<code>-no_sdc_promotion</code> <code>-no_auto_inst_discovery</code>	Converts any entity-bound SDC into a global SDC file read just once for the entire compilation, making it particularly fitting for bundling an SDC with an entity designated for export as a <code>qdb</code> file. This configuration still permits SDC's collection filters to specify global top-level paths in your <code>get</code> commands.

### 2.3.5.2.1. Entity-Bound SDC Constraint Scope

The entity-bound SDC approach offers diverse scoping possibilities for your constraints, each dictating the extent of their influence.

**Table 10. Entity-bound Constraint Scope**

Constraint Scope Type	Features	To Enable Instance-bound Scoping
<b>Automatic</b>	<ul style="list-style-type: none"> <li>Default mode applied to entity-bound SDC files defined in the Quartus Prime Pro Edition GUI.</li> <li>Under automatic scoping, constraints apply to every instance of the assigned entity across the project.</li> <li>Each result from any <code>get</code> command (for example, <code>get_pins</code>, <code>get_ports</code>, and so on) in the SDC file is prepended with the instance's path.</li> <li>All <code>get</code> commands are confined to the target elements within the bound instance associated with the SDC file.</li> </ul>	Default mode for <code>SDC_ENTITY_FILE</code> . No additional steps required.
<b>Manual</b>	<ul style="list-style-type: none"> <li>Accessible by QSF assignment only.</li> <li>The <code>-no_sdc_promotion</code> setting disables automatic scoping, necessitating full hierarchical path for targeting nodes.</li> <li>Allows the flexibility to target nodes beyond entity boundaries.</li> <li>The <code>get_current_instance</code> command specifies the top-level path to the current instance, allowing you to merge filters targeting elements in the current instance with commands addressing those beyond entity boundaries.</li> </ul>	Use <code>-no_sdc_promotion</code> . Append each collection filter with <code>get_current_instance</code> to target nodes within the entity boundaries. For example: <pre>get_registers [get_current_instance] reg[*]</pre>
<b>Disabled</b>	<ul style="list-style-type: none"> <li>Accessible by QSF assignment only.</li> <li><code>-no_sdc_promotion</code> and the <code>-no_auto_inst_discovery</code> arguments together disable scoping, treating an entity-bound SDC as a global SDC file. The SDC file is read only once for the entire compilation instead of processing repeatedly for each instance it is linked to.</li> <li>This mode is ideal when bundling an SDC with an entity destined for export as a <code>qdb</code> file, while preserving the capability for SDC's collection filters to specify global, top-level paths in their <code>get</code> commands.</li> </ul>	Use <code>-no_sdc_promotion</code> and <code>-no_auto_inst_discovery</code> arguments.

When you define entity-bound SDC files either through the GUI or via `.qsf` assignments (excluding the `-no_sdc_promotion` and `-no_auto_inst_discovery` arguments), the constraints use automatic scoping. Automatic scoping involves

prepending filters with the instance's path. To provide clarity, the following table illustrates how paths are interpreted in various Tcl commands due to the automatic scoping of constraints:

**Table 11. Automatic Scope of Constraints**

Constraint Example	Auto-Scope Constraint Interpretation for Instance X Y
<code>set_false_path -from [get_keepers a]</code>	<code>set_false_path -from [get_keepers X Y a]</code>
<code>set_false_path -from [get_registers a] -to [get_registers b]</code>	<code>set_false_path -from [get_registers X Y a] -to [get_registers X Y b]</code>
<code>set_false_path -from [get_clocks clk_1] -to [get_clocks clk_2]</code>	<code>set_false_path -from [get_clocks clk_1] -to [get_clocks clk_2]</code>
<code>set_max_delay -from [get_ports in] -to [get_registers A] 2.0</code>	<code>set_max_delay -from [get_ports in] -to [get_registers X Y A] 2.0</code>
<code>get_ports *</code>	<code>get_ports *</code>
<code>get_clocks *</code>	<code>get_clocks *</code>
<code>get_ports a</code>	<code>get_ports a</code>
<code>get_clocks a</code>	<code>get_clocks a</code>

When you disable automatic scoping through .qsf assignments, including the use of the `-no_sdc_promotion` argument, you must manually prepend the top-level path to achieve the same behavior as automatic scoping. To simplify this process, use the `-get_current_instance` command to return the top-level path of the current instance. The following table illustrates how paths are interpreted when the `-get_current_instance` command is employed to add the top-level path to certain Tcl commands:

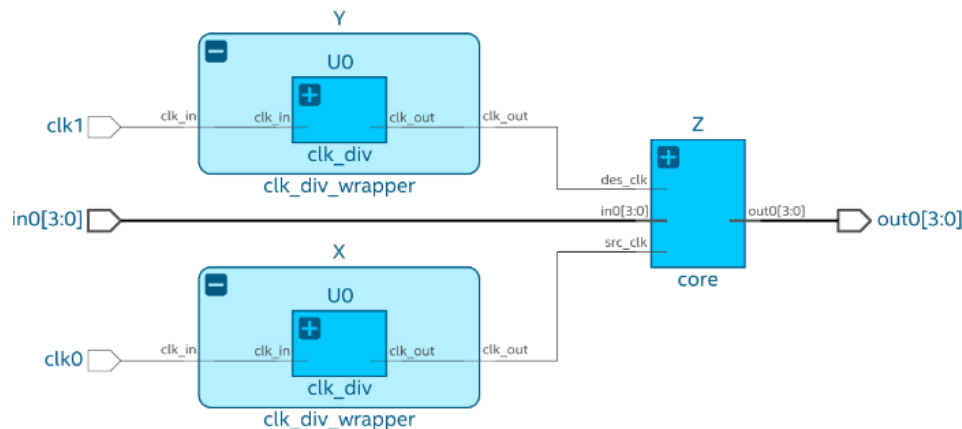

**Table 12. Manual Scope of Constraints**

Constraint Example	Manual Scope Constraint Interpretation
<code>set_false_path -from [get_current_instance] d \ -to [get_current_instance] e</code>	<code>set_false_path -from i1 inner d -to i1 inner e</code> <code>set_false_path -from i2 inner d -to i2 inner e</code> <code>set_false_path -from i3 d -to i3 e</code>
<code>create_generated_clock -divide_by 2 -source \ [get_ports inclk] -name \ [get_current_instance] divclk \ [get_current_instance] div</code> <code>set_multicycle_path -from [get_current_instance] a \ -to [get_current_instance] b 2</code>	<code>create_generated_clock -divide_by 2 -source \ [get_ports inclk] -name "i1_divclk" i1 div</code> <code>set_multicycle_path -from i1 a -to i1 b 2 \</code> <code>create_generated_clock -divide_by 2 -source \ [get_ports inclk] -name "i2_divclk" i2 div</code> <code>set_multicycle_path -from i2 a -to i2 b 2</code>

### 2.3.5.2.2. Automatic Scope Entity-bound Constraint Example

In the following design, two instances of the `clk_div` entity are constrained using the entity-bound SDC file approach. After running the Fitter's Plan stage and the timing netlist becomes available, follow the steps below to associate an SDC file with a particular entity in your design:

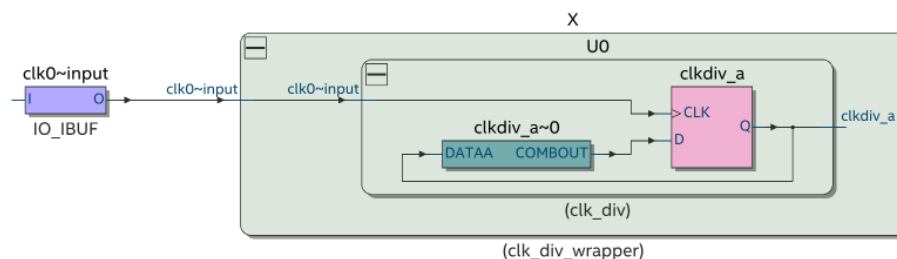

**Figure 72. Automatic Scope Example**

1. Create a non-entity-bound SDC file that defines constraints targeted by a global scope and add it to the project. For this design, two clocks (`clk0` and `clk1`) are defined.

```
# global.sdc
create_clock -period 100MHz -name clk_100 [get_ports clk0]
create_clock -period 75MHz -name clk_75 [get_ports clk1]
```

2. Create a second SDC file to constrain your target entity and add it to the project. This file follows the entity-bound approach and associates with the `clk_div` entity. Consequently, you define constraints as if this entity were at the top-level hierarchy, with path names relative to the entity. For example, the `get_pins clkdiv_a|q` command does not require the `X|U0` hierarchy. In this example, the `get_current_instance` Tcl command generates a unique name for each clock.

In this specific case, the `.sdc` file creates a new clock on the output of the module, and the `get_current_instance` Tcl command generates a unique name for each clock.

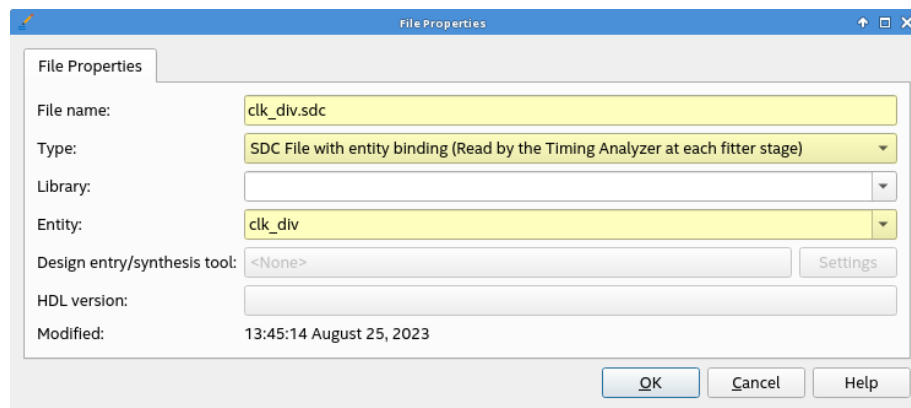

```
# clk_div.sdc
set unique_clock_name "[get_current_instance]_clkout"
create_generated_clock -divide_by 2 -source [get_pins clkdiv_a|clk] -name
$unique_clock_name [get_pins clkdiv_a|q]
```

3. Open the **File Properties** dialog for the .sdc file associated with the clk\_div entity from the files list in the left-hand **Project Tasks** pane.
  - a. Select the **SDC File with entity binding (Read by the Timing Analyzer at each fitter stage)** option in the **Type** list.
  - b. In the **Entity** list, select **clk\_div**.

This step applies automatic scoping to the entity-bound file, where all paths in filter commands are prepended with the top-level path of the current hierarchy. For instance, the command `get_registers clkdiv_a` is dynamically transformed into its fully hierarchical counterpart, such as `get_registers X|U0|clkdiv_a`.

*Note:* You must first complete Analysis & Synthesis to populate the list of entities.

**Figure 73. File Properties Dialog**

Alternatively, you can use the following .qsf assignment to set the entity binding:

```
set_global_assignment -name SDC_ENTITY_FILE clk_div.sdc -entity clk_div
```

4. Recompile the project to apply the changes. This results in the corresponding .sdc file being effectively bound to the entity in the automatic scope mode.
5. Verify the implementation of the entity-bound property by reviewing the **SDC File List** report in the Timing Analyzer. This report provides a comprehensive list of the applied SDC files for the design. For entity-bound SDC files, the report includes the associated instance, entity name, library, and the status of automatic scoping:

**Figure 74. SDC File List Report in the Timing Analyzer**

SDC File List									
Show:	Visible	Hide	Q <<Filter>> (use  <string> to invert filter)						
	SDC File Path	Instance	Entity	Library	Promoted	Status	Read at	Processing Time	SDC on RTL
1	main.sdc				No	OK	Fri Aug 25 18:30:09 2023	00:00:00	No
2	clk_div.sdc	X U0	clk_div	altera_work	Yes	OK	Fri Aug 25 18:30:09 2023	00:00:00	No
3	clk_div.sdc	Y U0	clk_div	altera_work	Yes	OK	Fri Aug 25 18:30:09 2023	00:00:00	No

6. Determine the correct application of each constraint according to the intended purpose. For example, examine the generated clocks and cross-reference with the clock hierarchy to determine if the constraints are successfully applied, as shown in the following images:

**Figure 75. Create Generated Clock Window in the Timing Analyzer**

Create Generated Clock						
Show:	Visible	Hide	Q <<Filter>> (use !<string> to invert filter)			
	SDC Command	Name	Source	Master Clock	Targets	Location
1	create_generated_clock	X U0_clkout	[get_pins {X U0 clkdiv_a clk}]	clk_100	[get_pins {X U0 clkdiv_a q}]	clk_div.sdc:2
2	create_generated_clock	Y U0_clkout	[get_pins {Y U0 clkdiv_a clk}]	clk_75	[get_pins {Y U0 clkdiv_a q}]	clk_div.sdc:2

**Figure 76. Clock Hierarchy Summary Window in the Timing Analyzer**

Clock Hierarchy Summary									
	Q <<Filter>> (use !<string> to invert filter)								
	Clock Name	Type	Master	Source	Targets	Period	Frequency	Rise	Fall
1	clk_75	Base			{ clk1 }	13.333	75.0 MHz	0.000	6.666
1	Y U0_clkout	Generated	clk_75	Y U0 clkdiv_a clk	{ Y U0 clkdiv_a q }	26.666	37.5 MHz	0.000	13.333
2	clk_100	Base			{ clk0 }	10.000	100.0 MHz	0.000	5.000
1	X U0_clkout	Generated	clk_100	X U0 clkdiv_a clk	{ X U0 clkdiv_a q }	20.000	50.0 MHz	0.000	10.000

### 2.3.5.2.3. Manual Scope Entity-bound Constraint Example

To modify the scope of the entity-bound SDC file to manual, for example, to target elements outside the entity, utilize .qsf assignments. By including the `-no_sdc_promotion` parameter in the entity-bound SDC file definition, you can prevent the Compiler from prepending each collection filter with the full path of the current instance. For example, to change to manual scope, the .sdc file associated with the `clk_div` entity in the automatic scope example above, add the `-no_sdc_promotion` parameter as follows:

```
set_global_assignment -name SDC_ENTITY_FILE clk_div.sdc -entity clk_div -no_sdc_promotion
```

To scope your collection filters precisely, use the `get_current_instance` command. By specifying the top-level path to the present instance, `get_current_instance` streamlines the process of scoping filters directed towards elements confined within instance boundaries.

```
# clk_div.sdc
set current_entity_instance [get_current_instance]
set unique_clock_name "${current_entity_instance}_clkout"
create_generated_clock -divide_by 2 -source [get_pins clkdiv_a|clk] \
-name $unique_clock_name [get_pins ${current_entity_instance}|clkdiv_a|q]
```

If you disable the automatic scope for a designated entity-bound SDC file, the **SDC File List** report within the Timing Analyzer indicates this change by displaying "No" in the promoted column:

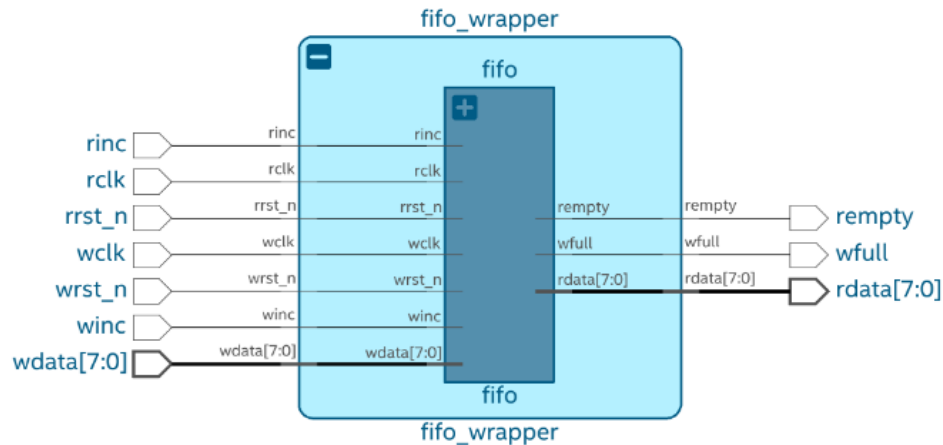

**Figure 77. SDC File List Report in the Timing Analyzer**

SDC File List								
Show:	Visible	Hide	Q <<Filter>> (use !<string> to invert filter)					
	SDC File Path	Instance	Entity	Library	Promoted	Status	Read at	Processing Time
1	main.sdc				No	OK	Fri Aug 25 17:40:25 2023	00:00:00
2	clk_div.sdc	X U0	clk_div	altera_work	No	OK	Fri Aug 25 17:40:25 2023	00:00:00
3	clk_div.sdc	Y U0	clk_div	altera_work	No	OK	Fri Aug 25 17:40:25 2023	00:00:00

### 2.3.5.2.4. Exporting a Design Partition with Entity-bound Constraints

The following example illustrates exporting a partition that includes entity bound constraints for use in another project. This example uses the `fifo` entity.

**Figure 78. Entity-Bound Constraints Design Example**

Perform these steps to export a design partition with entity-bound constraints:

1. After applying the constraints to the `fifo` entity, click **Fitter** on the Compilation Dashboard to run the Fitter. The Messages window report when the Fitter is complete.
2. Click **Assignments** ► **Design Partitions Window** and define **Default Type** design partition for the `fifo` entity in the **Assignments View** tab of the **Design Partition** dialog box.

**Figure 79. Assignments View of the Design Partition Window**

Assignments View		Compilation View			
Partition Name	Hierarchy Path	Type	Preservation Level	Empty	Partition Database File
<<new>>					
root_partition					
fifo	fifo_wrapper fifo	Default	Not Set	No	

3. Specify the entity-bound SDC **File name** and **Type** to establish the binding between the `fifo` entity and the `.sdc` file.

