get_ports clk]
create_clock -period 6.667 -name clk150MHz -add [get_ports clk]

# Two ways to use MHz to define clock period (Timing Analyzer only)
create_clock -period 250MHz -name clk250MHz [get_ports clk]
create_clock -period "250 MHz" -name clk250MHz [get_ports clk]
```

<td></td>
<td>-source &lt;clock_source&gt;</td>
</tr>
<tr>
<td>&lt;targets&gt;</td>
<td>List or collection of targets</td>
</tr>
</tbody>
</table>

**Description**

Defines an internally generated clock. If -name is not specified, the clock name is the same as the first target in the list or collection. The clock name is used to refer to the clock in other commands.

If a clock with the same name is already assigned to a given target, the create_generated_clock command overwrites the existing clock. If a clock with a different name exists on the given target, the create_generated_clock command is ignored unless the -add option is used. The -add option can be used to assign multiple clocks to a pin or port, and is recommended be used with -master_clock option.

The source of the generated clock, specified by -source, is a port, pin, register, or net in the design. All waveform modifications are relative to this point. If more than one clock feeds the source node, the -master_clock option must be used to specify which clock to modify.

The source latency of the generated clock is based on the clock...
network of the generated clock, and not the clock network of the
node specified using -source. This latency is added to any
source latency of the master clock.

If no target is specified, the clock is treated as a virtual clock.
In that case, the source latency of the generated clock will be
equal to the source latency of the master clock, plus any added
latency specified with set_clock_latency.

The -divide_by, -multiply_by, -invert, -duty_cycle, -edges, and
-edge_shift options modify the waveform relative to the waveform
at the source node.

Clock division and multiplication, using -divide_by and
-multiply_by, is performed relative to the first rising
edge. Clock division is based on edges in the master clock
waveform, and scaled if the division is an odd number. Use the
-duty_cycle option to specify the new duty cycle for clock
multiplication. Use the -phase option to specify any phase shift
relative to the new clock period. Use the -offset option to
specify an arbitrary offset or time shift. Use the -invert
option to invert the generated waveform. The -phase and -duty_cycle
options may be specified as a decimal value (e.g. 22.5) or
as a ratio of two numbers (e.g. 45/2). The latter form may
improve Timing Analyzer accuracy when detecting relationships between
related clocks.

Clock generation can also be specified with the -edges and
-edge_shift options. The -edges option accepts a list of three
numbers specifying the master clock edges to use for the first
rising edge, the next falling edge, and next rising edge. Edges
of the master clock are labeled according to the first rising
edge (1), next falling edge (2), next rising edge (3), etc. For
example, a basic clock divider can be specified equivalently
with -divide_by 2 or -edges {1 3 5}. The -edge_shift option
accepts a list of three time values, the amount to shift each of
the three edges.

The value of the targets is either a collection or a Tcl list of
wildcards used to create a collection of the appropriate
type. The values used must follow standard Tcl or
Timing Analyzer-extension substitution rules. See the help for
use_timing_analyzer_style_escaping for details.

Example Usage

# Create a clock and a divide-by-2 generated clock
create_clock -period 10 [get_ports clk]
create_generated_clock -divide_by 2 -source [get_ports clk] -name clkdiv [get_registers clkdiv]

# An equivalent generated clock
create_generated_clock -edges {1 3 5} -source [get_ports clk] -name clkdiv [get_registers clkdiv]

# Specify a clock multiplier with a 60% duty cycle
create_generated_clock -multiply_by 2 -source [get_ports clk] -duty_cycle 60 [get_pins clkmult | combout]

# Specify an inverted divide-by-2 clock relative to the output of the source clock
create_generated_clock -divide_by 2 -invert -source [get_ports clk] -name nclkdiv [get_registers clkdiv]

# Specify a divide-by-2 clock with a 90-degree phase shift
create_generated_clock -divide_by 2 -phase 90 -source [get_ports clk] -name clkdiv [get_registers clkdiv]

# Create a divide-by-2 generated clock generated off the falling edge of the source clock
create_generated_clock -edges {2 4 6} -source [get_ports clk] -name clkfall_div [get_registers clkfall_div]

# Assign two clocks to an input port that are switched externally,
# along with an internal clock divider.
create_clock -period 10 -name clk100Mhz [get_ports clk]
create_clock -period 6.667 -name clk150Mhz -add [get_ports clk]
create_generated_clock -divide_by 2 -name clk50Mhz -source (get_ports clk) -master_clock clk100Mhz -add [get_registers clkdiv]
create_generated_clock -divide_by 2 -name clk75Mhz -source (get_ports clk) -master_clock clk150Mhz -add [get_registers clkdiv]

# Create a virtual clock, and two generated clocks that derive from it.
# This makes the generated clocks related, so crossings between them are not asynchronous.
create_clock -period 10 -name virtual_base
create_generated_clock -master_clock virtual_base -divide_by 2 [get_ports clk]
create_generated_clock -master_clock virtual_base -divide_by 4 [get_ports clk]

# Continued...
3.1.35.7. derive_clocks (::quartus::sdc)

The following table displays information for the `derive_clocks` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc on page 562</th>
</tr>
</thead>
</table>

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-no_black_box_sources` Option to disable considering periphery nodes of black box atoms as possible clock sources when deriving clocks
- `-period <period_value>` Speed of the default clock in terms of clock period
- `-suffix <suffix_string>` Suffix of derived clock names
- `-waveform <edge_list>` List of edge values

**Description**

Creates a clock on sources of clock pins in the design that do not already have at least one clock sourcing the clock pin. This command is equivalent to calling create_clock on each clock source in the design that does not already have a clock assigned to it.

See the help for create_clock for more information.

Intel does not recommend using this command during final sign-off analysis of a design. `derive_clocks` should only be used early in the design phase when the clocks are not completely known. When possible, create_clock and create_generated_clock should be used instead.

**Example Usage**

- # Automatically create a 10ns, 60% duty cycle clock on all unconstrained clock sources.
- `derive_clocks -period 10 -waveform [0 6]`

- # Append a suffix to all derived clock names using the "-suffix" option.
- # All derived clock names will end with "-my_suffix".
- `derive_clocks -period 10 -suffix "my_suffix"`

3.1.35.8. get_cells (::quartus::sdc)

The following table displays information for the `get_cells` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc on page 562</th>
</tr>
</thead>
</table>

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values

**Example Usage**

- # Automatically create a 10ns, 60% duty cycle clock on all unconstrained clock sources.
- `derive_clocks -period 10 -waveform [0 6]`

- # Append a suffix to all derived clock names using the "-suffix" option.
- # All derived clock names will end with "-my_suffix".
- `derive_clocks -period 10 -suffix "my_suffix"`

<table>

<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
Returns a collection of cells in the design. All cell names in the
collection match the specified pattern. Wildcards can be used to
select multiple cells at once.

There are three Tcl string matching schemes available with this
command: the default method, the -hierarchical option, and the
-compatibility_mode option.

When you use the default matching scheme, use pipe characters to
separate one hierarchy level from the next. They are treated as
special characters and are taken into account when string matching
with wildcards is performed. When this matching scheme is enabled, the
specified pattern is matched against absolute cell names: the names
that include the entire hierarchical path. A full cell name can
contain multiple pipe characters in it to reflect the hierarchy. All
hierarchy levels in the pattern are matched level by level. Any
included wildcards refer to only one hierarchical level. For example,
”*” and ”**” produce different collections since they refer to the
highest hierarchical level and second highest hierarchical level
respectively.

When using the -hierarchical matching scheme, pipe characters are
treated as special characters and are taken into account when string
matching with wildcards is performed. This matching scheme forces the
search to proceed recursively down the hierarchy. The specified
pattern is matched against the relative cell names: the immediate
names that do not include any of the hierarchy information. Note that
a short cell name cannot contain pipe characters in it. Any included
wildcards are expanded to match the relative cell names.

The -compatibility_mode matching scheme uses simple Tcl string matching
on full, absolute cell names. Pipe characters are not treated as special
characters when used with wildcards.

The default matching scheme returns cells whose names match the
specified filter and also cells automatically generated by the Quartus
II software from these cells). Use -no_duplicates option to not
include duplicated cells.

The filter for the collection is a Tcl list of wildcards, and must
follow standard Tcl or Timing Analyzer-extension substitution rules. See
help for the use_timing_analyzer_style_escaping command for details.

Example Usage

```tcl
# Find a cell called "reg" using case insensitive search
get_cells -nocase reg

# Create a collection of all cells whose names start with "reg"
get_cells reg*

# Create a collection of all cells on the highest hierarchical level
set mycollection [get_cells *]

# Create a collection of all cells in the design
foreach_in_collection cell $mycollection {
    puts [get_cell_info -name $cell]
}
set fullcollection [get_cells -hierarchical *]

# Output cell IDs and names.
foreach_in_collection cell $fullcollection {
    puts -nonewline $cell
    puts -nonewline " ": 
    puts [get_cell_info -name $cell]
}
```

Return Value

</tr>
</tbody>
</table>
### 3.1.35.9. `get_clocks (::quartus::sdc)`

The following table displays information for the `get_clocks` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc on page 562</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td></td>
</tr>
<tr>
<td>`-h</td>
<td>-help`</td>
</tr>
<tr>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td><code>-include_generated_clocks</code></td>
<td>Includes generated clocks derived from the matched clocks</td>
</tr>
<tr>
<td><code>-nocase</code></td>
<td>Specifies the matching of node names to be case-insensitive</td>
</tr>
<tr>
<td><code>-nowarn</code></td>
<td>Do not issue warning messages when querying for clocks</td>
</tr>
<tr>
<td><code>-of_objects &lt;object_collection&gt;</code></td>
<td>Returns all clocks that target (defined on) or drive (determine data frequency of) the nodes in the collection.</td>
</tr>
<tr>
<td><code>&lt;filter&gt;</code></td>
<td>Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

**Description**

Returns a collection of previously defined clocks in the design. Use a clock collection as the -from/to argument of a command (such as `set_multicycle_path`) to refer to all nodes driven by the clocks in the collection.

```tcl
# The following multicycle constraint applies to all paths ending at registers driven by clk
set_multicycle_path -to [get_clocks clk] 2
```

If a filter, which is a Tcl list of wildcards and must follow standard Tcl or Timing Analyzer-extension substitution rules, is specified, then `get_clocks` returns all previously defined clocks whose names match the filter. See the help for `use_timing_analyzer_style_escaping` for filter rules.

If you use the `-of_objects` option, you must provide a collection of registers, ports, pins, or cells. The `get_clocks` command returns a collection of all the previously defined clocks that target these nodes, or if these nodes are not clock targets, all the previously defined clocks that drive these nodes. You cannot use the `-of_objects` option with the clock name filter. Refer to the long help for examples of using the `-of_objects` option.

Tip: the `get_clocks` command can be used as part of SDC commands, as well as for reporting. When it is used as part of SDC commands and includes the `-include_generated_clocks` option, the Timing Analyzer needs to analyze the design and may issue warnings about missing clocks. The missing clocks might still be created later on in the SDC file and are not necessarily indicative of a problem. Use the `-nowarn` option in this case to suppress those warnings. When you use the `-nowarn` option, pass a node collection generated by another `get_*` collection command as the filter. This way, warnings directly related to the filter resolution are still posted.

**Example Usage**

```tcl
# get clocks that begin with 'c' or 'C', and print out their names and periods:
set clocks [get_clocks c* -nocase]
foreach_in_collection clk $clocks {
    set name [get_clock_info -name $clk]
    set period [get_clock_info -period $clk]
    puts "$name: $period"
}

# getting the clock that targets a port, and its generated clock:
create_clock -name my_clock -period 10.000 [get_ports CLK_100]
create_generated_clock -name my_gen_clock -divide_by 2 -source [get_ports CLK_100]
get_registers clk_div_reg
get_clocks -nowarn -of_objects [get_ports CLK_100] -include_generated_clocks

# display the name of the clocks that drive registers beginning with 'reg_'
foreach_in_collection clk_id [get_clocks -nowarn -of_objects [get_registers reg_*]] {
    puts [get_clock_info -name $clk_id]
}
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<td>Do not issue warning messages about unmatched patterns</td>
</tr>
<tr>
<td><code>&lt;filter&gt;</code></td>
<td>Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

**Description**

Returns a collection of nets in the design. All net names in the collection match the specified pattern. Wildcards can be used to select multiple nets at once.

The default matching scheme returns nets whose names match the specified filter and nets that are automatically generated by the Quartus Prime software from these nets. Use the `-no_duplicates` option to exclude duplicated nets.

The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the `use_timing_analyzer_style_escaping` command for details.

**Example Usage**

- `# Find a net called "reg" using case insensitive search
  get_nets -nocase reg`
- `# Create a collection of all nets whose names start with "reg"
  get_nets reg*`
- `# Create a collection of all nets in the design
  set mycollection [get_nets *]
  # Output net names.
  foreach_in_collection net $mycollection {
    puts [get_net_info -name $net]
  }

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.</td>
</tr>
</tbody>
</table>
### 3.1.35.11. `get_pins` (::quartus::sdc)

The following table displays information for the `get_pins` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc on page 562</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>`-h</td>
<td>-help`</td>
</tr>
<tr>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td><code>-compatibility_mode</code></td>
<td>Use simple Tcl matching</td>
</tr>
<tr>
<td><code>-hierarchical</code></td>
<td>Specifies use of a hierarchical searching method</td>
</tr>
<tr>
<td><code>-no_duplicates</code></td>
<td>Do not match duplicated pin names</td>
</tr>
<tr>
<td><code>-nocase</code></td>
<td>Specifies case-insensitive node name matching</td>
</tr>
<tr>
<td><code>-nowarn</code></td>
<td>Do not issue warning messages about unmatched patterns</td>
</tr>
<tr>
<td><code>&lt;filter&gt;</code></td>
<td>Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

**Description**

Returns a collection of pins in the design. All pin names in the collection match the specified pattern. Wildcards can be used to select multiple pins at once.

There are three Tcl string matching schemes available with this command: the default method, the -hierarchical option, and the -compatibility_mode option.

By default, pipe characters are used to separate one hierarchy level from the next. They are treated as special characters and are taken into account when string matching with wildcards is performed. When the default matching scheme is enabled, the specified pattern is matched against absolute pin names: the names that include the entire hierarchical path. All hierarchy levels in the pattern are matched level by level. Pin names of the form `<absolute full cell name>|<pin suffix>` are used for matching. Note that a full cell name can contain multiple pipe characters in it to reflect the hierarchy. Any included wildcards refer to only one hierarchical level. For example, `*|*|*` and `*|*|*|*|*` produce different collections since they refer to the highest hierarchical level and second highest hierarchical level respectively.

When using the -hierarchical matching scheme, pipe characters are treated as special characters and are taken into account when string matching with wildcards is performed. This matching scheme forces the search to proceed recursively through the hierarchy. The specified pattern is matched against the relative pin names: the immediate names that do not include any of the hierarchy information. Pin names of the form `<relative short cell name>|<pin suffix>` are used for matching. Note that a short cell name cannot contain pipe characters. Any included wildcards are expanded to match the relative pin names. For example, `*|*` and `*|*|*` match exactly the same pins since the former is expanded into the latter.

The -compatibility_mode matching scheme uses simple Tcl string matching on full, absolute cell names. Pipe characters are not treated as special characters when used with wildcards.

The default matching scheme returns not only pins whose names match the specified filter, but also pins duplicated from these pins (refers to pins are automatically generated by Quartus from the pins). Use -no_duplicates option to not include duplicated pins.

The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

**Example Usage**

```
# Get regout pin of "reg" cell
get_pins -nocase reg|regout
# Create a collection of all pins of "reg" cell
get_pins reg |
# Create a collection of all pins on the highest hierarchical level
```

---

**continued...**
```tcl
set mycollection [get_pins *]
# Output pin names.
foreach_in_collection pin $mycollection {
  puts [get_pin_info -name $pin]
}
# Create a collection of all pins in the design
set fullcollection [get_pins -hierarchical *]
# Output pin IDs and names.
foreach_in_collection pin $fullcollection {
  puts -nonewline $pin
  puts -nonewline ": 
  puts [get_pin_info -name $pin]
}
```

### Return Value

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

#### 3.1.35.12. get_ports (::quartus::sdc)

The following table displays information for the `get_ports` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc on page 562</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>get_ports [-h</td>
</tr>
</tbody>
</table>

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-nocase` Specifies case-insensitive node name matching
- `-nowarn` Do not issue warning messages about unmatched patterns
- `<filter>` Valid destinations (string patterns are matched using Tcl string matching)

**Description**

Returns a collection of ports (design inputs and outputs) in the design.

The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

**Example Usage**

```tcl
project_open chiptrip
create_timing_netlist
# Get all ports starting with "In".
set ports [get_ports In*]
foreach_in_collection port $ports {
  puts [get_port_info -name $port]
}
delete_timing_netlist
project_close
```

<table>

<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.</td>
<td></td>
</tr>
</tbody>
</table>
### 3.1.35.13. remove_clock_groups (::quartus::sdc)

The following table displays information for the `remove_clock_groups` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc on page 562</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`remove_clock_groups [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-all</code> Specify remove all clock group settings</td>
</tr>
<tr>
<td>Description</td>
<td>Remove all clock group assignments. This command removes any clock groups that have been previously set. There is no way to remove specific groups.</td>
</tr>
</tbody>
</table>

**Example Usage**

```tcl
project_open top
create_timing_netlist
create_clock -period 10.000 -name clkA [get_ports sysclk[0]]
create_clock -period 10.000 -name clkB [get_ports sysclk[1]]
# Set clkA and clkB to be mutually exclusive clocks.
set_clock_groups -exclusive -group {clkA} -group {clkB}
set_clock_groups -exclusive -group {clkC} -group {clkD}
# Remove clock groups A, B, C, and D. Result is that there are no longer any mutually exclusive clocks.
remove_clock_groups -all
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.35.14. remove_clock_latency (::quartus::sdc)

The following table displays information for the `remove_clock_latency` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc on page 562</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`remove_clock_latency [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-source</code> Specifies the source clock latency</td>
</tr>
<tr>
<td></td>
<td><code>&lt;targets&gt;</code> Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
<tr>
<td>Description</td>
<td>Removes clock latency for a given clock or clock target. There are two types of latency: network and source. Network latency is the clock network delay between the clock and register clock pins. Source latency is the clock network delay between the clock and its source (e.g., a system clock or a base clock of a generated clock). The Timing Analyzer automatically computes network latencies for all register and generated clocks. Overriding clock network latencies is not supported by the Timing Analyzer. Therefore, the -source option must always be specified. Remove_clock_latency requires this option as well. You can apply clock latency to a clock, which affects all targets of</td>
</tr>
</tbody>
</table>

---

```
```
the clock, or to a specific clock target. Therefore, you can remove clock latency from a collection of clocks, or from a collection of target nodes. remove_clock_latency removes all latencies from a clock or node, so removing a node’s clock latency with respect to a particular clock, or removing only latencies with particular conditions is not supported.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

Example Usage

```
create_clock -name SYSCLK -period 10.000 [get_ports inclk]
create_generated_clock -name OUTCLK -divide_by 1 -source [get_ports inclk] [get_ports outclk]
create_generated_clock -name FDBKCLK -divide_by 1 -source [get_ports outclk] [get_ports fdbkclk]

# Apply a simple 2.000 ns source latency to the system clock.
set_clock_latency -source 2.000 [get_clocks SYSCLK]

# Specify feedback clock latencies between output port outclk and the output port fdbkclk.
set_clock_latency -source -late -rise 0.800 [get_clocks FDBKCLK]
set_clock_latency -source -late -fall 0.750 [get_clocks FDBKCLK]
set_clock_latency -source -early -rise 0.500 [get_clocks FDBKCLK]
set_clock_latency -source -early -fall 0.460 [get_clocks FDBKCLK]

# Remove all clock latency from FDBKCLK
remove_clock_latency -source [get_clocks FDBKCLK]
```

<tr>
<td></td>
<td>-from &lt;from_clock&gt;</td>
</tr>
<tr>
<td></td>
<td>-to &lt;to_clock&gt;</td>
</tr>
</tbody>
</table>

Description

Removes clock uncertainty from a collection of clocks to a collection of clocks. The source and destination clocks can be any arbitrary collection of clocks. This command removes all uncertainty between two clocks. If there does not exist uncertainty between two clocks specified in remove_clock_uncertainty, the command does nothing for those two clocks but continues to attempt to remove uncertainty between other clocks specified.

The values of the -from and -to options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

<tr>
<td></td>
<td><code>-exclusive</code> Specify mutually exclusive clocks (an alias for the -logically_exclusive option). Exists for backwards compatibility.</td>
</tr>
<tr>
<td></td>
<td><code>-group &lt;names&gt;</code> Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

continued...
Specify logically exclusive clocks (meaning they are not actively used at the same time)

Specify physically exclusive clocks (meaning they are not physically present at the same time)

Clock groups provide a quick and convenient way to specify which clocks are not related. Asynchronous clocks are those that are completely unrelated (e.g., have different ideal clock sources). Logically exclusive clocks are not actively used in the design at the same time (e.g., multiplexed clocks), but the clock signals may physically exist on-chip at the same time and therefore may still influence each other through crosstalk effects. Physically exclusive clocks, in contrast, cannot be physically present in the device at the same time (e.g., multiple clocks defined on the same clock pin).

The Timing Analyzer does not currently analyze crosstalk explicitly. Instead, the timing models use extra guard bands to account for any potential crosstalk-induced delays. As a result, the Timing Analyzer currently treats asynchronous, logically_exclusive, and physically_exclusive clock groups the same. However, different parts of the Timing Analyzer may treat asynchronous and exclusive groups differently. Any commands that are affected by clock groups will say so in their help text. But, no distinction is made between logically and physically exclusive clock groups, since the only difference between them is how they affect crosstalk.

The result of set_clock_groups is that all clocks in any group are cut from all clocks in every other group. The use of a single -group option tells the Timing Analyzer to cut this group of clocks from all other clocks in the design, including clocks that are created in the future. This command is similar to calling set_false_path from each clock in every group to each clock in every other group and vice versa, making set_clock_groups easier to specify for cutting clock domains. However, cutting clocks with set_clock_groups also affects the results of some other commands. Any commands that are affected by clock groups will say so in their help text.

Example Usage

```
project_open top
create_timing_netlist
create_clock -period 10.000 -name clkA [get_ports sysclk[0]]
create_clock -period 10.000 -name clkB [get_ports sysclk[1]]
# Set clkA and clkB to be mutually exclusive clocks.
set_clock_groups -logically_exclusive -group {clkA} -group {clkB}
# The previous line is equivalent to the following two commands.
set_false_path -from [get_clocks clkA] -to [get_clocks clkB]
set_false_path -from [get_clocks clkB] -to [get_clocks clkA]
```

### Description

Specifies clock latency for a given clock or clock target.

There are two types of latency: network and source. Network latency is the clock network delay between the clock and register clock pins. Source latency is the clock network delay between the clock and its source (e.g., the system clock or base clock of a generated clock).

The Timing Analyzer automatically computes network latencies for all register and generated clocks. Overriding clock network latencies is not supported by the Timing Analyzer. Therefore, the -source option must always be specified.

You can apply clock latency to a clock, which affects all targets of the clock, or to a specific clock target. If you specify a specific clock target that is driven by more than one clock, use the -clock option to specify which clock to use. Latencies assigned to a clock target override any latencies assigned to a clock.

Different clock latencies can be specified for early (-early) and late (-late) latencies, as well as for rising edges (-rise) and falling edges (-fall). If only some combinations are specified, the other combinations are used by default. For example, if only a -rise -early latency and a -fall -early latency are specified, then the -rise -late latency is assumed to be the same as the -rise -early latency and the -fall -late latency is assumed to be the same as the -fall -early latency. If neither -rise nor -fall are used or neither -early nor -late are used, then the latency applies to both conditions.

Source latency can also be assigned to generated clocks. This may be useful for specifying board level delays from a clock output port to a clock input port when the clock input port is acting as a feedback clock.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

### Example Usage

```tcl
create_clock -name SYSCLK -period 10.000 [get_ports inclk]
create_generated_clock -name OUTCLK -divide_by 1 -source [get_ports inclk] [get_ports outclk]
create_generated_clock -name FDBKCLK -divide_by 1 -source [get_ports outclk] [get_ports fdbkclk]

# Apply a simple 2.000 ns source latency to the system clock.
set_clock_latency -source 2.000 [get_clocks SYSCLK]

# Specify feedback clock latencies between output port outclk
# and the input port fdbkclk.
set_clock_latency -source -late -rise 0.800 [get_clocks FDBKCLK]
set_clock_latency -source -late -fall 0.750 [get_clocks FDBKCLK]
set_clock_latency -source -early -rise 0.500 [get_clocks FDBKCLK]
set_clock_latency -source -early -fall 0.460 [get_clocks FDBKCLK]
```

### Return Value

<tr>
<td></td>
<td>-setup</td>
</tr>
<tr>
<td></td>
<td>-to &lt;to_clock&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;uncertainty&gt;</td>
</tr>
</tbody>
</table>

#### Description

Specifies clock uncertainty or skew for clocks for clock-to-clock transfers. You can specify uncertainty separately for setup and hold, and you can specify separate rising and falling clock transitions. If you omit to specify -setup or -hold, the uncertainty value will be applied to both analysis types. Similarly, if you omit to specify rising or falling clock transitions, the uncertainty value will be applied to both transitions.

The setup uncertainty is subtracted from the data required time for each applicable path, and the hold uncertainty is added to the data required time for each applicable path.

Intel Quartus Prime software computes clock uncertainty for every clock transfer. For particular transfers, you can use the `set_clock_uncertainty` assignment to override the automatically derived value, or you can specify the -add option to add to the automatically derived value. Note that the -add option is only relative to the automatically derived value. If multiple `set_clock_uncertainty` assignments apply to the same clock transfer, the later value overrides the earlier ones, regardless of whether the -add option was used.

Note: The Timing Analyzer does not apply clock uncertainty to transfers involving the same physical launch and latch edge (that is, the latch and...
launch edges are the same edge of a clock source and occur at the same time) by default. Such transfers typically occur in hold analysis, but may also occur in setup analysis with a multicycle value of 0. You can use the -enable_same_physical_edge option to override this behavior.

The values for -from, -to, and similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

Example Usage

```
set_clock_uncertainty -setup -rise_from clk1 -fall_to clk2 200ps
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.35.23. set_disable_timing (::quartus::sdc)

The following table displays information for the set_disable_timing Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc on page 562</th>
</tr>
</thead>
</table>

| Syntax | `set_disable_timing [-h | -help] [-long_help] [-from <name>] [-to <name>] <cells>` |
|--------|---------------------------------------------------------------------|

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`-h</td>
<td>-help`</td>
</tr>
<tr>
<td><code>-long_help</code></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td><code>-from &lt;name&gt;</code></td>
<td>Valid source pin suffix</td>
</tr>
<tr>
<td><code>-to &lt;name&gt;</code></td>
<td>Valid destination pin suffix</td>
</tr>
<tr>
<td><code>&lt;cells&gt;</code></td>
<td>List of cells</td>
</tr>
</tbody>
</table>

Disables a timing edge (arc) from inside a given cell or cells. Disabling a timing edge prevents timing analysis through that edge. If either -from or -to (or both) are unspecified, the missing value or values are replaced by a "*" character.