**Figure 80. File Properties Dialog**

File Properties

File name:

fifo.sdc

Type:

SDC File with entity binding (Read by the Timing Analyzer at each fitter stage)

Library:

Entity:

fifo

Design entry/synthesis tool:

Help

4. Click **Compile Design** on the Compilation Dashboard to run a full compilation and apply the changes to your project. The Timing Analyzer opens by default following a successful full compilation.
5. Confirm the correct association of the .sdc file with the fifo entity by reviewing the **SDC File List** report in the Timing Analyzer.

**Figure 81. SDC File List Report in the Timing Analyzer**

	SDC File Path	Instance	Entity	Library	Promoted	Status	Read at	Processing Time	SDC on RTL
1	global.sdc				No	OK	Mon Sep 4 11:34:46 2023	00:00:00	No
2	fifo.sdc	fifo_wrapper fifo	fifo	altera_work	Yes	OK	Mon Sep 4 11:34:46 2023	00:00:00	No

6. Click **Project > Export Design Partition** and specify the following options:
  - a. In the **Partition name** list, select the partition to export.
  - b. In **Partition Database File**, specify the partition database file.
  - c. Turn on the **Include entity-bound SDC files for the selected partition** option for entity-bound SDC files linked to the chosen partitions.
  - d. For **Snapshot**, specify **Synthesized** or **Final**.

**Figure 82. Export Design Partition Dialog**

Allows you to export a design partition of a specified snapshot as a Partition Database File (.qdb). You can reuse the file in a design partition of another project.

### 2.3.5.2.5. Importing a Design Partition with Entity-bound Constraints

Importing a partition with entity-bound SDC files requires that you define a black box wrapper for the entity in your design. This wrapper declares a partition in which the data from the imported partition is utilized. Consider the following example with an entity named `fifo_imported`:

**Figure 83. Example of an Entity Named `fifo_imported`**

To import a design partition with entity-bound constraints, perform these steps:

1. To run design synthesis, click **Analysis & Synthesis** on the Compilation Dashboard.
2. To create a new partition within the wrapper entity, click **Assignments > Design Partitions Window** and specify the following options on the **Assignments View** tab:
  - a. Specify the **Partition Name** and the **Hierarchy Path** of the entity instance.
  - b. Specify **Default** for the partition **Type**.
  - c. Specify **synthesized** in the **Preservation Level** column.
  - d. Specify the `.qdb` file from the previous project as the **Partition Database File**

**Figure 84. Assignments View of the Design Partition Dialog**

Assignments View		Compilation View			
Partition Name	Hierarchy Path	Type	Preservation Level	Empty	Partition Database File
<<new>>					
root_partition					
fifo_imported	fifo_imported	Default	synthesized	No	../Test01/fifo.qdb

3. To run a full compilation, click **Compile Design** on the Compilation Dashboard. The Timing Analyzer appears automatically following successful compilation.
4. Verify the correct application of the entity-bound SDC file assignment in the **SDC File List** report.

**Figure 85. SDC File List Report in the Timing Analyzer**

SDC File List									
Show:	Visible	Hide	Q <<Filter>> (use !<string> to invert filter)						
	SDC File Path	Instance	Entity	Library	Promoted	Status	Read at	Processing Time	SDC on RTL
1	fifo.sdc	fifo_imported	fifo	altera_work	Yes	OK	Mon Sep 4 11:57:38 2023	00:00:00	No
2	main.sdc				No	OK	Mon Sep 4 11:57:38 2023	00:00:00	No

### 2.3.6. Constraining Design Partition Ports

You can assign clock definitions and SDC exceptions to design partition ports. The block-based design and partial reconfiguration design flows require the use of design partitions.

The Compiler represents design partition ports in your timing netlist as combinational nodes with persistent names that the Compiler cannot optimize away. You can safely refer to these ports as clock sources or `-through` points in SDC constraints. You can also use design partition port names as `-to` and `-from` points in the `report_path` command.

If a port on `partition_a` has the name `clk_divide`, then the SDC constraint is:

```
create_generated_clock -source clock -divide_by 2 \
    top|partition_a|clk_divide
```

If a set of ports on `partition_b` has the name `data_input[0..7]`, then the SDC constraint is:

```
set_multicycle_path -from top|partition_a|data_reg* \
    -through top|partition_b|data_input* 2
```

You can use multiple `-through` clauses. This technique allows you to specify paths that go through output ports of one design partition, and then through the input ports of another, downstream design partition.

To add constraints to partition ports:

1. Run Analysis & Synthesis or run full compilation on a design containing design partitions.
2. To open the RTL Viewer and locate the partition ports of interest, click **Tools > Netlist Viewers > RTL Viewer**.
3. Using the same names as the **RTL Viewer**, add clock and other SDC constraints to the `.sdc` file for your project. You can use wildcards to refer to more than one port.
4. Recompile the design to apply the new definitions and constraints.

Aside from block-based and PR flows, this technique also aids in emulation of ASICs using FPGAs. In this type of design, clock networks often span multiple hierarchies of partitions. Typically, designers remove the clock-dividing circuitry from the netlist, since they cannot easily emulate this circuitry on Intel FPGAs. For such clock networks, this technique allows you to define different versions of the clock signal in places where the circuitry is removed.

You must design and place your partitions strategically, and then define the appropriate ports on these partitions. Ensure that your ports and partitions coincide with the part of the clock network which contains the special circuitry. You can manually edit the emulated ASIC netlist to annotate appropriate clock

definitions and clock relationships. You can also use this technique in any projects where arbitrary locations on paths require constrained timing or defined clock sources.

- [Input Constraints \(set\\_input\\_delay\)](#) on page 94

#### 2.3.6.1. Timing Analysis of Imported Compilation Results

You can preserve the compilation results for your design as a version-compatible Quartus database file (.qdb) that you can open in a later version of the Quartus Prime software without compatibility issues.

When you import and open the .qdb in a later version of software, you can run timing analysis on the imported compilation results without re-running the Compiler.

#### 2.3.7. Using Fitter Overconstraints

Fitter overconstraints are timing constraints that you adjust to overcome modeling inaccuracies, mis-correlation, or other deficiencies in logic optimization. You can overconstrain setup and hold paths in the Fitter to enable more aggressive timing optimization of specific paths.

##### Overconstraints for Stratix 10 Designs

One typically writes overconstraints that apply only during the Fitter, with a conditional statement that checks the name of the executable that is reading the .sdc file. The following example shows a conditional statement that applies an overconstraint during the Fitter.

```
# Example Fitter overconstraint targeting specific nodes
if { $::TimingAnalyzerInfo(nameofexecutable) eq "quartus_fit" } {
    set_max_delay -from ${my_src_regs} -to ${my_dst_regs} 1ns
}
```

One typically applies overconstraints because a particular path (or set of paths) requires more than the default optimization effort from the Fitter. Therefore, overconstraints typically specify particular node or register names in the path or paths that require extra optimization.

For devices that support the Hyperflex® architecture, such as Stratix 10 and Agilex™ FPGA portfolio devices, timing constraints that apply to particular node or register names prevent the Hyper-Retimer from optimizing paths containing those nodes or registers.

Because the Hyper-Retimer is component of the Fitter, an overconstraint that conditionally applies during the Fitter is counter-productive during the Hyper-Retimer portion of the Fitter. The overconstraint actually prevents the optimization instead of focusing the optimization effectively.

When designing for the Hyperflex architecture, use the `is_post_route` Tcl function form of conditional statement to apply the overconstraint during placement and routing but not during the Hyper-Retimer. `is_post_route` allows you to apply

overconstraints and adjust slack for stages of the Fitter, such as Plan, Place, and Route. `is_post_route` also allows post-route retiming via the Hyper-Retimer without affecting sign-off timing analysis.

```
# Example Fitter overconstraint targeting specific nodes (allows for post-route retiming)
if { ! [is_post_route] } {
    set_max_delay -from ${my_src_regs} -to ${my_dst_regs} 1ns
}
```

**Note:** The `is_post_route` function is inclusive. To exclude the function, use the negation syntax (!).

### Overconstraints for Designs that Target All Other Device Families

You can assign Fitter overconstraints that check the name of the current executable, (either `quartus_fit` or `quartus_sta`) to apply different constraints for Fitter optimization and sign-off timing analysis.

```
set_fit_flow 0
if { $::TimingAnalyzerInfo(nameofexecutable) == "quartus_fit" } {
    set_fit_flow 1
}
if { $fit_flow } {
    # Example Fitter overconstraint targeting specific nodes (restricts retiming)
    set_max_delay -from ${my_src_regs} -to ${my_dst_regs} 1ns
}
```

### Other Overconstraint Combinations

You can apply timing constraints to specific stages of the Compiler, in addition to the Fitter as described above. The following table shows different combinations of compile stages and the conditional expression that applies those constraints during the stage or stages.

**Table 13. Overconstraint Combinations**

Compile Stages	Tcl Condition	Notes
Fitter	<code>if { \$::TimingAnalyzerInfo(nameofexecutable) eq "quartus_fit" }</code>	Applies constraints during entire Fitter stage. Use for fitter overconstraints with devices that do not support Hyperflex architecture.
Signoff timing	<code>if { \$::TimingAnalyzerInfo(nameofexecutable) eq "quartus_sta" }</code>	Applies constraints during timing analysis. This condition is uncommon. Typically you apply timing analysis constraints during the entire compile flow.
Plan, Place, and Route	<code>if { ! [is_post_route] }</code>	Applies constraints during the Plan, Place, and Route stages in devices that support the Hyperflex architecture. Use for fitter overconstraints.
Retime (HyperRetimer), Finalize, Signoff timing	<code>if { [is_post_route] }</code>	Applies constraints after the Route stage completes in devices that support the Hyperflex architecture. This combination of stages is

*continued...*

Compile Stages	Tcl Condition	Notes
		uncommon. Typically you apply timing analysis constraints during the entire compile flow.
Retime (HyperRetimer) and Finalize	if { [is_post_route] && \$::TimingAnalyzerInfo(nameofexecutable) eq "quartus_fit" }	Applies constraints during Retiming and Finalize stages in devices that support the Hyperflex architecture. This combination of stages is uncommon.

## 2.4. Timing Constraint Descriptions

This section provides examples and describes how to correctly apply SDC timing constraints that guide design synthesis, Fitter placement, and produce accurate timing analysis results.

You can define a set of initial timing constraints, and then iteratively modify those constraints as the design progresses.

Early in the design cycle, you can use SDC-on-RTL constraints to target analysis of RTL nodes. This analysis provides a stable reference for constraints that can remain unchanged in subsequent compilation stages, such as clock definitions. Establishing a set of SDC-on-RTL constraints enables their propagation and application throughout the entire design cycle. Concurrently, you can create a conventional .sdc file for analysis of the remaining design elements, providing flexibility for iterative constraint adjustments as the design evolves.

This section also outlines the proper application of recommended conventional SDC timing constraints. Conventional SDC constraints guide Fitter placement via .sdc files, offering alternative approaches to achieve precise control over constraints throughout the design flow.

### 2.4.1. Clock Constraints

You must define all clocks and any associated clock characteristics, such as uncertainty, latency or skew. The Timing Analyzer supports .sdc commands that accommodate various clocking schemes, such as:

- Base clocks
- Virtual clocks
- Multifrequency clocks
- Generated clocks

You can verify correct implementation of clock constraints by using **Report Clocks** (`report_clocks`) to generate clock timing reports. You can use **Check Timing** (`check_timing`) to report problems with a variety of timing constraints, such as missing clocks.

#### Related Information

- [Report Clocks](#) on page 135
- [Check Timing](#) on page 161

### 2.4.1.1. Creating Base Clocks

Base clocks are the primary input clocks to the device. The **Create Clock** (`create_clock`) constraint allows you to define the properties and requirements for base clocks in the design. Unlike clocks that are generated in the device (such as an on-chip PLL), base clocks are generated by off-chip oscillators or forwarded from an external device. Define base clocks at the top of your `.sdc` file, because generated clocks and other constraints often reference base clocks. The Timing Analyzer ignores any constraints that reference an undefined clock.

The following examples show common use of the `create_clock` constraint:

#### **create\_clock Command**

The following specifies a 100 MHz requirement on a `clk_sys` input clock port:

```
create_clock -period 100Mhz -name clk_sys [get_ports clk_sys]
```

#### **100 MHz Shifted by 90 Degrees Clock Creation**

The following creates a 10 ns clock, with a 50% duty cycle, that is phase shifted by 90 degrees, and applies to port `clk_sys`. This type of clock definition commonly refers to source synchronous, double-rate data that is center-aligned with respect to the clock.

```
create_clock -period 10ns -waveform { 2.5 7.5 } [get_ports clk_sys]
```

#### **Two Oscillators Driving the Same Clock Port**

You can apply multiple clocks to the same target with the `-add` option. For example, to specify that you can drive the same clock input at two different frequencies, enter the following commands in your `.sdc` file:

```
create_clock -period 10ns -name clk_100 [get_ports clk_sys]  
create_clock -period 5ns -name clk_200 [get_ports clk_sys] -add
```

Although uncommon to define more than two base clocks for a port, you can define as many as are appropriate for your design, making sure you specify `-add` for all clocks after the first.

#### **Creating Multifrequency Clocks**

You must create a multifrequency clock if your design has more than one clock source feeding a single clock node. The additional clock may act as a low-power clock, with a lower frequency than the primary clock. If your design uses multifrequency clocks, use the `set_clock_groups` command to define clocks that are physically exclusive (that is, clocks that are not physically present at the same time).

Use the `create_clock` command with the `-add` option to create multiple clocks on a clock node. You can create a 10 ns clock applied to clock port `clk`, and then add an additional 15 ns clock to the same clock port. The Timing Analyzer analyzes both clocks.

```
create_clock -period 10ns -name clock_primary -waveform { 0 5 } \  
[get_ports clk]  
create_clock -period 15ns -name clock_secondary -waveform { 0 7.5 } \  
[get_ports clk] -add
```

You can verify correct implementation of clock constraints by using **Report Clocks** (`report_clocks`) to generate clock timing reports. You can use **Check Timing** (`check_timing`) to report problems with a variety of timing constraints, such as missing clocks.

#### 2.4.1.1.1. Automatic Clock Detection and Constraint Creation

Use the `derive_clocks` command to automatically create base clocks in your design. The `derive_clocks` command is equivalent to using the `create_clock` command for each register or port feeding the clock pin of a register. The `derive_clocks` command creates clock constraints on ports or registers to ensure every register in your design has a clock constraints, and it applies one period to all base clocks in your design.

The following command specifies a base clock with a 100 MHz requirement for unconstrained base clock nodes.

```
derive_clocks -period 10
```

The `derive_clocks` command names the automatically created base clocks according to the name of the register or port that is the target of each clock. Automatically derived clocks have the suffix "~derived". You can choose another suffix to append with the `-suffix` option for the `derive_clocks` command.

#### Caution:

If your design has more than a single clock, the `derive_clocks` command constrains all the clocks to the same specified frequency. To achieve a realistic analysis of your design's timing requirements, do not use `derive_clocks` command for final timing sign-off. Instead, use `create_clock` and `create_generated_clock` commands to make individual clock constraints for all clocks in your design.

If you want to create some base clocks automatically, use the `-create_base_clocks` option to `derive_pll_clocks`. With this option, the `derive_pll_clocks` command automatically creates base clocks for each PLL, based on the input frequency information that you specify when you generate the PLL. This feature works for simple port-to-PLL connections. Base clocks do not automatically generate for complex PLL connectivity, such as cascaded PLLs. You can also use the command `derive_pll_clocks -create_base_clocks` to create the input clocks for all PLL inputs automatically.

#### 2.4.1.1.2. Creating Virtual Clocks

A virtual clock is a clock without a real source in the design, or a clock that does not interact directly with the design. You can use virtual clocks in I/O constraints to represent clocks that drive external devices connected to the FPGA.

To create virtual clocks, use the `create_clock` constraint with no value for the `<targets>` option.

This following example defines a 100 MHz virtual clock because the command includes no *<targets>*.

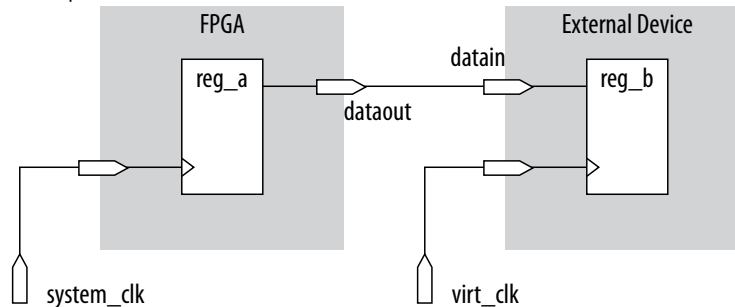

```
create_clock -period 10 -name my_virt_clk
```

### I/O Constraints with Virtual Clocks

You can use a base clock to constrain the circuit in the FPGA and a virtual clock to represent the clock driving the external device. .

**Figure 86. Virtual Clock Board Topology**

The figure shows the base clock (*system\_clk*), virtual clock (*virt\_clk*), and output delay for the virtual clock constraints example

The following example creates the 10 ns *virt\_clk* virtual clock, with a 50% duty cycle, with the first rising edge occurring at 0 ns. The virtual clock can then become the clock source for an output delay constraint.

**Example 3. Virtual Clock Constraints**

```
#create base clock for the design
create_clock -period 5 [get_ports system_clk]
#create the virtual clock for the external register
create_clock -period 10 -name virt_clk
#set the output delay referencing the virtual clock
set_output_delay -clock virt_clk -max 1.5 [get_ports dataout]
set_output_delay -clock virt_clk -min 0.0 [get_ports dataout]
```

You can verify correct implementation of clock constraints by using **Report Clocks** (*report\_clocks*) to generate clock timing reports. You can use **Check Timing** (*check\_timing*) to report problems with a variety of timing constraints, such as the number of unreferenced virtual clocks without constraint.

### Related Information

- [Report Clocks](#) on page 135
- [Check Timing](#) on page 161

#### 2.4.1.2.1. Specifying I/O Interface Uncertainty

Virtual clocks are recommended for I/O constraints because they most accurately represent the clocking topology of the design. An additional benefit is that you can specify different uncertainty values on clocks that interface with external I/O ports and clocks that feed register-to-register paths inside the FPGA.