The values of the -from and -to are valid pin suffixes. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

Example Usage

```
set_disable_timing -from datain -to combout A|B
set_disable_timing -from carryin *
```

<table>

</tr>
<tr>
<td></td>
<td><code>-through &lt;names&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>-to &lt;names&gt;</code></td>
</tr>
</tbody>
</table>

**Description**

Specifies a false-path exception, removing (or cutting) paths from timing analysis.

The `-from` and `-to` values are collections of clocks, registers, ports, pins, or cells in the design. If the `-from` or `-to` values are not specified, the collection is converted automatically into `[get_keepers *]`. It is worth noting that if the counterpart of the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection only if the clock collection also generates the desired assignment.

Applying exceptions between clocks applies the exception from all register or ports driven by the `-from` clock to all registers or ports driven by the `-to` clock. Applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.

If the `-latency_insensitive` flag is set, the Fitter will be allowed to freely insert additional pipelining stages on any paths that are cut by the exception. These pipelined stages will be retimed to improve performance, but the timing requirements of the paths will still be ignored, just like for ordinary false paths. Without this flag, the Fitter will not perform any optimizations on the cut paths.

If pin names or collections are used, the `-from` value must be a clock pin and the `-to` value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.

**continued...**
The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node. The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The -rise_from and -fall_from options can be used in place of the -from destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node, taking into consideration any logical inversions along the clock path. The -from option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value, taking into consideration any logical inversions that are along the clock path.

The -setup and -hold options allow the false path to only be applied to the corresponding setup/recovery or hold/removal checks. The default if neither value is specified is to apply the false path to both -setup and -hold.

The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

See help for the set_clock_groups command for information.

### Example Usage

- **# Set a false-path between two unrelated clocks**

  ```tcl```
  set_false_path -from [get_clocks clkA] -to [get_clocks clkB]
  ```tcl```

- **# Set a false-path for a specific path**

  ```tcl```
  set_false_path -from [get_pins regA|clk] -to [get_pins regB|aclr]
  ```tcl```

- **# Set a false-path from a node to a falling clock**

  ```tcl```
  set_false_path -from [get_pins regA|clk] -fall_to [get_clocks clkB]
  ```tcl```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>

  Specifies that input delay is relative to the falling edge of the clock

---

Specifies the falling input delay at the port

-**max**

Applies value as maximum data arrival time

-**min**

Applies value as minimum data arrival time

-**reference_pin** &lt;name&gt;

Specifies a pin or port in the design to which the input delay is relative

-**rise**

Specifies the rising input delay at the port

-**source_latency_included**

Specifies that input delay includes added source latency

-**delay**

Time value

-**targets**

List of input port type objects

**Description**

Specifies the data arrival times at the specified input ports relative to the clock specified by the -clock option. The clock must refer to a clock name in the design.

Input delays can be specified relative to the rising edge (default) or falling edge (-clock_fall) of the clock.

Input delays can be specified relative to a pin or a port (-reference_pin) in the clock network. Clock arrival times to the reference pin or port are added to data arrival times.

If no -reference_pin is specified, if the input delay is specified relative to a generated clock with a single target, the clock arrival times to the generated clock are added to the data arrival time. If the generated clock has multiple targets, the worst case arrival time to those targets will be used.

Input delays can already include clock source latency. By default the clock source latency of the related clock is added to the input delay value, but when the -source_latency_included option is specified, the clock source latency is not added because it was factored into the input delay value.

The maximum input delay (-max) is used for clock setup checks or recovery checks and the minimum input delay (-min) is used for clock hold checks or removal checks. If only -min or -max (or neither) is specified for a given port, the same value is used for both.

Separate rising (-rise) and falling (-fall) arrival times at the port can be specified. If only one of -rise and -fall are specified for a given port, the same value is used for both.

By default, set_input_delay removes any other input delays to the port except for those with the same -clock, -clock_fall, and -reference_pin combination. Multiple input delays relative to different clocks, clock edges, or reference pins can be specified using the -add_delay option. Future input delays relative to different clocks, clock edges, or reference pins that do not specify the -add_delay option will still remove previous input delays that specified the -add_delay option.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

**Example Usage**

```tcl
# Simple input delay with the same value for min/max and rise/fall:
# 1) set on ports with names of the form myin*
set_input_delay -clock clk 1.5 [get_ports myin*]
# 2) set on all input ports
set_input_delay -clock clk 1.5 [all_inputs]

# Input delay with respect to the falling edge of clock
set_input_delay -clock clk -clock_fall 1.5 [get_ports myin*]

# Input delays for different min/max and rise/fall combinations
set_input_delay -clock clk -max -rise 1.4 [get_ports myin*]
set_input_delay -clock clk -max -fall 1.5 [get_ports myin*]
set_input_delay -clock clk -min -rise 0.7 [get_ports myin*]
set_input_delay -clock clk -min -fall 0.8 [get_ports myin*]

# Adding multiple input delays with respect to more than one clock
set_input_delay -clock clkA -min 1.2 [get_ports myin*]
set_input_delay -clock clkA -max 1.8 [get_ports myin*]
```

</tbody>
</table>

**Description**

Specifies a maximum delay exception for a given path.

The maximum delay is similar to changing the setup relationship (latching clock edge - launching clock edge), except that it can be applied to input or output ports without input or output delays assigned to them. Maximum delays are always relative to any clock network delays (if the source or destination is a register) or any input or output delays (if the source or destination is a port). Therefore, input delays and clock latencies are added to the data arrival times. Clock latencies also added to data required times and output delays are subtracted from data required times.

The `-from` and `-to` values are collections of clocks, registers, ports, pins, or cells in the design. If the `-from` or `-to` values are not specified, the collection is converted automatically into `get_keepers()`. It is worth noting that if the counterpart to the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection but only if the clock collection also generates the desired assignment.
Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.

If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.

The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node.

The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points.

For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The -rise_from and -fall_from options can be used in place of the -from destination nodes. The rise or fall value of the option indicates that the *from* nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The *-from* option is the combination of both rising and falling *from* nodes. If the *from* collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The -rise_to and -fall_to options behave similarly to the *from* options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.

The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

### Example Usage

```tcl
# Apply a 10ns max delay between two unrelated clocks
set_max_delay -from [get_clocks clkA] -to [get_clocks clkB] 10.000

# Apply a 2ns max delay for an input port (TSU)
set_max_delay -from [get_ports in[*]] -to [get_registers *] 2.000

# Apply a 2ns max delay for an output port (TCO)
set_max_delay -from [get_registers *] -to [get_ports out[*]] 2.000

# Apply a 2ns max delay for an input port to an output port (TPD)
set_max_delay -from [get_ports in[*]] -to [get_ports out[*]] 2.000

# Apply a 2ns max delay for an input port only to nodes driven by
# the rising edge of clock CLK
set_max_delay -from [get_ports in[*]] -rise_to [get_clocks CLK] 2.000
```

### Return Value

<td><code>-exact</code> Forces the time borrowed to be the exact value provided (if physically possible)</td>
</tr>
</tbody>
</table>
### set_max_time_borrow

**Description**

Specifies the maximum borrowed time for level-sensitive latches. The actual borrowed time will be determined automatically, but will never exceed the amount you specify. For any latches without a set_max_time_borrow constraint, no limit will apply (except for the physical limit of what is possible on the device, as described below).

By using the -exact option, you can bypass the automatic algorithm and specify the exact amount of borrowing at a given latch. For optimum results, using the automatic algorithm is recommended (ideally, without any set_max_time_borrow constraints).

Time borrowing is specified with respect to the earliest possible time a signal can be clocked into the latch node. For example, for a positive latch, if the earliest possible arrival time of the rising clock edge is 1.025ns, then a signal that has an arrival time of 1.035ns (where this arrival time already includes the micro-setup time of the latch) will require at least 0.010ns of time borrowing.

Regardless of how the borrowed time is determined (automatically without a limit, automatically with a set_max_time_borrow constraint, or manually with a set_max_time_borrow -exact constraint), the borrowed time can never exceed what is physically possible to borrow on the device. The maximum amount that can be borrowed is the period of time when the latch is open (e.g. half the clock period if the clock has a 50% duty cycle), but this time is reduced by clock propagation time spread and clock uncertainty between the latch-opening and latch-closing clock edges, and is further reduced by the closing-edge setup time of the latch. Some of these factors vary from corner to corner, as well as from clock to clock (if multiple clocks drive the latch).

Time borrowing analysis will only occur in the Timing Analysis (Signoff) stage, or when manually running the Timing Analyzer. The Fitter will not utilize time borrowing information and will assume zero time borrowed. Thus, the use of level-sensitive latches with high-speed clocks is not recommended, unless other constraints (such as set_max_delay) are manually set to ensure optimal Fitter behavior.

The targets of this command must be level-sensitive latches (all other targets will be ignored).

The targets can be specified as either a collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

#### Example Usage

```tcl
# Borrow at most 3ns at all "lat*" latches:
set_max_time_borrow 3 [get_registers lat*]
```

### Return Value

</tr>
</thead>
</table>

#### Description

Specifies a minimum delay exception for a given path.

The minimum delay is similar to changing the hold relationship (launching clock edge – latching clock edge), except that it can be applied to input or output ports without input or output delays assigned to them. Minimum delays are always relative to any clock network delays (if the source or destination is register) or any input or output delays (if the source or destination is a port). Therefore, input delays and clock latencies are added to the data arrival times. Clock latencies also added to data required times and output delays are subtracted from data required times.

The -from and -to values are collections of clocks, registers, ports, pins, or cells in the design. If the -from or -to values are not specified, the collection is converted automatically into

```tcl
[get_keepers *]
```

It is worth noting that if the counterpart of the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection, but only if the clock collection also generates the desired assignment.

Applying exceptions between clocks applies the exception from all registers or ports driven by the -from clock to all registers or ports driven by the -to clock. Also, applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.

If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.

The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node.

The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The -rise_from and -fall_from options can be used in place of the destination nodes specified using the -from option. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The -from option is the combination of both rising and falling "from" nodes. If the -from collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.

The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

#### Example Usage

```
# Apply a 5ns min delay between two unrelated clocks
set_min_delay -from [get_clocks clkA] -to [get_clocks clkB] 0.000
```

---

**3. TCL Commands and Packages**

3.1.35.30. set_multicycle_path (::quartus::sdc)

The following table displays information for the set_multicycle_path Tcl
command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc on page 562</th>
</tr>
</thead>
</table>

**Syntax**

**Arguments**
- **-h | -help**: Short help
- **-long_help**: Long help with examples and possible return values
- **-end**: Specifies that the multicycle is relative to the destination clock waveform (default)
- **-fall_from <names>**: Valid source clocks (string patterns are matched using Tcl string matching)
- **-fall_to <names>**: Valid destination clocks (string patterns are matched using Tcl string matching)
- **-from <names>**: Valid sources (string patterns are matched using Tcl string matching)
- **-hold**: Specifies that the multicycle value applies to clock hold or removal checks
- **-rise_from <names>**: Valid source clocks (string patterns are matched using Tcl string matching)
- **-rise_to <names>**: Valid destination clocks (string patterns are matched using Tcl string matching)
- **-setup**: Specifies that the multicycle value applies to clock setup or recovery checks (default)
- **-start**: Specifies that the multicycle is relative to the source clock waveform
- **-through <names>**: Valid through nodes (string patterns are matched using Tcl string matching)
- **-to <names>**: Valid destinations (string patterns are matched using Tcl string matching)
- **<value>**: Number of clock cycles

continued...
Specifies a multicycle exception for a given set of paths.

Multicycles can be specified relative to the source clock (-start) or destination clock (-end). This is useful when the source clock and destination clock are operating at different frequencies. For example, if the source clock is twice as fast (half period) as the destination clock, a -start multicycle of 2 is usually required.

Hold multicycles (-hold) are computed relative to setup multicycles (-setup). The value of the hold multicycle represents the number of clock edges away from the default hold multicycle. The default hold multicycle value is 0.

The -from and -to values are collections of clocks, registers, ports, pins, or cells in the design. If the -from or -to values are not specified, the collection is converted automatically into [get_keepers *]. It is worth noting that if the counterpart of the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection but only if the clock collection also generates the desired assignment.

Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Also, applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.

If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.

The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node.

The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The -rise_from and -fall_from options can be used in place of the "-from" destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The "-from" option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.

The values of the -from, -to, -through, and similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

Example Usage

```tcl
create_clock -period 10.000 -name CLK [get_ports clk]
create_generated_clock -divide_by 2 -source [get_ports clk] -name CLKDIV2 [get_registers clkdiv]

# Apply a source multicycle of 2 with a hold multicycle of 1 for all paths from the CLK domain to the CLKDIV2 domain.
set_multicycle_path -start -setup -from [get_clocks CLK] -to [get_clocks CLKDIV2] 2
set_multicycle_path -start -hold -from [get_clocks CLK] -to [get_clocks CLKDIV2] 1

# Apply a multicycle constraint of 3 (with a default hold multicycle of 0) for a specific path in the design.
set_multicycle_path -end -setup -from [get_pins rega|clk] -to [get_pins regb|aclr] 3

# Apply a multicycle constraint of 2 to a given cell, except for the reset pin.
set_multicycle_path -end -setup -to [get_cells regb] 2
set_multicycle_path -end -setup -to [get_pins regb|aclr] 1

#Apply a multicycle constraint of 3 rising from a clock
set_multicycle_path -end -rise -from [get_clocks CLK] 3
```

<tr>
<td></td>
<td>&lt;delay&gt; (Time value)</td>
</tr>
<tr>
<td></td>
<td>&lt;targets&gt; (Collection or list of output ports)</td>
</tr>
</tbody>
</table>

Description:

Specifies the data required times at the specified output ports relative to the clock specified by the -clock option. The clock must refer to a clock name in the design.

Output delays can be specified relative to the rising edge (default) or falling edge (-clock_fall) of the clock.

Output delays can be specified relative to a pin or a port (-reference_pin) in the clock network. Clock arrival times to the referenced pin or port are added to the data required time.

If no -reference_pin is specified, if the output delay is specified relative to a generated clock with a single target, the clock arrival times to the generated clock are added to the data required time. If the generated clock has multiple targets, the worst case arrival time to those targets will be used.

Output delays can include clock source latency. By default the clock source latency of the related clock is added to the output delay value, but when the -source_latency_included option is specified, the clock source latency is not added because it was factored into the output delay value.
The maximum output delay (-max) is used for clock setup checks or recovery checks and the minimum output delay (-min) is used for clock hold checks or removal checks. If only one of -min and -max (or neither) is specified for a given port, the same value is used for both.

Separate rising (-rise) and falling (-fall) required times at the port can be specified. If only one of -rise and -fall are specified for a given port, the same value is used for both.

By default, set_output_delay removes any other output delays to the port except for those with the same -clock, -clock_fall, and -reference_pin combination. Multiple output delays relative to different clocks, clock edges, or reference pins can be specified using the -add_delay option. Future output delays relative to different clocks, clock edges, or reference pins that do not specify the -add_delay option will still remove previous output delays that specified the -add_delay option.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

Example Usage

```
# Simple output delay with the same value for min/max and rise/fall:
# 1) set on ports with names of the form myout*
set_output_delay -clock clk 0.5 [get_ports myout*]
# 2) set on all output ports
set_output_delay -clock clk 0.5 [all_outputs]

# Output delay with respect to the falling edge of clock
set_output_delay -clock clk -clock_fall 0.5 [get_ports myout*]

# Output delays for different min/max and rise/fall combinations
set_output_delay -clock clk -max -rise 0.5 [get_ports myout*]

3.1.36.1. derive_clock_uncertainty (::quartus::sdc_ext)

The following table displays information for the derive_clock_uncertainty Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc_ext on page 595</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-add</td>
</tr>
<tr>
<td></td>
<td>-overwrite</td>
</tr>
<tr>
<td>Description</td>
<td>Applies inter-clock, intra-clock and I/O interface uncertainties based on timing model characterization. This command calculates and applies setup and hold clock uncertainties for each clock-to-clock transfer found in the design. The calculation of the uncertainties is delayed until the next update_timing_netlist call. To get I/O interface uncertainty in addition to inter-clock and intra-clock uncertainties, create a virtual clock to represent an off-chip clock for input or output delay specification and assign delays to input/output ports with set_input_delay and set_output_delay commands that specify the virtual clock. If set_input_delay and set_output_delay commands specifying a non-</td>
</tr>
</tbody>
</table>
virtual clock are called, derive_clock_uncertainty applies either
inter-clock or intra-clock uncertainty for that clock transfer since
those transfers represent a clock-to-clock domain rather than an
I/O-to-register clock domain.

The set_clock_uncertainty calls will override the derived values for a
source clock and destination clock pair unless either the
set_clock_uncertainty command or the derive_clock_uncertainty command
specified the -add option, in which case the values are added. Specifying
the -overwrite option will instead cause all set_clock_uncertainty commands
to be ignored. Previous set_clock_uncertainty assignments can also be
manually removed by using the remove_clock_uncertainty command.

Note that this command is called automatically and the user only
needs to manually call it to specify the -add or -overwrite options.

Example Usage

# create a virtual clock
create_clock -name virtual -period 1

# apply input/output delays with the virtual clock to get
# I/O interface uncertainties
set_input_delay -clock virtual -add_delay 0 [all_inputs]
set_output_delay -clock virtual -add_delay 0 [all_outputs]

# call derive_clock_uncertainty. results will be calculated
# at the next update_timing_netlist call
derive_clock_uncertainty
update_timing_netlist

Return Value | Code Name | Code | String Return |
-------------|-----------|-----|---------------|
TCL_OK       | 0         | INFO: Operation successful

3.1.36.2. derive_pll_clocks (::quartus::sdc_ext)

The following table displays information for the derive_pll_clocks Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to::quartus::sdc_ext on page 595</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>derive_pll_clocks [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>NOTE: This command is no longer supported for Stratix 10 and later families.</td>
</tr>
<tr>
<td></td>
<td>Identifies PLLs or similar resources in the design and creates generated clocks for their output clock pins. Multiple generated clocks may be created for each output clock pin if the PLL is using clock switchover, one for the inclk[0] input clock pin and one for the inclk[1] input clock pin.</td>
</tr>
<tr>
<td></td>
<td>By default this command does not create base clocks on input clock ports that are driving the PLL. When you use the create_base_clocks option, derive_pll_clocks also creates the base clock on an input clock port deriving the PLL. This option does not overwrite an existing clock.</td>
</tr>
<tr>
<td></td>
<td>By default the clock name is the same as the output clock pin name. To use the net name, use the -use_net_name option.</td>
</tr>
<tr>
<td></td>
<td>Note that this command is not supported for Stratix 10 and later device families. The only families that still have support for this command are Arria 10 and Cyclone 10GX. The reason why this command has been deprecated is because all PLL clocks are now automatically generated by the SDC files generated alongside the PLL IP. No user action is required.</td>
</tr>
</tbody>
</table>
Example Usage

```tcl
project_open top
create_timing_netlist

# Create the base clock for the input clock port driving the PLL
create_clock -period 10.0 [get_ports sysclk]

# Create the generated clocks for the PLL.
derive_pll_clocks

update_timing_netlist

# Other user actions
report_timing

delete_timing_netlist

project_close
```

</tr>
</tbody>
</table>

### 3.1.36.5. `get_fanins` (::quartus::sdc_ext)

The following table displays information for the `get_fanins` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::sdc_ext</code> on page 595</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-asynch</td>
</tr>
<tr>
<td></td>
<td>-clock</td>
</tr>
<tr>
<td></td>
<td>-inverting_paths</td>
</tr>
<tr>
<td></td>
<td>-no_logic</td>
</tr>
<tr>
<td></td>
<td>-non_inverting_paths</td>
</tr>
<tr>
<td></td>
<td>-stop_at_clocks</td>
</tr>
<tr>
<td></td>
<td>-synch</td>
</tr>
<tr>
<td></td>
<td>-through &lt;names&gt;</td>
</tr>
</tbody>
</table>

### Description

Returns a collection of fanin ports, registers (and optionally clock targets) reachable from the `<filter>` in the design. When you supply the `-no_logic` option, `get_fanins` ignores paths that pass through combinational logic elements other than buffers and inverters.

NOTE: the `-no_logic` option does not consider logic absorbed into the cells of the `<filter>` nor the cells of fanin registers, ports or clock targets.

When you use `-synch`, `-asynch`, or `-clock` options, `get_fanins` traverses the netlist through corresponding edges. You can specify more than one of these options. If you do not specify any of these three...
options, the command does not ignore any paths.

When the `-non_inverting_paths` option is used, `no_logic` does not follow any paths that includes odd number of inverters. Similarly, when the `-inverting_paths` option is used, `no_logic` does not follow any paths that includes even number of inverters. Both the `-non_inverting_paths` and `-inverting_paths` options require the `-no_logic` option and are mutually exclusive.

When the `-through` option is used, only the fanins that can be reached by going through those nodes are returned.

When `-stop_at_clocks` is used, combinational clock targets may be returned (in addition to clock or non-clock registers and ports), and registers or ports that can only be reached by traversing through a clock target will not be returned.

The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for the use_timing_analyzer_style_escaping command for details.

**Example Usage**

```tcl
set fanins [get_fanins $item -synch -clock]
foreach_in_collection fanin_keeper $fanins {
    lappend fanin_keeper_list [get_node_info $fanin_keeper -name]
}
set fanins_no_logic [get_fanins $item -no_logic -asynch]
foreach_in_collection fanin_keeper $fanins_no_logic {
    lappend fanin_keeper_list_no_logic [get_node_info $fanin_keeper -name]
}
#-through example
get_fanins inst18 -through inst11
```

<table>

<td></td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.36.6. `get_fanouts` (::quartus::sdc_ext)

The following table displays information for the `get_fanouts` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc_ext on page 595</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code> Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td><code>-asynch</code> Traverse through asynchronous edges</td>
</tr>
<tr>
<td></td>
<td><code>-clock</code> Traverse through clock edges</td>
</tr>
<tr>
<td></td>
<td><code>-inverting_paths</code> Only follow inverting combinational paths</td>
</tr>
<tr>
<td></td>
<td><code>-no_logic</code> Do not follow combinational paths</td>
</tr>
<tr>
<td></td>
<td><code>-non_inverting_paths</code> Only follow non-inverting combinational paths</td>
</tr>
<tr>
<td></td>
<td><code>-stop_at_clocks</code> Return clock targets as fanin/fanouts rather than traversing through them</td>
</tr>
<tr>
<td></td>
<td><code>-synch</code> Traverse through synchronous edges</td>
</tr>
</tbody>
</table>

*continued...*
-through <names> | Valid through nodes (string patterns are matched using Tcl string matching)

<filter> | Valid starting nodes (string patterns are matched using Tcl string matching or collection)

**Description**

Returns a collection of fanout ports, registers (and optionally clock targets) reachable from the <filter> in the design. When the -no_logic option is used, get_fanouts ignores the paths that pass through combinational logic elements other than buffers and inverters.

When you use the -synch, -asynch, or -clock options, get_fanouts traverses the netlist through corresponding edges. You can specify more than one of these options. If you do not specify any of these three options, the command does not ignore any paths.

When the -non_inverting_paths option is used in conjunction with the -no_logic option, get_fanouts does not follow paths that include an odd number of inverters. Similarly, when the -inverting_paths option is used in conjunction with the -no_logic option, get_fanouts does not follow any paths that include an even number of inverters. Both the -non_inverting_paths and -inverting_paths options require the -no_logic option and are mutually exclusive.

**NOTE:**
The -no_logic option does not consider logic absorbed into the cells of the <filter> nor the cells of fanout registers, ports or clock targets.
The -no_inversion option does not consider inversions absorbed into synchronous inputs of fanout registers, as the Intel Quartus Prime software register timing model always considers these edges as being positive unate.

When the -through option is used, only the fanouts that can be reached by going through those nodes are returned.

When -stop_at_clocks is used, combinational clock targets may be returned (in addition to clock or non-clock registers and ports), and registers or ports that can only be reached by traversing through a clock target will not be returned.

The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

**Example Usage**

```tcl
set fanouts [get_fanouts $item]
foreach_in_collection fanout_keeper $fanouts {
    lappend fanout_keeper_list [get_node_info $fanout_keeper -name]
}
set fanouts_no_logic [get_fanouts $item -no_logic]
foreach_in_collection fanout_keeper $fanouts_no_logic {
    lappend fanout_keeper_list_no_logic [get_node_info $fanout_keeper -name]
}

# Using through option to find the fanout registers whose enable input is connected to the signal while ignoring the inverting paths.
get_fanouts inst1 -no_logic -non_inverting_paths -through [get_pins -hierarchical *|ena]
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>
3.1.36.7. get_keepers (::quartus::sdc_ext)

The following table displays information for the get_keepers Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc_ext on page 595</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td></td>
<td>-nowarn</td>
</tr>
<tr>
<td>&lt;filter&gt;</td>
<td>Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

**Description**

Returns a collection of non-combinational or "keeper" nodes in the design.

The default matching scheme returns not only non-combinational nodes whose names match the specified filter, but also non-combinational nodes duplicated from these keepers (refers to cells are automatically generated by Quartus from these keepers). Use the -no_duplicates option to exclude duplicated keepers.

The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

**Example Usage**

```tcl
project_open chiptrip
create_timing_netlist
set kprs [get_keepers *reg*]
foreach_in_collection kpr $kprs {
    puts [get_object_info -name $kpr]
}
delete_timing_netlist
project_close
```

**Return Value**

<tr>
<td>-of_clocks</td>
<td>Returns nodes that are on the clock domains of the specified clock names</td>
</tr>
<tr>
<td>&lt;filter&gt;</td>
<td>Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

**Description**

Returns a collection of nodes in the design.

The default matching scheme returns not only nodes whose names match the specified filter, but also nodes duplicated from these nodes (refers to cells are automatically generated by Quartus from these nodes). Use the -no_duplicates option to not include duplicated nodes. If the -of_clocks option is used, the nodes returned are limited to those on the clock domains of clocks whose names match the specified filter.

The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

**Example Usage**

```
project_open chiptrip
create_timing_netlist
set nodes [get_nodes *name*]
foreach_in_collection node $nodes {
    puts [get_object_info -name $node]
}
delete_timing_netlist
project_close
```

**Return Value**

</tr>
<tr>
<td></td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td></td>
<td>Returns a cell collection inside the partitions matching the &lt;filter&gt;</td>
</tr>
</tbody>
</table>
### get_partitions

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-hierarchical</td>
<td>Specifies if hierarchical searching method should be used</td>
</tr>
<tr>
<td>-nocase</td>
<td>Specifies the matching of node names to be case-insensitive</td>
</tr>
<tr>
<td>&lt;filter&gt;</td>
<td>Valid partitions (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

**Description**

Returns a collection of partitions matching the filter by default. All partition names in the collection match the specified pattern. Wildcards can be used to select multiple partitions at once.

The -cell option creates and returns the collection of cells found inside the partitions matching the <filter> instead of returning a partition collection.

There are three Tcl string matching schemes available with this command: default, -hierarchical, and -nocase.

When using the default matching scheme, pipe characters separate one hierarchy level from the next. They are treated as special characters and are taken into account when string matching with wildcards is performed. The default matching scheme does not force the search to proceed recursively down the hierarchy.

Using the hierarchical matching scheme forces the search to proceed recursively down the hierarchy.

The -nocase matching scheme uses case-insensitive matching behavior.

The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

**Example Usage**

```
# Get the partitions matching the filter
get_partitions *

# Get the collection of cells inside partitions matching the filter
get_partitions * -cell
```

**Return Value**

<table>

### Valid destinations (string patterns are matched using Tcl string matching)

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns a collection of registers in the design. The default matching scheme returns not only registers whose names match the specified filter, but also returns registers duplicated from these registers (cells automatically generated from these registers by the Quartus Prime software). Use the <code>-no_duplicates</code> option to exclude duplicated registers. The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the <code>use_timing_analyzer_style_escaping</code> command for details.</td>
</tr>
</tbody>
</table>

### Example Usage

```tcl
project_open chiptrip
create_timing_netlist
set regs [get_registers *reg*]
foreach_in_collection reg $regs {
  puts [get_object_info -name $reg]
}
delete_timing_netlist
project_close
```

<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>&lt;clocks&gt;</td>
</tr>
</tbody>
</table>

**Description**

Sets the list of active clocks for timing analysis. All other clocks not in the list or collection are considered inactive.

Timing analysis is only performed on active clocks. All clocks are active by default. Generated clocks that are generated from inactive clocks are considered inactive. Therefore, to make a generated clock active, specify both the parent and generated clock when calling `set_active_clocks`.

To reset all clocks to active, call `set_active_clocks **` or `set_active_clocks [all_clocks]`.

The `set_active_clocks` command does not affect all reports. For example, inactive clocks are still reported by `report_clocks`, `report_clock_transfers`, and similar commands.

**Example Usage**

```tcl
# Only analyze clk1
set_active_clocks [get_clocks clk1]

# Only analyze clk2
set_active_clocks [get_clocks clk2]

# Analyze all clocks
set_active_clocks [all_clocks]
```

**Return Value**

<table>
<thead>
<tr>

<tr>
<td></td>
<td>-cell</td>
</tr>
<tr>
<td></td>
<td>-ff</td>
</tr>
</tbody>
</table>

**continued...**
Specifies that FR delay must be set

- from <names>  Valid source pins or ports (string patterns are matched using Tcl string matching)

- max  Specifies that only max delay should be set

- min  Specifies that only min delay should be set

- net  Specifies that net delay must be set

- operating_conditions <operating_conditions>  Operating conditions Tcl object

- rf  Specifies that RF delay must be set

- rr  Specifies that RR delay must be set

- to <names>  Valid destination pins or ports (string patterns are matched using Tcl string matching)

<delay>  The delay value in default time units

Description
Annotates the cell delay between two or more pins/nodes on a cell, or the interconnect delay between two or more pins on the same net, in the current design. Multiple transition edges (rr, fr, rf, ff) can be specified. If no transition is specified, then the given delay is assigned to all four values. If either -from or -to (or both) values are left unspecified, the missing value or values are substituted by an "*" character. Options -max and -min allow users to specify max or only min delay. If neither -max or -min is specified, both delays are set. Using this command to reduce delay pessimism might lead to optimistic results from timing analysis.

The values for -from and -to are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.

Delay annotation is deferred until the next time update_timing_netlist is called. To remove annotated delays, use remove_annotated_delay command. This assignment is for timing analysis only, and is not considered during timing-driven compilation.

Example Usage
set_annotated_delay -cell 100 -from A|B|C|datain -to A|B|C|combout -rr -ff
set_annotated_delay -net 100 -to A|carryin
update_timing_netlist

# To clear all net delays
set_annotated_delay -net 0
update_timing_netlist

# To remove all annotated delay assignments
remove_annotated_delay -all
update_timing_netlist

Return Value

<td><strong>-rise_to &lt;names&gt;</strong></td>
</tr>
<tr>
<td></td>
<td><strong>-through &lt;names&gt;</strong></td>
</tr>
<tr>
<td></td>
<td><strong>-to &lt;names&gt;</strong></td>
</tr>
<tr>
<td></td>
<td><strong>-value_multiplier &lt;multiplier&gt;</strong></td>
</tr>
<tr>
<td></td>
<td><strong>&lt;value&gt;</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Specifies a maximum datapath delay exception for a given path. The maximum delay analysis includes Tco of the launching register, and Tsu of the latching register. By default, it does not include clock arrival times at the launching or latching register. To include launch clock arrival times, use the -allow_launch_clock option. To include latch clock arrival times, use the -allow_latch_clock option. If the path starts or ends at a port, the analysis does not include delays due to <code>set_input_delay</code> or <code>set_output_delay</code>.</td>
</tr>
</tbody>
</table>
Use `-get_value_from_clock_period` to set the delay requirement for each path to be equal to the launching or latching clock period, or whichever of the two has a smaller or larger period. If `-value_multiplier` is used, the requirement will be multiplied by that value. If there are no clocks clocking the endpoints of the path (such as if the path begins or ends at an unconstrained I/O), the constraint will be ignored.

The datapath delay constraint is applied in addition to other constraints on the given path, including the default constraint. Furthermore, the datapath delay constraint is analyzed independently from other SDC constraints, including `set_false_path` and `set_clock_groups`, and cannot be overridden by other SDC constraints. For example, you can use `set_data_delay` to specify an upper limit on logic and routing delay for paths cut by `set_false_path`.

To both cut a path for (clock-aware) timing and constrain its datapath delay, the path must be constrained with both `set_false_path` and `set_data_delay`.

The `-from` and `-to` values are collections of clocks, registers, ports, pins, or cells in the design.

Applying exceptions between clocks applies the exception from all register or ports driven by the `-from` clock to all registers or ports driven by the `-to` clock.

If pin names or collections are used, the `-from` value must be a clock pin and the `-to` value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.

The `-through` values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node. The Timing Analyzer allows you to specify the `-through` argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The `-rise_from` and `-fall_from` options can be used in place of the `-from` destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The "-from" option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The `-rise_to` and `-fall_to` options behave similarly to the "-from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.

The values of the `-from`, `-to`, `-through`, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the `use_timing_analyzer_style_escaping` command for details.

If the source of a path with a `set_data_delay` constraint has any time borrowed, the delay budget will be reduced by the time borrowed. By default, the delay budget will not be increased by time borrowed at the destination of a path constrained by a `set_data_delay` constraint, and negative slack on a `set_data_delay` constraint will not cause time borrowing to happen. To change this behavior, use the `-allow_destination_borrowing` option.

**Example Usage**

```tcl
# Apply a 10ns max data delay on paths between two unrelated clocks
set_data_delay -from [get_clocks clkA] -to [get_clocks clkB] 10.000
# Apply a 2ns max data delay from an input port to any register
set_data_delay -from [get_ports in[*]] -to [get_registers *] 2.000
# Require net delay to be at most 90% of the period of the clock driving the inst9 register
set_data_delay -get_value_from_clock_period dst_clock_period -value_multiplier 0.9 -from [get_clocks clk] -to [get_keepers inst9]
# Apply a 2ns max data delay for an input port only to nodes driven by the rising edge of clock CLK
set_data_delay -from [get_ports in[*]] -rise_to [get_clocks CLK] 2.000
```

</tr>
<tr>
<td></td>
<td>-to_clock &lt;names&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;skew&gt;</td>
</tr>
</tbody>
</table>

**Description**

Use the set_max_skew constraint to perform maximum allowable skew analysis between sets of registers or ports. In order to constrain skew across multiple paths, all such paths must be defined within a single set_max_skew constraint. The set_max_skew timing constraint is not affected by the set_max_delay, set_min_delay, and set_multicycle_path constraints, but is affected by the set_clock_groups -exclusive constraint. Paths between exclusive clocks are not analyzed for skew, and no two paths are compared for skew if their clocks are exclusive to each other. However, paths whose clocks are asynchronous are...
still analyzed for skew.

Legal values for the `-from` and `-to` options are collections of clocks, registers, ports, pins, cells or partitions in a design.

Applying maximum skew constraints between clocks applies the constraint from all register or ports driven by the clock specified with the `-from` option to all registers or ports driven by the clock specified with the `-to` option.

If pin names or collections are used, the `-from` value must be a clock pin and the `-to` value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells apply to all registers contained in the cell or driven by the clock pin. Similarly, `-to` and `-from` partition specifications apply to all registers in the specified partition.

Max skew analysis includes data arrival times, clock arrival times, register micro parameters, clock uncertainty, on-die variation and ccpp removal.

Use `-get_skew_value_from_clock_period` to set the skew requirement to be equal to the launching or latching clock period, or whichever of the two has a smaller period. If `-skew_value_multiplier` is used, the requirement is multiplied by that value. If this option is used, then the positional skew option may not be set. If the set of skew paths is clocked by more than one clock, the Timing Analyzer will use the one with smallest period to compute the skew constraint.

When this constraint is used, results of max skew analysis are displayed in the Report Max Skew (report_max_skew) report from the Timing Analyzer. Since skew is defined between two or more paths, no results are displayed if the `-from/-from_clock` and `-to/-to_clock` filters satisfy less than two paths.

Example Usage

```
# Constrain the skew on an input port to all registers it feeds
set_max_skew -from [get_ports din] 0.200

# Constrain the skew on output bus dout[*]
set_max_skew -to [get_ports dout[\*]] 0.200

# Constrain skew to be less than 90% of the period of any clock in the source
# register set
set_max_skew -to [get_keepers inst1[*]] -get_skew_value_from_clock_period src_clock_period -skew_value_multiplier 0.900

# Report the results of max skew assignments
report_max_skew -panel_name "Report Max Skew" -paths 10 -detail path_only
```

3. TCL Commands and Packages

3.1.36.18. set_net_delay (::quartus::sdc_ext)

The following table displays information for the set_net_delay Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sdc_ext on page 595</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>set_net_delay [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-from &lt;names&gt;</td>
</tr>
<tr>
<td></td>
<td>-get_value_from_clock_period &lt;src_clock_period</td>
</tr>
<tr>
<td></td>
<td>-max</td>
</tr>
<tr>
<td></td>
<td>-min</td>
</tr>
<tr>
<td></td>
<td>-to &lt;names&gt;</td>
</tr>
<tr>
<td></td>
<td>-value_multiplier &lt;multiplier&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;delay&gt;</td>
</tr>
</tbody>
</table>

**Description**

Use the set_net_delay command to query the net delays and perform minimum or maximum timing analysis across nets. The -from and -to options can be string patterns or pin, port, register, or net collections. When pin or net collection is used, the collection should include output pins or nets.

If the -to option is unused or if the -to filter is an *** character, all the output pins and registers on timing netlist become valid destination points.

When you use the -min option, slack is calculated by looking at the minimum delay on the edge. If you use -max option, slack is calculated with the maximum edge delay.

Use -get_value_from_clock_period to set the net delay requirement to be equal to the launching or latching clock period, or whichever of the two has a smaller or larger period.

If -value_multiplier is used, the requirement will be multiplied by that value. If the set of nets is clocked by more than one clock, the Timing Analyzer will use the one with smallest period to compute the constraint for a -max constraint, and the largest period for a -min constraint. If there are no clocks clocking the endpoints of the net (e.g. if the endpoints of the nets are not registers or constrained ports), then the net delay constraint will be ignored.

**Example Usage**

```tcl
project_open my_project
create_timing_netlist
read_sdc
update_timing_netlist

# add min delay constraint
set_net_delay -min 0.160 -from [get_pins inst9|combout] -to [get_pins *|dataf]

# add max delay constraint
set_net_delay -max 0.500 -from inst8|combout

# this is same as the previous call
set_net_delay -max 0.500 -from inst8|combout -to *
```
# Require net delay to be at most 90% of the period of the clock driving the inst9 register
set_net_delay -max -get_value_from_clock_period dst_clock_period -value_multiplier 0.9 -from inst8|combout -to [get_keepers inst9]
update_timing_netlist
report_net_delay -panel "Net Delay"

<tr>
<td></td>
<td>-decimal_places &lt;decimal_places&gt;</td>
</tr>
<tr>
<td></td>
<td>-unit &lt;unit&gt;</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Sets time format, including time unit and decimal places.</td>
</tr>
<tr>
<td></td>
<td>Time units are assumed to be nanoseconds (ns) by default. The <code>-unit</code> option overrides the default time units. Legal time unit values are: ps, ns, us, ms.</td>
</tr>
<tr>
<td></td>
<td>Time units are displayed with three decimal places by default. The <code>-decimal_places</code> option overrides the default number of decimal places to show.</td>
</tr>
<tr>
<td></td>
<td>The smallest resolution of all times units is one picosecond (ps). Any additional specified precision will be truncated.</td>
</tr>
</tbody>
</table>

#### Example Usage

```tcl
# Create two clocks with a clock period of 8 nanoseconds.
create_clock -period 8.000 clk1
set_time_format -unit ps -decimal_places 0
create_clock -period 8000 clk2
```

<tr>
<td></td>
<td>-cell_delay</td>
</tr>
<tr>
<td></td>
<td>-early</td>
</tr>
<tr>
<td></td>
<td>-late</td>
</tr>
<tr>
<td></td>
<td>-net_delay</td>
</tr>
</tbody>
</table>

continued...
Sets the global derate factors for the current design. The maximum and minimum delays of all timing arcs in the design are multiplied by the factors specified with the -late and -early options respectively. Only positive derate factors are allowed. If neither the -cell_delay nor -net_delay option is used, the derating factors apply to both cell and net delays. For net delay derates, the derate factor is applied to nets driven by matching cells.

Specifying a derate value of less than 1.0 for the -late option or a derate value of greater than 1.0 for the -early option reduces delay pessimism, which might lead to optimistic results from timing analysis.

The effect of set_timing_derate command is deferred until the next time update_timing_netlist is called. To reset derate factors to original values, use the reset_timing_derate command.

This assignment is for timing analysis only, and is not considered during timing-driven compilation.

Example Usage

```tcl
set_timing_derate -early 0.9 [get_cells *]
set_timing_derate -late 1.1 [get_cells *]
```

### 3.1.37.1. add_to_collection (::quartus::sta)

The following table displays information for the `add_to_collection` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>add_to_collection [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>&lt;collection_obj_1&gt;</td>
</tr>
</tbody>
</table>

This command takes two collections and returns a new collection that is a union of the two. The second collection is allowed to be a string, whereas the first has to be previously-created collection, either by passing any of the "get_" functions directly, or by passing a variable that contains a collection (see code examples for this command). If a collection is used for the second argument, the types in the second collection must be the same as or a subset of the types in the first collection.

If the first collection consists of keepers, the second collection can only consist of keepers, registers or ports.
If the first collection consists of partitions, the second collection can only consist of partitions or cells. If the first collection consists of nodes, the second collection can only consist of nodes, keepers, registers, ports, pins, nets or combinational nodes.

Example Usage

```tcl
set kprs1 [get_keepers b*]
set regs1 [get_registers a*]
set regs_union [add_to_collection $kprs1 $regs1]
# or:
set regs_union [add_to_collection [get_keepers b*] $regs1]
# or even:
set regs_union [add_to_collection $kprs1 a*]
# - note that the last statement will actually add all keepers with name a*
#   not only registers! (will add I/Os with name a*, if any)
# Get the first 100 nodes in the collection.
query_collection $regs_union -limit 100
```

</tr>
<tr>
<td></td>
<td>-panel_name &lt;name&gt;</td>
</tr>
</tbody>
</table>

...continued...
## Description

Checks for problems in the design or problems with design constraints. The `check_timing` command performs a series of different checks based on user-specified variables and options. There is no default list of checks. Use the `--include` option to specify which checks to perform. You must precede `check_timing` with `update_timing_netlist`.

The `no_clock` check reports whether registers have at least one clock at their clock pin, and that ports determined to be clocks have a clock assigned to them, and also checks that PLLs have a clock assignment.

The `multiple_clock` check verifies that registers have at most one clock at their clock pin. When multiple clocks reach a register clock pin, it is undefined which clock is used for analysis.

The `generated_clock` check verifies that generated clocks are valid. Generated clocks must have a source that is triggered by a valid clock.

The `no_input_delay` check verifies that every input port that is not determined to be a clock has an input delay assignment.

The `no_output_delay` check verifies that every output port has an output delay constraint.

The `partial_input_delay` check verifies that input delays are complete, and ensures that input delays have a `rise-min`, `fall-min`, `rise-max`, and `fall-max` portion set.

The `partial_output_delay` check verifies that output delays are complete, and makes sure that output delays have a `rise-min`, `fall-min`, `rise-max`, and `fall-max` portion set.

The `io_min_max_delay_consistency` check verifies that `min` delay values specified by `set_input_delay` or `set_output_delay` assignments are less than `max` delay values.

The `reference_pin` check verifies that reference pins specified in `set_input_delay` and `set_output_delay` using the `--reference_pin` option are valid. A `reference_pin` is valid if the `--clock` option specified in the same `set_input_delay/set_output_delay` command matches the clock that is in the direct fanin of the `reference_pin`. Being in the direct fanin of the `reference_pin` means that there must be no keepers between the clock and the `reference_pin`.

The `latency_override` check reports whether the clock latency set on a port or pin overrides the more generic clock latency set on a clock. Clock latency can be set on a clock, where the latency applies to all keepers clocked by the clock, whereas clock latency can also be set on a port or pin, where the latency applies to registers in the fanout of the port or pin.

The `loops` check verifies that there are no strongly connected components in the netlist. These loops prevent a design from being properly analyzed. The `loops` check also reports if loops exist but were marked so that they would not be traversed.

The `latches` check reports latches in the design and warns that latches may not be analyzed properly. For best results, change your design to remove latches whenever possible.

The `pos_neg_clock_domain` check determines if any register is clocked by both the rising and falling edges of the same clock. If this scenario is necessary such as in a clock multiplexer, create two separate clocks that have similar settings and are assigned to the same node.

The `pll_cross_check` checks the clocks that are continued...
assigned to a PLL against the PLL settings defined in design files. Inconsistent settings or an unmatched number of clocks associated with the PLL are reported to the user.

The uncertainty check reports each clock-to-clock transfer that does not have a clock uncertainty assignment set between the two clocks. When a device family has derive_clock_uncertainty support, this report also checks if a user-defined set_clock_uncertainty assignment has a less than recommended clock uncertainty value.

The virtual_clock check reports all unreferenced virtual clocks. It also reports if design does not have any virtual clock assignment.

The partial_multicycle check ensures that each setup multicycle assignment has a corresponding hold multicycle assignment, and each hold multicycle assignment has a corresponding setup multicycle assignment.

The multicycle_consistency check reports all the multicycle cases where a setup multicycle does not equal one greater than the hold multicycle. Hold multicycle assignments are usually one cycle less than setup multicycle assignments.

The partial_min_max_delay check verifies that each minimum delay assignment has a corresponding maximum delay assignment, and vice versa.

The clock_assignments_on_output_ports check reports all the clock assignments that have been applied to output ports.

The input_delay_assigned_to_clock check verifies that no input delay value is set for a clock. Input delays set on clock ports are ignored because clock-as-data analysis takes precedence.

The internal_io_delay check reports all the IO delays that have no specifications for -reference_pin and -source_latency_included, and -clock is a clock that is not assigned to a top level input or output port.

Example Usage

```tcl
# Constrain design
create_clock -name clk -period 4.000 -waveform { 0.000 2.000 } [get_ports clk]
set_input_delay -clock clk2 1.5 [get_ports in*]
set_output_delay -clock clk 1.6 [get_ports out*]
set_false_path -from [get_keepers in] -through [get_nets r1] -to [get_keepers out]
# Check if there were any problems
check_timing -include {loops latches no_input_delay partial_input_delay}
```

Return Value | Code Name | Code | String Return
--- | --- | --- | ---
TCL_OK | 0 | INFO: Operation successful

### 3.1.37.3. `create_report_histogram (::quartus::sta)`

The following table displays information for the `create_report_histogram` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::sta</code> on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`create_report_histogram [ -h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
</tbody>
</table>
Create a user defined histogram.

Use <data> to specify the data entries to be displayed on the histogram. It can be a tcl list of either one of the following two formats or a mix of the two: `{time_integer}` or `{time_integer number_count}`, where time_integer is a integer possibly with a unit representing time (default unit is second), and number_count is a positive integer specifying number of entries (y value) of the corresponding time_integer.

Use -num_bins to specify the number of bins, or the number of bars to be displayed on the histogram.

Use -color_div and -color_list to specify the color of each bin. -color_div takes a tcl list of time_integers (see <data> above). Each entry in the list specifies the upper bound of each color division and therefore is forced to be a boundary of bins. -color_list takes a tcl list of colors. Each color in the list is used in the order specified and if less color is given than color divisions, the list is re-used. For example, if specified `-color_div {-1 0 1}` `-color_list {red green}`, then bins below -1 are red, bins between -1 and 0 are green, bins between 0 and 1 are red again, and bins larger than 1 are blue again. Possible choices of colors: black, blue, brown, green, grey, light_grey, orange, purple, red, white. Default -color_div is `{0}` and default -color_list is `{red blue}`.

Use -max_data to specify the upper bound, i.e. largest number to be included in the histogram.

Use -min_data to specify the lower bound, i.e. smallest number to be included in the histogram.

Use -panel_name to specify the path and panel name of the created histogram. e.g. `-panel_name {Folder 1||Histogram 1}` creates a histogram named "Histogram 1" and put it in a folder with the name "Folder 1".

Use -x_label to specify the text label on x-axis.

Use -y_label to specify the text label on y-axis.
Use \(-x\_unit\) to specify a text unit to be attached to \(x\_axis\).