#### 2.4.1.2.2. I/O Interface Clock Uncertainty Example

To specify I/O interface uncertainty, you must create a virtual clock and constrain the input and output ports with the `set_input_delay` and `set_output_delay` commands that reference the virtual clock.

When the `set_input_delay` or `set_output_delay` commands reference a clock port or PLL output, the virtual clock allows the `derive_clock_uncertainty` command to apply separate clock uncertainties for internal clock transfers and I/O interface clock transfers.

Create the virtual clock with the same properties as the original clock that is driving the I/O port, as the following example shows:

#### Example 4. SDC Commands to Constrain the I/O Interface

```
# Create the base clock for the clock port
create_clock -period 10 -name clk_in [get_ports clk_in]
# Create a virtual clock with the same properties of the base clock
# driving the source register
create_clock -period 10 -name virt_clk_in
# Create the input delay referencing the virtual clock and not the base
# clock
# DO NOT use set_input_delay -clock clk_in <delay value>
# [get_ports data_in]
set_input_delay -clock virt_clk_in <delay value> [get_ports data_in]
```

#### 2.4.1.3. Creating Generated Clocks (create\_generated\_clock)

The **Create Generate Clock** (`create_generated_clock`) constraint allows you to define the properties and constraints of an internally generated clock in the design. You specify the **Clock name** (`-name`), the **Source** node (`-source`) from which clock derives, and the **Relationship to the source** properties. Define generated clocks for any node that modifies the properties of a clock signal, including modifying the phase, frequency, offset, or duty cycle.

You apply generated clocks most commonly on the outputs of PLLs, on register clock dividers, clock muxes, and clocks forwarded to other devices from an FPGA output port, such as source synchronous and memory interfaces. In the `.sdc` file, enter generated clocks after the base clocks definitions. Generated clocks automatically account for all clock delays and clock latency to the generated clock target.

The `-source` option specifies the name of a node in the clock path that you use as reference for your generated clock. The source of the generated clock must be a node in your design netlist, and not the name of a clock you previously define. You can use any node name on the clock path between the input clock pin of the target of the generated clock and the target node of its reference clock as the source node.

Specify the input clock pin of the target node as the source of your new generated clock. By accepting a node as the generated clock's source clock, the generated clock constraint decouples from the source clock. If you change the source clock for the generated clock and the source node is the same, you do not have to edit the generated clock constraint.

If you have multiple base clocks feeding a node that is the source for a generated clock, you must define multiple generated clocks. You associate each generated clock with one base clock using the `-master_clock` option in each generated clock statement. In some cases, generated clocks generate with combinational logic.

Depending on how your clock-modifying logic synthesizes, the source or target node can change from one compilation to the next. If the name changes after you write the generated clock constraint, the Compiler ignores the generated clock because that target name no longer exists in the design. To avoid this problem, use a synthesis attribute or synthesis assignment to retain the final combinational node name of the clock-modifying logic. Then use the kept name in your generated clock constraint.

**Figure 87. Example of clock-as-data**

Setup: clk

Command Info		Summary of Paths						
	Slack	From Node	To Node	Launch Clock	Latch Clock	Relationship	Clock Skew	Data Delay
1	9.166	toggle_reg q	toggle_reg	toggle_clk	clk	10.000	-0.158	0.593
2	9.171	toggle_reg q	toggle_reg	toggle_clk	clk	10.000	-0.158	0.588

Path #1: Setup slack is 9.166

Path Summary		Statistics	Data Path	Waveform	Extra Fitter Information			
	Property	Value						
1	From Node	toggle_reg q						
2	To Node	toggle_reg						
3	Launch Clock	toggle_clk (INVERTED)						
4	Latch Clock	clk						
5	Data Arrival Time	12.515						
6	Data Required Time	21.681						
7	Slack	9.166						

When you create a generated clock on a node that ultimately feeds the data input of a register, this creates a special case of "clock-as-data." The Timing Analyzer treats clock-as-data differently. For example, if you use clock-as-data with DDR, you must consider both the rise and the fall of this clock, and the Timing Analyzer reports both rise and fall. With clock-as-data, the Compiler treats the **From Node** as the target of the generated clock, and the **Launch Clock** as the generated clock.

In [Example of clock-as-data](#), the first path is from toggle\_clk (INVERTED) to clk, and the second path is from toggle\_clk to clk. The slack in both cases is slightly different due to the difference in rise and fall times along the path. The **Data Delay** column reports the ~5 ps difference. Only the path with the lowest slack value requires consideration. The Timing Analyzer only reports the worst-case path between the two (rise and fall). In this example, if you do not define the generated clock on the register output, then timing analysis reports only one path with the lowest slack value.

You can use the `derive_pll_clocks` command to automatically generate clocks for all PLL clock outputs. The properties of the generated clocks on the PLL outputs match the properties you define for the PLL.

You can verify correct implementation of clock constraints by using **Report Clocks** (`report_clocks`) to generate clock timing reports. You can use **Check Timing** (`check_timing`) to report problems with a variety of timing constraints, such as the number of generated clocks that are invalid.

### 2.4.1.3.1. Clock Divider Example (-divide\_by)

A common form of generated clock is the divide-by-two register clock divider. The following example constraint creates a half-rate clock on the divide-by-two register.

```
create_clock -period 10ns -name clk_sys [get_ports clk_sys]
create_generated_clock -name clk_div_2 -divide_by 2 -source \
[get_ports clk_sys] [get_pins reg|q]
```

To specify the clock pin of the register as the clock source:

```
create_clock -period 10ns -name clk_sys [get_ports clk_sys]
create_generated_clock -name clk_div_2 -divide_by 2 -source \
[get_pins reg|clk] [get_pins reg|q]
```

**Figure 88. Clock Divider**

**Figure 89. Clock Divider Waveform**

### 2.4.1.3.2. Clock Multiplexer Example

The output of a clock multiplexer (mux) is a form of generated clock. Each input clock requires one generated clock on the output. The following .sdc example also includes the set\_clock\_groups command to indicate that the two generated clocks can never be active simultaneously in the design. Therefore, the Timing Analyzer does not analyze cross-domain paths between the generated clocks on the output of the clock mux.

**Figure 90. Clock Mux**

```
create_clock -name clock_a -period 10 [get_ports clk_a]
create_clock -name clock_b -period 10 [get_ports clk_b]
create_generated_clock -name clock_a_mux -source [get_ports clk_a] \
```

```
[get_pins clk_mux|mux_out]
create_generated_clock -name clock_b_mux -source [get_ports clk_b] \
[get_pins clk_mux|mux_out] -add
set_clock_groups -logically_exclusive -group clock_a_mux -group clock_b_mux
```

#### 2.4.1.4. Deriving PLL Clocks

The **Derive PLL Clocks** (`derive_pll_clocks`) constraint automatically creates clocks for each output of any PLL in your design. `derive_pll_clocks` detects your current PLL settings and automatically creates generated clocks on the outputs of every PLL by calling the `create_generated_clock` command.

**Note:** Only Arria 10 and Cyclone 10 GX devices support the **Derive PLL Clocks** (`derive_pll_clocks`) constraint. For all other supported devices, the Timing Analyzer automatically derives PLL clocks from constraints bound to the related IP.

##### Create Base Clock for PLL input Clock Ports

If your design contains transceivers, LVDS transmitters, or LVDS receivers, use the `derive_pll_clocks` to constrain this logic in your design and create timing exceptions for those blocks.

```
create_clock -period 10.0 -name fpga_sys_clk [get_ports fpga_sys_clk]
derive_pll_clocks
```

Include the `derive_pll_clocks` command in your `.sdc` file after any `create_clock` command. Each time the Timing Analyzer reads the `.sdc` file, the appropriate generated clock is created for each PLL output clock pin. If a clock exists on a PLL output before running `derive_pll_clocks`, the pre-existing clock has precedence, and an auto-generated clock is not created for that PLL output.

The following shows a simple PLL design with a register-to-register path:

**Figure 91. Simple PLL Design**

The Timing Analyzer generates messages like the following example when you use the `derive_pll_clocks` command to constrain the PLL.

#### Example 5. `derive_pll_clocks` Command Messages

```
Info:
Info: Deriving PLL Clocks:
Info: create_generated_clock -source pll_inst|altpll_component|pll|inclk[0] -
divide_by 2 -name
pll_inst|altpll_component|pll|clk[0] pll_inst|altpll_component|pll|clk[0]
Info:
```

The input clock pin of the PLL is the node `pll_inst|altpll_component|pll|inclk[0]` which is the `-source` option. The name of the output clock of the PLL is the PLL output clock node, `pll_inst|altpll_component|pll|clk[0]`.

If the PLL is in clock switchover mode, multiple clocks generate for the output clock of the PLL; one for the primary input clock (for example, `inclk[0]`), and one for the secondary input clock (for example, `inclk[1]`). Create exclusive clock groups for the primary and secondary output clocks since they are not active simultaneously.

You can verify correct implementation of clock constraints by using **Report Clocks** (`report_clocks`) to generate clock timing reports. You can use **Check Timing** (`check_timing`) to report problems with a variety of timing constraints, such as the number of instances where clocks that are assigned to a PLL do not correspond properly with the PLL settings you define in design files.

- [Report Clocks](#) on page 135
- [Check Timing](#) on page 161

### 2.4.1.5. Creating Clock Groups (`set_clock_groups`)

The **Set Clock Groups** (`set_clock_groups`) constraint allows you to specify which clocks in the design are unrelated.

The `set_clock_groups` command allows you to cut timing between unrelated clocks in different groups. The Timing Analyzer performs the same analysis regardless of whether you specify `-exclusive` or `-asynchronous` groups. You define a clock group with the `-group` option. The Timing Analyzer excludes the timing paths between clocks for each of the separate groups.

The following tables show the impact of `set_clock_groups`.

**Table 14.** `set_clock_groups -group A`

- [set\\_clock\\_groups Command, Quartus Prime Help](#)

#### 2.4.1.5.1. Exclusive Clock Groups (-logically\_exclusive or -physically\_exclusive)

You can use the `logically_exclusive` option to declare that two clocks are physically active simultaneously, but the two clocks are not actively used at the same time (that is, the clocks are logically mutually exclusive). The `physically_exclusive` option declares clocks that cannot be physically on the device at the same time.

If you define multiple clocks for the same node, you can use clock group assignments with the `logically_exclusive` option to declare clocks as mutually exclusive. This technique can be useful for multiplexed clocks.

For example, consider an input port that is clocked by either a 100-MHz or 125-MHz clock. You can use the `logically_exclusive` option to declare that the clocks are mutually exclusive and eliminate clock transfers between the 100-MHz and 125-MHz clocks, as the following diagrams and example SDC constraints show:

**Figure 92. Synchronous Path with Clock Mux Internal to FPGA**

#### Example SDC Constraints for Internal Clock Mux

```
# Create a clock on each port
create_clock -name clk_100 -period 10 [get_ports clkA]
create_clock -name clk_125 -period 8 [get_ports clkB]
# Create derived clocks on the output of the mux
create_generated_clock -name mux_100 -source [get_ports clkA] \
[get_pins clkmux|combout]
create_generated_clock -name mux_125 -source [get_ports clkB] \
[get_pins clkmux|combout] -add
# Set the two clocks as exclusive clocks
set_clock_groups -logically_exclusive -group {mux_100} -group {mux_125}
```

**Figure 93. Synchronous Path with Clock Mux External to FPGA**

#### Example SDC Constraints for External Clock Mux

```
# Create virtual clocks for the external primary clocks
create_clock -period 10 -name clkA
create_clock -period 20 -name clkB
# Create derived clocks on the port clk
create_generated_clock -name mux_100 -master_clock clkA [get_ports clk]
create_generated_clock -name mux_125 -master_clock clkB [get_ports clk] -add
# Assume no clock network latency between the external clock sources & the \
clock mux output
set_clock_latency -source 0 [get_clocks {mux_100 mux_125}]
# Set the two clocks as exclusive clocks
set_clock_groups -physically_exclusive -group mux_100 -group mux_125
```

#### 2.4.1.5.2. Asynchronous Clock Groups (-asynchronous)

Use the `-asynchronous` option to create asynchronous clock groups. You can use asynchronous clock groups to break the timing relationship when data transfers through a FIFO between clocks running at different rates.

#### 2.4.1.5.3. set\_clock\_groups Constraint Tips

When you use `derive_pll_clocks` to create clocks, it can be time consuming to determine all the clock names to include in `set_clock_groups` constraints. However, you can use the following technique to somewhat automate clock constraint creation, even if you do not know all of the clock names.

1. Create a basic `.sdc` file that contains the [Recommended Initial Conventional SDC Constraints](#), except omit the `set_clock_groups` constraint for now.
2. To add the `.sdc` to the project, click **Assignments > Settings > Timing Analyzer**. Specify the `.sdc` file under **SDC files to include in the project**.
3. To open the Timing Analyzer, click **Tools > Timing Analyzer**.
4. In the **Task** pane, double-click **Report Clocks**. The Timing Analyzer reads your `.sdc`, applies the constraints (including `derive_pll_clocks`), and reports all the clocks.
5. From the Clocks Summary report, copy all the clock names that appear in the first column. The report lists the clock names in the correct format for recognition in the Timing Analyzer.
6. Open `.sdc` file and paste the clock names into the file, one clock name per line.
7. Format the list of clock names list into the `set_clock_groups` command by cutting and pasting clock names into appropriate groups. Next, paste the following template into the `.sdc` file:

```
set_clock_groups -asynchronous -group { \  
} \  
-group { \  
} \  
-group { \  
} \  
-group { \  
}
```

8. Cut and paste the clock names into groups to define their relationship, adding or removing groups, as necessary. Format the groups to make the code readable.

**Note:** This command can be difficult to read on a single line. You can use the Tcl line continuation character `"\"` to make this more readable. Place a space after the last character, and then place the `"\"` character at the end of the line. Be careful not to include any spaces after the escape character. Otherwise, the space becomes the escape character, rather than the end-of-line character.

```
set_clock_groups -asynchronous \  
-group {adc_clk \  
    the_adc_pll|altpll_component_autogenerated|pll|clk[0] \  
    the_adc_pll|altpll_component_autogenerated|pll|clk[1] \  
    the_adc_pll|altpll_component_autogenerated|pll|clk[2] \  
} \  
-group {sys_clk \  
    the_system_pll|altpll_component_autogenerated|pll|clk[0] \  
    the_system_pll|altpll_component_autogenerated|pll|clk[1] \  
}
```

```
} \
-group {the_system_pll|altpll_component_autogenerated|pll|clk[2] \
}
```

**Note:** The last group has a PLL output `system_pll|..|clk[2]` while the input clock and other PLL outputs are in different groups. If you use PLLs, and the input clock frequency does not relate to the frequency of the PLL's outputs, you must treat the PLLs asynchronously. Typically the outputs of a PLL are related and are in the same group, but this is not a requirement.

For designs with complex clocking, creating clock groups can be an iterative process. For example, a design with two DDR3 cores and high-speed transceivers can have thirty or more clocks. In such cases, you start by adding the clocks that you manually create. Timing Analyzer assumes that the clocks not appearing in the clock groups command relate to every clock and conservatively groups the known clocks. If the design still has failing paths between unrelated clock domains, you can add the new clock domains, as necessary. In this case, a large number of the clocks are not in the `set_clock_groups` command, because they are either cut in the `.sdc` file for the IP (such as the `.sdc` files that the DDR3 cores generate), or they connect only to related clock domains.

For many designs, that is all that's necessary to constrain the IP.

### Related Information

[Multicycle Paths](#) on page 102

## 2.4.1.6. Accounting for Clock Effect Characteristics

The clocks you create with the Timing Analyzer are ideal clocks that do not account for any board effects. You can account for clock effect characteristics with clock latency and clock uncertainty constraints.

You can verify correct implementation of clock constraints by using **Report Clocks** (`report_clocks`) to generate clock timing reports. You can use **Check Timing** (`check_timing`) to report problems with a variety of timing constraints, such as missing clocks.

### Related Information

- [Report Clocks](#) on page 135
- [Check Timing](#) on page 161

### 2.4.1.6.1. Set Clock Latency (`set_clock_latency`)

The **Set Clock Latency** (`set_clock_latency`) constraint allows you to specify additional delay (that is, latency) in a clock network. This delay value represents the external delay from a virtual (or ideal) clock through the longest **Late** (`-late`) or shortest **Early** (`-early`) path, with reference to the **Rise** (`-rise`) or **Fall** (`-fall`) of the clock transition.

When calculating setup analysis, the Timing Analyzer uses the late clock latency for the data arrival path and the early clock latency for the clock arrival path. . When calculating hold analysis, the Timing Analyzer uses the early clock latency for the data arrival time and the late clock latency for the clock arrival time.

There are two forms of clock latency: clock source latency, and clock network latency. Source latency is the propagation delay from the origin of the clock to the clock definition point (for example, a clock port). Network latency is the propagation delay from a clock definition point to a register's clock pin. The total latency at a register's clock pin is the sum of the source and network latencies in the clock path.

To specify source latency to any clock ports in your design, use the `set_clock_latency` command.

**Note:** The Timing Analyzer automatically computes network latencies. Therefore, you can only characterize source latency with the `set_clock_latency` command using the `-source` option.

### Related Information

[set\\_clock\\_latency Command, Quartus Prime Help](#)

#### 2.4.1.6.2. Clock Uncertainty

By default, the Timing Analyzer creates clocks that are ideal and have perfect edges. To mimic clock-level effects like jitter, you can add uncertainty to those clock edges. The Timing Analyzer automatically calculates appropriate setup and hold uncertainties and applies those uncertainties to all clock transfers in your design, even if you do not include the `derive_clock_uncertainty` command in your `.sdc` file. Setup and hold uncertainties are a critical part of constraining your design correctly.

The Timing Analyzer subtracts setup uncertainty from the data required time for each applicable path and adds the hold uncertainty to the data required time for each applicable path. This slightly reduces the setup and hold slack on each path.

The Timing Analyzer accounts for uncertainty clock effects for three types of clock-to-clock transfers: intraclock transfers, interclock transfers, and I/O interface clock transfers.