**Example Usage**

```tcl
# create a path-based slack histogram
project_open my_project
create_timing_netlist
read_sdc
update_timing_netlist

# get path-based slack data in the format of a tcl list
set data [list]
set paths [get_timing_paths -setup -npaths 1000]
foreach_in_collection path $paths {
    lappend data [get_path_info $path -slack]
}

# output data to histogram
create_report_histogram $data -panel_name {Path-based Slack Histogram} -num_bins 20
delete_timing_netlist
project_close
```

**Return Value**

<td>-max_slack &lt;max_slack&gt;</td>
</tr>
<tr>
<td></td>
<td>-min_slack &lt;min_slack&gt;</td>
</tr>
<tr>
<td></td>
<td>-num_bins &lt;num_bins&gt;</td>
</tr>
</tbody>
</table>

**continued...**
-panel_name <name> Sends the results to the panel and specifies the name of the new panel

-recovery Recovery Analysis

-removal Removal Analysis

-setup Setup Analysis

-stdout Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.

Description

Creates a slack histogram in the timing report for the specified clock domain "-clock_name," showing the number of timing edges within various ranges of slacks for a clock setup analysis. The histogram can be named using the "-panel_name" option.

By default, only slack at the endpoint nodes of the timing netlist are considered. To include slack at all edges in the histogram, use the "-all_edges" option. This option results in increased memory consumption.

Use the "-setup", "-hold", "-recovery", or "-removal" options to specify which kind of analysis should be performed. If none is specified, setup analysis is used by default.

Reports can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical interface ("-panel_name"), or any combination of the three.

The range of reported slack values can be controlled by specifying the "-min_slack" and "-max_slack" options. The number of bins (histogram bars) can also be specified using the "-num_bins" option.

Use the "-partition" to show more information about each partition. A path is in a partition if it's starting point is in the partition. This option only works for "-panel".

Example Usage

```
project_open top
create_timing_netlist
read_sdc
update_timing_netlist

# Create a slack histogram for clk1, defaulting to
# the name "Slack Histogram (clk1)"
create_slack_histogram -clock_name clk1

# Create a slack histogram for clk2 named "MyHistogram"
create_slack_histogram -clock_name clk2 -panel_name MyHistogram

delete_timing_netlist
project_close
```

Return Value

|                                                                             |                                                                        | -snapshot <snapshot>: Snapshot of the design to load  
|                                                                             |                                                                        | -speed <speed>: Speed grade  
|                                                                             |                                                                        | -temperature <value_in_C>: Operating temperature  
|                                                                             |                                                                        | -voltage <value_in_mV>: Operating voltage  
|                                                                             |                                                                        | -zero_ic_delays: Option to set all IC delays to zero  
|                                                                             |                                                                        | <operating_conditions>: Operating conditions Tcl object name string  

**Description**

Creates the timing netlist by annotating the atom netlist with delay information using post-fitting results.

Use the `-post_syn` option to obtain post-synthesis results.

In Quartus Prime Pro edition, you can use the `-snapshot` option to specify which netlist you want to perform timing analysis on.

The `create_timing_netlist` command skips delay annotation by default. Use `-force_dat` to rerun delay annotation. This is required if any delay annotation setting is changed in the Quartus Prime project revision (e.g. `OUTPUT_PIN_LOAD`).

Use `-model fast` to run the analysis using the fast corner delay models first. The `-temperature`, `-voltage`, and `-speed`, options are also available. See help for `set_operating_conditions` for details on these options.

You can use model, temperature and voltage options to specify operating conditions while creating timing netlist (temperature and voltage options are not supported by all families). You can also set operating conditions by passing an operating conditions object name as a positional argument to `create_timing_netlist` command. After the timing netlist has been created, you can use `set_operating_conditions` command to change timing models without deleting and re-creating the timing netlist.
Timing netlist.

Use the -grade option to analyze the design at a different temperature grade. This option is provided to support what-if analysis and is not recommended for final sign-off analysis.

Use the -no_latch option to analyze latches as combinational loops instead of synchronous elements.

Use the -zero_ic_delays option to set all IC delays in the netlist to zero.

Example Usage

```tcl
project_open my_top

# Create timing netlist before calling
# any report functions
create_timing_netlist

# Read SDC and update timing
read_sdc
update_timing_netlist

# Ready to call report functions
report_timing -npaths 1 -clock_setup

# The following command is optional
delete_timing_netlist

project_close

project_open my_top

# Report worst case period for -9 speed grade
create_timing_netlist -speed 9

# Read SDC and update timing
read_sdc
update_timing_netlist

report_timing -clock_setup -clock_filter clk
delete_timing_netlist

# Report hold violation for fastest corner
# Use set_operating_conditions instead
create_timing_netlist -model fast

# Read SDC and update timing
read_sdc
update_timing_netlist

report_timing -clock_hold -clock_filter clk
delete_timing_netlist

# If Delay Annotation has been run for the fast corner
# Force Delay Annotation
create_timing_netlist -model fast -force_dat

# Read SDC and update timing
read_sdc
update_timing_netlist

report_timing -clock_hold -clock_filter clk
delete_timing_netlist

# Report worst case period for post-technology mapping netlist
create_timing_netlist -post_map

# Read SDC and update timing
read_sdc
update_timing_netlist

report_timing -clock_setup -clock_filter clk
delete_timing_netlist

project_close
```

</tr>
<tr>
<td>-stdout</td>
<td>Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.</td>
</tr>
</tbody>
</table>

**Description**

Reports the worst-case Clock Setup and Clock Hold slacks and endpoint TNS (total negative slack) per clock domain. Total negative slack is the sum of all slacks less than zero for either destination registers or ports in the clock domain. The number of endpoints in the domain with negative slack is also shown.

This command shows the worst-case slack for each clock domain. You right click in these reports to run more detailed reports like Histograms and Report Timing.

By default, this command creates a Setup Summary. This command can also generate a Hold Summary (-hold), Recovery Summary (-recovery), Removal Summary (-removal), or Minimum Pulse Width Summary (-mpw).

The report can be directed to the Tcl console (-stdout, default), a file (-file), the Timing Analyzer graphical interface (-panel_name), or any combination of the three.

**Example Usage**

```bash
project_open my_project
# Always create the netlist first and process constraints
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
# Create Clock Domain Summary
create_timing_summary -panel_name "Setup Summary"
create_timing_summary -hold -panel_name "Hold Summary"
# The following command is optional
delete_timing_netlist
project_close
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>

<td>1</td>
<td>ERROR: Report database is not open</td>
</tr>
</tbody>
</table>
3.1.37.7. delete_sta_collection (::quartus::sta)

The following table displays information for the delete_sta_collection Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>delete_sta_collection [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td>&lt;collection&gt;</td>
<td>The collection to delete</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
</table>

This function is deprecated since sta cleans up the memory once the collection is out of scope. If you want to force a collection to go out of scope, use built-in tcl command 'unset'. Otherwise this function can remove the collection in cache.

<table>
<thead>
<tr>
<th>Example Usage</th>
</tr>
</thead>
</table>

```tcl
project_open chiptrip
create_timing_netlist
set nodes [get_nodes Reg*]
# ...
# do some work with the $nodes collection
# ...
# Delete the collection.
delete_sta_collection $nodes
# ...
# do more work
# ...
delete_timing_netlist
project_close
```

<table>

<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Cannot find specified collection. Specify an existing collection.</td>
<td></td>
</tr>
</tbody>
</table>

3.1.37.8. delete_timing_netlist (::quartus::sta)

The following table displays information for the delete_timing_netlist Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>delete_timing_netlist [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
</table>

Use this command to delete a timing netlist previously created using create_timing_netlist. This should be done at the end of a script or before calling create_timing_netlist again using different options or after recompiling the design.

Use the set_operating_conditions command instead of

continued...
delete_timing_netlist and create_timing_netlist to change timing models. This avoids the cost of deleting and re-creating the timing netlist, and also preserves current timing assignments.

**Example Usage**
This command currently contains no example usage.

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td></td>
<td>ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.</td>
</tr>
</tbody>
</table>

### 3.1.37.9. enable_ccpp_removal (::quartus::sta)

The following table displays information for the `enable_ccpp_removal` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-depth &lt;depth&gt;</td>
</tr>
<tr>
<td></td>
<td>-off</td>
</tr>
<tr>
<td></td>
<td>-on</td>
</tr>
</tbody>
</table>

**Description**
Enables (or disables) common clock path pessimism (CCPP) removal during slack computation. CCPP removal can improve timing results by removing min/max delay differences from common portions of clock paths. Enabling CCPP removal increases the time required to perform timing analysis.

When specified, the optional depth parameter limits the clock tree depth used for CCPP removal. This is generally not applicable to FPGA compilations where the clock tree is fixed, but for large designs with potentially deep synthesized clock trees this can reduce outlier run time.

When not specified, or when specified with a value of 0, the complete clock tree is used for CCPP removal (i.e. full clock-tree depth).

**Example Usage**
```
project_open top
create_timing_netlist
read_sdc

# Report timing without CCPP removal
report_timing

# Enable CCPP removal and re-report timing.
enable_ccpp_removal
report_timing

delete_timing_netlist
project_close
```

<table>
<thead>
<tr>

### 3.1.37.11. get_available_operating_conditions (::quartus::sta)

The following table displays information for the `get_available_operating_conditions` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>`get_available_operating_conditions [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
</tr>
<tr>
<td>-h</td>
<td>-help</td>
</tr>
<tr>
<td>-long_help</td>
<td>Long help with examples and possible return values</td>
</tr>
<tr>
<td>-all</td>
<td>Returns all available operating conditions</td>
</tr>
<tr>
<td>-compile</td>
<td>Returns only the operating conditions that are critical to analyze in the inner loop compilation</td>
</tr>
</tbody>
</table>

continued...
Returns a Tcl collection of available operating conditions for the current device. The Tcl collection contains the most extreme operating conditions within a user-specified junction temperature range. Use the -all option to return all available operating conditions.

Example Usage

```tcl
#do report timing for different operating conditions
foreach_in_collection op [get_available_operating_conditions] {
    set_operating_conditions $op
    update_timing_netlist
    report_timing
}

#see detailed information about operating conditions
foreach_in_collection op [get_available_operating_conditions] {
    puts "Delay Model: [get_operating_conditions_info $op -model]"
}
```

<td></td>
<td>ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td></td>
<td>ERROR: VID mode is not supported by part &lt;string&gt;.</td>
</tr>
</tbody>
</table>

### 3.1.37.12. get_cell_info (::quartus::sta)

The following table displays information for the `get_cell_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-buried_nodes</td>
</tr>
<tr>
<td></td>
<td>-buried_regs</td>
</tr>
<tr>
<td></td>
<td>-in_pin_names</td>

<tr>
<td></td>
<td>-out_pin_names</td>
</tr>
<tr>
<td></td>
<td>-out_pins</td>
</tr>
<tr>
<td></td>
<td>-pin_names</td>
</tr>
<tr>
<td></td>
<td>-pins</td>
</tr>
<tr>
<td></td>
<td>-type</td>
</tr>
<tr>
<td></td>
<td>-wysiwyg_type</td>
</tr>
<tr>
<td></td>
<td>&lt;cell_object&gt;</td>
</tr>
</tbody>
</table>

continued...
Description

Gets information about the specified cell (referenced by cell ID). You can obtain cell using the `get_cells` Tcl command.

The "-type" option returns "cell".

Options "-name", "-type", "-pin_name", "-in_pin_names", "-out_pin_names", "-pins", "-clock_pins", "-in_pins", "-out_pins", "-buried_nodes", "-buried_regs", "-location", and "-wysiwyg_type" are mutually exclusive.

Example Usage

```tcl
project_open chiptrip
create_timing_netlist
set cells [get_cells]
foreach_in_collection cell $cells {
    puts "[get_cell_info $cell -name]: [get_cell_info $cell -type]"
}
delete_timing_netlist
project_close
```

Return Value

<table>
<thead>
<tr>
<th>Code</th>
<th>Code Name</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Options are mutually exclusive: &lt;string&gt;. Specify only one of the these options.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Object with ID &lt;string&gt; is not an object of type &lt;string&gt;. Specify the ID of an object with the correct type.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Cannot find object of ID &lt;string&gt;. Specify an existing object ID.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Unsupported object type: &lt;string&gt;. Specify a supported object type.</td>
</tr>
</tbody>
</table>

3.1.37.13. `get_clock_domain_info` (::quartus::sta)

The following table displays information for the `get_clock_domain_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::sta</code> on page 615</th>
</tr>
</thead>
</table>

Syntax

```
```

Arguments

- `-h | -help`  
  Short help
- `-long_help`  
  Long help with examples and possible return values
- `-data_delay`  
  Data Delay Analysis (only applicable for setup and recovery analysis)
- `-edge_slack`  
  Compute edge TNS (this option may significantly increase memory consumption)
- `-hold`  
  Hold Analysis
- `-mpw`  
  Minimum Pulse Width Analysis
- `-recovery`  
  Recovery Analysis
- `-removal`  
  Removal Analysis
- `-setup`  
  Setup Analysis (Default)

Description

Similar to `create_timing_summary`, the `get_clock_domain_info` command returns a Tcl list of
information about each active clock domain: the clock name, worst-case slack, endpoint TNS, number of endpoints in the domain with negative slack, and the timing model for which the worst-case slack is most critical.

If the edge_slack option is specified, an extra entry for the edge TNS will be present, placed after the endpoint TNS. Computing the edge TNS may result in a significant increase in memory consumption.

TNS is total negative slack, and it is the sum of all slacks less than zero for either destination registers or ports in the clock domain (endpoint TNS) or for all edges affecting the clock domain (edge TNS).

By default, this command creates a Setup Summary. This command can also generate a Hold Summary (-hold), Recovery Summary (-recovery), Removal Summary (-removal), or Minimum Pulse Width Summary (-mpw).

Example Usage

```tcl
project_open my_project
# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
# Get domain summary object
set domain_list [get_clock_domain_info -setup]
foreach domain $domain_list {
    set name [lindex $domain 0]
    set slack [lindex $domain 1]
    set keeper_tns [lindex $domain 2]
    puts "Clock $name : Slack = $slack , TNS = $keeper_tns"
}
# The following command is optional
delete_timing_netlist
project_close
```

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>

<td>1</td>
<td>ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.</td>
</tr>
</tbody>
</table>

### 3.1.37.14. get_clock_fmax_info (::quartus::sta)

The following table displays information for the `get_clock_fmax_info` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td>get_clock_fmax_info [-h</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Reports potential Fmax for every clock in the design, regardless of the user-specified clock periods. Fmax is only computed for paths where the source and destination registers or ports are driven by the same clock. Paths of different clocks, including generated clocks, are ignored. For paths between a clock and its inversion, Fmax is computed as if the rising and falling edges of the clock are scaled along with fmax, such that the duty cycle (in terms of a percentage) is maintained. Restricted Fmax considers hold timing in addition to setup timing, as well as minimum pulse and minimum period restrictions. Similar to unrestricted Fmax, the restricted Fmax is computed as if the rising edge of the clock is driven by the clock.</td>
</tr>
</tbody>
</table>

continued...
and falling edges of the clock are scaled along with $F_{\text{max}}$, such that the duty cycle (in terms of a percentage) is maintained. Refer to hold timing reports (e.g., report_timing with the -hold option) or minimum pulse width reports (report_min_pulse_width) for details about specific paths, registers, or ports.

This command is similar to report_clock_fmax_summary, except that it returns the results as a Tcl list for use in Tcl scripts. Each entry in the list represents one clock domain. Each entry is a Tcl list of the clock name, $F_{\text{max}}$ (MHz), and restricted $F_{\text{max}}$ (MHz).

**Example Usage**

```tcl
project_open my_project
#
# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
#
# Get domain summary object
set domain_list [get_clock_fmax_info]
foreach domain $domain_list {
    set name [lindex $domain 0]
    set fmax [lindex $domain 1]
    set restricted_fmax [lindex $domain 2]
    puts "Clock $name : Fmax = $fmax (Restricted Fmax = $restricted_fmax)"
}
#
# The following command is optional
delete_timing_netlist
project_close
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>-waveform</td>
<td>Return the waveform (rise time and fall time)</td>
</tr>
<tr>
<td>&lt;clk_object&gt;</td>
<td>Clock object</td>
</tr>
</tbody>
</table>

**Description**

Returns information about the specified clock (referenced by clock ID). Clock IDs can be obtained by Tcl commands such as `get_clocks`.

The "-type" option returns one of "base", "virtual_base", "generated", "virtual_generated".

Options "-name", "-type", "-period", "-duty_cycle", "-waveform", "-edges", "-edge_shifts", "-multiply_by", "-divide_by", "-is_inverted", "-latency", "-master_clock", and "-targets" are mutually exclusive. The "-latency" option requires a specified "-max" or "-min" option as well as a "-rise" or "-fall" option.

**Example Usage**

```tcl
project_open chiptrip
create_timing_netlist
set clocks [get_clocks]
foreach_in_collection clk [clocks]
    puts "[get_clock_info $clk -name]: [get_clock_info $clk -period]"
delete_timing_netlist
project_close
```

<tr>
<td>-setup</td>
<td>Return the setup analysis information if you use the “-false_path” option. The setup analysis relationship is returned by default</td>
</tr>
<tr>
<td>-to &lt;clk_object&gt;</td>
<td>Valid destination clocks (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

**Description**

The `get_clock_pair_info` command returns various clock information between two given clocks.

- If you specify the "-false_path" option, the command returns a description of the satisfied false path assignment between the "from" and "to" clocks, which includes clock groups.
- If you specify the "-hierarchy" option, the command returns a description of the clock hierarchy relationship between the two clocks, such as whether the "from" clock is a parent of the "to" clock.

Use the "-from" option to specify the source clock that you want to query, and use the "-to" option to specify the destination clock that you want to query.

When using the "-false_path" option, you can use the "-rise_from" option to specify a source clock’s rising edge to report on, or use the "-fall_from" option to specify a source clock’s falling edge to report on. Likewise, you can use the "-rise_to" option to specify a destination clock’s rising edge, or use the "-fall_to" option to specify a destination clock’s falling edge. You can also specify to retrieve either the setup or hold false path relationship using the "-setup" or "-hold" option respectively. By default, the setup relationship is reported.
3.1.37.17. `get_datasheet (::quartus::sta)`

The following table displays information for the `get_datasheet` Tcl command:

```
<table>

<tr>
<td></td>
<td><code>-dst</code></td>
</tr>
<tr>
<td></td>
<td><code>-ff</code></td>
</tr>
</tbody>
</table>

continued...
Returns information about the specified edge (referenced by edge ID). Edge IDs can be obtained by Tcl commands such as get_node_info <node_id> -synch_edges.

The "-type" and "-name" options exist only to keep the interface compliant with the get_object_info command. The "-type" option returns specific edge type as "synchronous", "asynchronous", "clock", or "combinational", while the "-name" option always returns an empty string.

The "-delay" option returns the delay associated to the edge. Use -max, -min and -rr, -rf, -fr, -ff options to specify the type of returned delay. One of the -max, -min options must be specified. One of the -rr, -rf, -fr, -ff options must be specified.

The -hslp option returns the HS/LP setting associated to the edge.

The -unateness option returns the unateness associated to the edge.

The -is_disabled option returns 1 if the edge should not be traversed through, and 0 if the edge can be traversed through. Disabled edges include edges in SCC loops and edges that the user has manually cut with the set_disable_timing command.

Example Usage:

```tcl
project_open chiptrip
create_timing_netlist
set nodes [get_pins]
foreach_in_collection node $nodes {
    set node_name [get_node_info -name $node]
    set edges [get_node_info $node -fanout_edges]
    foreach edge $edges {
        # Traverse to the fanout node
        set dst_node [get_edge_info -dst $edge]
        set dst_name [get_node_info -name $dst_node]
        set delay_type [get_edge_info -delay_type $edge]
        set rr_delay [get_edge_info $edge -max -delay -rr]
        set rf_delay [get_edge_info $edge -max -delay -rf]
        set fr_delay [get_edge_info $edge -max -delay -fr]
        set ff_delay [get_edge_info $edge -max -delay -ff]
        puts "Max $delay_type delay of edge $edge, from $node_name to $dst_name: (RR:$rr_delay RF:$rf_delay FR:$fr_delay FF:$ff_delay)"
    }
}
delete_timing_netlist
project_close
```

</tbody>
</table>

**Description**

Gets information about the specified partition (referenced by partition ID). Partition ID’s can be obtained by Tcl commands such as *get_partitions*. The -name, -type, -parent, and -child options are mutually exclusive.

**Example Usage**

```tcl
project_open chiptrip
create_timing_netlist
set partitions [get_partitions *]
foreach_in_collection partition $partitions {
    puts "[get_partition_info $partition -name]"
}
delete_timing_netlist
project_close
```

**Return Value**

</tr>
<tr>
<td>-show_routing</td>
<td>Option to display detailed routing in the path</td>
</tr>
<tr>
<td>-through &lt;names&gt;</td>
<td>Valid through nodes (string patterns are matched using Tcl string matching)</td>
</tr>
<tr>
<td>-to &lt;names&gt;</td>
<td>Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

### Description

Returns a collection of path objects for the longest delay paths between arbitrary points in the netlist.

This command behaves the same as the report_path command. However, instead of reporting the paths, it returns a Tcl collection of path objects. You can retrieve path object data using the get_path_info and get_point_info commands.

Note that get_path_info does not provide any clock-related information, required points, or meaningful slack values, for paths represented by the path objects returned by this function.

For help on the options shared with report_path, see help for the report_path command.

### Example Usage

```tcl
# Define a few helper procedures to print out points on a path, and the path itself
proc print_point { point } {
    set total   [ get_point_info $point -total    ]
    set incr    [ get_point_info $point -incr     ]
    set node_id [ get_point_info $point -node     ]
    set type    [ get_point_info $point -type     ]
    set rf      [ get_point_info $point -rise_fall]
    set node_name ""
    if { $node_id ne "" } {
        # continued...
```
set node_name [get_node_info $node_id -name]
}
puts [format "%10s %8s %2s %-6s %s" $total $incr $rf $type $node_name]}
proc print_path {path} {
    puts "Delay : [get_path_info $path -arrival_time]"
    puts "";
    puts [format "%10s %8s %-2s %-6s %s" "Total" "Incr" "RF" "Type" "Name"]
    foreach_in_collection pt [get_path_info $path -arrival_points] {
        print_point $pt
    }
}
project_open my_project
# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
# And now simply iterate over the 10 longest delay paths,
# printing each as we go.
foreach_in_collection path [get_path -nworst 10] {
    print_path $path
    puts ""
}
delete_timing_netlist
project_close

3.1.37.29. get_path_info (::quartus::sta)

<tr>
<td>&lt;path_ref&gt;</td>
<td>Path object</td>
</tr>
</tbody>
</table>

**Description**

Returns information about the referenced timing path object.

You can generate references to path objects with the get_timing_paths and get_path functions.

The -type option returns one of the following types: “setup”, “hold”, “recovery”, “removal”, “max_path”, or “min_path”.

The -from and -to options return the ID of the nodes at the start and end, respectively, of the arrival path. If there is no node, an empty string is returned. The -from node remains the same, regardless of the level of clock detail provided. It is always the first node clocked by the -from clock in the data.
arrival path. You can use the node ID with the
get_node_info function to obtain additional
information about the node.

The -from_clock and -to_clock options return the ID of
the launching and latching clocks, respectively. If
there is no clock, an empty string is returned. You
can obtain additional information about the clocks
using the get_clock_info function.

Path objects generated by get_path do not have clock
information, required points, or meaningful slack
values.

The -arrival_points and -required_points options
return a collection of point objects for the arrival
and required paths, respectively. By iterating over
the collection, and using the get_point_info function,
you can obtain specific details about each portion of
the path.

If a path was created with additional clock detail,
the elements of the clock path are included in
each collection of points.

The values for the -from, -to, and other options are
either collections or a Tcl list of wildcards used to
create collections of appropriate types. The values
used must follow standard Tcl or Timing Analyzer-extension
substitution rules. See the help for
use_timing_analyzer_style_escaping for details.

When the path starts at a level-sensitive latch, the
-borrow_src option may be used to get the time borrowed
at the source. Similarly, when the path ends at a level-sensitive
latch, -borrow_dst may be used to get the time borrowed at
the destination. When these options are used with anything
other than level-sensitive latches, zero is returned.

For level-sensitive latches, when you use the -launch_time
or -latch_time options, the times reported do not include time borrowed.

The operating condition corresponding to all of a path’s delay and time
values can be found using the -corner option.

Example Usage

```tcl
# Define a few helper procedures to print out points
# on a path, and the path itself
proc get_clock_string { path clk } {
    set clk_str ""
    set clk_id [ get_path_info $path -$clk_clock ]
    if { $clk_id ne "} {
        set clk_str [ get_clock_info $clk_id -name ]
        if { [ get_path_info $path -$clk_clock_is_inverted ] } {
            append clk_str " (INVERTED)"

<tr>
<td></td>
<td><code>-suffix</code></td>
</tr>
<tr>
<td></td>
<td><code>-type</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;pin_object&gt;</code></td>
</tr>
</tbody>
</table>

**Description**

Gets information about the specified pin (referenced by pin ID). Pin ID's can be obtained by Tcl commands such as `get_pins`.

The `-type` option returns "pin".

Options `-name`, `-type`, `-parent_cell`, `-net`, `-suffix`, `-is_clock_pin`, `-is_in_pin` and `-is_out_pin` are mutually exclusive.

**Example Usage**

```tcl
project_open chiptrip
create_timing_netlist
set pins [get_pins]
foreach_in_collection pin $pins {
    set pin_name [get_pin_info $pin -name]
    continued...
```
set parent_cell [get_pin_info $pin -parent_cell] 
puts "Pin $pin_name belongs to cell [get_cell_info -name $parent_cell]"
}
delete_timing_netlist
project_close

</tr>
<tr>
<td></td>
<td>-type</td>
</tr>
<tr>
<td></td>
<td>&lt;point_ref&gt;</td>
</tr>
</tbody>
</table>

**Description**

Returns information about the referenced timing point object. References to path objects can be generated using the `get_path_info` function.

A point object is the equivalent of a row in a path in the output from `report_timing`.

The `-node` option returns a node ID for the corresponding node in the...
path. For points that do not have a corresponding node (such as points for the lumped clock network delay, launch time, latch time, individual routing elements, etc.), the node ID is an empty string. A non-empty node ID can be used in conjunction with the get_node_info function to obtain additional information about the node.

The -edge option returns an edge ID for the corresponding edge in the path. Only points of type "ic", "cell", and "comp" may have edges. For other point types, an empty string is returned. A non-empty edge ID can be used in conjunction with the get_edge_info function to obtain additional information about the edge.

The -total_delay option returns the total delay along the path, up to and including the current point. The -incremental_delay option returns the delay incurred by going through this point in the path. Both delays are formatted in terms of the current time units, excluding the unit string.

The -number_of_fanout option returns the number of fanouts that the corresponding node has in the timing netlist. If there is no node for this point, the return value is 0.

The -location option returns a string indicating the location of the corresponding node in the part. If there is no corresponding node, this returns an empty string.

The -rise_fall option returns the transition type of this point. Possible values for -rise_fall are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(empty)</td>
<td>Unknown transition</td>
</tr>
<tr>
<td>r</td>
<td>Rising output</td>
</tr>
<tr>
<td>f</td>
<td>Falling output</td>
</tr>
<tr>
<td>rr</td>
<td>Rising input, rising output</td>
</tr>
<tr>
<td>rf</td>
<td>Rising input, falling output</td>
</tr>
<tr>
<td>fr</td>
<td>Falling input, rising output</td>
</tr>
<tr>
<td>ff</td>
<td>Falling input, falling output</td>
</tr>
</tbody>
</table>

The -type option returns a string indicating the type of delay that this point represents in the path. Possible return values for -type are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>borrow</td>
<td>Time borrowed (for level-sensitive latches)</td>
</tr>
<tr>
<td>cell</td>
<td>Cell delay</td>
</tr>
<tr>
<td>clknet</td>
<td>Lumped clock network delay</td>
</tr>
<tr>
<td>clksrc</td>
<td>Clock source. Used to ensure that the end-point of a clock segment is marked in the path when source latency is specified, or when the actual path cannot be found.</td>
</tr>
<tr>
<td>comp</td>
<td>PLL clock network compensation delay</td>
</tr>
<tr>
<td>ic</td>
<td>Interconnect delay</td>
</tr>
<tr>

<td>Lumped combinational loop delay</td>
</tr>
<tr>
<td>oext</td>
<td>External output delay</td>
</tr>
<tr>
<td>re</td>
<td>Routing element (only for paths generated with the -show_routing option)</td>
</tr>
<tr>
<td>srclat</td>
<td>Source latency for a clock segment. This appears if latency was specified between two clocks, or if a path could not be found between them.</td>
</tr>
<tr>
<td>unc</td>
<td>Clock uncertainty</td>
</tr>
<tr>
<td>utco</td>
<td>Register micro-Tco time</td>
</tr>
<tr>
<td>utsu</td>
<td>Register micro-Tsu time</td>
</tr>
<tr>
<td>uth</td>
<td>Register micro-Th time</td>
</tr>
</tbody>
</table>

Example Usage

```tcl
# Define a few helper procedures to print out points
# on a path, and the path itself
proc get_clock_string { path clk } {
    set clk_str ""
    set clk_id [ get_path_info $path -$({$clk}_clock ]
    if { $clk_id ne "" } {
        set clk_str [ get_clock_info $clk_id -name ]
        if { [ get_path_info $path -$({$clk}_clock_is_inverted ] } {
            append clk_str " (INVERTED)"
        }
    }
    return $clk_str
}
```

continued...
proc print_point { point } {
    set total [get_point_info $point -total]
    set incr [get_point_info $point -incr]
    set node_id [get_point_info $point -node]
    set type [get_point_info $point -type]
    set rf [get_point_info $point -rise_fall]
    set node_name ""
    if { [string compare $node_id ""] ne 0 } {
        set node_name [get_node_info $node_id -name]
    }
    puts [format "%10s %8s %2s %-6s %s" $total $incr $rf $type $node_name]
}

proc print_path { path } {
    puts "Slack      : [get_path_info $path -slack]"
    puts "To Clock   : [get_clock_string $path to]"
    puts "From Clock : [get_clock_string $path from]"
    puts "-------------------------------------------------------------------"
    puts [format "%10s %8s %-2s %-6s %s" "Total" "Incr" "RF" "Type" "Name"]
    foreach_in_collection pt [get_path_info $path -arrival_points] {
        print_point $pt
    }
}

project_open my_project
# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
# And now simply iterate over the 10 worst setup paths, printing each path
foreach_in_collection path [get_timing_paths -npaths 10 -setup] {
    print_path $path
    puts ""
}
delete_timing_netlist
project_close

**Port object**

**Description**

Returns information about the specified port (referenced by port ID). Port ID's can be obtained by Tcl commands such as `get_ports`. The `-type` option returns "port". The `-name`, `-type`, `-edge_rate`, `-is_input_port`, `-is_output_port` and `-is_inout_port` options are mutually exclusive.

**Example Usage**

```tcl
project_open chiptrip
create_timing_netlist
set ports [get_ports]
foreach_in_collection port $ports {
    set port_type ""
    if [get_port_info $port -is_inout_port] {
        set port_type "bidir"
    } elseif [get_port_info $port -is_input_port] {
        set port_type "in"
    } else {
        set port_type "out"
    }
    puts "[get_port_info $port -name]: $port_type"
}
delete_timing_netlist
project_close
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>

<tr>
<td>-tsu</td>
<td>Return the Tsu value</td>
</tr>
<tr>
<td>-type</td>
<td>Return the object type</td>
</tr>
<tr>
<td>&lt;reg_object&gt;</td>
<td>Register object</td>
</tr>
</tbody>
</table>

**Description**

Gets information about the specified register (referenced by register ID). Register IDs can be obtained by Tcl commands such as `get_registers`.

The `-type` option returns "reg". The `-name`, `-type`, `-tco`, `-tsu`, `-th`, `-tch`, `-tcl`, `-tmin`, `-clock_edges`, `-synch_edges`, `-asynch_edges`, `-fanout_edges` and `-is_latch` options are mutually exclusive.

**Example Usage**

```tcl
project_open chiptrip
create_timing_netlist
set registers [get_registers]
foreach_in_collection reg $registers {
    set name [get_register_info $reg -name]
    set tco [get_register_info $reg -tco]
    puts "Tco of $name is $tco"
}
delete_timing_netlist
project_close
```

**Return Value**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
### 3.1.37.34. `get_timing_paths (::quartus::sta)`

The following table displays information for the `get_timing_paths` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::sta</code> on page 615</th>
</tr>
</thead>
</table>

#### Arguments

- `-h | -help`  
  Short help

- `-long_help`  
  Long help with examples and possible return values

- `-asynch_clock`  
  Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups

- `-data_delay`  
  Report only paths that are covered by a data delay assignment

- `-detail <summary|path_only|path_and_clock|full_path>`  
  Option to determine how much detail should be shown in the path report

- `-fall_from <names>`  
  Valid sources (string patterns are matched using Tcl string matching)

- `-fall_from_clock <names>`  
  Valid source clocks (string patterns are matched using Tcl string matching)

- `-fall_through <names>`  
  Valid through nodes (string patterns are matched using Tcl string matching)

- `-fall_to <names>`  
  Valid destinations (string patterns are matched using Tcl string matching)

- `-fall_to_clock <names>`  
  Valid destination clocks (string patterns are matched using Tcl string matching)

- `-false_path`  
  Report only paths that are cut by a false path assignment

- `-from <names>`  
  Valid sources (string patterns are matched using Tcl string matching)

- `-from_clock <names>`  
  Valid source clocks (string patterns are matched using Tcl string matching)

- `-hold`  
  Option to report clock hold paths

- `-inter_clock`  
  Only report paths whose launch and latch clock are different

- `-intra_clock`  
  Only report paths whose launch and latch clock are the same

- `-less_than_slack <slack limit>`  
  Limit the paths reported to those with slack values less than the specified limit.

- `-npaths <number>`  
  Specifies the number of paths to report (default=1, or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported but be wary that this may be slow)
-nworst <number>  Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst

-pairs_only  When set, paths with the same start and end points are considered equivalent. Only the worst case path for each unique combination is displayed.

-recovery  Option to report recovery paths

-removal  Option to report removal paths

-rise_from <names>  Valid sources (string patterns are matched using Tcl string matching)

-rise_from_clock <names>  Valid source clocks (string patterns are matched using Tcl string matching)

-rise_through <names>  Valid through nodes (string patterns are matched using Tcl string matching)

-rise_to <names>  Valid destinations (string patterns are matched using Tcl string matching)

-rise_to_clock <names>  Valid destination clocks (string patterns are matched using Tcl string matching)

-setup  Option to report clock setup paths

-show_routing  Option to display detailed routing in the path

-through <names>  Valid through nodes (string patterns are matched using Tcl string matching)

-to <names>  Valid destinations (string patterns are matched using Tcl string matching)

-to_clock <names>  Valid destination clocks (string patterns are matched using Tcl string matching)

### Description
Get a collection of path objects for the worst-case paths.

This command behaves the same as the report_timing command. However, instead of reporting the paths, it returns a Tcl collection of path objects. You can retrieve path object data using the get_path_info and get_point_info commands.

For help on the options shared with report_timing, see the report_timing help page.

### Example Usage

```tcl
# Define a few helper procedures to print out points on a path, and the path itself
proc get_clock_string { path clk } {
    set clk_str ""
    set clk_id [ get_path_info $path -$clk_clock ]
    if { $clk_id ne "" } {
        set clk_str [ get_clock_info $clk_id -name ]
        if { [ get_path_info $path -$clk_clock_is_inverted ] } {
            append clk_str " (INVERTED)"
        }
    }
    return $clk_str
}

proc print_point { point } {
    set total   [ get_point_info $point -total    ]
    set incr    [ get_point_info $point -incr     ]
    set node_id [ get_point_info $point -node     ]
    set type    [ get_point_info $point -type     ]
    set rf      [ get_point_info $point -rise_fall]
    set node_name ""
    return
}
```

```tcl
if { $node_id ne "" } {
    set node_name [ get_node_info $node_id -name ]
    puts [format "%10s %8s %2s %-6s %s" $total $incr $rf $type $node_name ]
}
proc print_path { path } {
    puts "Slack	: [ get_path_info $path -slack ]"
    puts "To Clock	: [ get_clock_string $path to ]"
    puts "From Clock	: [ get_clock_string $path from ]"
    puts "="
    puts [format "%10s %8s %-2s %-6s %s" "Total" "Incr" "RF" "Type" "Name"]
    puts "=================================================================="
    foreach_in_collection pt [ get_path_info $path -arrival_points ] {
        print_point $pt
    }
}
project_open my_project
# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
# And now simply iterate over the 10 worst setup paths, printing each path
foreach_in_collection path [ get_timing_paths -npaths 10 -setup ] {
    print_path $path
    puts ""
}
delete_timing_netlist
project_close
```

### Return Value

</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Timing netlist does not exist. Use <code>create_timing_netlist</code> to create a timing netlist.</td>
<td></td>
</tr>
</tbody>
</table>

### 3.1.37.37. locate (::quartus::sta)

The following table displays information for the `locate` Tcl command:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
<td></td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Timing netlist does not exist. Use <code>create_timing_netlist</code> to create a timing netlist.</td>
<td></td>
</tr>
</tbody>
</table>
Locate an object from the Timing Analyzer in another Quartus Prime tool.

With this command, one or more objects, or collections of objects, can be located in a supported Quartus tool from the Timing Analyzer.

The destination must be specified with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Destination Tool</th>
</tr>
</thead>
<tbody>
<tr>
<td>-chip</td>
<td>Chip Planner</td>
</tr>
<tr>
<td>-rpe</td>
<td>Resource Property Editor</td>
</tr>
<tr>
<td>-rtt</td>
<td>RTL Viewer</td>
</tr>
<tr>
<td>-classic_rtt</td>
<td>Classic RTL Viewer</td>
</tr>
<tr>
<td>-tmv</td>
<td>Technology Map Viewer</td>
</tr>
<tr>
<td>-classic_tmv</td>
<td>Classic Technology Map Viewer</td>
</tr>
<tr>
<td>-rtm</td>
<td>Hyper-Retiming Viewer</td>
</tr>
<tr>
<td>-dpp</td>
<td>Design Partition Planner</td>
</tr>
</tbody>
</table>

The -label option can be used to specify a label for the located objects. The -color command can be used to specify a color to be used to identify the located objects in the destination tool.

Example Usage:

```tcl
proc prepare_design {} {
    set sleep_for 2000
    create_timing_netlist -risefall
    post_message -type info "Give the GUI some time to catch up to the new netlist. Sleep for $sleep_for ms"
    after $sleep_for
    read_sdc
    update_timing_netlist
}
prepare_design
# Locate all of the nodes in the longest ten paths
# into the Resource Property Editor
locate [get_path -npaths 10] -rpe
# Locate ten paths into the chip planner, labelling each one individually.
set path_col [get_timing_paths -npaths 10]
set path_id 0
foreach_in_collection path $path_col {
    incr path_id
    locate -label "Path #$path_id" $path -chip
}
# locate all keepers that begin with the letter t
# to the Tech Map Viewer
locate [get_keepers t*] -tmv
# locate all nodes that begin with the letter a
# The Timing Analyzer GUI will prompt the user for the tool to which the nodes should be located.
# Pause first to allow the previous locations to appear, as the dialog that pops up, to ask
# the user for a location, will block the rest of the GUI until cleared.
after 5000
post_message -type info "Interactive locate"
locate a*
```

continued...
### 3.1.37.38. print_total_sdc_processing_time (::quartus::sta)

The following table displays information for the `print_total_sdc_processing_time` Tcl command:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td></td>
<td>INFO: Operation successful</td>

<tr>
<td></td>
<td>-list_format</td>
</tr>
<tr>
<td></td>
<td>-report_format</td>
</tr>
<tr>
<td></td>
<td>&lt;collection&gt;</td>
</tr>
</tbody>
</table>

**Description**

Query collection objects.

Collections can be obtained by Tcl commands such as get_clocks,
get_ports, get_cells. If neither the -limit nor the -all option is specified, then first 20 objects (if the collection has more than 20 objects) or all objects (if the collection has less than or equal to 20 objects) are returned.

Example Usage

```tcl
project_open chiptrip
create_timing_netlist
set nodes [get_nodes Reg*]
# Get the first 100 nodes in the collection.
query_collection $nodes -limit 100
delete_timing_netlist
project_close
```

Return Value

<table>

<td>1</td>
<td>ERROR: Cannot find specified collection. Specify an existing collection.</td>
</tr>
</tbody>
</table>

3.1.37.40. read_sdc (::quartus::sta)

The following table displays information for the read_sdc Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-hdl</td>
</tr>
<tr>
<td></td>
<td>-instance &lt;instance_name&gt;</td>
</tr>
<tr>
<td></td>
<td>-no_import</td>
</tr>
<tr>
<td></td>
<td>-no_sdc_promotion</td>
</tr>
<tr>
<td></td>
<td>-post_fit</td>
</tr>
<tr>
<td></td>
<td>-post_syn</td>
</tr>
<tr>
<td></td>
<td>-project_relative</td>
</tr>
<tr>
<td>&lt;file_name&gt;</td>
<td>Name of the SDC file</td>
</tr>
</tbody>
</table>

Description

Reads an SDC file with all current constraints and exceptions. If an SDC file is specified, read_sdc only reads that SDC file. If the -hdl option is specified, read_sdc only reads SDC commands that were embedded in HDL. If no arguments are specified, read_sdc reads the default SDC files along with any SDC commands that were embedded in QSL. If one or more SDC_FILE assignments exists in the QSF, read_sdc reads all of them in order. Otherwise, read_sdc reads the file <revision>.sdc if it exists.
Example Usage

```c
project_new test
create_timing_netlist

# Read SDC commands from test_constraints.sdc
read_sdc test_constraints.sdc

# Read SDC commands embedded in HDL
read_sdc -hdl
update_timing_netlist
report_timing
delete_timing_netlist
project_close
```

3.1.37.41. register_delete_timing_netlist_callback (::quartus::sta)

The following table displays information for the `register_delete_timing_netlist_callback` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>`register_delete_timing_netlist_callback [-h</td>
</tr>
<tr>
<td>Arguments</td>
<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;body&gt;</code></td>
</tr>
</tbody>
</table>

Description

Use this command to specify a TCL procedure that runs before the timing netlist is deleted.

This command can be used to specify a procedure to run, like so:

```c
proc mycallback {
    # This is the body of the delete_timing_netlist callback.
    ...
}
register_delete_timing_netlist_callback mycallback
```

Or, you may specify the procedure directly:

```c
register_delete_timing_netlist_callback {
    # This is the body of the delete_timing_netlist callback.
    ...
}
```

Example Usage

This command currently contains no example usage.

<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td><code>&lt;base_collection&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;items_to_remove&gt;</code></td>
</tr>
</tbody>
</table>

**Description**

This command takes two collections and returns a new collection that is the difference of the two, effectively the second collection subtracted from the first collection. The second collection can be a string, but the first has to be previously-created collection: either by passing any of the "get_" functions directly, or by passing a variable that contains a collection (see code examples for this command). If a collection is used for the second argument, the types in the second collection must be the same as or a subset of the types in the first collection.

If the first collection consists of keepers, the second collection can only consist of keepers, registers or ports.

If the first collection consists of partitions, the second collection can only consist of partitions or cells. If the first collection consists of nodes, the second collection can only consist of nodes, keepers, registers, ports, pins, nets or combinational nodes.

**Example Usage**

```
set a_keeprs [get_keepers a*]
set a1_regs [get_registers a1*]

set keepers_without_a1 [remove_from_collection $a_keeprs $a1_regs]
# or:
set keepers_without_a1 [remove_from_collection $a_keeprs [get_registers a1*]]
# or even:
set keepers_without_a1 [remove_from_collection $a_keeprs a1*]

# - note that the last statement will actually remove all keepers with name a1*
# - not only registers! (will remove IOs with name a1*, if any)

# Get the first 100 nodes in the collection.
query_collection $keepers_without_a1 -limit 100
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Cannot specified collection. Specify an existing collection.</td>
</tr>
</tbody>
</table>
3.1.37.43. report_advanced_io_timing (::quartus::sta)

The following table displays information for the report_advanced_io_timing Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
</table>

**Syntax**

```
```

**Arguments**

- `-h | -help`
  
  Short help
- `-long_help`
  
  Long help with examples and possible return values
- `-append`
  
  If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
- `-file <name>`
  
  Sends the results to an ASCII or HTML file. Depending on the extension
- `-panel_name <name>`
  
  Sends the results to the panel and specifies the name of the new panel
- `-stdout`
  
  Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.

**Description**

This command creates a report containing all of the relevant signal integrity measurements computed during I/O buffer simulation.

You must perform delay annotation with Advanced I/O Timing enabled before using this command. This option can be enabled from the Timing Analyzer Page of the Settings dialog box.

**Example Usage**

```
project_open my_project
# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
# Create "Advanced I/O Timing" report panel
report_advanced_io_timing -panel_name "Advanced I/O Timing"
# The following command is optional
delete_timing_netlist
project_close
```

**Return Value**

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

### Description

This report displays all Clock-Domain-Crossings (CDC) between asynchronous clocks in a design.

The report can be directed to the Tcl console ("-stdout", default), a file, or the panel ("-panel_name <name>").
By default, this command reports all CDC's in a design. You can limit the analysis performed by this command to specific CDC source and destination nodes, using the "-from" and "-to" options. The analysis can also be limited using clocks. Specify the CDC's source and destination clocks using the "-from_clock" and "-to_clock" options. Alternatively, specify edges of the clock using "-rise_from_clock", "-fall_from_clock", "-rise_to_clock", and "-fall_to_clock" options.

To limit the report to only display specific categories of CDC's, use "-multi_bit_cdc" to report multi-bit CDC buses, "-single_bit_cdc" to report single-bit CDC synchronizers, and "-reset_cdc" to report asynchronous reset topologies. By default, all three CDC categories are reported.

Use the "-nentries" option to limit the number of CDC's displayed per CDC topology type. The topology types fall into one of the three categories above. Run the report to see all the topology types that are supported.

Use the "-detail" option to specify the desired level of reporting detail. 
"summary" generates a table listing only the number of CDC topologies recognized per category and the total number of crossings for that category. 
"full" reports every recognized CDC under each topology type, and is the default behaviour. In the full report, you can click on each individual CDC in the Timing Analyzer graphical user interface to view its statistics.

Example Usage

```bash
# Report all bus CDC's, up to 10 buses per CDC topology type
report_asynch_cdc -buses -nentries 10

# Report all CDC's from clkA to clkB
report_asynch_cdc -from_clock clkA -to_clock clkB

# Report all synchronizer chains whose source node contains "transfer"
report_asynch_cdc -from *transfer* -synch_chains
```

### Return Value

</tbody>
</table>

### 3.1.37.45. report_bottleneck (::quartus::sta)

The following table displays information for the report_bottleneck Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
</table>

#### Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-cmetric <cmetric_name>` Custom metric function to evaluate individual nodes
- `-details` Show the detailed information (number of failing edges, number of fanins, etc)
- `-metric <default|tns|num_paths|num_fpaths|num_fanins|num_fanouts>` Indicate the metric to use to rate individual nodes
- `-nworst <number>` Specifies the maximum number of nodes to report. If unspecified, there is no limit
- `-panel_name <panel_name>` Sends the results to the panel and specifies the name of the new panel
- `-stdout` Output the result onto stdout
Reports bottleneck nodes in a design based on user-specified criteria for rating each node.

The following considerations are pre-defined:

- `num_fpaths`: (default) returns the number of paths that fail timing through the node.
- `num_fanins`: returns the number of fanin edges from the node.
- `num_fanouts`: returns the number of fanout edges from the node.
- `num_paths`: returns the number of paths through the node.
- `tns`: returns the total negative slack of all the paths through the node.

The paths to be analyzed can be specified by passing the result of any `get_timing_paths` call as the last argument to `report_bottleneck`. If no paths are specified, `report_bottleneck` analyzes the worst 1000 setup paths in the design.

You can also create your own custom criteria for evaluating nodes based on the combination of the number of fanouts, fanins, failing paths, and total paths.

To use custom criteria, do the following:

1. Create a Tcl procedure that takes one argument, "arg", for example.
2. Use "upvar $arg metric" in the procedure.
3. Calculate the rating based on `metric(tns)`, `metric(num_fanouts)`, `metric(num_fanins)`, and `metric(num_fpaths)`.
4. Return the rating with "return $rating".
5. Pass the name of your custom criteria procedure to `report_bottleneck` using the `-cmetric` option.

Example Usage

```
project_open my_project
create_timing_netlist
read_sdc
update_timing_netlist
# use the worst 500 hold paths
set paths [ get_timing_paths -npaths 500 -hold ]
report_bottleneck -metric default -panel "Timing Analysis Bottleneck Report - Default Metric" $paths
report_bottleneck -metric tns -panel "Timing Analysis Bottleneck Report - TNS" $paths
report_bottleneck -metric num_paths -panel "Timing Analysis Bottleneck Report - Number of Paths" $paths
report_bottleneck -metric num_fpaths -panel "Timing Analysis Bottleneck Report - Number of Failing Paths" $paths
report_bottleneck -metric num_fanouts -panel "Timing Analysis Bottleneck Report - Number of Fanouts" $paths
# create custom metric and use the worst 2000 setup paths
proc report_bottleneck_custom_metric {arg} {
    # Description: use the number of fanins as the custom metric.
    upvar $arg metric
    set rating $metric(num_fanins)
    return $rating
}
set paths [ get_timing_paths -npaths 2000 -setup ]
report_bottleneck -cmetric report_bottleneck_custom_metric -panel "Timing Analysis Bottleneck Report - Custom" $paths
```

Return Value

</tr>
<tr>
<td><code>-summary</code></td>
<td>Do not display slack information</td>
</tr>
<tr>
<td><code>-timed</code></td>
<td>Include all timed transfers (i.e. those not fully cut by false paths or clock groups)</td>
</tr>
</tbody>
</table>
Valid destination clocks (string patterns are matched using Tcl string matching)

Alias for the -hierarchy option

Generates a Clock Domain Crossing Viewer (CDC Viewer) report. It displays all clock transfers (i.e., data paths between one clock domain and another clock domain) in a design, as well as data on each transfer: the number of uncut & cut paths in the transfer, the worst-case and total-negative slack of the transfer, and the tightest setup/removal/recovery relationship between the clocks in the transfer.

The report indicates what clock transfers are cut ("false paths") by set_clock_groups or clock-to-clock set_false_path commands, and which clock transfers are ignored due to clocks marked as inactive by set_active_clocks.

The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three. When directed to a panel or a file without the -list option, the CDC Viewer report will be a grid, where each cell represents paths transferring between a source and destination clock. When directed to a panel or an HTML file, the grid is color-coded to highlight passing, failing, cut, and inactive transfers, as well as clock groups. When directed to the Tcl console or a file with the -list option, a list of clock transfers are reported.