- Intraclock transfers occur when the register-to-register transfer takes place in the device and the source and destination clocks come from the same PLL output pin or clock port.
- Interlock transfers occur when a register-to-register transfer takes place in the core of the device and the source and destination clocks come from a different PLL output pin or clock port.
- I/O interface clock transfers occur when data transfers from an I/O port to the core of the device or from the core of the device to the I/O port.

To manually specify clock uncertainty, use the `set_clock_uncertainty` command. You can specify the uncertainty separately for setup and hold. You can also specify separate values for rising and falling clock transitions. You can override the value that the `derive_clock_uncertainty` command automatically applies.

The `derive_clock_uncertainty` command accounts for PLL clock jitter, if the clock jitter on the input to a PLL is within the input jitter specification for PLL's in the target device. If the input clock jitter for the PLL exceeds the specification, add additional uncertainty to your PLL output clocks to account for excess jitter with the `set_clock_uncertainty -add` command. Refer to the device handbook for your device for jitter specifications.

You can also use `set_clock_uncertainty -add` to account for peak-to-peak jitter from a board when the jitter exceeds the jitter specification for that device. In this case you add uncertainty to both setup and hold equal to 1/2 the jitter value:

```
set_clock_uncertainty -setup -to <clock name> \
  -setup -add <p2p jitter/2>
```

```
set_clock_uncertainty -hold -enable_same_physical_edge -to <clock name> \
  -add <p2p jitter/2>
```

There is a complex set of precedence rules for how the Timing Analyzer applies values from `derive_clock_uncertainty` and `set_clock_uncertainty`, which depend on the order of commands and options in your `.sdc` files. The Help topics below contain complete descriptions of these rules. These precedence rules are easier to implement if you follow these recommendations:

- To assign your own clock uncertainty values to any clock transfers, put your `set_clock_uncertainty` exceptions after the `derive_clock_uncertainty` command in the `.sdc` file.
- When you use the `-add` option for `set_clock_uncertainty`, the value you specify is additive to the `derive_clock_uncertainty` value. If you do not specify `-add`, the value you specify replaces the value from `derive_clock_uncertainty`.

#### 2.4.1.7. Constraining CDC Paths

It is essential to apply timing constraints to the multibit clock domain crossing (CDC) paths in your design. You can use the following constraints to constrain CDC paths:

**Attention:** As of Quartus Prime Pro Edition software version 21.3, the `set_false_path` constraint does not override the `set_max_skew` constraint. You can now apply the `set_false_path` and `set_max_skew` constraints on the same path without override.

**Table 19. CDC Path Constraints**

Constraints	Description
<code>set_false_path</code> <code>set_clock_groups -asynchronous</code>	<p>Both constraints prevent the Compiler from optimizing slack between asynchronous domain crossings. <code>set_clock_groups</code> is the most aggressive constraint.</p> <ul style="list-style-type: none"> <li>• Clock-based false paths are less aggressive because these constraints only cut timing on the <code>from_clock</code> to <code>to_clock</code> order specified.</li> <li>• Clock-based false paths are unlike clock groups that cut the path in both directions.</li> <li>• Path-based false paths are the most specific constraint because they cut only on the specified <code>from</code> and <code>to</code> nodes.</li> </ul>
<code>set_max_skew</code>	Sets a bound on the allowable skew between different bus bits.

*continued...*

Constraints	Description
	<ul style="list-style-type: none"> <li>Check the timing of your clock domain crossing by running the <b>Report Max Skew Summary</b> command.</li> <li>The actual skew requirements depends on your design characteristics, and how you handle the clock domain crossing.</li> </ul>
<pre>set_net_delay -max set_data_delay</pre>	<p>Sets a bound on the allowable datapath delay on any bit of a bus transfer.</p> <ul style="list-style-type: none"> <li><code>set_net_delay</code> is for constraining individual clock edges and nets. Run the <b>Report Net Delay Summary</b> command to report data for this constraint.</li> <li><code>set_data_delay</code> is for constraining entire paths. Run the <b>Report Data Delay</b> command to report data for this constraint.</li> </ul>

The following shows example constraints for a clock domain crossing between `data_a` in clock domain `clk_a`, and `data_b` in clock domain `clk_b`:

```
create_clock -name clk_a -period 4.000 [get_ports {clk_a}]
create_clock -name clk_b -period 4.500 [get_ports {clk_b}]
set_clock_groups -asynchronous -group [get_clocks {clk_a}] -group \
[get_clocks {clk_b}]
set_net_delay -from [get_registers {data_a[*]}] -to [get_registers \
{data_b[*]}] -max -get_value_from_clock_period \
dst_clock_period -value_multiplier 0.8
set_max_skew -from [get_keepers {data_a[*]}] -to [get_keepers \
{data_b[*]}] -get_skew_value_from_clock_period min_clock_period \
-skew_value_multiplier 0.8
```

The following examples show applying `set_false_path` for a design that contains a DCFIFO block to avoid timing failures in the synchronization registers. These examples are for constraining single-bit synchronizer CDC paths:

- For paths crossing from the write into the read domain, apply a false path assignment between registers `delayed_wrptr_g` and `rs_dgwp`:

```
set_false_path -from [get_registers {*dcfifo*delayed_wrptr_g[*]}] \
-to [get_registers {*dcfifo*rs_dgwp*}]
```

- For paths crossing from the read into the write domain, apply a false path assignment between registers `rdptr_g` and `ws_dgrp`:

```
set_false_path -from [get_registers {*dcfifo*rdptr_g[*]}] \
-to [get_registers {*dcfifo*ws_dgrp*}]
```

You can verify correct implementation of clock constraints in the following CDC related reports:

### 2.4.2. I/O Constraints

The Timing Analyzer reviews setup and hold relationships for designs in which an external source interacts with a register internal to the design. The Timing Analyzer supports input and output external delay modeling with the `set_input_delay` and `set_output_delay` commands. You can specify the clock and minimum and maximum arrival times relative to the clock.

Specify internal and external timing requirements before you fully analyze a design. With external timing requirements specified, the Timing Analyzer verifies the I/O interface, or periphery of the device, against any system specification.

You can use the **Check Timing** (`check_timing`) command to report problems with a variety of timing constraints, such as the number of input ports that are not clocks that have no input delay constraint.

### Related Information

[Check Timing](#) on page 161

#### 2.4.2.1. Input Constraints (`set_input_delay`)

Input constraints specify delays for all external signals feeding the FPGA. Specify input requirements for all input ports in your design.

```
set_input_delay -clock { clock } -clock_fall -fall -max 20 foo
```

Use the **Set Input Delay** (`set_input_delay`) constraint to specify external input delay requirements. Specify the **Clock name** (`-clock`) to reference the virtual or actual clock. You can specify a clock to allow the Timing Analyzer to correctly derive clock uncertainties for interclock and intraclock transfers. The clock defines the launching clock for the input port. The Timing Analyzer automatically determines the latching clock inside the device that captures the input data, because all clocks in the device are defined.

**Figure 94. Input Delay Diagram**

**Figure 95. Input Delay Calculation**

$$\begin{aligned} \text{input delay}_{\text{MAX}} &= (\text{cd\_ext}_{\text{MAX}} - \text{cd\_altr}_{\text{MIN}}) + \text{tco\_ext}_{\text{MAX}} + \text{dd}_{\text{MAX}} \\ \text{input delay}_{\text{MIN}} &= (\text{cd\_ext}_{\text{MIN}} - \text{cd\_altr}_{\text{MAX}}) + \text{tco\_ext}_{\text{MIN}} + \text{dd}_{\text{MIN}} \end{aligned}$$

If your design includes partition boundary ports, you can use the `-blackbox` option with `set_input_delay` to assign input delays. The `-blackbox` option creates a new keeper timing node with the same name as the boundary port. This new node permits the propagation of timing paths through the original boundary port and acts as a `set_input_delay` constraint. The new keeper timing nodes display when you use the `get_keepers` command. You can remove these black box constraints with `remove_input_delay -blackbox`.

You can use the **Check Timing** (`check_timing`) command to report problems with a variety of timing constraints, such as the number of input ports that are not clocks that have no input delay constraint.

### Related Information

[Check Timing](#) on page 161

#### 2.4.2.2. Output Constraints (`set_output_delay`)

Output constraints specify all external delays from the device for all output ports in your design.

```
set_output_delay -clock { clock } -clock_fall -rise -max 2 foo
```

Use the **Set Output Delay** (`set_output_delay`) constraint to specify external output delay requirements. Specify the **Clock name** (`-clock`) to reference the virtual or actual clock. When specifying a clock, the clock defines the latching clock for the output port. The Timing Analyzer automatically determines the launching clock inside the device that launches the output data, because all clocks in the device are defined. The following figure is an example of an output delay referencing a virtual clock.

**Figure 96. Output Delay Diagram**

**Figure 97. Output Delay Calculation**

$$\begin{aligned}\text{output delay}_{\text{MAX}} &= dd_{\text{MAX}} + tsu\_ext + (cd\_altr_{\text{MAX}} - cd\_ext_{\text{MIN}}) \\ \text{output delay}_{\text{MIN}} &= (dd_{\text{MIN}} - th\_ext + (cd\_altr_{\text{MIN}} - cd\_ext_{\text{MAX}}))\end{aligned}$$

If your design includes partition boundary ports, you can use the `-blackbox` option with `set_output_delay` to assign output delays. The `-blackbox` option creates a new keeper timing node with the same name as the boundary port. This new node permits the propagation of timing paths through the original boundary port and acts as a `set_output_delay` constraint. The new keeper timing nodes display when you use the `get_keepers` command.

You can remove blackbox constraints with `remove_output_delay -blackbox`.

You can use the **Check Timing** (`check_timing`) command to report problems with a variety of timing constraints, such as the number of output ports that have no output delay constraint.

### 2.4.3. Delay and Skew Constraints

You can specify skew and delays to model external device timing and board timing parameters.

#### 2.4.3.1. Advanced I/O Timing and Board Trace Model Delay

The Timing Analyzer can use advanced I/O timing and board trace model constraints to model I/O buffer delays in your design.

If you change any advanced I/O timing settings or board trace model assignments, recompile your design before you analyze timing, or use the `-force_dat` option to force delay annotation when you create a timing netlist.

#### Example 6. Forcing Delay Annotation

```
create_timing_netlist -force_dat
```

#### 2.4.3.2. Maximum Skew (set\_max\_skew)

The **Set Max Skew** (`set_max_skew`) constraint specifies the maximum allowable skew between the sets of registers or ports you specify. In order to constrain skew across multiple paths, you must constrain all such paths within a single `set_max_skew` constraint.

```
set_max_skew -from_clock { clock } -to_clock { * } -from foo -to blat 2
```

The `set_max_delay`, `set_min_delay`, `set_multicycle_path`, and `set_false_path` constraints do not affect the `set_max_skew` timing constraint. However, the `set_clock_groups` constraint does impact the `set_max_skew` constraint.

**Note:** Exclusive clock groups (set with `set_clock_groups -exclusive`) override `set_max_skew` constraints.

The Timing Analyzer does not compare two paths for skew if their clocks are exclusive to each other. However, the Timing Analyzer does analyze for skew paths whose clocks are asynchronous.

**Table 20. set\_max\_skew Options**

Arguments	Description
<code>-h   -help</code>	Short help.
<code>-long_help</code>	Long help with examples and possible return values.
<code>-fall_from_clock &lt;names&gt;</code>	Valid source clocks (Tcl matches string patterns). Analysis only considers paths from falling clock edges.
<code>-fall_to_clock &lt;names&gt;</code>	Valid destination clocks (Tcl matches string patterns). Analysis only considers paths from falling clock edges.
<code>-from &lt;names&gt;<sup>(2)</sup></code>	Valid sources (Tcl matches string patterns).
<i>continued...</i>	

Arguments	Description
<code>-from_clock &lt;names&gt;</code>	Valid source clocks (Tcl matches string patterns).
<code>-get_skew_value_from_clock_period &lt;src_clock_period dst_clock_period  min_clock_period&gt;</code>	Option to interpret skew constraint as a multiple of the clock period.
<code>-rise_from_clock &lt;names&gt;</code>	Valid source clocks (Tcl matches string patterns). Analysis only considers paths from rising clock edges.
<code>-rise_to_clock &lt;names&gt;</code>	Valid destination clocks (Tcl matches string patterns). Analysis only considers paths to rising clock edges.
<code>-skew_value_multiplier &lt;multiplier&gt;</code>	Value by which the clock period multiplies to compute skew requirement.
<code>-to &lt;names&gt;<sup>(2)</sup></code>	Valid destinations (Tcl matches string patterns)
<code>-to_clock &lt;names&gt;</code>	Valid destination clocks (Tcl matches string patterns).
<code>&lt;skew&gt;</code>	The value of the skew you require.

Applying maximum skew constraints between clocks applies the constraint from all register or ports driven by the clock you specify (with the `-from` option) to all registers or ports driven by the clock you specify (with the `-to` option).

Maximum skew analysis can include data arrival times, clock arrival times, register micro parameters, clock uncertainty, on-die variation, and clock pessimism removal. Among these, the Fitter only disables clock pessimism removal by default.

Use `-get_skew_value_from_clock_period` to set the skew as a multiple of the launching or latching clock period, or whichever of the two has a smaller period. If you use this option, set `-skew_value_multiplier`, and you may not set the positional skew option. If more than one clock clocks the set of skew paths, Timing Analyzer uses the clock with smallest period to compute the skew constraint.

Click **Report Max Skew...** (`report_max_skew`) to view the max skew analysis. Since skew occurs between two or more paths, no results display if the `-from/-from_clock` and `-to/-to_clock` filters satisfy less than two paths.

#### Related Information

- [report\\_max\\_skew Command, Quartus Prime Help](#)

#### 2.4.3.3. Net Delay (`set_net_delay`)

Use the `set_net_delay` command to set the net delays and perform minimum or maximum timing analysis across nets. A net delay constraint is invalid if there is a combinational cell between the From and To nodes.

<sup>(2)</sup> Legal values for the `-from` and `-to` options are collections of clocks, registers, ports, pins, cells or partitions in a design.

The `-from` and `-to` options can be string patterns or pin, port, register, or net collections. When you use pin or net collection, include output pins or nets in the collection.

```
set_net_delay -from reg_a -to reg_c -max 20
```

**Table 21.** `set_net_delay` Options

Arguments	Description
<code>-h</code>   <code>-help</code>	Short help.
<code>-long_help</code>	Long help with examples and possible return values.
<code>-from &lt;names&gt;<sup>(3)</sup></code>	Valid source pins, ports, registers or nets (Tcl matches string patterns).
<code>-get_value_from_clock_period</code> <code>&lt;src_clock_period dst_clock_period </code> <code>min_clock_period max_clock_period&gt;</code>	Option to interpret net delay constraint as a multiple of the clock period.
<code>-max</code>	Specifies maximum delay.
<code>-min</code>	Specifies minimum delay.
<code>-to &lt;names&gt;<sup>(4)</sup></code>	Valid destination pins, ports, registers or nets (Tcl matches string patterns).
<code>-value_multiplier &lt;multiplier&gt;</code>	Value by which the clock period multiplies to compute net delay requirement.
<code>&lt;delay&gt;</code>	Delay value.

If you use the `-min` option, the Timing Analyzer calculates slack by determining the minimum delay on the edge. If you use `-max` option, the Timing Analyzer calculates slack by determining the maximum edge delay.

Use `-get_value_from_clock_period` to set the net delay requirement as a multiple of the launching or latching clock period, or whichever of the two has a smaller or larger period. If you use this option, you must not set the positional delay option. If more than one clock clocks the set of nets, the Timing Analyzer uses the net with the smallest period to compute the constraint for a `-max` constraint, and the largest period for a `-min` constraint. If no clocks are clocking the endpoints of the net (that is, if the endpoints of the nets are not registers or constraint ports), the Timing Analyzer ignores the net delay constraint.

#### Related Information

- [Timing Exception Precedence](#) on page 99
- [report\\_net\\_delay Command, Quartus Prime Help](#)

<sup>(3)</sup> If option is a wildcard ( `"*"` ) character, all the output pins and registers on timing netlist become valid source points.

<sup>(4)</sup> If no option, or if option is a wildcard ( `"*"` ) character, all the output pins and registers on timing netlist become valid destination points.

## 2.4.4. Timing Exception Constraints

Timing exception assignments allow you to modify (or provide exception to) the default timing analysis behavior to account for your specific design conditions.

You can specify the following timing constraints that modify the default timing analysis behavior:

- Set False Path
- Set Multicycle Path
- Set Minimum Delay
- Set Maximum Delay

Verify correct implementation of timing exception assignments by using the **Report Exceptions** (`report_exceptions`) command to report all exceptions to default timing analysis conditions.

### Related Information

[Report Exceptions](#) on page 159

### 2.4.4.1. Timing Exception Precedence

If the same clock or node names occur in multiple timing exceptions, the Timing Analyzer observes the following order of timing exception precedence:

1. **Set False Path** (`set_false_path`) is the first priority. False paths and clock groups have identical priority, except when you use the `-latency_insensitive` or `-no_synchronizer` options with a false path exception. With either option, the false path has priority over a clock group.
2. **Set Clock Groups** (`set_clock_groups`) is the second priority.
3. **Set Minimum Delay** (`set_min_delay`) and **Set Maximum Delay** (`set_max_delay`) are the third priority.
4. **Set Multicycle Path** (`set_multicycle_path`) is the fourth priority.

The false path timing exception has the highest precedence. Within each category, assignments to individual nodes have precedence over assignments to clocks. For exceptions of the same type:

1. `-from <node>` is the first priority.
2. `-to <node>` is the second priority.
3. `-thru <node>` is the third priority.
4. `-from <clock>` is the fourth priority.
5. `-to <clock>` is the fifth priority.

An asterisk wildcard (\*) for any of these options applies the same precedence as not specifying the option at all. For example, `-from a -to *` is treated identically to `-from a` with regards precedence.

### Precedence example

1. `set_max_delay 1 -from x -to y`
2. `set_max_delay 2 -from x`
3. `set_max_delay 3 -to y`

The first exception has higher priority than either of the other two, since the first exception specifies a `-from` (while #3 does not) and specifies a `-to` (while #2 does not). In the absence of the first exception, the second exception has higher priority than the third, since the second exception specifies a `-from`, which the third does not. Finally, the remaining order of precedence for additional exceptions is order-dependent, such that the assignments most recently created overwrite, or partially overwrite, earlier assignments.

The `set_net_delay`, `set_max_skew`, and `set_data_delay` constraints analyze independently of minimum or maximum delays, or multicycle path constraints.

- The `set_net_delay` exception applies regardless of the existence of a `set_false_path` exception, or `set_clock_groups` exception, or other path-based constraint or exception. It is a net-based exception, and net-based and path-based exceptions are applied independently of each other.
- The `set_max_skew` exception applies on paths cut by an asynchronous clock group, and regardless of any `set_false_path` exception. Exclusive clock groups override max skew exceptions, because paths between exclusive clocks are entirely inactive and should not be analyzed for timing or skew requirements. This precedence allows you to define more targeted constraints on asynchronous CDC bus transfers.
- The `set_data_delay` exception specifies a maximum datapath delay exception for a given path. Exclusive clock groups override data delay exceptions, because paths between exclusive clocks are entirely inactive and should not be analyzed for timing or data delay requirements. Asynchronous clock groups do not override data delay exceptions. False path exceptions override data delay exceptions in the Quartus Prime Pro software version 21.2 and earlier. Beginning in version 21.3, false path exceptions do not override data delay exceptions. This change in precedence allows you to write more targeted constraints on asynchronous CDC bus transfers.

Verify correct implementation of timing exception assignments by using the **Report Exceptions** (`report_exceptions`) command to report all exceptions to default timing analysis conditions.

#### 2.4.4.2. False Paths (`set_false_path`)

The **Set False Path** (`set_false_path`) constraint allows you to exclude a path from timing analysis, such as test logic or any other path not relevant to the circuit's operation. You can specify the source (`-from`), common through elements (`-thru`), and destination (`-to`) elements of that path.

The following SDC command makes false path exceptions from all registers starting with A, to all registers starting with B:

```
set_false_path -from [get_pins A*] -to [get_pins B*]
```

You can specify either a point-to-point or clock-to-clock path as a false path. A false path's `-from` and `-to` targets can be either nodes or clocks. However, the `-thru` targets can only be combinational nodes. For example, you can specify a false path for a static configuration register that writes once during power-up initialization, but does not change state again.

Although signals from static configuration registers often cross clock domains, you may not want to make false path exceptions to a clock-to-clock path, because some data may transfer across clock domains. However, you can selectively make false path exceptions from the static configuration register to all endpoints.

The Timing Analyzer assumes all clocks are related unless you specify otherwise. Use clock groups to more efficiently make false path exceptions between clocks, rather than writing multiple `set_false_path` exceptions between each clock transfer you want to eliminate.

Verify correct implementation of timing exception assignments by using the **Report Exceptions** (`report_exceptions`) command to report all exceptions to default timing analysis conditions.

#### Related Information

#### 2.4.4.3. Minimum and Maximum Delays

To specify an absolute minimum or maximum delay for a path, use the **Set Minimum Delay** (`set_min_delay`) or the **Set Maximum Delay** (`set_max_delay`) constraints, respectively. Specifying minimum and maximum delay directly overwrites existing setup and hold relationships with the minimum and maximum values.

Use the `set_max_delay` and `set_min_delay` constraints for asynchronous signals that do not have a specific clock relationship in your design, but require a minimum and maximum path delay. You can create minimum and maximum delay exceptions for port-to-port paths through the device without a register stage in the path. If you

use minimum and maximum delay exceptions to constrain the path delay, specify both the minimum and maximum delay of the path; do not constrain only the minimum or maximum value.

If the source or destination node is clocked, the Timing Analyzer takes into account the clock paths, allowing more or less delay on the data path. If the source or destination node has an input or output delay, the minimum or maximum delay check also includes that delay.

If you specify a minimum or maximum delay between timing nodes, the delay applies only to the path between the two nodes. If you specify a minimum or maximum delay for a clock, the delay applies to all paths where the clock clocks the source node or destination node.

You can create a minimum or maximum delay exception for an output port that does not have an output delay constraint. You cannot report timing for the paths that relate to the output port; however, the Timing Analyzer reports any slack for the path in the setup summary and hold summary reports. Because there is no clock that relates to the output port, the Timing Analyzer reports no clock for timing paths of the output port.

**Note:** To report timing with clock filters for output paths with minimum and maximum delay constraints, you can set the output delay for the output port with a value of zero. You can use an existing clock from the design or a virtual clock as the clock reference.

Verify correct implementation of timing exception assignments by using the **Report Exceptions** (`report_exceptions`) command to report all exceptions to default timing analysis conditions.

#### Related Information

#### 2.4.4.4. Multicycle Paths

By default, the Timing Analyzer performs a single-cycle analysis, which is the most restrictive type of analysis. When analyzing a path without a multicycle constraint, the Timing Analyzer determines the setup launch and latch edge times by identifying the closest two active edges in the respective waveforms.

**Figure 98. Default Setup and Hold Relationship (No Multicycle)**

For hold time analysis, the timing analyzer analyzes the path for two timing conditions for every possible setup relationship, not just the worst-case setup relationship. Therefore, the hold launch and latch times can be unrelated to the setup launch and latch edges.

A multicycle constraint adjusts this default setup or hold relationship by the number of clock cycles you specify, based on the source (`-start`) or destination (`-end`) clock. A setup multicycle constraint of 2 extends the worst-case setup latch edge by one destination clock period. If you do not specify `-start` and `-end` values, the default constraint is `-end`.

**Figure 99. Setup and Hold Relationship with Multicycle = 2**

Hold multicycle constraints derive from the default hold position (the default value is 0). An end hold multicycle constraint of 1 effectively subtracts one destination clock period from the default hold latch edge.

When the objects are timing nodes, the multicycle constraint only applies to the path between the two nodes. When an object is a clock, the multicycle constraint applies to all paths where the source node (`-from`) or destination node (`-to`) is clocked by the clock. When you adjust a setup relationship with a multicycle constraint, the default hold relationship adjusts automatically.

You can use timing constraints to modify either the launch or latch edge times that the Timing Analyzer uses to determine a setup relationship or hold relationship.

**Table 22. Multicycle Constraints**

Command	Modification
<code>set_multicycle_path -setup -end &lt;value&gt;</code>	Latch edge time of the setup relationship.
<code>set_multicycle_path -setup -start&lt;value&gt;</code>	Launch edge time of the setup relationship.
<code>set_multicycle_path -hold -end &lt;value&gt;</code>	Latch edge time of the hold relationship.
<code>set_multicycle_path -hold -start &lt;value&gt;</code>	Launch edge time of the hold relationship.

Verify correct implementation of timing exception assignments by using the **Report Exceptions** (`report_exceptions`) command to report all exceptions to default timing analysis conditions.

#### Related Information

[Report Exceptions](#) on page 159

#### 2.4.4.4.1. Common Multicycle Applications

Multicycle exceptions adjust the timing requirements for a register-to-register path, allowing the Fitter to optimally place and route a design. Two common multicycle applications are relaxing setup to allow a slower data transfer rate, and altering the setup to account for a phase shift.

#### 2.4.4.4.2. Relaxing Setup with Multicycle (set\_multicycle\_path)

You can use a multicycle exception when the data transfer rate is slower than the clock cycle. Relaxing the setup relationship increases the window when timing analysis accepts data as valid.

In the following example, the source clock has a period of 10 ns, but the clock enable signal controls a group of latching registers, so the registers only enable every other cycle. The 10 ns clock feeds registers, so the Timing Analyzer reports a setup of 10 ns and a hold of 0 ns. However, the data is transferring every other cycle, so the Timing Analyzer must analyze the relationships as if the clock is operating at 20 ns. The result is a setup of 20 ns, while the hold remains 0 ns, thus extending the window for data recognition.

The following pair of multicycle assignments relax the setup relationship by specifying the `-setup` value of N and the `-hold` value as N-1. You must specify the hold relationship with a `-hold` assignment to prevent a positive hold requirement.

##### Constraint to Relax Setup and Maintain Hold

```
set_multicycle_path -setup -from src_reg* -to dst_reg* 2
set_multicycle_path -hold -from src_reg* -to dst_reg* 1
```

**Figure 100. Multicycle Setup Relationships**

You can extend this pattern to create larger setup relationships to ease timing closure requirements. A common use for this exception is when writing to asynchronous RAM across an I/O interface. The delay between address, data, and a write enable may be several cycles. A multicycle exception to I/O ports allows extra time for the address and data to resolve before the enable occurs.

The following constraint relaxes the setup by three cycles:

### Three Cycle I/O Interface Constraint

```
set_multicycle_path -setup -to [get_ports {SRAM_ADD[*] SRAM_DATA[*]}] 3
set_multicycle_path -hold -to [get_ports {SRAM_ADD[*] SRAM_DATA[*]}] 2
```

#### 2.4.4.4.3. Accounting for a Phase Shift (-phase)

In the following example, the design contains a PLL that performs a phase-shift on a clock whose domain exchanges data with domains that do not experience the phase shift. This occurs when the destination clock phase-shifts forward, and the source clock does not shift. The default setup relationship becomes that phase-shift, thus shifting the window when data is valid.

For example, the following code phase-shifts one output of a PLL forward by a small amount, in this case 0.2 ns.

### Cross Domain Phase-Shift

```
create_generated_clock -source pll|inclk[0] -name pll|clk[0] pll|clk[0]
create_generated_clock -source pll|inclk[0] -name pll|clk[1] -phase 30 pll|clk[1]
```

The default setup relationship for this phase-shift is 0.2 ns, shown in Figure A, creating a scenario where the hold relationship is negative, which makes achieving timing closure nearly impossible.

**Figure 101. Phase-Shifted Setup and Hold**

The following constraint allows the data to transfer to the following edge:

```
set_multicycle_path -setup -from [get_clocks clk_a] -to [get_clocks clk_b] 2
```

The hold relationship derives from the setup relationship, making a multicycle hold constraint unnecessary.

### 2.4.4.5. Multicycle Exception Examples

The examples in this section illustrate how the multicycle exceptions affect the default setup and hold analysis in the Timing Analyzer. The multicycle exceptions apply to a simple register-to-register circuit. Both the source and destination clocks are set to 10 ns.

Verify correct implementation of timing exception assignments by using the **Report Exceptions** (`report_exceptions`) command to report all exceptions to default timing analysis conditions.

#### Related Information

[Report Exceptions](#) on page 159

#### 2.4.4.5.1. Default Multicycle Analysis

By default, the Timing Analyzer performs a single-cycle analysis to determine the setup and hold checks. Also, by default, the Timing Analyzer sets the end multicycle setup assignment value to one and the end multicycle hold assignment value to zero.

The source and the destination timing waveform for the source register and destination register, respectively where HC1 and HC2 are hold checks 1 and 2 and SC is the setup check.

**Figure 102. Default Timing Diagram**

The timing waveforms show the source and destination registers of a data transfer. HC1 and HC2 are the hold checks that Timing Analyzer performs. SC is the setup check that Timing Analyzer performs.

**Figure 103. Setup Check Calculation**

$$\begin{aligned}
 \text{setup check} &= \text{current latch edge} - \text{closest previous launch edge} \\
 &= 10 \text{ ns} - 0 \text{ ns} \\
 &= 10 \text{ ns}
 \end{aligned}$$

The most restrictive default single-cycle setup relationship, with an implied end multicycle setup assignment of one, is 10 ns.

**Figure 104. Default Setup Report**

Path #1: Setup slack is 8.226					
Path Summary		Statistics	Data Path	Waveform	
Data Arrival Path					
	Total	Incr	RF	Type	Element
1	0.000	0.000			launch edge time
2	0.000	0.000		borrow	time borrowed

**Figure 105. Hold Check Calculation**

The figure shows the setup timing report with the launch and latch edge times highlighted.

$$\begin{aligned}
 \text{hold check 1} &= \text{current launch edge} - \text{previous latch edge} \\
 &= 0 \text{ ns} - 0 \text{ ns} \\
 &= 0 \text{ ns}
 \end{aligned}$$

$$\begin{aligned}
 \text{hold check 2} &= \text{next launch edge} - \text{current latch edge} \\
 &= 10 \text{ ns} - 10 \text{ ns} \\
 &= 0 \text{ ns}
 \end{aligned}$$

The most restrictive default single-cycle hold relationship, with an implied end multicyle hold assignment of zero, is 0ns.

**Figure 106. Default Hold Report**

The figure shows the hold timing report with the launch and latch edge times highlighted.

#### 2.4.4.5.2. End Multicycle Setup = 2 and End Multicycle Hold = 0

In this example, the end multicycle setup assignment value is two, and the end multicycle hold assignment value is zero.

#### Multicycle Constraint

```
set_multicycle_path -from [get_clocks clk_src] -to [get_clocks clk_dst] \
    -setup -end 2
```

**Note:** The Timing Analyzer does not require an end multicycle hold value because the default end multicycle hold value is zero.

In this example, the setup relationship relaxes by a full clock period by moving the latch edge to the next latch edge. The hold analysis is does not change from the default settings. The following shows the setup timing diagram for the analysis that the Timing Analyzer performs. The latch edge is a clock cycle later than in the default single-cycle analysis.

**Figure 107. Setup Timing Diagram**

**Figure 108. Setup Check Calculation**

$$\begin{aligned}\text{setup check} &= \text{current latch edge} - \text{closest previous launch edge} \\ &= 20 \text{ ns} - 0 \text{ ns} \\ &= 20 \text{ ns}\end{aligned}$$

The most restrictive setup relationship with an end multicycle setup assignment of two is 20 ns. The following shows the setup report in the Timing Analyzer and highlights the launch and latch edges.

**Figure 109. Setup Report with Setup Multicycle Exception**

Path #1: Setup slack is 18.226					
Path Summary   Statistics   Data Path   Waveform

5	21.996	0.043		uTsu	dst

Because the multicycle hold latch and launch edges are the same as the results of hold analysis with the default settings, the multicycle hold analysis in this example is equivalent to the single-cycle hold analysis. The hold checks are relative to the setup check. Normally, the Timing Analyzer performs hold checks on every possible setup check, not only on the most restrictive setup check edges.

**Figure 110. Hold Timing Diagram**

**Figure 111. Hold Report with Setup Multicycle Exception**

**Figure 112. Hold Check Calculation**

$$\begin{aligned}
 \text{hold check 1} &= \text{current launch edge} - \text{previous latch edge} \\
 &= 0 \text{ ns} - 10 \text{ ns} \\
 &= -10 \text{ ns} \\
 \\ 
 \text{hold check 2} &= \text{next launch edge} - \text{current latch edge} \\
 &= 10 \text{ ns} - 20 \text{ ns} \\
 &= -10 \text{ ns}
 \end{aligned}$$

#### 2.4.4.5.3. End Multicycle Setup = 2 and End Multicycle Hold = 1

In this example, the end multicycle setup assignment value is two, and the end multicycle hold assignment value is one.

##### Multicycle Constraint

```

set_multicycle_path -from [get_clocks clk_src] -to [get_clocks clk_dst] \
    -setup -end 2
set_multicycle_path -from [get_clocks clk_src] -to
    \[get_clocks clk_dst] -hold -end 1

```

In this example, the setup relationship relaxes by one clock period by moving the latching edge to the right of the default latching edge by 1 clock period. The hold relationship relaxes by one clock period by moving the latch edges to the left of the default latching edges by one.

The following shows the setup timing diagram for the analysis that the Timing Analyzer performs:

**Figure 113. Setup Timing Diagram**

**Figure 114. Setup Check Calculation**

$$\begin{aligned} \text{setup check} &= \text{current latch edge} - \text{closest previous launch edge} \\ &= 20 \text{ ns} - 0 \text{ ns} \\ &= 20 \text{ ns} \end{aligned}$$

The most restrictive hold relationship with an end multicycle setup assignment value of two is 20 ns.

The following shows the setup report for this example in the Timing Analyzer and highlights the launch and latch edges.

**Figure 115. Setup Report with Setup and Hold Multicycle Exception**

Path #1: Setup slack is 18.226					
Path Summary		Statistics	Data Path	Waveform	
Data Arrival Path					
	Total	Incr	RF	Type	Element

1	21.983	1.983	R		clock network delay
4	21.953	-0.030			clock uncertainty
5	21.996	0.043		uTsu	dst

The following shows the timing diagram for the hold checks for this example. The hold checks are relative to the setup check.

**Figure 116. Hold Timing Diagram**

**Figure 117. Hold Check Calculation**

hold check 1 = current launch edge – previous latch edge  
= 0 ns – 0 ns  
= 0 ns

hold check 2 = next launch edge – current latch edge  
= 10 ns – 10 ns  
= 0 ns

The most restrictive hold relationship with an end multicycle setup assignment value of two and an end multicycle hold assignment value of one is 0 ns.

The following shows the hold report for this example in the Timing Analyzer and highlights the launch and latch edges.

**Figure 118. Hold Report with Setup and Hold Multicycle Exception**

Path #1: Hold slack is 0.230					
Path Summary		Statistics	Data Path		Waveform
Data Arrival Path					
	Total	Incr	RF	Type	Element

5	1.299	0.135		uTh	dst

#### 2.4.4.5.4. Same Frequency Clocks with Destination Clock Offset

In this example, the source and destination clocks have the same frequency, but the destination clock is offset with a positive phase shift. Both the source and destination clocks have a period of 10 ns. The destination clock has a positive phase shift of 2 ns with respect to the source clock.

The following example shows a design with the same frequency clocks and a destination clock offset.

**Figure 119. Same Frequency Clocks with Destination Clock Offset Diagram**

The following timing diagram shows the default setup check analysis that the Timing Analyzer performs.