The -setup, -hold, -recovery, and -removal options determine the analysis type of the report, particularly the reporting of false_paths that apply to only one analysis type. If you do not specify any of these options, a report is generated for each analysis.

By default, the only transfers that are shown in the report are ones that participate in clock domain crossings. This means that transfers to/from the same clock are not shown, even if they fail timing. To show all transfers, use the -show_all option.

The generated report can be customized by a variety of options. Refer to the help text of those options for more information.

Example Usage

```
project_open top
create_timing_netlist -skip_dat
report_cdc_viewer -panel_name
delete_timing_netlist
project_close
```

Return Value

</tbody>
</table>

3.1.37.47. report_clock_fmax_summary (::quartus::sta)

The following table displays information for the `report_clock_fmax_summary` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>`[-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-append</code></td>
</tr>
</tbody>
</table>
### Description
Reports potential fmax for every clock in the design, regardless of the user-specified clock periods. Fmax is only computed for paths where the source and destination registers or ports are driven by the same clock. Paths of different clocks, including generated clocks, are ignored. For paths between a clock and its inversion, fmax is computed as if the rising and falling edges of the clock are scaled along with fmax, such that the duty cycle (in terms of a percentage) is maintained.

Restricted fmax considers hold timing in addition to setup timing, as well as minimum pulse and minimum period restrictions. Similar to unrestricted fmax, the restricted fmax is computed as if the rising and falling edges of the clock are scaled along with fmax, such that the duty cycle (in terms of a percentage) is maintained. The "Note" column reports which analyses restricted fmax. Refer to hold timing reports (e.g., report_timing with the -hold option) or minimum pulse width reports generated by the report_min_pulse_width command for details of specific paths, registers, or ports.

### Example Usage
```tcl
project_open my_project
# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
# Output results in the form of messages
report_clock_fmax_summary
# Create "Fmax" report panel
report_clock_fmax_summary -panel_name Fmax
# Report both with report panel and messages
report_clock_fmax_summary -panel_name Fmax -stdout
# The following command is optional
delete_timing_netlist
project_close
```

### Return Value
<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>

<tr>
<td><code>-target &lt;names&gt;</code></td>
<td>Valid nodes in the clock network or clocks (string patterns are matched using Tcl string matching).</td>
</tr>
</tbody>
</table>

Description

The clock network report shows the netlist topology of clock paths that make up the clock network in a design. It allows the user to track a clock signal from its source, through transformations such as PLL's, to the loads that the clock drives. It also reveals clock relationships by indicating nodes where generated clocks are defined.

The report can be directed to the Tcl console (`-stdout`, default), a file (`-file`), the Timing Analyzer graphical user interface (`-panel_name`), or any combination of the three.

Use the `-target` option to specify report targets. These can be clocks in the design or nodes on the clock network, for example PLL outputs. If you specify clocks as targets, the clock network report uses the clock's target nodes as report targets. The clock network report then displays all nodes in the clock network that are in the fanin and fanout cones of the report targets. If no report target is specified, all clock target nodes in the design are used by default.

Each row in the report may include one node or multiple trivial nodes with singular fanin and fanout edge. To disable the behaviour of collapsing down trivial nodes into one row, use the `-show_full_paths` option.

When running the clock network report in the Timing Analyzer GUI, rows in the main table corresponding to report target nodes are highlighted in light blue. You may click on each row of the table to view information such as clock frequencies, relationships, and why this node belongs in the clock network. You may right-click on any row to locate the node in other Quartus tools such as RTL Viewer. You may also right-click on specific rows to locate the shortest clock path from the clock source to that node in tools such as RTL Viewer.

Use the `-initial_depth` option to reduce the height of the report table in the Timing Analyzer GUI. Rows in the main table that are deeper than the set initial depth are collapsed by default, but can be manually expanded. If this option is not set, the report determines an appropriate initial depth to use.

Use the `-include_non_clock_paths` option if a node that you expect to be in the clock network cannot be found. This option shows nodes that lead into a register's clock pin, but are not downstream of any known clock source. Furthermore, registers that are not clocked by any clocks will be shown using this option.

Use the `-locate_with_routing` option to show the routing elements that make up a path when locating a path to Chip Planner. Only use this option if you use the `-target` option to specify reporting targets, otherwise the report may be slow to generate.

---

continued...
### Example Usage

- `# Report the clock network that feeds into register regA`
  - `report_clock_network -panel {Report} -target [get_registers regA]`
- `# Report the clock network starting from clk_100 clock, but show only the first 10 levels`
  - `report_clock_network -panel (Report) -target [get_clocks clk_100] -initial_depth 10`
- `# Report the clock network passing through the combinational node clk_mux|combout.  
  In the report, include paths that end at a register's clock pin but do not start 
  at a clock source.`
  - `report_clock_network -panel (Report) -target [get_nodes clk_mux|combout] 
    - include_non_clock_paths`

<tr>
<td></td>
<td><code>-setup</code></td>
</tr>
<tr>
<td></td>
<td><code>-stdout</code></td>
</tr>
</tbody>
</table>

**Description**

Generates a timing report table showing all clock transfers (i.e., data paths between one clock domain and another clock domain). The from and to clocks are shown as well as the number of paths for each transfer: RR, RF, FR, FF. An RF transfer, for example, occurs when the source register of path is clocked by the rising edge of its clock and the destination register is clocked by the falling edge of its clock.

The report also indicates what clock transfers are cut ("false paths") by set_clock_groups or clock-to-clock set_false_path commands. For transfers that are not cut, the number of paths reported does not take into account paths cut by path-specific set_false_path commands. Actual path counts may be lower than reported.

The report can be directed to the Tcl console ("~stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three. The -setup, -hold, -recovery, and -removal options determine the...
analysis type of the report, particularly the reporting of false_paths that apply to only one analysis type. If you do not specify any of these options, a report is generated for each analysis.

Example Usage

```
project_open top
create_timing_netlist -skip_dat
report_clock_transfers -panel_name
delete_timing_netlist
project_close
```

Return Value

<table>

<tr>
<td></td>
<td>-panel_name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-stdout</td>
</tr>
<tr>
<td></td>
<td>-summary</td>
</tr>
<tr>
<td></td>
<td>-tree</td>
</tr>
<tr>
<td></td>
<td>-waveform</td>
</tr>
</tbody>
</table>

Description

Report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical interface ("-panel_name"), or any combination of the three.

For stdout/file output, the clock details are reported in two sections. The first section shows all clocks, their period, and their waveform. This includes generated clocks after an update_timing_netlist. The second section shows details for all generated clocks. For the panel report, both sections are combined into a single report.
3.1.37.51. report_datasheet (::quartus::sta)

The following table displays information for the report_datasheet Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>

<td>-file &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-panel_name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-stdout</td>
</tr>
<tr>
<td>Description</td>
<td>This function creates a datasheet report which summarizes the timing characteristics of the design as a whole. It reports setup (tsu), hold (th), clock-to-output (tco), minimum clock-to-output (mintco), output enable (txz), minimum output enable (mintxz), output disable (txz), minimum output disable (mintxz), propagation delay (tpd), and minimum propagation delay (mintpd) times. These delays are reported for each clock or port for which they are relevant. If there is a case where there are multiple paths for a clock (for example if there are multiplexed clocks), then the maximum delay is reported for the tsu, th, tco, txz, txz and tpd, and the minimum delay is reported for mintco, mintxz, mintxz and mintpd. The datasheet can be outputed to the Tcl console (&quot;-stdout&quot;, default), a file (&quot;-file&quot;), or a report panel (&quot;-panel_name&quot;). Additionally if the &quot;-file&quot; option is used then the &quot;-append&quot; option can be used to specify that new data should be written to the end of the specified file.</td>

</tr>
</tbody>
</table>

Description

This command generates custom timing reports for EMIF instantiations.

Example Usage

```
project_new test
create_timing_netlist
read_sdc
update_timing_netlist
report_ddr -panel "Report DDR"
delete_timing_netlist
project_close
```

<table>

</tbody>
</table>
### 3.1.37.53. report_exceptions (::quartus::sta)

The following table displays information for the `report_exceptions` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
</table>

**Syntax**

```
clock_groups] [-detail <summary|path_summary|path_only|path_and_clock|full_path>] [-
fail_from_clock <names>] [-fall_to_clock <names>] [-false_path] [-file
<name>] [-from <names>] [-from_clock <names>] [-hold] [-ignored] [-
inter_clock] [-intra_clock] [-less_than_slack <slack limit>] [-max_delay] [-
min_delay] [-multicycle_path] [-npaths <number>] [-num_exceptions <number>] [-
worst <number>] [-pairs_only] [-panel_name <name>] [-reachability] [-
<names>] [-to <names>] [-to_clock <names>] [-valid]
```

**Arguments**

- `-h | -help`  
  Short help

- `-long_help`  
  Long help with examples and possible return values

- `-append`  
  If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.

- `-asynch_clock`  
  Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups

- `-clock_groups`  
  Option to show clock groups in reports. This option also treats clock groups as timing exceptions

- `-detail <summary|path_summary|path_only|path_and_clock|full_path>`  
  Option to determine how much detail should be shown in the path report

- `-fall_from_clock <names>`  
  Valid source clocks (string patterns are matched using Tcl string matching)

- `-fall_to_clock <names>`  
  Valid destination clocks (string patterns are matched using Tcl string matching)

- `-false_path <names>`  
  Option to report false path exceptions

- `-file <name>`  
  Sends the results to an ASCII or HTML file. Depending on the extension

- `-from <names>`  
  Valid sources (string patterns are matched using Tcl string matching)

- `-from_clock <names>`  
  Valid source clocks (string patterns are matched using Tcl string matching)

- `-hold`  
  Option to report clock hold paths

- `-ignored`  
  Option to report only exceptions that are partially or fully ignored

- `-inter_clock`  
  Only report paths whose launch and latch clock are different

- `-intra_clock`  
  Only report paths whose launch and latch clock are the same

- `-less_than_slack <slack limit>`  
  Limit the paths reported to those with slack values less than the specified limit.

- `-max_delay`  
  Option to report maximum delay exceptions

- `-min_delay`  
  Option to report minimum delay exceptions

*continued...*
### Description

Reports status and timing analysis results for each timing exception in your design. A timing exception is one of: `set_false_path`, `set_multicycle_path`, `set_min_delay`, or `set_max_delay`.

The status is relative to the paths covered by the `-from`, `-to`, and other options. A complete timing exception relative to the values specified for the `-from` and `-to` options may not actually be complete with respect to the full design.

**Complete**: The exception has not been overridden and is valid. There are paths affected by this exception.

### Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-multicycle_path</code></td>
<td>Option to report multicycle path exceptions</td>
</tr>
<tr>
<td><code>-npaths &lt;number&gt;</code></td>
<td>Specifies the number of paths to report (default=1, or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported but be wary that this may be slow)</td>
</tr>
<tr>
<td><code>-num_exceptions &lt;number&gt;</code></td>
<td>Option to only show a certain number of exceptions in the report</td>
</tr>
<tr>
<td><code>-nworst &lt;number&gt;</code></td>
<td>Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst</td>
</tr>
<tr>
<td><code>-pairs_only</code></td>
<td>When set, paths with the same start and end points are considered equivalent. Only the worst case path for each unique combination is displayed.</td>
</tr>
<tr>
<td><code>-panel_name &lt;name&gt;</code></td>
<td>Sends the results to the panel and specifies the name of the new panel</td>
</tr>
<tr>
<td><code>-reachability</code></td>
<td>Option to report a percent value of how many nodes in an exception's targets are satisfied by the exception</td>
</tr>
<tr>
<td><code>-recovery</code></td>
<td>Option to report recovery paths</td>
</tr>
<tr>
<td><code>-removal</code></td>
<td>Option to report removal paths</td>
</tr>
<tr>
<td><code>-report_clock_groups</code></td>
<td>Option to treat clock groups as exceptions</td>
</tr>
<tr>
<td><code>-rise_from_clock &lt;names&gt;</code></td>
<td>Valid source clocks (string patterns are matched using Tcl string matching)</td>
</tr>
<tr>
<td><code>-rise_to_clock &lt;names&gt;</code></td>
<td>Valid destination clocks (string patterns are matched using Tcl string matching)</td>
</tr>
<tr>
<td><code>-setup</code></td>
<td>Option to report clock setup paths</td>
</tr>
<tr>
<td><code>-split_by_corner</code></td>
<td>When set, running this command with the -panel option creates a folder containing versions of this report for selected multiple operating conditions. This option has no effect when used with the -stdout or -file options.</td>
</tr>
<tr>
<td><code>-stdout</code></td>
<td>Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.</td>
</tr>
<tr>
<td><code>-through &lt;names&gt;</code></td>
<td>Valid through nodes (string patterns are matched using Tcl string matching)</td>
</tr>
<tr>
<td><code>-to &lt;names&gt;</code></td>
<td>Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
<tr>
<td><code>-to_clock &lt;names&gt;</code></td>
<td>Valid destination clocks (string patterns are matched using Tcl string matching)</td>
</tr>
<tr>
<td><code>-valid</code></td>
<td>Option to report only exceptions that cover valid paths and have been successfully applied</td>
</tr>
</tbody>
</table>
Partial overridden: The exception includes some paths that have been overridden by one or more higher-precedence exceptions.

Fully overridden: All paths affected by this exception have been overridden by one or more higher-precedence exceptions.

Invalid: No paths are affected by this exception. This occurs when a timing exception has valid -from, -to, or -through collections, but there are no actual paths from the -from nodes to the -to nodes.

Paths will not be analyzed: This exception has no paths for the given analysis type (setup/hold/recovery/removal). This occurs when a timing exception has paths, but only for analysis types other than the type used for the current report.

Use the -valid option to show only exceptions that have the status of "Complete" or "Partially overridden". These exceptions cover valid paths and have been successfully applied.

Use the -ignored option to show only exceptions that are partially or fully ignored. This includes exceptions with the status "Partially Overridden", "Fully Overridden", "Invalid", as well as any exceptions that have errors and were not included in the analysis.

Use the -setup (default), -hold, -recovery, or -removal options to further filter the exceptions reported.

The report can be directed to the Tcl console using -stdout (default), a file using -file, the Timing Analyzer graphical user interface using -panel_name, or any combination of those three options.

You can limit the reporting by this command to specific start and end points, using the -from and -to options. You can further limit reporting to clocks using the -from_clock and -to_clock options, or to specific edges of the clock using the -rise_from_clock, -fall_from_clock, -rise_to_clock, and -fall_to_clock options. Additionally, the -through option can be used to restrict reporting to paths which go through specified pins or nets.

To determine which timing exceptions override other timing exceptions, use the same -from and -to options that were used with the overridden timing exception.

Use the -npaths option to limit the number of paths to report per timing exception. If you do not specify this option, only the single worst-case path per timing exception is provided. Use the -less_than_slack option to limit output to all paths with slack less than the specified value, up to the number specified by -npaths.

Use the -nworst option to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the -npaths option. If this option is used, but -npaths is not specified, -npaths defaults to the same value specified for -nworst.

Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.

Use the "-num_exceptions" option to limit the report to only show a certain number of exceptions. If the limit is not set or set too high, the report may need to run for extended durations.

Use the "-reachability" option to determine a percentage of how many start and endpoint pairs given by an exception's -from and -to filters are satisfied by the exception. If an exception does not have a -from target, the reachability ratio measures how many of the -to targets are satisfied by the exception, and vice versa for exceptions without a -to target. Exceptions without both -from and -to targets are not calculated for reachability. An exception that targets clocks or uses wildcards that match many nodes likely has a lower reachability than an exception that targets specific nodes. To avoid overly-broad exception constraints, you should use exceptions with a higher reachability value.

Reachability is calculated differently depending on whether the exception is bus-type. A bus-type exception has both -from and -to options declared, and they target the same number of nodes. As well, all nodes in the -from option must be declared together, and all nodes in the -to option must be declared together. Otherwise, the exception is non-bus type. Bus-type reachability ratio assumes that each node in the -from target connects with one node in the -to target. Non-bus type reachability ratio is typically more pessimistic because it assumes that each node in the -from target connects with every node in the -to target.
Use the `-detail` option to specify the desired level of report detail. Specifying "summary" generates a single table listing only the highlights of each timing exception (status and worst-case slack). Specifying "path_summary" generates a table, per timing exception, listing only the highlights of each path. Specifying "path_only" reports the path from the source to the destination without any detail about the clock path. Instead, the clock network delay is shown as a single number. This is the default behavior. Specifying "path_and_clock" extends the arrival and required paths back to the launch and latch clocks. Specifying "full_path" causes continued tracing back through generated clocks to the underlying base clock.

To treat clock groups as timing exceptions (meaning that they override exceptions with a lower priority), use the `-report_clock_groups` option.

By default, all exception types are reported, and clock groups are reported only if the `-report_clock_groups` option is used. Use a combination of `-false_path`, `-multicycle_path`, `-max_delay`, `-min_delay`, and `-clock_groups` to limit the analysis to specific exception types. Note that `-clock_groups` option also treats clock groups as timing exceptions.

False path exceptions (set_false_path) are reported as if the false path was not applied, similar to the `-false_path` option for report_timing.

The values of the `-from`, `-to`, and `-through` options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

Clock-Domains-Crossing Verification:

To view the effects of clock groups on your design, run "report_exceptions -report_clock_groups". If any pair of clocks in your design are cut by a set_clock_groups command and NOT cut by a set_false_path command, the Report shows paths between that pair of clocks as a clock-to-clock exception.

Example:

```
set_clock_groups -logically_exclusive -group {clkA clkB} -group {clkC clkD}
report_exceptions -report_clock_groups -npaths 0 -detail path_only
```

You might want to run "report_exceptions -report_clock_groups" if:

1. You want to check which paths are cut by a set_clock_groups SDC command.
2. You want to cut clock paths, but don't want to add set_clock_groups because you're concerned that you might cut a path incorrectly. With the "report_exceptions -report_clock_groups" command, you can add set_clock_groups to split clocks that are truly asynchronous, then add set_false_path commands to manually cut what you want, and then verify (in the Report) that no paths were found (since false paths have priority). If a path is found by the report, you can correct that without wasting a compilation concentrating on some unrelated false paths.
3. If you use the set_clock_groups command and have some logic that is behaving badly and think it's timing related, run the "report_exceptions -report_clock_groups" command on that hierarchy to verify whether the correct paths have been cut.

Example Usage

```
# Reports all timing exceptions for a setup analysis.
report_exceptions

# Reports all timing exceptions for a hold analysis.
report_exceptions -hold

# Reports all timing exceptions affecting input paths for recovery analysis, reporting the 10 worst paths per exception.
report_exceptions -from [all_inputs] -to [all_registers] -recovery -npaths 10 -detail full_path

# Reports all paths affected by timing exceptions, including all clock-to-clock-paths cut by clock groups.
report_exceptions -report_clock_groups -npaths 0 -detail path_only
```

*continued...*
**Description**

Reports a summary showing the distribution of logic depth among the critical paths. Logic depth typically corresponds to the number of look-up tables (LUTs) that a path passes through. If a path passes through non-LUT elements such as RAM or DSP blocks, special rules may apply.

Use the "-setup", "-hold", "-recovery", "-removal", or "-topology" options to specify which kind of analysis should be performed. In topology analysis, paths are ordered by logic depth as opposed to slack.

The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.

You can limit the analysis performed by this command to specific start and end points, using the "-from" and "-to" options. Use the "rise_from" and "fall_from" options to limit the analysis to endpoints with established high or low starting states. Use the "rise_to" and "fall_to" options to limit the analysis to destination points with high or low ending states.

The analysis can be further limited to clocks using the "-from_clock" and "-to_clock" options, or to specific edges of the clock using the "rise_from_clock", "fall_from_clock", "rise_to_clock", and "fall_to_clock" options.

Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Use the "rise_through" and "fall_through" options to limit the analysis to intermediate points.
with high or low ending states.

Use "-npaths" to limit the number of paths to report. If you do not specify this option, 1000 paths with the worst slack are included in the report. Use the "-less_than_slack" option to limit output to all paths with slack less than the specified value, up to the number specified by "-npaths".

Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. If this option is used, but "-npaths" is not specified, then "-npaths" defaults to the same value specified for "-nworst".

Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.

Use the "-detail" option to specify the desired level of report detail. Specifying "histogram" generates a summary showing the distribution of logic depth among the critical paths. A row is provided for each clock and a column for each logic depth. Specifying "path" generates a table of paths as rows with a column corresponding the paths' logic depths similar to the tables reported by "report_timing" and "report_path". The default behavior is to report a histogram.

The values of the "-from", "-to", and "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

The following options are not supported for this command:
--ccpp, --summary_view, --show_routing, --show_xtalk, --detail, --false_path

If any of the following filters are provided, then the logic depth distribution occurs over "n critical paths" rather than "n critical paths per clock"
-true, -false, -true_clock, -false_clock, -rise_true, -fall_true,
-rise_false, -fall_false, -true_clock, -false_clock, -rise_true_clock,
-fall_true_clock, -rise_false_clock, -fall_false_clock

Example Usage

```tcl
project_open my_project
# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
report_logic_depth -npaths 1000 -file "logic_depth.txt"
project_close
```

3.1.37.56. report_max_clock_skew (::quartus::sta)

The following table displays information for the `report_max_clock_skew` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
</table>

### Syntax

```
report_max_clock_skew [-h | -help] [-long_help] [-append] [-detail \<summary|full_path\>] [-file \<name\>] [-less_than_slack \<slack limit\>] [-npaths \<number\>] [-panel_name \<name\>] [-show_routing] [-stdout]
```

### Arguments

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-append` If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
- `-detail \<summary|full_path\>` Option to determine how much detail should be shown in the path report
- `-file \<name\>` Sends the results to an ASCII or HTML file. Depending on the extension
- `-less_than_slack \<slack limit\>` Limit the paths reported to those with slack values less than the specified limit.
- `-npaths \<number\>` Specifies the number of paths to report for each latest and earliest arrival skew result per set_max_skew assignment (default=1)
- `-panel_name \<name\>` Sends the results to the panel and specifies the name of the new panel
- `-show_routing` Option to display detailed routing in the path report
- `-stdout` Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.

</tbody>
</table>

### Description

Reports max skew analysis results for all set_max_skew commands in a single report. For each valid set_max_skew constraint, this command computes skew with respect to the latest and the earliest arrival of each path.

By default, "Skew for the Latest Arrival" is computed by comparing the latest arrival of each path with the earliest arrival of the path that has the smallest value for early arrival of all other paths included in the constraint. Similarly, "Skew for the Earliest Arrival" is computed by comparing the earliest arrival of each path with the latest arrival of the path that has the largest value for late arrival of all other paths included in the constraint. No path is compared with itself.

Use the -stdout option to direct the report to the Tcl console (default), the -file option to write the report to a file or the -panel_name option to direct the report to the Timing Analyzer graphical user interface. You can use these options in any combination.

Use the -npaths option to limit the number of path result pairs reported for each set_max_skew constraint. If you do not specify this option, report_max_skew only reports the result pair for the single worst-case path. Use the -less_than_slack option to limit output to all paths with slack less than the specified value, up to the number specified with -npaths.

Use the -detail option to specify the desired level of report detail. The -detail summary option generates a single table listing only the highlights of each path (and is the same as -summary option, which this replaces: "-detail path_only" (default) reports the path from the source to the destination without any detail about the clock path. Instead, the clock network delay is shown as a single number. "-detail path_and_clock" extends the arrival and required paths back to the launch and latch clocks. "-detail full_path" continues tracing back through generated clocks to the underlying base clock.

The -show_routing option displays detailed routing information in the path. Lines marked "IC" without the option are shown, but only as a placeholder. The routing elements for that line are broken out.

---

continued...
individually and listed before the line.

The return value of this command is a two-element list. The first number is the number of paths found in the analysis. The second is the worst-case slack, in terms of the current default time unit.

The "RF" column in the report output uses a two-letter symbol to indicate the rise/fall transition that occurs at that point in the path.

Possible "RF" values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(empty)</td>
<td>Unknown transition</td>
</tr>
<tr>
<td>R</td>
<td>Rising output</td>
</tr>
<tr>
<td>F</td>
<td>Falling output</td>
</tr>
<tr>
<td>RR</td>
<td>Rising input, rising output</td>
</tr>
<tr>
<td>RF</td>
<td>Rising input, falling output</td>
</tr>
<tr>
<td>FR</td>
<td>Falling input, rising output</td>
</tr>
<tr>
<td>FF</td>
<td>Falling input, falling output</td>
</tr>
</tbody>
</table>

The "Type" column in the report uses a symbol to indicate what type of delay occurs at that point in the path.

Possible "Type" values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CELL</td>
<td>Cell delay</td>
</tr>
<tr>
<td>COMP</td>
<td>PLL clock network compensation delay</td>

**Description**

Report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical interface ("-panel_name"), or any combination of the three.

The `report_metastability` function can be used to estimate the robustness of asynchronous transfers in your design.

**Background**

Synchronization register chains should be used when transferring data between unrelated clock domains to greatly reduce the probability of the captured data signal becoming metastable. A synchronization register chain is a sequence of registers with the same clock, that is driven by a pin, or logic from an unrelated clock domain. The output of all but the last register in the chain must connect only to the next register, either directly or indirectly through logic.

When a register is metastable, its output hovers at a voltage between high and low for a length of time beyond the normal Tco for the register. The design can fail if subsequent registers that use this metastable signal latch different values. Therefore, it is important to properly synchronize data signals to prevent such occurrences.