**Figure 120. Setup Timing Diagram**

**Figure 121. Setup Check Calculation**

$$\begin{aligned} \text{setup check} &= \text{current latch edge} - \text{closest previous launch edge} \\ &= 2 \text{ ns} - 0 \text{ ns} \\ &= 2 \text{ ns} \end{aligned}$$

The setup relationship shown is too pessimistic and is not the setup relationship required for typical designs. To adjust the default analysis, you assign an end multicycle setup exception of two. The following shows a multicycle exception that adjusts the default analysis:

#### Multicycle Constraint

```
set_multicycle_path -from [get_clocks clk_src] -to [get_clocks clk_dst] \
-setup -end 2
```

The following timing diagram shows the preferred setup relationship for this example:

**Figure 122. Preferred Setup Relationship**

The following timing diagram shows the default hold check analysis that the Timing Analyzer performs with an end multicycle setup value of two.

**Figure 123. Default Hold Check**

**Figure 124. Hold Check Calculation**

$$\begin{aligned}\text{hold check 1} &= \text{current launch edge} - \text{previous latch edge} \\ &= 0 \text{ ns} - 2 \text{ ns} \\ &= -2 \text{ ns}\end{aligned}$$

$$\begin{aligned}\text{hold check 2} &= \text{next launch edge} - \text{current latch edge} \\ &= 10 \text{ ns} - 12 \text{ ns} \\ &= -2 \text{ ns}\end{aligned}$$

In this example, the default hold analysis returns the preferred hold requirements and no multicycle hold exceptions are required.

The associated setup and hold analysis if the phase shift is -2 ns. In this example, the default hold analysis is correct for the negative phase shift of 2 ns, and no multicycle exceptions are required.

**Figure 125. Negative Phase Shift**

The figure shows an example of the setup and hold analysis for a negative phase shift of -2 ns. In this example, the default setup and hold analysis are correct, and no multicycle exceptions are required.

#### 2.4.4.5.5. Destination Clock Frequency is a Multiple of the Source Clock Frequency

In this example, the destination clock frequency value of 5 ns is an integer multiple of the source clock frequency of 10 ns. The destination clock frequency can be an integer multiple of the source clock frequency when a PLL generates both clocks with a phase shift on the destination clock.

The following example shows a design in which the destination clock frequency is a multiple of the source clock frequency.

**Figure 126. Destination Clock is Multiple of Source Clock**

The following timing diagram shows the default setup check analysis that the Timing Analyzer performs:

**Figure 127. Setup Timing Diagram**

**Figure 128. Setup Check Calculation**

$$\begin{aligned} \text{setup check} &= \text{current latch edge} - \text{closest previous launch edge} \\ &= 5 \text{ ns} - 0 \text{ ns} \\ &= 5 \text{ ns} \end{aligned}$$

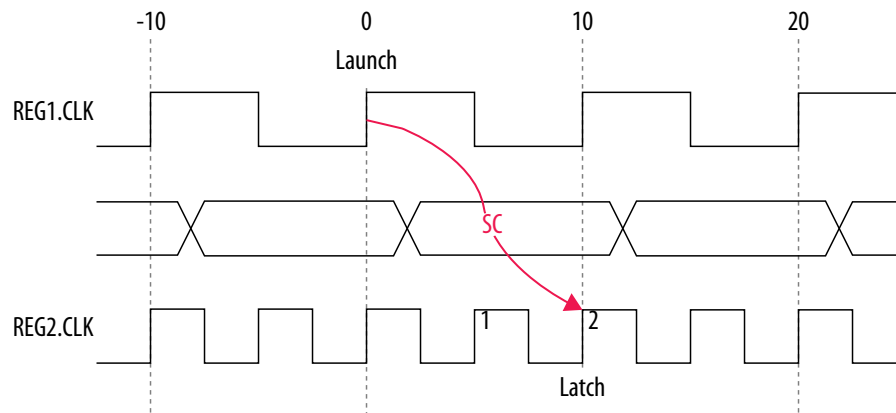

The setup relationship demonstrates that the data requires capture at edge two; therefore, you can relax the setup requirement. To correct the default analysis, you shift the latch edge by one clock period with an end multicycle setup exception of two. The following multicycle exception assignment adjusts the default analysis in this example:

#### Multicycle Constraint

```
set_multicycle_path -from [get_clocks clk_src] -to [get_clocks clk_dst] \
-setup -end 2
```

The following timing diagram shows the preferred setup relationship for this example:

**Figure 129. Preferred Setup Analysis**

The following timing diagram shows the default hold check analysis the Timing Analyzer performs with an end multicycle setup value of two.

**Figure 130. Default Hold Check**

**Figure 131. Hold Check Calculation**

$$\begin{aligned}\text{hold check 1} &= \text{current launch edge} - \text{previous latch edge} \\ &= 0 \text{ ns} - 5 \text{ ns} \\ &= -5 \text{ ns}\end{aligned}$$

$$\begin{aligned}\text{hold check 2} &= \text{next launch edge} - \text{current latch edge} \\ &= 10 \text{ ns} - 10 \text{ ns} \\ &= 0 \text{ ns}\end{aligned}$$

In this example, hold check one is too restrictive. The data is launched by the edge at 0 ns and must check against the data captured by the previous latch edge at 0 ns, which does not occur in hold check one. To correct the default analysis, you must use an end multicycle hold exception of one.

#### 2.4.4.5.6. Destination Clock Frequency is a Multiple of the Source Clock Frequency with an Offset

This example is a combination of the previous two examples. The destination clock frequency is an integer multiple of the source clock frequency, and the destination clock has a positive phase shift. The destination clock frequency is 5 ns, and the source clock frequency is 10 ns. The destination clock also has a positive offset of 2 ns with respect to the source clock. The destination clock frequency can be an integer multiple of the source clock frequency. The destination clock frequency can be with an offset when a PLL generates both clocks with a phase shift on the destination clock.

The following example shows a design in which the destination clock frequency is a multiple of the source clock frequency with an offset.

**Figure 132. Destination Clock is Multiple of Source Clock with Offset**

The timing diagram for the default setup check analysis the Timing Analyzer performs.

**Figure 133. Setup Timing Diagram**

**Figure 134. Setup Check Calculation**

$$\begin{aligned} \text{setup check} &= \text{current latch edge} - \text{closest previous launch edge} \\ &= 2 \text{ ns} - 0 \text{ ns} \\ &= 2 \text{ ns} \end{aligned}$$

The setup relationship in this example demonstrates that the data does not require capture at edge one, but rather requires capture at edge three; therefore, you can relax the setup requirement. To adjust the default analysis, you shift the latch edge by two clock periods, and specify an end multicycle setup exception of three.

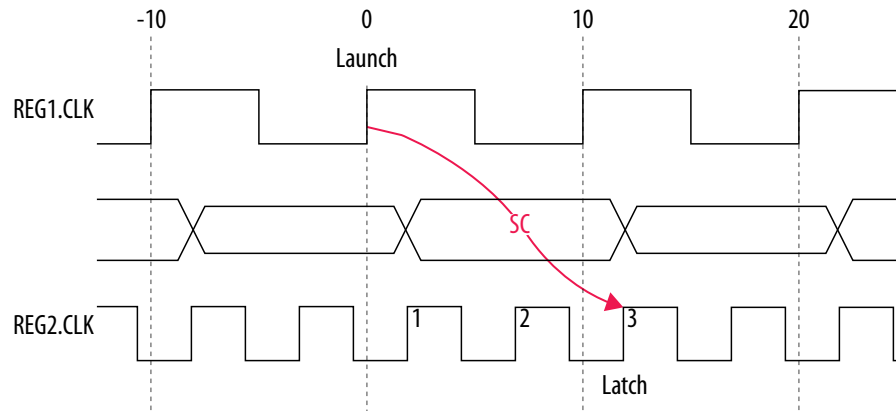

The multicycle exception adjusts the default analysis in this example:

### Multicycle Constraint

```
set_multicycle_path -from [get_clocks clk_src] -to [get_clocks clk_dst] \
-setup -end 3
```

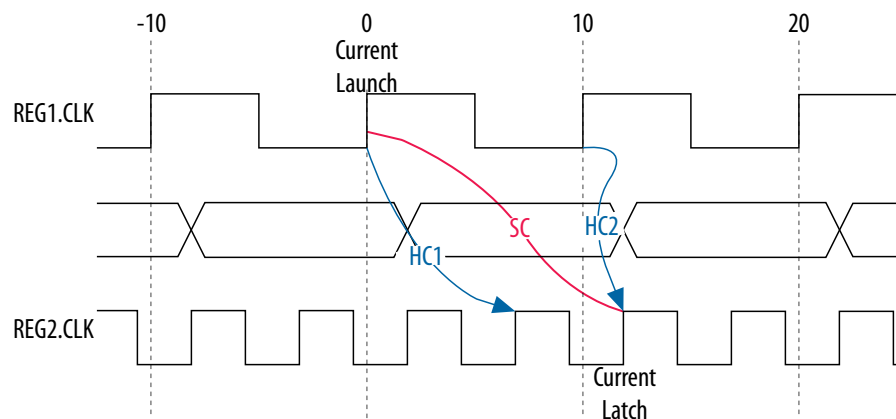

The timing diagram for the preferred setup relationship for this example.

**Figure 135. Preferred Setup Analysis**

The following timing diagram shows the default hold check analysis that the Timing Analyzer performs with an end multicycle setup value of three:

**Figure 136. Default Hold Check**

**Figure 137. Hold Check Calculation**

hold check 1	= current launch edge – previous latch edge
	= 0 ns – 7 ns
	= –7 ns
hold check 2	= next launch edge – current latch edge
	= 10 ns – 12 ns
	= –2 ns

In this example, the hold check one is too restrictive. The data is launched by the edge at 0 ns, and must check against the data that the previous latch edge at 2ns captures. You can use the multicycle hold assignment of 1 to correct this.

#### 2.4.4.5.7. Source Clock Frequency is a Multiple of the Destination Clock Frequency

In this example, the source clock frequency value of 5 ns is an integer multiple of the destination clock frequency of 10 ns. The source clock frequency can be an integer multiple of the destination clock frequency when a PLL generates both clocks and use different multiplication and division factors.

In the following example the source clock frequency is a multiple of the destination clock frequency:

**Figure 138. Source Clock Frequency is Multiple of Destination Clock Frequency:**

The following timing diagram shows the default setup check analysis the Timing Analyzer performs:

**Figure 139. Default Setup Check Analysis**

**Figure 140. Setup Check Calculation**

$$\begin{aligned}\text{setup check} &= \text{current latch edge} - \text{closest previous launch edge} \\ &= 10 \text{ ns} - 5 \text{ ns} \\ &= 5 \text{ ns}\end{aligned}$$

The setup relationship demonstrates that the data launched at edge one does not require capture, and the data launched at edge two requires capture; therefore, you can relax the setup requirement. To correct the default analysis, you shift the launch edge by one clock period with a start multicycle setup exception of two. The following multicycle exception adjusts the default analysis in this example:

### Multicycle Constraint

```
set_multicycle_path -from [get_clocks clk_src] -to [get_clocks clk_dst] \
-setup -start 2
```

The following timing diagram shows the preferred setup relationship for this example:

**Figure 141. Preferred Setup Check Analysis**

The following timing diagram shows the default hold check analysis the Timing Analyzer performs for a start multicycle setup value of two:

**Figure 142. Default Hold Check**

**Figure 143. Hold Check Calculation**

$$\begin{aligned}\text{hold check 1} &= \text{current launch edge} - \text{previous latch edge} \\ &= 0 \text{ ns} - 0 \text{ ns} \\ &= 0 \text{ ns} \\ \\ \text{hold check 2} &= \text{next launch edge} - \text{current latch edge} \\ &= 5 \text{ ns} - 10 \text{ ns} \\ &= -5 \text{ ns}\end{aligned}$$

In this example, the hold check two is too restrictive. The data is launched next by the edge at 10 ns and must check against the data captured by the current latch edge at 10 ns, which does not occur in hold check two. To correct the default analysis, you use a start multicyle hold exception of one.

#### 2.4.4.5.8. Source Clock Frequency is a Multiple of the Destination Clock Frequency with an Offset

In this example, the source clock frequency is an integer multiple of the destination clock frequency and the destination clock has a positive phase offset. The source clock frequency is 5 ns and destination clock frequency is 10 ns. The destination clock also has a positive offset of 2 ns with respect to the source clock. The source clock frequency can be an integer multiple of the destination clock frequency with an offset when a PLL generates both clocks with different multiplication.

**Figure 144. Source Clock Frequency is Multiple of Destination Clock Frequency with Offset**

The following timing diagram shows the default setup check analysis the Timing Analyzer performs:

**Figure 145. Setup Timing Diagram**

**Figure 146. Setup Check Calculation**

$$\begin{aligned}\text{setup check} &= \text{current latch edge} - \text{closest previous launch edge} \\ &= 12 \text{ ns} - 10 \text{ ns} \\ &= 2 \text{ ns}\end{aligned}$$

The setup relationship in this example demonstrates that the data is not launched at edge one, and the data that is launched at edge three must be captured; therefore, you can relax the setup requirement. To correct the default analysis, you shift the launch edge by two clock periods with a start multicycle setup exception of three.

The following multicycle exception adjusts the default analysis in this example:

#### Multicycle Constraint

```
set_multicycle_path -from [get_clocks clk_src] -to [get_clocks clk_dst] \
-setup -start 3
```

The following timing diagram shows the preferred setup relationship for this example:

**Figure 147. Preferred Setup Check Analysis**

The Timing Analyzer performs the following calculation to determine the hold check:

**Figure 148. Hold Check Calculation**

$$\begin{aligned}\text{hold check 1} &= \text{current launch edge} - \text{previous latch edge} \\ &= 0 \text{ ns} - 2 \text{ ns} \\ &= -2 \text{ ns} \\ \text{hold check 2} &= \text{next launch edge} - \text{current latch edge} \\ &= 5 \text{ ns} - 12 \text{ ns} \\ &= -7 \text{ ns}\end{aligned}$$

The following timing diagram shows the default hold check analysis the Timing Analyzer performs for a start multicycle setup value of three:

**Figure 149. Default Hold Check Analysis**

In this example, the hold check two is too restrictive. The data is launched next by the edge at 10 ns and must check against the data captured by the current latch edge at 12 ns, which does not occur in hold check two. To correct the default analysis, you must specify a multicycle hold exception of one.

### 2.4.5. Delay Annotation

To modify the default delay values used during timing analysis, use the `set_annotated_delay` and `set_timing_derate` commands. You must update the timing netlist to apply these commands.

To specify different operating conditions in a single `.sdc` file, rather than having multiple `.sdc` files that specify different operating conditions, use the `set_annotated_delay -operating_conditions` command.

## 2.5. Timing Report Descriptions

The Timing Analyzer generates only a subset of all available reports by default, including the Setup Summary and Timing Analyzer Summary reports. However, you can generate dozens of other detailed reports in the Timing Analyzer GUI, or with command-line commands to help pin-point timing issues. You can customize the display of information in the reports.

You can automatically generate reports that are useful to you, to display after opening a project in the stand-alone Timing Analyzer GUI, as [The quartus\\_staw executable](#) describes.

The following section describes a partial list of all the timing analysis reports that you can generate:

- [Report Fmax Summary](#) on page 127
- [Report Timing](#) on page 128
- [Report Timing By Source Files](#) on page 134
- [Report Data Delay](#) on page 134
- [Report Net Delay](#) on page 134
- [Report Clocks and Clock Network](#) on page 135

### Related Information

- [Step 4: Analyze Timing Reports](#) on page 40

## 2.5.1. Report Fmax Summary

The Timing Analyzer **Reports > Datasheet > Report Fmax Summary** command generates a report panel showing the potential maximum frequency for every clock in your design. The **Fmax** column reports the fastest frequency that your clock can run, and still pass `report_timing -setup -intra_clock` with a slack of 0. The equivalent console command is `report_clock_fmax_summary`.

**Figure 150. Fmax Summary Report**

	Fmax	Restricted Fmax	Clock Name	Note	Worst-Case Operating Conditions
1	180.08 MHz	180.08 MHz	clk		Slow 900mV 100C Model

**Note:** The related `get_clock_fmax_info` command returns a Tcl list, which is useful for scripting and parsing. Refer to `get_clock_fmax_info (::quartus::sta)` in *Quartus Prime Pro Edition User Guide Scripting*.

Timing analysis only computes  $f_{MAX}$  for paths where the source and destination registers or ports are driven by the same clock. Timing analysis ignore paths of different clocks, including generated clocks. For paths between a clock and its inversion, the Timing Analyzer computes  $f_{MAX}$  as if the rising and falling edges of the clock scale along with  $f_{MAX}$ , such that duty cycle (by percentage) is maintained.

However, the **Fmax** report does not indicate whether your design meets timing for recovery, removal, nor setup or hold without the `intra_clock` option. For these reasons, always make sure to view the Setup, Hold, Recovery, Removal, and Min Pulse Width slack summaries to determine whether your design meets timing.

The **Restricted Fmax** column reports the lesser of the following values:

- The fastest frequency that your clock can run, and still pass `report_timing -hold -intra_clock` with a slack of 0 or `report_min_pulse_width` with a slack of 0.
- The **Fmax** column value.<sup>(5)</sup>

**Restricted Fmax** considers hold timing in addition to setup timing, as well as minimum pulse and minimum period restrictions. Similar to unrestricted  $f_{MAX}$ , the analysis computes the restricted  $f_{MAX}$  as if the rising and falling edges of the clock scale along with  $f_{MAX}$ , such that the duty cycle (in terms of a percentage) is maintained.

The **Restricted Fmax** may display text indicating any of the following limiting factors:

- Limit due to hold check
- Limit due to minimum pulse width restriction
- Limit due to high minimum pulse width restriction
- Limit due to low minimum pulse width restriction

<sup>(5)</sup> The **Restricted Fmax** column never reports a value higher than the **Fmax** column.

Typically, hold checks do not limit the maximum frequency ( $f_{MAX}$ ) because the checks are for same-edge relationships, and therefore independent of clock frequency. For example, when launch equals zero and latch equals zero. However, with an inverted clock transfer, or a multicycle transfer, the hold relationship is not a same-edge transfer and changes with the clock frequency.