**Output**

The `report_metastability` function generates a list of synchronization register chains found in the design, and can provide estimates of the Mean Time Between Failures (MTBF) of each chain. The design MTBF is an estimate of the overall robustness of the design, computed from the MTBF results from all synchronization chains with calculated MTBFs. The design MTBF metric is reported only when the design meets timing. Therefore, it is important to fully timing constrain your design.
The typical MTBF result assumes typical silicon characteristics for the selected device speed grade, with nominal operating conditions.

The worst case MTBF result uses the worst case silicon characteristics for the selected device speed grade, with worst case operating conditions.

--------

Settings
--------

To get a list of possible synchronization chains, set "Synchronizer Identification" to AUTO in the Timing Analyzer Page in the Settings dialog box. This sets the "Synchronizer Identification" QSF assignment in your QSF file. The Timing Analyzer uses timing constraints to automatically detect synchronization chains in the design. Metastability analysis checks for signal transfers between circuitry in unrelated or asynchronous clock domains, so clock domains must be related correctly with the timing constraints.

Set the maximum number of registers to consider as part of one synchronization chain, via the "Synchronization Register Chain Length" setting under Analysis and Synthesis Page in the Settings dialog box. The default length is 2. All the registers in a chain (up to this length) are protected from optimizations that can decrease MTBF.

Note that if you change the "Synchronizer Identification" setting, you should rerun the Fitter, as this setting can impact some optimization algorithms.

Use the -nchains option to limit the number of chains to report. If you do not specify this option, only the single worst-case chain is reported.

To filter the synchronizer chains by their lengths, use the -min_length option to set the minimum chain length to be reported, and use the -max_length option to set the maximum chain length to be reported. Alternatively, use the -length option to report only chains with a specific length.

-----------

Report Panels
-----------

The MTBF Summary report provides the estimated mean time between failure for the design. This is an estimate for the overall robustness of the design in terms of metastability, and it is computed from all available synchronization chain MTBFs present in the design.

The MTBF metric of automatically identified synchronization chains is not computed. To compute the MTBF of a synchronization chain, set "Synchronizer Identification" to "Forced If Asynchronous" or "Forced" for all registers of the synchronization chain. By explicitly specifying that this synchronization chain is valid, this chain will then be optimized during the Fitter, and its MTBF will be computed. Its MTBF will then be included in the computation of the design MTBF.

The Synchronizer Summary table lists all the synchronization chains found in your design. It is possible that the analysis performed might erroneously interpret certain structures, such as shift registers, as synchronization chains. If some synchronization chains are misidentified and you wish to remove them from the report, you can turn off analysis of these paths by making node-based assignments via the Assignment Editor, set "Synchronizer Identification" to "Off" for the first register in these synchronization chains. Conversely, if there are synchronization chains in your design that were not detected, you can set "Synchronizer Identification" assignment to "Forced If Asynchronous" for all registers in this chain through the Assignment Editor, and this chain will be reported if it meets the criteria for being a synchronization chain. This can often occur if there is logic present between the registers of the synchronization chain. In the automatic mode of synchronizer identification, these structures are not considered to be synchronizers. If you want to force a register to be identified as the head of a synchronizer, set the "Synchronizer Identification" assignment to "Forced" to the register, and it will always be identified as the first of a synchronization chain. This setting should not be applied to the entire design, since this identifies every register in the design as a synchronizer.

The MTBF estimates assume the data being synchronized is switching at a toggle rate of 12.5% of the source clock frequency. That is, the estimates assume that the arriving data signal switches once every 8 source clock cycles. If multiple clocks apply, the highest frequency is used. If no source clocks can be determined, then the data rate is taken as 12.5% of the synchronization clock frequency.

If you know the approximate rate at which the data changes, and would like to obtain a more accurate MTBF, use the "Synchronizer Toggle Rate" assignment in the Assignment Editor. Set the data toggle rate, in number of transitions per second, on the first register of a synchronization chain. The Timing Analyzer then takes the specified rate into account when computing the MTBF.
of that particular chain. You can also apply this assignment to an entity or the entire design. Since a "Synchronizer Toggle Rate" assignment of 0 indicates that the data signal never toggles, the affected synchronization chain will not be reported since it does not affect the reliability of the design.

Example Usage

```tcl
project_open top
create_timing_netlist
read_sdc
update_timing_netlist
report_metastability

# Reports only 10 chains that are between 2 and 4 registers long
report_metastability -min_length 2 -max_length 4 -nchains 10
delete_timing_netlist
project_close
```

<tr>
<td></td>
<td>&lt;targets&gt;</td>
</tr>
</tbody>
</table>
Reports the results of minimum pulse width and minimum period checks. A minimum pulse width check verifies that a clock high ("High") or low ("Low") pulse sustains long enough to qualify as a recognizable change in the clock signal at a register or latch clock pin. A failed minimum pulse width check indicates that the register or latch may not recognize the clock transition. Each node in the design is reported twice per clock for minimum pulse width checks: once for the high pulse and once for the low pulse. While registers and latches may have a pulse width requirement greater than zero, other nodes are checked to ensure the pulse does not collapse entirely.

A minimum period check verifies that the clock period ("Period") is large enough for the device to operate. Minimum period checks apply to registers and latches. The results of the minimum pulse width checks can be output to the Tcl console ("-stdout," the default), a report panel ("-panel"), a file ("-file"), or a combination of the three.

Results are sorted from worst-case slack to best-case slack. To limit the number of checks reported, use the "-nworst" option.

Results can be shown in summary ("-detail summary") or in detail ("-detail full_path," the default), showing the path details for the clock arrival times and how they affect the actual pulse width.

The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

### Example Usage

```tcl
project_open top
create_timing_netlist
read_sdc
update_timing_netlist
# Report the worst 100 minimum pulse width checks
report_min_pulse_width -nworst 100
# Report minimum pulse width checks for the register test_reg[*]
report_min_pulse_width test_reg[*]
# Output the previous results to a report panel and a file.
report_min_pulse_width -panel_name "Min Pulse (test_reg)" test_reg[*]
# Output the previous results to a file.
report_min_pulse_width -file min_pulse_test_reg.txt test_reg[*]
```

</tr>
<tr>
<td><code>-nworst &lt;number&gt;</code></td>
<td>Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst</td>
</tr>
</tbody>
</table>

**continued...**
-pairs_only

When set, paths with the same start and end points are considered equivalent. Only the worst case path for each unique combination is displayed.

-panel_name <name>

Sends the results to the panel and specifies the name of the new panel.

-recovery

Option to report recovery paths.

-removal

Option to report removal paths.

-rise_from <names>

Valid sources (string patterns are matched using Tcl string matching).

-rise_from_clock <names>

Valid source clocks (string patterns are matched using Tcl string matching).

-rise_through <names>

Valid through nodes (string patterns are matched using Tcl string matching).

-rise_to <names>

Valid destinations (string patterns are matched using Tcl string matching).

-rise_to_clock <names>

Valid destination clocks (string patterns are matched using Tcl string matching).

-setup

Option to report clock setup paths.

-stdout

Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.

-through <names>

Valid through nodes (string patterns are matched using Tcl string matching).

-to <names>

Valid destinations (string patterns are matched using Tcl string matching).

-to_clock <names>

Valid destination clocks (string patterns are matched using Tcl string matching).

Description

Reports the most timing-critical paths in the design, including associated slack and additional path summary information, including path bounding boxes. Additionally, for each path, shows its most timing-critical neighbor paths: the path with the worst slack that fans into the source of the current path (shown on the report as "Critical Path Before") and the path with the worst slack that fans out of the destination of the current path (shown as "Critical Path After"). Note that if a register's output is connected to its own input, one or both of the neighbor paths may be identical to the current path. When looking for neighbor paths with the worst slack, all operating conditions are considered, not just the operating conditions of the main path itself.

Use the "-setup", "-hold", "-recovery", or "-removal" options to specify which kind of analysis should be performed.

The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.

You can limit the analysis performed by this command to specific start and end points, using the "-from" and "-to" options. Use the "-rise_from" and "-fall_from" options to limit the analysis to endpoints with established high or low starting states. Use the "-rise_to" and "-fall_to" options to limit the analysis to destination points with high or low ending states.

The analysis can be further limited to clocks using the "-from_clock" and "-to_clock" options, or to specific edges of the clock using the "-rise_from_clock", "-fall_from_clock", "-rise_to_clock", and "-fall_to_clock" options.

Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Use the "rise_through" and "fall_through" options to limit the analysis to intermediate points with high or low ending states.
Use "-npaths" to limit the number of paths to report. If you do not specify this option, only the single worst-case path is provided. Use the "-less_than_slack" option to limit output to all paths with slack less than the specified value, up to the number specified by "-npaths".

Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. If this option is used, but "-npaths" is not specified, then "-npaths" defaults to the same value specified for "-nworst".

Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.

The values of the "-from", "-to", and "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for useTimingAnalyzerStyleEscaping for details.

The following options are not supported for this command:
--ccpp, --summary_view, --show_routing, --show_xtalk, --false_path
Ideally you should use -panel_name or -file option to get the best view of the report.

Here is description of each of the rows displayed for each path:
From: Source node in the path
To: Destination node in the path
Launch Clock: Source node clock
Latch Clock: Destination node clock
Relationship: Clock relationship
Slack: Slack on the path
Complement Analysis Slack: Slack of the same path via complement analysis
Number of Paths: Number of paths with the same source and destination nodes
Clock Skew: Clock Skew on the path
Data Delay: Data delay on the path (~ cell delay + interconnect delay + misc. delay)
uTCO Delay: input delay
Cell Delay: Cell delay
Interconnect Delay: Wire Delay
Misc. Delay: Other kinds of delay
Uncertainty Delay: Clock uncertainty delay
dTSU Delay: Data stability delay - setup
dTH Delay: Data stability delay - hold
Logic Levels: Logic levels in the path
Max Fanout: Maximum fanout for any node on the path
I/O Crossings: Number of I/O crossings in the path
Number of wires: number of wires encountered on the path
Source/Destination Bounding Box: Co-ordinates covered by source destination blocks
Cell Bounding Box: Co-ordinates covered by cell blocks
Interconnect Bounding Box: Co-ordinates covered by wires
Source/Destination Relative Area: Normalized to 1.0
Cell Relative Area: Ratio of cell area against src/dst bounding area
Interconnect Relative Area: Ratio of wire area against src/dst bounding area
Elements on Path: Displays the element type that makeup that path
TDB Names Along Path: All the TDB elements that make up the path (only available with developer license)
Corner: Describes the corner the path is found in
Complement Analysis Corner: Corner of the complement analysis path found

Example Usage

```
project_open my_project
# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
report_neighbor_paths -npaths 10 -file "neighbor_path_analysis.txt"
# The following command is optional
delete_timing_netlist
project_close
```

<table>

<td>-panel_name &lt;name&gt;</td>
</tr>
<tr>
<td></td>
<td>-split_by_corner</td>
</tr>
<tr>
<td></td>
<td>-stdout</td>
</tr>
</tbody>
</table>

**Description**

Reports net delay analysis results based on `set_net_delay` commands. Each `set_net_delay` command is treated as a separate analysis and `report_net_delay` reports the results of all `set_net_delay` commands in a single report.

The report contains each `set_net_delay` command with the worst case slack result followed by the results of each edge matching the criteria set by that `set_net_delay` command. These results are ordered based on the slack value.

Use `-nworst` option to limit the number of lines reported for a `set_net_delay` command.

**Example Usage**

```tcl
project_open my_project
create_timing_netlist
read_sdc
update_timing_netlist
set_net_delay -min 0.160 -from [get_pins inst9|combout] -to [get_pins *|dataf]
set_net_delay -max 0.500 -from inst8|combout
report_net_delay -panel "Net Delay"
```

</tr>
<tr>
<td></td>
<td>-stdout</td>
</tr>
<tr>
<td>&lt;name&gt;</td>
<td>Signal or collection name</td>
</tr>
</tbody>
</table>

Description

Reports delay and fanout information about a net in the design. A net corresponds to a cell output pin.

Report can be directed to the Tcl console ("stdout", default), a file ("-file"), the Timing Analyzer graphical interface ("-panel_name"), or any combination of the three.

The value of the name is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

Example Usage

```
project_open <design>
create_timing_netlist
# Show delay and fanout information for all nets
# that match "abc*"
report_net_timing [get_nets abc*]
# Report delay and fanout information for the 10 nets showing higher delays
report_net_timing -nworst_delay 10
# Report delay and fanout information for the 10 nets showing higher fanout
report_net_timing -nworst_fanout 10
project_close
```

continued...

</tr>
<tr>
<td></td>
<td>-stdout</td>
</tr>
<tr>
<td></td>
<td>-to_clock &lt;names&gt;</td>
</tr>
</tbody>
</table>

**Description**

Reports timing information related to design partitions.

The report_partitions command analyzes the worst 1000 failing setup paths in the design by default, but you can optionally set the nworst option to increase or decrease this number. The from_clock and to_clock arguments can be used to control how this function finds the paths to be analyzed.

This function reports the number of failing paths within each partition and the worst-case slack of the paths that are entirely contained within a single partition in a Partition Timing Overview table.

The function also creates a Partition Timing Details table that lists the number of failing paths and worst-case slack of paths that feed from one partition to another partition. This information provides more details on where the critical paths in the design are with respect to design partitions.

The function also creates a Partition Timing Breakdown table. This table bins the worst failing paths by all partitions that the path spans, and reports the...
number of failing paths and worst case slack for each group of partitions.

This report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.

Example Usage

project_open my_project
create_timing_netlist
read_sdc
update_timing_netlist

# Report a maximum of 500 failing paths between partitions to the
# Timing Analyzer graphical interface and to the Tcl console.
report_partitions -panel_name "Partition Timing Report" -nworst 500 -stdout

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Design partitions are not supported in this project.</td>
</tr>
</tbody>
</table>

3.1.37.64. report_path (::quartus::sta)

The following table displays information for the `report_path` Tcl command:

Tcl Package and Version | Belongs to `::quartus::sta` on page 615

Syntax

Arguments

- `h | -help`: Short help
- `long_help`: Long help with examples and possible return values
- `append`: If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
- `fall_from <names>`: Valid sources (string patterns are matched using Tcl string matching)
- `fall_through <names>`: Valid through nodes (string patterns are matched using Tcl string matching)
- `fall_to <names>`: Valid destinations (string patterns are matched using Tcl string matching)
- `file <name>`: Sends the results to an ASCII or HTML file. Depending on the extension
- `from <names>`: Valid sources (string patterns are matched using Tcl string matching)
- `list_clocks`: Includes the driving clocks associated with the from and to nodes of each path in the Path Summary table
- `logic_depth`: Option to display the logic depth instead of path delay
- `min_path`: Find the minimum delay path(s)
### TCL Commands and Packages

<td>Valid destinations (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>

### Description

Reports the longest delay paths and the corresponding delay value.

The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.

You can limit the analysis performed by this command to specific start and end points, using the "-from" and "-to" options. Any node or cell in the design is considered a valid endpoint. Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Paths that are reported can not start before or go beyond a keeper node (register or port); this restriction considers register pins as combinational nodes in the design.

Use "-npaths" to limit the number of paths to report. If this option is not specified, only the single longest delay path is provided.

Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. If this option is used, but "-npaths" is not specified, then "-npaths" defaults to the same value specified for "-nworst".

Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.

Use the "-summary" option to generate a single table listing only the highlights of each path.

---

**continued...**
The "-min_path" option finds the minimum delay path(s) rather than the maximum delay paths which is the default behavior.

The "-show_routing" option displays detailed routing information in the path. Lines that were marked as "IC" without the option are still shown, but only as a placeholder. The routing elements for that line are broken out individually and listed before the line.

The return value of this command is a two-element list. The first number is the number of paths found in the analysis. The second is the longest delay, in terms of the current default time unit.

The values of the "-from", "-to", "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

Example Usage

```tcl
project_open my_project

# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist

# Report path delay between nodes "foo" and "bar", reporting the longest delay if a path is found.
set my_list [report_path -from foo -to bar]
set num_paths [lindex $my_list 0]
set longest_delay [lindex $my_list 1]
if { $num_paths > 0 } {
    puts "Longest delay -from foo -to bar is $longest_delay"
}

# The following command is optional
delete_timing_netlist

project_close
```

### Return Value

### report_pipelineing_info (::quartus::sta)

The following table displays information for the report_pipelineing_info Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**continued...**
If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.

- **bus_name** `<names>`
  - When set, pipelining report gives detailed information on the specific bus.

- **file** `<name>`
  - Sends the results to an ASCII or HTML file. Depending on the extension.

- **max_rows** `<number>`
  - Specifies the maximum number of rows to report.

- **min_depth** `<number>`
  - Specifies the minimum average bus depth.

- **min_width** `<number>`
  - Specifies the minimum bus width.

- **panel_name** `<name>`
  - Sends the results to the panel and specifies the name of the new panel.

- **stdout**
  - Sends output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.

### Description

This command reports back-to-back pipelining registers information and collapses pipelining chains based on which bus they are in.

Use the "-min_depth" option to specify the minimum average depths of pipelining buses to report. The default value for this field is "3".

Use the "-min_width" option to specify the minimum width of pipelining buses to report. The default value for this field is "16".

By default, the command reports all of the pipelining buses with average depth and width over the value specified by "-min_depth" and "-min_width" options. To help check one pipelining bus in detail, this command also provides detailed mode. Use the "bus_name" to specify which bus to focus.

### Example Usage

This command currently contains no example usage.

### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
</tbody>
</table>

### 3.1.37.66. report_register_spread (::quartus::sta)

The following table displays information for the `report_register_spread` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
</table>

#### Syntax

```
```

#### Arguments

- **-h | -help**
  - Short help

- **-long_help**
  - Long help with examples and possible return values

- **-append**
  - If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.

- **-file <name>**
  - Sends the results to an ASCII or HTML file. Depending on the extension.

- **-from_clock <names>**
  - Valid source clocks (string patterns are matched using Tcl string matching)
This report analyzes the final placement of a design and strive to identify registers with sinks that are pulling them in various directions. These registers are then recommended as candidates for duplication. There are two types of sink: "Immediate Fan-Out" and "Timing Path Endpoint". There are two types of pull: "Tension" and "Span".

The report can be directed to the Tcl console ("stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.

Use "-sink_type" to specify between endpoints and immediate fanouts to report on. If not specified, the default reports on endpoint fanouts.

Timing Path Endpoints: the nodes (usually registers) that terminate timing paths from a register.
Immediate Fanouts: the immediately connected nodes (lookup tables, other registers, RAM or DSP blocks, etc.) of the register.

Use "-spread_type" to specify the type of spread to report on, a user can choose between:
- Tension: the sum over each sink of the distance from it to the centroid of all the sinks.
- Span: the maximum 1-dimensional delta between the left/bottom-most sink and the right/top-most sink.
- Area: the area covered by a box drawn around the left/bottom-most sink and the right/top-most sink.
- Angle: the angular span of the sinks around to the source, defined as 360 minus the largest angle between any two angularly-adjacent sinks that are each a sufficiently large distance from the source.
- Count: the number of each sink type associated with the source register.

The analysis can be limited to clocks using the "-from_clock" and "-to_clock" options.

Use "-min_sinks" to filter out any registers with a number of sinks below the threshold. Span, Area, and Angle have a low sensitivity to sink count, which can result in registers with a small sink count having a larger spread score than other registers with more sinks. The minimum number of sinks must be at least 2 for the spread calculations to work properly.

Use "-num_registers" to limit the number source registers reported. Registers are reported in decreasing order of the spread type selected so the top n registers are reported. If you do not specify this option, the number of source registers displayed is limited to a maximum of 10.

**Example Usage**

```bash
project_open my_project
# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist
report_register_spread -num_registers 20 -spread_type "tension" -sink_type "endpoint"
project_close
```

continued...
3. TCL Commands and Packages

### 3.1.37.67. report_register_statistics (::quartus::sta)

The following table displays information for the `report_register_statistics` Tcl command:

<table>

Description

Reports RSKM for dedicated LVDS circuitry.

In designs that use dedicated LVDS circuitry, receiver input skew margin (RSKM) is the time margin available before the LVDS receiver megafunction fails to operate. RSKM is defined as the total time margin that remains after subtracting the sampling window (SW) size and the receiver channel-to-channel skew (RCCS) from the time unit interval (TUI), as expressed in the following formula:

\[ \text{RSKM} = (\text{TUI} - \text{SW} - \text{RCCS}) / 2 \]

The time unit interval is the LVDS clock period (1/fmax). The sampling window is the period of time that the input data must be stable to ensure that the data is successfully sampled by the LVDS receiver megafunction. The sampling window size varies by device speed grade. RCCS is the difference between the fastest and slowest data output transitions, including the tco variation and clock skew. To obtain an accurate analysis of an LVDS circuit, you should assign an appropriate input delay to the LVDS receiver megafunction. RCCS is equal to the difference between maximum input delay and minimum input delay. If no input delay is set, RCCS defaults to zero.

Example Usage

```tcl
project_open top
create_timing_netlist
read_sdc
update_timing_netlist
# Ensure a tccs of 1ns
set_input_delay -max -clock lvds_clk 2ns [get_ports lvds_input]
set_input_delay -min -clock lvds_clk 1ns [get_ports lvds_input]
# Show lvds information
report_rskm
```

</tr>
<tr>
<td>-to_clock &lt;names&gt;</td>
<td>Valid destination clocks (string patterns are matched using Tcl string matching)</td>
</tr>
</tbody>
</table>
This report performs skew analysis on selected paths. As opposed to report generated by `report_max_skew` command, this command does not depend on the existence of `set_max_skew` assignments. This report computes skew with respect to the latest and the earliest arrival of each selected path.

By default, "Skew for the Latest Arrival" is computed by comparing the latest arrival of each path with the earliest arrival of the path that has the smallest value for early arrival of all other paths included in the constraint. Similarly, "Skew for the Earliest Arrival" is computed by comparing the earliest arrival of each path with the latest arrival of the path that has the largest value for late arrival of all other paths included in the constraint. No path is compared with itself.

Use the -stdout option to direct the report to the Tcl console (default), the -file option to write the report to a file or the -panel_name option to direct the report to the Timing Analyzer graphical user interface. You can use these options in any combination.

Report skew includes data arrival times, clock arrival times, register micro parameters, clock uncertainty, on-die variation and ccpp removal.

Use the -npaths option to limit the number of path result pairs reported for each set_max_skew constraint. If you do not specify this option, `report_skew` only reports the result pair for the single worst-case path. Use the -less_than_slack option to limit output to all paths with skew greater than the specified value, up to the number specified with -npaths.

Use the -detail option to specify the desired level of report detail. "-detail path_only" (default) reports the path from the source to the destination without any detail about the clock path. Instead, the clock network delay is shown as a single number. "-detail path_and_clock" extends the arrival and required paths back to the launch and latch clocks. "-detail full_path" continues tracing back through generated clocks to the underlying base clock. The "-detail summary" option is deprecated.

The -show_routing option displays detailed routing information in the path. Lines marked "IC" without the option are shown, but only as a placeholder. The routing elements for that line are broken out individually and listed before the line.

The return value of this command is a two-element list. The first number is the number of paths found in the analysis. The second is the worst-case skew, in terms of the current default time unit.

The "RF" column in the report output uses a two-letter symbol to indicate the rise/fall transition that occurs at that point in the path.

Possible "RF" values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(empty)</td>
<td>Unknown transition</td>
</tr>
<tr>
<td>R</td>
<td>Rising output</td>
</tr>
<tr>
<td>F</td>
<td>Falling output</td>
</tr>
<tr>
<td>RR</td>
<td>Rising input, rising output</td>
</tr>
<tr>
<td>RF</td>
<td>Rising input, falling output</td>
</tr>
<tr>
<td>FR</td>
<td>Falling input, rising output</td>
</tr>
<tr>
<td>FF</td>
<td>Falling input, falling output</td>
</tr>
</tbody>
</table>

The "Type" column in the report uses a symbol to indicate what type of delay occurs at that point in the path.

Possible "Type" values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CELL</td>
<td>Cell delay</td>
</tr>
<tr>
<td>COMP</td>
<td>PLL clock network compensation delay</td>
</tr>
<tr>
<td>IC</td>
<td>Interconnect delay</td>
</tr>
</tbody>
</table>

continued...
### iExt
External input delay

### LOOP
Lumped combinational loop delay

### oExt
External output delay

### RE
Routing element (only for paths generated with the -show_routing option)

### uTco
Register micro-Tco time

### uTsu
Register micro-Tsu time

### uTh
Register micro-Th time

#### Example Usage

```
project_open my_project
create_timing_netlist
read_sdc:
update_timing_netlist

# show worst 10 paths for each earliest and latest arrival results
report_skew -from [get_ports input[*]] -to [get_registers *] -panel_name "Report Skew" -npaths 10 -greater_than_skew 0.100 -detail full_path

delete_timing_netlist
project_close
```

#### Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Report database is not open</td>
</tr>
</tbody>
</table>

### 3.1.37.73. report_tccs (::quartus::sta)

The following table displays information for the `report_tccs` Tcl command:

#### Tcl Package and Version

Belongs to `::quartus::sta` on page 615

#### Syntax

```
```

#### Arguments

- `-h`, `-help`
  Short help

- `-long_help`
  Long help with examples and possible return values

- `-append`
  If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.

- `-file <name>`
  Sends the results to an ASCII or HTML file. Depending on the extension

- `-panel_name <name>`
  Sends the results to the panel and specifies the name of the new panel

- `-stdout`
  Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.

#### Description

Reports TCCS for dedicated LVDS transmitters.