Refer to the timing reports, such as those that you can generate using `report_timing`, or using minimum pulse width reports via the `report_min_pulse_width` command for details of specific paths, registers, or ports.

[Quartus Prime Pro Edition User Guide: Scripting](#)

## 2.5.2. Report Timing

The Timing Analyzer's **Reports > Timing Slack > Report Timing...** command allows you to specify settings to report the timing of any path or clock domain in the design. The equivalent scripting command is `report_timing`.

**Figure 151. Report Timing Report**

Report Timing						
Command Info		Summary of Paths				
	Slack ▾	From Node	To Node	Launch Clock	Latch Clock	Relationship
1	39.103	addr...g[2]	my_...[2]	clk	clk	40.000
2	39.144	addr...g[2]	my_...[2]	clk	clk	40.000
3	39.153	addr...g[2]	my_...[2]	clk	clk	40.000
◀						
Path #1: Setup slack is 39.103						
Path Summary		Statistics	Data Path	Waveform		
	Property			Value		
1	From Node			addressr_reg[2]		
2	To Node			my_mlab_inst0 radd_reg_b[2]		
3	Launch Clock			clk		
4	Latch Clock			clk		
5	Data Arrival Time			3.055		
6	Data Required Time			42.158		
7	Slack			39.103		
8	Worst-Case Operating Conditions			Slow 900mV 100C Model		

You can specify diverse options to customize the reporting. You can specify the **Clocks** and **Targets** that the report displays, the **Analysis Type** to run, whether to display **Extra Info** in the report, and the **Output** options for the report. For example, you can increase the number of paths to report, add a **Target** filter, and add a **From Clock**.

**Figure 152. Report Timing Dialog Box (Top Section)**

**Figure 153. Report Timing Dialog Box (Bottom Section)**

**Table 23. Report Timing Settings**

Option	Description
<b>Clocks</b>	<b>From Clock</b> and <b>To Clock</b> filter paths in the report to show only the launching or latching clocks you specify.
<b>Targets</b>	Specifies the target node for <b>From Clock</b> and <b>To Clock</b> to report paths with only those endpoints. Specify an I/O or register name or I/O port for this option. The field also supports wildcard characters. For example, to report only paths within a specific hierarchy: <pre>report_timing -from * egress:egress_inst * \ -to * egress:egress_inst * -(other options)</pre>

*continued...*

Option	Description
	When the <b>From</b> , <b>To</b> , or <b>Through</b> boxes are empty, the Timing Analyzer assumes all possible targets in the device. The <b>Through</b> option limits the report to paths that pass through combinatorial logic, or a particular pin on a cell.
<b>Analysis type</b>	The <b>Analysis type</b> options are <b>Setup</b> , <b>Hold</b> , <b>Recovery</b> , or <b>Removal</b> . The Timing Analyzer reports the results for the type of analysis you select.
<b>Paths</b>	Specifies the number of paths to display by endpoint and slack level. The default value for <b>Report number of paths</b> is 10, otherwise, the report can be very long. Enable <b>Pairs only</b> to list only one path for each pair of source and destination. Limit further with <b>Maximum number of paths per endpoints</b> . You can also filter paths by entering a value in the <b>Maximum slack limit</b> field.
<b>Extra Info</b>	Provides additional data that is relevant for diagnosing timing failure root cause, such as setup slack breakdown, and unexpected routing detours caused by congestion and hold time fix-up. Specify whether to include <b>None</b> , <b>Basic</b> , or <b>All</b> extra information in the report. The <b>Extra Info</b> tab data can help you identify potential, unnecessary routing detours, as well as placement or circuit issues that restrict the path $f_{MAX}$ performance. Refer to <a href="#">Setup Slack Breakdown On the Extra Info Tab</a> on page 131. <ul style="list-style-type: none"> <li><b>All</b>—report includes <b>Extra Info</b> tab that reports extra information for source timing endpoints that pass through the unregistered output of a RAM or DSP block, or for destination timing endpoints that pass through the unregistered input of a DSP block. The <b>Data Path</b> tab includes Estimated Delay Added for Hold and Route Stage Congestion Impact data.</li> <li><b>Basic</b>—report includes the <b>Extra Info</b> tab but no extra information on the <b>Data Path</b> tab.</li> <li><b>None</b>—report includes no <b>Extra Info</b> tab or other extra information on the <b>Data Path</b> tab.</li> </ul>
<b>Output</b>	Specify the path types the analysis includes in output for <b>Detail level</b> : <ul style="list-style-type: none"> <li><b>Summary</b>—level includes basic summary reports. Review the <b>Clock Skew</b> column in the <b>Summary</b> report. If the skew is less than +/-150ps, the clock tree is well balanced between source and destination.</li> <li><b>Path only</b>—displays all the detailed information, except the <b>Data Path</b> tab displays the clock tree as one line item.</li> <li><b>Path and Clock</b>—displays the same as <b>Path only</b> with respect to the clock.</li> <li><b>Full path</b>—when higher clock skew is present, enable the <b>Full path</b> option. This option breaks the clock tree into greater detail, showing every cell, including the input buffer, PLL, global buffer (called <code>CLKCTRL_</code>), and any logic. Review this data to determine the cause of clock skew in your design. Use the <b>Full path</b> option for I/O analysis because only the source clock or destination clock is inside the FPGA, and therefore the delay is a critical factor to meet timing.</li> </ul>
<b>Show routing</b>	Shows routing data in the report.
<b>Split the report by operating conditions</b>	For the operating condition timing corners, subdivides the data by each operating condition.
<b>Report panel name</b>	Specifies the name of the report panel. You can optionally enable <b>File name</b> to write the information to a file. If you append <code>.htm</code> or <code>.html</code> as a suffix, the Timing Analyzer produces the report as HTML. If you enable <b>File name</b> , you can <b>Overwrite</b> or <b>Append</b> the file with latest data.
<b>Tcl command</b>	Displays the Tcl syntax that corresponds with the GUI options you select. You can copy the command from the <b>Console</b> into a Tcl file.

### Setup Slack Breakdown On the Extra Info Tab

The **Extra Info** tab contains other timing metrics to help you diagnose timing closure issues, including **Setup Slack Breakdown** for the path.

The slack of a path specifies the margin by which the path meets its timing requirement. The setup slack breakdown is a numeric value that the Timing Analyzer calculates from the following timing requirements and path element delays:

**Figure 155. Setup Slack Breakdown Calculations**

A path can fail timing requirements for many varied reasons. For example, the clock relationship can be impossibly tight, or there can be excessive routing delays that alone cause failure for the timing path. Calculating the intrinsic margin of a timing path, and then comparing that margin to other delays of the path, can help identify the specific reasons why a path fails its timing requirement.

The **Extra Info** tab can help you identify potential significant or unexpected routing detours caused by congestion and hold time fix-up. The **Extra Info** tab can also report extra information for source timing endpoints that pass through the unregistered output of a RAM or DSP block, or for destination timing endpoints that pass through the unregistered input of a DSP block.

You can review the **Extra Info** data and **Locate Path** or **Locate Chip Area** in Chip Planner, Technology Map Viewer, or Resource Property Viewer to determine whether to make changes to improve placement and routing.

Some delay elements are more sensitive to a path's placement and routing than others. Intrinsic delays that are part of **Setup Slack Breakdown** are less sensitive to placement and routing, and are inherent in the RTL and timing requirements. Non-intrinsic delays are the other delays that are sensitive to placement and routing.

**Table 24. Extra Info Tab Data**

Extra Info Data	Description
<b>Intrinsic Margin</b>	Reports the intrinsic and non-intrinsic timing elements that comprise the timing path slack value. Intrinsic margin is a numeric value that the Timing Analyzer calculates from the timing requirements and path element delays. The Timing Analyzer also derives the slack of the path from the same requirements and delays, but with a different calculation. Intrinsic delays are less sensitive to placement and routing, and are inherent in the RTL and timing requirements. Non-intrinsic delays are the other delays that are sensitive to placement and routing.
<b>From Node Info</b>	Specifies the node Type, any Retiming Restriction, and any Power-Up "Don't Care" attributes for the From Node. Consider removing the retiming restriction to allow retiming and improve performance for timing closure.
<b>To Node Info</b>	Specifies the node Type, any Retiming Restriction, and any Power-Up "Don't Care" attributes for the To Node. Consider removing the retiming restriction to allow retiming and improve performance for timing closure.
<b>Max Fanout</b>	Reports the maximum fan-out of register and combinational nodes in the path.
<b>Route Stage Congestion Impact</b>	Reports whether routing has a <b>Low</b> , <b>Medium</b> , or <b>High</b> impact on congestion. A <b>Low</b> value suggests timing issues are not congestion related. A <b>High</b> value suggests competition for scarce routing resources plays a role in poor timing.
<b>Estimated Delay Added for Hold</b>	Reports the estimated amount of delay added on to the fastest delay route to satisfy hold. This value can help you determine whether delays are routing congestion or Hold related.
<b>Sufficient Setup Margin for Hold</b>	Reports whether the setup margin is suitable for the hold timing. <b>Yes</b> , indicates that the setup margin is sufficient. <b>No</b> indicates that the setup margin is insufficient for hold timing.
<b>Source/Destination Bounding Box</b>	Reports the lower-left and upper-right coordinates for the boundary box enclosing the source and destination registers. In an ideal case, the <b>Source/Destination Bounding Box</b> , <b>Cell Bounding Box</b> , and <b>Interconnect Bounding Box</b> values are roughly the same, and the relative areas are approximately 1.0. If the cell bounding box size grows relative to the <b>Source/Destination Bounding Box</b> , that can indicate a potential unnecessary routing detour on the path.
<b>Source/Destination Area Covered</b>	Reports the total area covered in terms of LABs.
<b>Source/Destination Relative Area</b>	Reports the area for the source and destination, relative to the <b>Source/Destination Bounding Box</b> . The value is always 1.0, which equals the same size.
<b>Cell Bounding Box</b>	Reports the lower-left and upper-right coordinates for the boundary box enclosing the source and destination registers, and any cells in the path.
<b>Cell Area Covered</b>	Reports the area for the cell, relative to the <b>Source/Destination Bounding Box</b> . A value of 1.0 equals the same size. A value greater than 1.0 can indicate a path has a cell outside of the space between the registers in the path.

The following describe the interpretation of timing conditions indicated by the **Setup Slack Breakdown**:

- **When the Setup Slack Breakdown is less than 0**—the path has such a tight timing relationship, a significant difference in microparameters, or such significant clock source uncertainty, that the path fails before the addition of any delay. Review the SDC constraints to verify that the timing relationship is correct. An incorrect relationship can exist between unrelated clocks that lack the proper timing cut. Ensure that parameterizable hard blocks (such as 20K RAM and DSP blocks) are fully registered. Investigate clock sources to verify that the clocks use global signals for routing.
- **When the clock skew exceeds the Setup Slack Breakdown**—address the clock transfer to meet timing on the path. You may need to create clock region assignments. You might also need to redesign cross-clock transfers to switch from synchronous to asynchronous implementation, such as with a FIFO or other handshake.

- **When the cell delay is greater than its intrinsic margin**—reduce the cell delay, as the path would fail timing even if the clocks are perfect and use no routing wires. Rewrite RTL to reduce the logic depth, restructure logic to allow the Compiler to use faster LUT inputs, or unblock retiming optimizations. The Compiler can automatically retime registers to reduce logic depth, but only in ways that maintain functionality and that the device architecture supports. To unblock the Hyper-Retimer, remove asynchronous resets and initial conditions.
- **When the interconnect delay is greater than its intrinsic margin**—the path would fail timing even if the clocks are perfect, and there is no logic. This occurs if registers are too far apart, or a timing path detours around a congested chip area. Review the fan-in and fan-out of registers that are far apart. Apply Logic Lock regions so the Fitter places the registers closer together. Use Logic Lock regions only after determining why placement is initially poor.

#### Related Information

### 2.5.3. Report Timing By Source Files

The Timing Analyzer's **Reports > Timing Slack > Report Timing By Source Files** command allows you to specify settings to report the timing of any path or clock domain in the design, similar to [Report Timing](#) on page 128. However, **Report Timing By Source Files** groups the timing paths by the containing entity, and groups the entities by the source file that defines the entity.

This report allows you to attribute timing paths to exactly one instance in the design. The Path TNS column shows the sum of all negative slacks within a file or entity. The equivalent scripting command is `report_timing_by_source_files`.

From the report in the Timing Analyzer GUI, you can right-click on any source file to open it in a text editor to easily investigate timing paths within a particular source file.

### 2.5.4. Report Data Delay

You can run the Timing Analyzer's **Reports > Other Slack Analyses > Report Data Delay...** command to generate a custom report showing the worst-case slack for the datapath delay exception for a given path. The report shows only paths covered by data delay (`set_data_delay`) constraints, including paths whose non-datapath analysis is cut by a false path.

**Note:** Exclusive clock groups (set with `set_clock_groups -exclusive`) override `set_data_delays` constraints.

#### Related Information

[Timing Exception Precedence](#) on page 99

### 2.5.5. Report Net Delay

The Timing Analyzer's **Reports > Other Slack Analyses > Report Net Delay...** command to configure and display a customized report that details the results of net delay analysis, as defined by timing constraints and exceptions.

Each `set_net_delay` command is treated as a separate analysis and `report_net_delay` reports the results of all `set_net_delay` commands in a single report. The report contains each `set_net_delay` command with the worst case slack result followed by the results of each edge matching the criteria set by that `set_net_delay` command. These results are ordered based on the slack value.

## 2.5.6. Report Clocks and Clock Network

The Timing Analyzer's **Reports > Clocks > Report Clocks** command reports all clock signals in the design. The equivalent scripting command is `report_clocks`.

**Report Clocks** generates the Clock Summary report that lists details about all of the signals with clock setting constraints in the design.

**Figure 156. Clock Summary Report Shows Properties of Clock Signals in Design**

Clocks Summary

Show: 

Visible

Hide

Q <<Filter>>

	Clock Name	Type	Period	Frequency	Rise	Fall	Duty Cycle	Divide by	Multiply by	Phase	Offset
1	clk	Base	40.000	25.0 MHz	0.000	20.000					

Similarly, you can click the **Reports > Clocks > Report Clock Network...** command to generate a custom report that helps you identify and evaluate advanced clock structures, such as clock muxes, clock gates, and clock dividers.

**Figure 157. Report Clock Network Dialog Box**

The dialog box titled "Report Clock Network" contains the following sections:

- Targets:** A text field labeled "Report target:" with a browse button (...).
- Additional Options:** Two unchecked checkboxes: "Show full clock paths" and "Include potential clock paths".
- Output:**
  - A checked checkbox "Report panel name:" followed by a text field containing "Report Clock Network".
  - An unchecked checkbox "File name:" followed by a text field, a browse button (...), and an "Open" button.
  - File options:** A group box containing two radio buttons: "Overwrite" (selected) and "Append".
  - An unchecked checkbox "Console".
- Tcl command:** A text field containing the command: `report clock network -panel name {Report Clock N`.
- Buttons:** "OK", "Cancel", and "Help" at the bottom right.

**Table 25. Report Clock Network Dialog Box Settings**

Option	Description
<b>Report target</b>	Specifies the collection of clocks and nodes that you want to analyze and report.
<b>Expand clock path</b>	Displays all subordinate nodes in expanded view. The default display collapses trivial nodes in the report.
<b>Include potential clock paths</b>	Includes nodes in the report that are not on a clock path, but are upstream of a register clock port.
<b>Report panel name</b>	Specifies the name that appears in the report panel title bar.
<b>File name</b>	Specifies the name of an optional output file to contain report data.
<b>Tcl command</b>	Displays the Tcl syntax that corresponds with the GUI options you select. You can copy the command from the <b>Console</b> into a Tcl file.

This report shows the nodes on the clock network hierarchically, starting from the input clock ports, followed by any other nodes that transform or route the clocks to the clock loads. The **Join Points** indicate whether the clock network has convergence, such as with clock muxes. The **Statistics Table** provides more details about the signals that you select in the report, such as the relationships between the incoming and outgoing clocks of this node.

**Figure 158. Report Clock Network Report**

The screenshot shows the 'Report Clock Network' dialog box. It features a search filter at the top, a hierarchical tree of clock nodes, and a 'Statistics Table' at the bottom. The tree shows a base clock 'clk' branching into 'clk~input|i', which further branches into 'clk~input|o' and 'clk~i...e[89]'. A 'Clock load (1588 registers)' is also shown. The 'Join Point' column is highlighted with an orange dashed box. The 'Statistics Table' provides details for the selected node 'clk~input|i'.