In designs that implement the LVDS I/O standard, transmitter channel-to-channel skew (TCCS) is the timing difference between the fastest and slowest output transitions, including tco variations and clock skew.

#### Example Usage

```
project_open top
create_timing_netlist
read_sdc:
update_timing_netlist
```

to <names> Valid destinations (string patterns are matched using Tcl string matching)

to_clock <names> Valid destination clocks (string patterns are matched using Tcl string matching)

**Description**

Reports the worst-case paths and associated slack.

Use the "-setup", "-hold", "-recovery", or "-removal" options to specify which kind of analysis should be performed.

The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.

You can limit the analysis performed by this command to specific start and end points, using the "-from" and "-to" options. Use the "-rise_from" and "-fall_from" options to limit the analysis to endpoints with established high or low starting states. Use the "-rise_to" and "-fall_to" options to limit the analysis to destination points with high or low ending states.

The analysis can be further limited to clocks using the "-from_clock" and "-to_clock" options, or to specific edges of the clock using the "-rise_from_clock", "-fall_from_clock", "-rise_to_clock", and "-fall_to_clock" options.

Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Use the "-rise_through" and "-fall_through" options to limit the analysis to intermediate points with high or low ending states.

Use "-npaths" to limit the number of paths to report. If you do not specify this option, only the single worst-case path is provided. Use the "-less_than_slack" option to limit output to all paths with slack less than the specified value, up to the number specified by "-npaths".

Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. If this option is used, but "-npaths" is not specified, then "-npaths" defaults to the same value specified for "-nworst".

Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.

Use the "-detail" option to specify the desired level of report detail. "-summary" generates a single table listing only the highlights of each path (and is the same as "-summary" option, which this replaces). "-path_only" reports the path from the source to the destination without any detail about the clock path. Instead, the clock network delay is shown as a single number. This is the default behavior. "-path_and_clock" extends the arrival and required paths back to the launch and latch clocks. "-full_path" continues tracing back through generated clocks to the underlying base clock.

The "-show_routing" option displays detailed routing information in the path. Lines that were marked as "IC" without the option are still shown, but only as a placeholder. The routing elements for that line are broken out individually and listed before the line.

The "-false_path" option reports only those paths that are normally hidden by false_path assignments or clock to clock cuts. Like the default report, this option only reports constrained paths.

The "-data_delay" option reports only those paths that are constrained by set_data_delay. Without this option, such paths are excluded from the report.

The return value of this command is a two-element list. The first number is the number of paths found in the analysis. The second is the worst-case slack, in terms of the current default time unit.

The "RF" column in the report output uses a two-letter symbol to indicate the rise/fall transition that occurs at that point in the path.

**Possible "RF" values are:**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(empty)</td>
<td>Unknown transition</td>
</tr>
<tr>
<td>R</td>
<td>Rising output</td>
</tr>
<tr>
<td>F</td>
<td>Falling output</td>
</tr>
<tr>
<td>RR</td>
<td>Rising input, rising output</td>
</tr>
</tbody>
</table>
RF  Rising input, falling output
FR  Falling input, rising output
FF  Falling input, falling output

The "Type" column in the report uses a symbol to indicate what type
of delay occurs at that point in the path.

Possible "Type" values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CELL</td>
<td>Cell delay</td>
</tr>
<tr>
<td>COMP</td>
<td>PLL clock network compensation delay</td>
</tr>
<tr>
<td>IC</td>
<td>Interconnect delay</td>
</tr>
<tr>
<td>IExt</td>
<td>External input delay</td>
</tr>
<tr>
<td>LOOP</td>
<td>Lumped combinational loop delay</td>
</tr>
<tr>
<td>OExt</td>
<td>External output delay</td>
</tr>
</tbody>
</table>
| RE    | Routing element (only for paths generated with the
|       | -show_routing option) |
| uTco  | Register micro-Tco time |
| uTsu  | Register micro-Tsu time |
| uTh   | Register micro-Th time |

The values of the "-from", "-to", and "-through" options are either
collections or a Tcl list of wildcards used to create collections
of appropriate types. The values used must follow standard Tcl or
Timing Analyzer-extension substitution rules. See the help for
use_timing_analyzer_style_escaping for details.

Example Usage

```tcl
project_open my_project

# Always create the netlist first
create_timing_netlist
read_sdc my_project.sdc
update_timing_netlist

# Run a setup analysis between nodes "foo" and "bar",#
# reporting the worst-case slack if a path is found.
set my_list [report_timing -from foo -to bar]
set num_paths [lindex $my_list 0]
set wc_slack [lindex $my_list 1]
if { $num_paths > 0 } {
    puts "Worst case slack -from foo -to bar is $wc_slack"
}

# The following command is optional
delete_timing_netlist
project_close
```

Return Value

</tbody>
</table>

### Description

The command groups the most timing critical paths to identify the most timing critical entities and source files. Use the "-setup", "-hold", "-recovery", or "-removal" options to specify which kind of analysis should be performed.

The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.

You can limit the analysis performed by this command to specific start and end points, using the "-from" and "-to" options. Use the "-rise_from" and "-fall_from" options to limit the analysis to endpoints with established high or low starting states. Use the "-rise_to" and "-fall_to" options to limit the analysis to destination points with high or low ending states.

The analysis can be further limited to clocks using the "-from_clock" and "-to_clock" options, or to specific edges of the clock using the "-rise_from_clock", "-fall_from_clock", "-rise_to_clock", and "-fall_to_clock" options.

Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Use the "-rise_through" and "-fall_through" options to limit the analysis to intermediate points with high or low ending states.

Use "-npaths" to limit the number of paths to report. If you do not specify this option, 1000 worst-case paths are provided. Use the "-less_than_slack" option to limit output to all paths with slack...
less than the specified value, up to the number specified by "-npaths".

Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. If this option is used, but "-npaths" is not specified, then "-npaths" defaults to the same value specified for "-nworst".

Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.

The "-false_path" option reports only those paths that are normally hidden by false_path assignments or clock to clock cuts. Like the default report, this option only reports constrained paths.

The values of the "-from", "-to", and "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

The return value of this command is a three-element list. The first number is the number of paths found in the analysis. The second is the worst-case slack, in terms of the current default time unit. The third is the total negative slack across all paths found in the analysis.

Example Usage

```
set my_list [report_timing_by_source_files -setup -npaths 1000 -panel_name {Report Timing by Source Files}]
set num_paths [lindex $my_list 0]
set wc_slack [lindex $my_list 1]
set tns [lindex $my_list 2]
if { $num_paths > 0 } {
    puts "Analyzed $num_paths paths against their source file(s)."
    puts "Worst-case slack found is $wc_slack."
    puts "Total Negative Slack found is $tns."
}
```

### 3.1.37.76. report_timing_tree (::quartus::sta)

The following table displays information for the `report_timing_tree` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to <code>::quartus::sta</code> on page 615</th>
</tr>
</thead>
</table>

**Syntax**

```

**Arguments**

- `-h | -help`
  - Short help
- `-long_help`
  - Long help with examples and possible return values
- `-asynch_clock`
  - Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups
- `-fall_from <names>`
  - Valid sources (string patterns are matched using Tcl string matching)
- `-fall_from_clock <names>`
  - Valid source clocks (string patterns are matched using Tcl string matching)
-fall_through <names> | Valid through nodes (string patterns are matched using Tcl string matching)
-fall_to <names> | Valid destinations (string patterns are matched using Tcl string matching)
-fall_to_clock <names> | Valid destination clocks (string patterns are matched using Tcl string matching)
-from <names> | Valid sources (string patterns are matched using Tcl string matching)
-from_clock <names> | Valid source clocks (string patterns are matched using Tcl string matching)
-hold | Option to report clock hold paths
-inter_clock | Only report paths whose launch and latch clock are different
-intra_clock | Only report paths whose launch and latch clock are the same
-less_than_slack <slack limit> | Limit the paths reported to those with slack values less than the specified limit.
-npaths <number> | Specifies the number of paths to report (default=1, or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported but be wary that this may be slow)
-nworst <number> | Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst
-pairs_only | When set, paths with the same start and end points are considered equivalent. Only the worst case path for each unique combination is displayed.
-panel_name <name> | Report panel_name
-recovery | Option to report recovery paths
-removal | Option to report removal paths
-rise_from <names> | Valid sources (string patterns are matched using Tcl string matching)
-rise_from_clock <names> | Valid source clocks (string patterns are matched using Tcl string matching)
-rise_through <names> | Valid through nodes (string patterns are matched using Tcl string matching)
-rise_to <names> | Valid destinations (string patterns are matched using Tcl string matching)
-rise_to_clock <names> | Valid destination clocks (string patterns are matched using Tcl string matching)
-setup | Option to report clock setup paths
-through <names> | Valid through nodes (string patterns are matched using Tcl string matching)
-to <names> | Valid destinations (string patterns are matched using Tcl string matching)
-to_clock <names> | Valid destination clocks (string patterns are matched using Tcl string matching)
Description

Reports the worst-case paths and associated slack grouped by design entity. Each entity level indicates the worst-case slack and number of paths at that level.

Use the "-setup", "-hold", "-recovery", or "-removal" options to specify which kind of analysis should be performed.

Use the "-panel_name" option to direct the report to the Timing Analyzer graphical user interface.

You can limit the analysis performed by this command to specific start and end points, using the "-from" and "-to" options. Use the "-rise_from" and "fall_from" options to limit the analysis to endpoints with established high or low starting states. Use the "rise_to" and "fall_to" options to limit the analysis to destination points with high or low ending states.

The analysis can be further limited to clocks using the "-from_clock" and "-to_clock" options, or to specific edges of the clock using the "-rise_from_clock", "-fall_from_clock", "-rise_to_clock", and "-fall_to_clock" options.

Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Use the "rise_through" and "fall_through" options to limit the analysis to intermediate points with high or low ending states.

Use "-npaths" to limit the number of paths to report. If you do not specify this option, only the single worst-case path is provided. Use the "-less_than_slack" option to limit output to all paths with slack less than the specified value, up to the number specified by "-npaths".

Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. Use the "-pairwise" option to filter the output further, restricting the results to only unique combinations of start and end points.

The values of the "-from", "-to", and "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.

Example Usage

This command currently contains no example usage.

continued...
-panel_name <name> Sends the results to the panel and specifies the name of the new panel
-stdout Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
-summary Generate everything except for the detailed paths panels.

**Description**
Reports unconstrained paths.

**Example Usage**
- `project_open chiptrip`
- `create_timing_netlist`
- `read_sdc`
- `update_timing_netlist`
- `report_ucp`
- `delete_timing_netlist`
- `project_close`

**Return Value**

</table>

### 3.1.37.78. set_operating_conditions (::quartus::sta)

The following table displays information for the `set_operating_conditions` Tcl command:

**Tcl Package and Version**
Belongs to ::quartus::sta on page 615

**Syntax**
```
set_operating_conditions [-h | -help] [-long_help] [-force_dat] [-grade <c|m|e|a>] [-model <fast|slow>] [-speed <speed>] [-temperature <value_in_C>] [-voltage <value_in_mV>] [<list_of_operating_conditions>]
```

**Arguments**
- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-force_dat` Option to force delay annotation (only done when selecting an unanalyzed corner)
- `-grade <c|m|e|a>` Option to specify temperature grade
- `-model <fast|slow>` Option to specify timing model
- `-speed <speed>` Speed grade
- `-temperature <value_in_C>` Operating temperature
- `-voltage <value_in_mV>` Operating voltage
- `<list_of_operating_conditions>` list or collection of Operating conditions Tcl objects or names

**Description**
Use this command to specify operating conditions different from the initial conditions used to create the timing netlist. When a timing model is not specified, the slow model is used.

Voltage and temperature options must be used together. These two options are not available for all devices. The `get_available_operating_conditions` command returns the list of available operating conditions for your device.

Use the `-speed` option to analyze the design at a different speed grade of the selected device.

Use the `--temperature` option to analyze the design at a different temperature grade. This option is provided to support what-if analysis and is not continued...
**Example Usage**

```tcl
# do report timing for different operating conditions one by one
foreach_in_collection op [get_available_operating_conditions] {
    set_operating_conditions $op
    update_timing_netlist
    report_timing
}

# set aggregated report timing for all operating conditions when corner aggregation is enabled
set_operating_conditions [get_available_operating_conditions]
report_timing

# manually set operating conditions
set_operating_conditions -model fast -temperature 85 -voltage 1200
update_timing_netlist

# change device speed grade and set operating conditions
set_operating_conditions -speed 3 -model slow -temperature 0 -voltage 1100
update_timing_netlist
```

## Return Value

<tr>
<td></td>
<td>-loop_aware_dynamic_borrow</td>
</tr>
<tr>
<td></td>
<td>-no_borrow</td>
</tr>
<tr>
<td></td>
<td>-recompute_borrow</td>
</tr>
</tbody>
</table>

**Description**

Updates and applies SDC commands to the timing netlist. The update_timing_netlist command expands and validates generated clocks, warns about sources in the design that require clock settings, identifies and removes combinational loops, and warns about undefined input/output delays.

Most Tcl commands (e.g., report_timing) automatically update the timing netlist when necessary. You can use the update_timing_netlist command explicitly to control when updating occurs, or to force a full update using the -full option.

The update_timing_netlist command can also be used to control time borrowing behavior. Time borrowing is a technique whereby certain flip-flops in certain device families are allowed to have signals that arrive late (thus improving upstream slack), at the expense of downstream slack. The amount of time borrowing allowed at each flip-flop is hardware-dependent.

By default, optimal time borrowing values are computed at the end of the Fitter (Finalize) stage (if enabled by your compilation settings), and these are the values you will see in the timing reports. To turn off time borrowing support, use the -no_borrow option. This is not recommended, as it may result in significantly pessimistic timing results.

If you have changed clock constraints after compiling your design, pre-computed optimal time borrowing values may no longer be valid. Time borrowing is turned off for the changed clocks, resulting in pessimistic timing. To get optimal results once again, run update_timing_netlist with the -recompute_borrow option. This may take significant time on large designs, but the results are saved and available the next time you run update_timing_netlist without any time borrowing options.

The time borrowing optimization algorithm has a few limitations – for example, it never borrows any time on sources of cross-clock transfers, sources of paths with set_max_delay or set_max_skew constraints, or in any clock domain containing at least one level-sensitive latch. If your design is correctly constrained, you may overcome these limitations and get better timing results with the -dynamic_borrow option, which calculates time borrowing amounts based on your actual clock constraints (rather than optimizing for highest FMax within...
each clock domain). Note that -dynamic_borrowing is not recommended for overconstrained designs.

Using the -dynamic_borrow option may result in excessive time borrowing in sequential loops of level-sensitive latches, potentially leading to worse downstream slack. If your design contains such loops and you encounter this behavior, use the -loop_aware_dynamic_borrow option to detect sequential latch loops when evaluating their borrow amounts. Note that enabling this loop-detection feature may result in increased memory consumption and significantly increased runtime for large designs.

Example Usage

```
project_open top
create_timing_netlist
read_sdc
update_timing_netlist
report_timing -to_clock clk1
report_timing -to_clock clk2
delete_timing_netlist
project_close
```

Return Value

<td>ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.</td>
</tr>
</tbody>
</table>

### 3.37.81. use_timing_analyzer_style_escaping (::quartus::sta)

The following table displays information for the `use_timing_analyzer_style_escaping` Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
</table>

**Syntax**

`use_timing_analyzer_style_escaping [-h | -help] [-long_help] [-off] [-on]`

**Arguments**

- `-h | -help` Short help
- `-long_help` Long help with examples and possible return values
- `-off` Disable this setting.
- `-on` Enable this setting.

**Description**

Use Timing Analyzer-style escaping. (Timing Analyzer-style escaping is enabled by default.

The values used to create a collection, whether explicitly using a collection command or implicitly as a value specified as a "-from", "-to", or similar option to various SDC and report commands, are a Tcl list of wildcards. This includes a single name with an exact match.

The value must follow standard Tcl substitution rules for Tcl lists and "string match" as described below, unless using Timing Analyzer-style escaping (default).

For special characters such as '$', the character must be escaped using a single `'\`' character to prevent Tcl from interpreting the word after '$' as a Tcl variable, such as: Clk\$Signal.

A `'\`' character itself must be escaped with another `'\`' character in the '$' case, must be escaped again for the Tcl list, and must be escaped yet again for Tcl "string match." The final result is eight `'\`' characters, such as: Clk\\\\\\\\\$Signal.

Using Tcl "list" eliminates one level of escaping, since it escapes any `'\`' characters automatically for the Tcl list, such as: [list Clk\\\$Signal].

Using '{' and '}' characters also eliminates the need for one or two levels of escaping, since '{' and '}' prevent string substitution in the contents, such as: [list (Clk\Signal)]

...continued...
The use_timing_analyzer_style_escaping option, which is on by default, allows the user to specify a name containing \ characters with only two \ characters in all cases, such as: Clk\Signal. The extra \ characters required for Tcl list string substitution and "string match" are added automatically by the Timing Analyzer.

To disable Timing Analyzer style string escaping, call "use_timing_analyzer_style_escaping -off" before adding any timing constraints or exceptions.

Example Usage

```tcl
project_open top
use_timing_analyzer_style_escaping -on
create_timing_netlist
set res [get_cells my_test|special_\reg]
query_collection $res -all
delete_timing_netlist
project_close
```

Return Value

<table>
<thead>
<tr>
<th>Code Name</th>
<th>Code</th>
<th>String Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_OK</td>
<td>0</td>
<td>INFO: Operation successful</td>
</tr>
<tr>
<td>TCL_ERROR</td>
<td>1</td>
<td>ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.</td>
</tr>
</tbody>
</table>

3.1.37.82. write_sdc (::quartus::sta)

The following table displays information for the write_sdc Tcl command:

<table>
<thead>
<tr>
<th>Tcl Package and Version</th>
<th>Belongs to ::quartus::sta on page 615</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>-h</td>
</tr>
<tr>
<td></td>
<td>-long_help</td>
</tr>
<tr>
<td></td>
<td>-expand</td>
</tr>
<tr>
<td></td>
<td>-history</td>
</tr>
<tr>
<td></td>
<td>-valid_exceptions</td>
</tr>
<tr>
<td></td>
<td>&lt;file_name&gt;</td>
</tr>
</tbody>
</table>

Description

Generates an SDC file with all current constraints and exceptions. When you use the -expand option, derive_clocks, derive_pll_clocks, derive_lvds_clocks and derive_clock_uncertainty macros are be expanded to corresponding sdc assignments before they are written to a file. If you do not use the -expand option, these macros are preserved.

Use the -valid_exceptions option to generate an SDC file that contains only valid timing exceptions. Run the report_exceptions command with the -valid option to see all the valid timing exceptions in your design.

Example Usage

```tcl
project_new test
create_timing_netlist
create_clock -period 10 -name clk10 clk
set_multicycle_path -from [get_cells a] -to [get_cells b]
update_timing_netlist
report_timing
write_sdc my_sdc_file.sdc
```
### Return Value

<tr>
<td></td>
<td><code>[-trigger &lt;trigger&gt;]</code></td>
</tr>
</tbody>
</table>

**Description**

Exports the specified data log from the current open session into another file in different format. If a data log is not explicitly specified, the last active one is used.

The supported file formats are Comma Separated Value file (.csv), Value Change Dump file (.vcd), and Table file (.tbl).

**Example Usage**

```tcl
#opens signaltap session
open_session -name stp1.stp

#capture data to log named log1, timeout after 5 seconds if no trigger occurs
if { [catch [run -instance auto_signaltap_0 -signal_set signal_set_1 -trigger trigger_1 -data_log log1 |-timeout 5] err_msg] { # Timeout event is thrown as TCL exception puts "ERROR: $err_msg" } }

#export data into a VCD file
export_data_log -instance auto_signaltap_0 -signal_set signal_set_1 -trigger trigger_1 -data_log log1 |-filename log1.vcd -format vcd

#close signaltap session
close_session
```

<td>`-h</td>
</tr>
<tr>
<td></td>
<td><code>-long_help</code></td>
</tr>
<tr>
<td></td>
<td><code>-name &lt;.stp file name&gt;</code></td>
</tr>
</tbody>
</table>

**Description**

Opens a session from the specified Signal Tap File (.stp).

**Example Usage**

```tcl
# opens a session from the specified Signal Tap File (.stp).
open_session -name stp1.stp

# capture data to log named log1, timeout after 5 seconds if no trigger occurs
if { [catch {run -instance auto_signaltap_0 -signal_set signal_set_1 -trigger trigger_1 -data_log log_1 -timeout 5} err_msg] { # Timeout event is thrown as TCL exception   puts "ERROR: $err_msg"   } }

# close signal tap session
close_session
```

For the latest and previous versions of this user guide, refer to *Quartus Prime Pro Edition User Guide: Scripting*. If a software version is not listed, the guide for the previous software version applies.
A. Quartus Prime Pro Edition User Guides

Refer to the following user guides for comprehensive information on all phases of the Quartus Prime Pro Edition FPGA design flow.

Related Information

- **Quartus Prime Pro Edition User Guide: Getting Started**
  Introduces the basic features, files, and design flow of the Quartus Prime Pro Edition software, including managing Quartus Prime Pro Edition projects and IP, initial design planning considerations, and project migration from previous software versions.

  Describes creating and optimizing systems using Platform Designer, a system integration tool that simplifies integrating customized IP cores in your project. Platform Designer automatically generates interconnect logic to connect intellectual property (IP) functions and subsystems.

  Describes best design practices for designing FPGAs with the Quartus Prime Pro Edition software. HDL coding styles and synchronous design practices can significantly impact design performance. Following recommended HDL coding styles ensures that Quartus Prime Pro Edition synthesis optimally implements your design in hardware.

- **Quartus Prime Pro Edition User Guide: Design Compilation**
  Describes set up, running, and optimization for all stages of the Quartus Prime Pro Edition Compiler. The Compiler synthesizes, places, and routes your design before generating a device programming file.

  Describes Quartus Prime Pro Edition settings, tools, and techniques that you can use to achieve the highest design performance in Intel® FPGAs. Techniques include optimizing the design netlist, addressing critical chains that limit retiming and timing closure, optimizing device resource usage, device floorplanning, and implementing engineering change orders (ECOs).

  Describes operation of the Quartus Prime Pro Edition Programmer, which allows you to configure Intel® FPGA devices, and program CPLD and configuration devices, via connection with an Intel® FPGA download cable.

- **Quartus Prime Pro Edition User Guide: Block-Based Design**
  Describes block-based design flows, also known as modular or hierarchical design flows. These advanced flows enable preservation of design blocks (or logic that comprises a hierarchical design instance) within a project, and reuse of design blocks in other projects.
• **Quartus Prime Pro Edition User Guide: Partial Reconfiguration**
  Describes Partial Reconfiguration, an advanced design flow that allows you to reconfigure a portion of the FPGA dynamically, while the remaining FPGA design continues to function. Define multiple personas for a particular design region, without impacting operation in other areas.

• **Quartus Prime Pro Edition User Guide: Third-party Simulation**
  Describes RTL- and gate-level design simulation support for third-party simulation tools by Aldec*, Cadence*, Siemens EDA, and Synopsys that allow you to verify design behavior before device programming. Includes simulator support, simulation flows, and simulating Intel® FPGA IP.

• **Quartus Prime Pro Edition User Guide: Third-party Synthesis**
  Describes support for optional synthesis of your design in third-party synthesis tools by Siemens EDA, and Synopsys. Includes design flow steps, generated file descriptions, and synthesis guidelines.

• **Quartus Prime Pro Edition User Guide: Third-party Logic Equivalence Checking Tools**
  Describes support for optional logic equivalence checking (LEC) of your design in third-party LEC tools by OneSpin*.

• **Quartus Prime Pro Edition User Guide: Debug Tools**
  Describes a portfolio of Quartus Prime Pro Edition in-system design debugging tools for real-time verification of your design. These tools provide visibility by routing (or "tapping") signals in your design to debugging logic. These tools include System Console, Signal Tap logic analyzer, system debugging toolkits, In-System Memory Content Editor, and In-System Sources and Probes Editor.

• **Quartus Prime Pro Edition User Guide: Timing Analyzer**
  Explains basic static timing analysis principals and use of the Quartus Prime Pro Edition Timing Analyzer, a powerful ASIC-style timing analysis tool that validates the timing performance of all logic in your design using an industry-standard constraint, analysis, and reporting methodology.

• **Quartus Prime Pro Edition User Guide: Power Analysis and Optimization**
  Describes the Quartus Prime Pro Edition Power Analysis tools that allow accurate estimation of device power consumption. Estimate the power consumption of a device to develop power budgets and design power supplies, voltage regulators, heat sink, and cooling systems.

• **Quartus Prime Pro Edition User Guide: Design Constraints**
  Describes timing and logic constraints that influence how the Compiler implements your design, such as pin assignments, device options, logic options, and timing constraints. Use the Interface Planner to prototype interface implementations, plan clocks, and quickly define a legal device floorplan. Use the Pin Planner to visualize, modify, and validate all I/O assignments in a graphical representation of the target device.

• **Quartus Prime Pro Edition User Guide: PCB Design Tools**
  Describes support for optional third-party PCB design tools by Siemens EDA and Cadence*. Also includes information about signal integrity analysis and simulations with HSPICE and IBIS Models.

• **Quartus Prime Pro Edition User Guide: Scripting**
  Describes use of Tcl and command line scripts to control the Quartus Prime Pro Edition software and to perform a wide range of functions, such as managing projects, specifying constraints, running compilation or timing analysis, or generating reports.