Name	Type	Incoming Clock	Outgoing Clock	Join Point	Potential Clock Path Node
clk	Input Port		clk		
clk~input i	Cell input	clk	clk		
clk~input o	Cell output	clk	clk		
clk~i...e[89]	Cell internal node	clk	clk		
->	Clock load (1588 registers)	clk			

Property	Value
1 Node	Type
2 Reason for inclusion	Downstream of user-defined c...stream of register clock pin.
3 Purpose	Routing
4 Clock Fmax	
5 Clock SDC Location	
6 Incoming/Outgoing Clock Relationships	

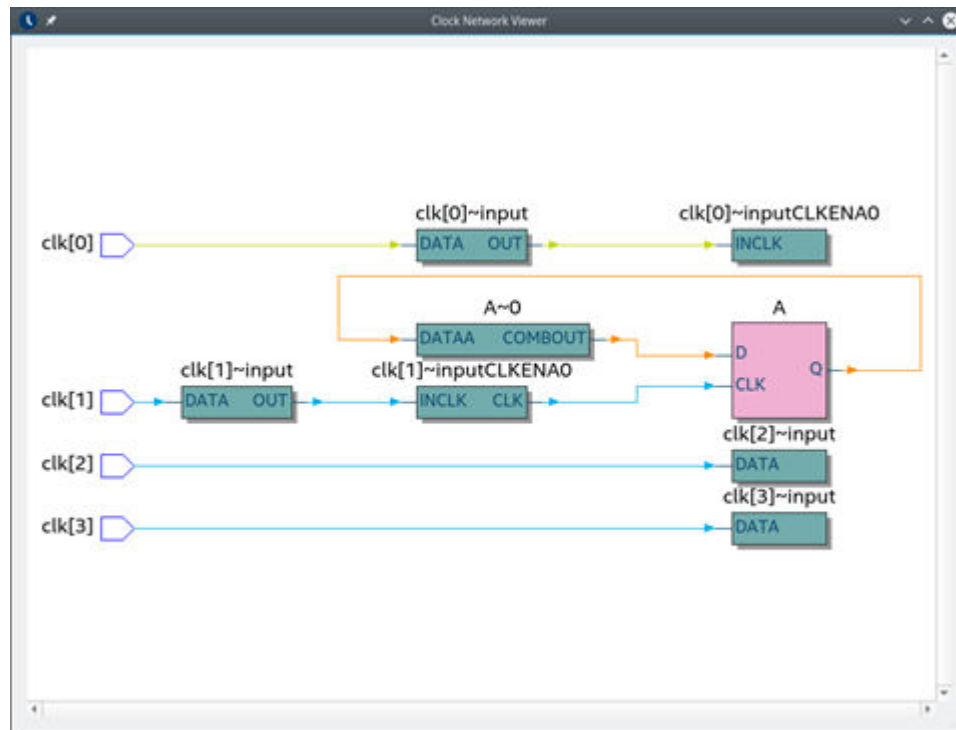

Right-click any of the nodes in the Clock Network report to click **Open Clock Network Viewer**. The Clock Network Viewer displays a graphical representation of the clock domains and constraints on the clock network to help you to see clock tree problems, such as signals entering and exiting globals. Use this graphical view to determine which clocks drive portions of the design. The Clock Network Viewer color codes the clock connection edge to indicate the clock types.

- Blue—the base clock
- Orange—a derived clock
- Green—a multicycle clock

The display shows a truncated signal name by default. Hover the mouse over the clock signals to display the full signal name. Right-click any signal to display the **Color Legend**. Click the **Zoom** controls to view more detail. You can export the schematic view as a PDF from the right-click menu.

**Figure 159. Clock Network Viewer**

You can also right-click and choose **Report Paths from Node**, **Report Paths Thru Node**, **Report Paths To Node**, or **Focus On Node** to rerun the report on the selected node.

### 2.5.7. Report Clock Transfers

The Timing Analyzer's **Reports > Clock Domain Crossings > Report Clock Transfers** command reports all clock-to-clock transfers in the design. The equivalent scripting command is `report_clock_transfers`.

**Report Clock Transfers** generates the Setup Transfers report and the Hold Transfers report that display data about the clock-to-clock transfers.

**Figure 160. Setup Transfers Report Shows Clock-to-Clock Transfers**

Setup Transfers								
Show:	Visible	Hide	Q <<Filter>>					
	From Clock	To Clock	RR Paths	FR Paths	RF Paths	FF Paths	Clock Pair Classification	Worst-Case Slack
1	clock	clock	34	0	0	0	Intra-Clock (Timed Safe)	3.319
							Worst-Case Operating Conditions	
							Slow vid2 100C Model	

The Setup Transfers report and Hold Transfers report display all possible transfers, including rising clock edge to rising clock edge (RR), falling clock edge to rising clock edge (FR), rising clock edge to falling clock edge (RF), and falling clock edge to falling clock edge (FF) paths.

- If a path exists in the design, the report column cell is white and lists the number of paths.
- If a path is a false path, the report column cell is light gray and contains the text "false path."
- If a path does not exist in the design, then the report column cell is dark gray.

The Setup Transfers report and Hold Transfers report also lists the Worst-Case Slack for setup, the Worst-Case Operating Conditions, and the Clock Pair Classification for each clock path. The Clock Pair Classification includes the following:

**Table 26. Clock Pair Classifications**

Clock Pair Classification	Definition
<b>Intra-Clock (Timed Safe)</b>	<ul style="list-style-type: none"> <li>• From Clock and To Clock are the same.</li> <li>• No timing constraint required.</li> </ul>
<b>Inter-Clock Synchronous (Timed Safe)</b>	<ul style="list-style-type: none"> <li>• From Clock and To Clock relate synchronously, and have a known phase and frequency relationship.</li> <li>• Multicycle path constraint may or may not exist.</li> </ul>
<b>Asynchronous (Timed Unsafe)</b>	<ul style="list-style-type: none"> <li>• From Clock and To Clock are asynchronous.</li> <li>• Timing constraints (false path, clock groups, set_max_skew) do not exist.</li> </ul>
<b>Ignored (Not Timed)</b>	<ul style="list-style-type: none"> <li>• From Clock and To Clock are asynchronous.</li> <li>• Timing constraints (false path, clock groups, set_max_skew) exist and setup and hold slack are not applicable.</li> </ul>

## 2.5.8. Report Metastability

The Timing Analyzer's **Reports > Clock Domain Crossings > Report Metastability...** command generates a list of synchronization register chains found in the design, and can provide estimates of the Mean Time Between Failures (MTBF) of each chain. The equivalent scripting command is `report_metastability`.

Metastable registers have outputs hovering at a voltage between high and low for a length of time beyond the normal  $t_{CO}$  for the register, which may cause subsequent registers that use this metastable signal to latch different values. Synchronize register chains when transferring data between unrelated clock domains to reduce the probability of the captured data signal becoming metastable.

A synchronization register chain is a sequence of registers with the same clock, that is driven by a pin, or logic from an unrelated clock domain. All but the last register in the chain must connect only to the next register, but may do so through logic.

The Metastability Report displays the following for each synchronization chain the analysis discovers:

- Typical Mean Time Between Failures (MTBF) for the chain
- MTBF equation and method of synchronizer identification
- Available settling time of the synchronization register chain
- Number of synchronization registers in the chain

- Names of synchronization registers in the chain
- name of asynchronous source registers
- Data toggle rate used in the MTBF estimation
- Source clock domain names
- Synchronization clock domain names

To help you analyze synchronizer chains in more detail, you can report the neighbor paths for synchronization registers in a chain. From the list of synchronization registers in the report in the Timing Analyzer GUI, you can right-click any of the synchronization register names and click **Report Neighbor Paths** in the context menu.

To report the timing for the synchronization registers, you can right-click and then click **Report Timing** for the synchronization registers. For the asynchronous source registers, right-click and click **Report Path**.

When you do not specify a data toggle rate, the Timing Analyzer uses the value of 12.5% of the frequency of the clock domain that contains the synchronizer to calculate MTBF.

#### Related Information

- [Metastability Analysis](#) on page 16
- [Step 1: Specify General Timing Analyzer Settings](#) on page 29

### 2.5.9. Report CDC Viewer

The Timing Analyzer's **Reports > Clock Domain Crossings > Report CDC Viewer...** command allows you to configure and display a custom clock domain crossing report and the Clock Domain Crossing (CDC) Viewer. The CDC Viewer graphically displays the setup, hold, recovery, or removal analysis of all clock transfers in your design. The equivalent scripting command is `report_cdc_viewer`.

**Table 27. Report Clock Domain Crossing Viewer Settings**

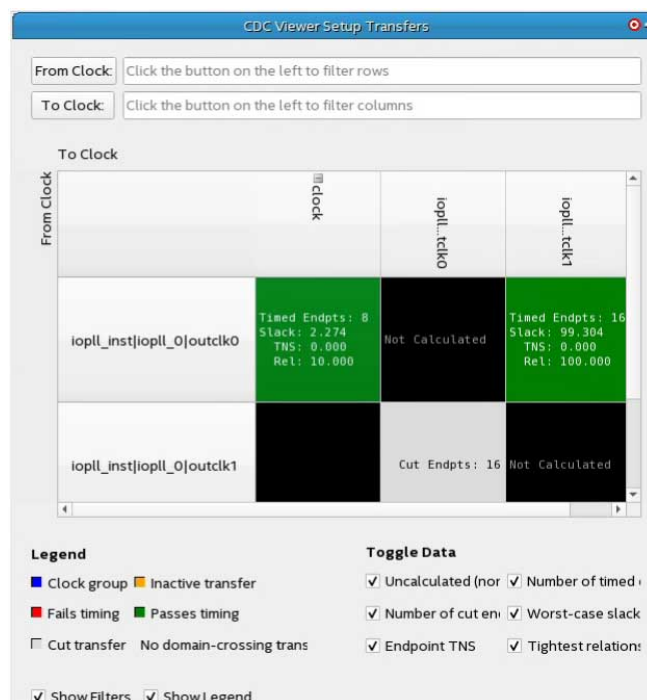

Option	Description
<b>Clocks</b>	<b>From Clock</b> and <b>To Clock</b> filter paths in the report to show only the launching or latching clocks you specify.
<b>Analysis type</b>	Options are <b>Setup</b> , <b>Hold</b> , <b>Recovery</b> , or <b>Removal</b> . The Timing Analyzer reports the results for the type of analysis you select.
<b>Transfers</b>	Specifies the type of clock transfers to include or exclude from the report, including <b>Timed transfers</b> , <b>Fully cut transfers</b> , <b>Clock groups</b> , <b>Inactive clocks</b> , and <b>Non-crossing transfers</b> . You can specify the <b>Maximum slack limit</b> and <b>Grid options</b> for the report.
<b>Detail level</b>	<b>Full</b> shows all details of the report and <b>Summary</b> filters the details and shows summary data.
<b>Report panel name</b>	Specifies the name of the report panel. You can optionally enable <b>File name</b> to write the information to a file. If you append <code>.htm</code> or <code>.html</code> as a suffix, the Timing Analyzer produces the report as HTML. If you enable <b>File name</b> , you can <b>Overwrite</b> or <b>Append</b> the file with latest data, and specify <b>Grid</b> or <b>List</b> format. <i>Note:</i> In grid format reports, clocks with non-crossing transfers always appear if they have transfers between other clocks.
<b>Tcl command</b>	Displays the Tcl syntax that corresponds with the GUI options you select. You can copy the command from the <b>Console</b> into a Tcl file.

You can specify the following options to customize CDC Viewer reporting:

**Table 28. CDC Viewer Report Controls**

Control	Description
<b>From Clock:</b> and <b>To Clock:</b>	Filters the display according to the clock names you specify. Click <b>From Clock:</b> or <b>To Clock:</b> to search for specific clock names.
<b>Legend</b>	Defines the status colors. A color coded grid displays the clock transfer status. The clock headers list each clock with transfers in the design. The GUI truncates long clock names, but you can view the full name in a tool tip or by resizing the clock header cell. The GUI represents the generated clocks as children of the parent clock. A '+' icon next to a clock name indicates the presence of generated clocks. Clicking on the clock header displays the generated clocks associated with that clock.
<b>Toggle Data</b>	The text in each transfer cell contains data specific to each transfer. Turn on or off display of the following types of data: <ul style="list-style-type: none"> <li><b>Number of timed endpoints</b> between clocks— the number of timed, endpoint-unique paths in the transfer. A path being "timed" means that analysis occurs on that path. Only paths with unique endpoints count towards this total.</li> <li><b>Number of cut endpoints</b> between clocks— the number of cut endpoint-unique paths, instead of timed paths. These paths are cut by either a false path or clock group assignment. Timing analysis skips such paths.</li> <li><b>Worst-case slack</b> between clocks— the worst-case slack among all endpoint-unique paths in the transfer.</li> <li><b>Total negative slack</b> between clocks— the sum of all negative slacks among all endpoint-unique paths in this transfer.</li> <li><b>Tightest relationship</b> between clocks— the lowest-value setup, hold, recovery, or removal relationship between the two clocks in this transfer.</li> </ul>
<b>Show Filters</b> and <b>Show Legend</b>	Turns on or off Filters and <b>Legend</b> .

**Figure 161. CDC Viewer Setup Transfers Report**

Each block in the grid is a transfer cell. Each transfer cell uses color and text to display important details of the paths in the transfer. The color coding represents the following states:

**Table 29. Transfer Cell Content**

Cell Color	Color Legend
Black	Indicates no transfers. There are no paths crossing between the source and destination clock of this cell.
Green	Indicates passing timing. All timing paths in this transfer, that have not been cut, meet their timing requirements.
Red	Indicates failing timing. One or more of the timing paths in the transfer do not meet their timing requirements. If the transfer is between unrelated clocks, the paths likely require a synchronizer chain.
Blue	Indicates clock groups. The source and destination clocks of these transfers are cut by means of asynchronous clock groups.
Gray	Indicates a cut transfer. All paths in this transfer are cut by false paths. Therefore, timing analysis does not consider these paths.
Orange	Indicates inactive clocks. One of the clocks in the transfer is an inactive clock (with the <code>set_active_clocks</code> command). The Timing Analyzer ignores such transfers.

Right-click menus allow you to perform operations on transfer cells and clock headers. When the operation is a Timing Analyzer report or SDC command, a dialog box opens containing the contents of the transfer cell.

**Table 30. Transfer Cell Right-Click Menus**

Command	Description
<b>Copy</b>	Copies the contents of the transfer cell or clock header to the clipboard.
<b>Report Timing</b>	Reports timing. Not available for transfer cells with no valid paths (gray or black cells).
<b>Report Endpoints</b>	Reports endpoints. Not available for transfer cells with no cut paths (gray or black cells).
<b>Report False Path</b>	Reports false paths. Not available for transfer cells with no valid paths (black cells).
<b>Report Exceptions</b>	Reports exceptions. Only available for clock group transfers (blue cells).
<b>Report Exceptions (with clock groups)</b>	Reports exceptions with clock groups. Only available for clock group transfers (blue cells).
<b>Set False Path</b>	Sets a false path constraint.
<b>Set Multicycle Path</b>	Sets a multicycle path exception.
<b>Set Min Delay</b>	Sets a min delay constraint.
<b>Set Max Delay</b>	Sets a max delay constraint.
<b>Set Clock Uncertainty</b>	Sets a clock uncertainty constraint.

**Table 31. Clock Header Right-Click Menus**

Command	Description
<b>Copy (include children)</b>	Copies the name of the clock header, and the names of each of its derived clocks. This option only appears for clock headers with generated clocks.
<b>Expand/Collapse All Rows/Columns</b>	Shows or hides all derived clocks in the grid.
<i>continued...</i>	

Command	Description
<b>Create Slack Histogram</b>	Generates a slack histogram report for the clock you select.
<b>Report Timing From/To Clock</b>	Generates a timing report for the clock you select. If you do not expand the clock to display derived clocks, the timing report includes all clocks that derive from the clock. To prevent this, expand the clock before right-clicking it.
<b>Remove Clock(s)</b>	Removes the clock you select from the design. If you do not expand the clock, timing analysis removes all clocks that derive from the clock.

You can view CDC Viewer output in any of the following formats:

- A report panel in the Timing Analyzer
- Output in the Timing Analyzer Tcl console
- A plain-text file
- An HTML file you can view in a web browser.

## 2.5.10. Report Asynchronous CDC

The Timing Analyzer's **Reports > Clock Domain Crossings > Report Asynchronous CDC...** command allows you to classify and report all asynchronous clock-domain-crossing (CDC) transfers in your design. Asynchronous CDCs include single-bit transfers, multibit transfers, and asynchronous reset CDCs. Designs often contain unintended CDCs or transfers. Use this report to ensure that the Timing Analyzer correctly detects all CDCs.

**Table 32. Report Asynchronous CDC Information Settings**

Option	Available Settings
<b>Clocks</b>	Filters the report to only show CDCs that originate from <b>From clock</b> and terminate at <b>To clock</b> .
<b>Targets</b>	Filters the report to only show CDCs that originate from <b>From</b> register and terminate at <b>To</b> register. Both the <b>From</b> and <b>To</b> must be registers. This option is optional with the <b>Clocks</b> option.
<b>Entries</b>	Limits the number of entries that are reported per CDC category
<b>Detail</b>	Chooses whether to show a summary of all CDC's or give detail on each individual CDC
<b>CDC Categories</b>	Specifies the CDC categories to be reported.
<b>Report panel name</b>	Specifies the name of the report panel. You can optionally enable <b>File name</b> to write the information to a file. If you append <b>.htm</b> or <b>.html</b> as a suffix, the Timing Analyzer produces the report as HTML. If you enable <b>File name</b> , you can overwrite or append the file with latest data.
<b>Tcl command</b>	Displays the Tcl syntax that corresponds with the GUI options you select. You can copy the command from the <b>Console</b> into a Tcl file.

Figure 162. Report Asynchronous CDC Summary View

Asynchronous CDC Summary			
Q <<Filter>>			
	CDC Type	CDC Count	Total Transfer Width
1	▼ Single-bit CDC		
1	Unsynchronized Transfer	5	5
2	Unconstrained Synchronizer	1	1
3	Synchronizer Drive Clock Domains	2	2
4	Intra-Clock False Path Synchronizer	2	2
5	Synchronizer Not Protected for MTBF	1	1
6	Compliant Synchronizer	11	11
7	Transfer Precedence Combinational Logic	0	0
2	▼ Multi-bit CDC		
1	Unconstrained CE-type CDC Bus	2	5
2	Compliant CE-type CDC Bus	2	5
3	Unconstrained MUX-type CDC Bus	2	8
4	Compliant MUX-type CDC Bus	2	8
5	Unsynchronized Synchronizer Bus	2	8
6	Unconstrained Synchronizer Bus	1	2
7	Compliant Synchronizer Bus	1	4
8	Synchronizer Bus Uneven Lengths	0	0
9	Synchronizer after Control Signal	0	0
3	▼ Asynchronous Reset CDC		
1	Unsynchronized Reset Synchronizer	1	1
2	Unconstrained Reset Synchronizer	1	1
3	Reset Synchronizer Multiple Sources	1	1
4	Inactive Reset Synchronizer	1	1

The summary view of the Asynchronous CDC Report provides an overview of the number of CDC's that fall into each category in your design. CDC Count gives the number of topologies detected for a category. **Total Transfer Width** shows the total number of CDC crossings for a category. This value is different than **CDC Count** for multibit CDC's because each topology consists of multiple crossings.

The full view of the Asynchronous CDC report shows the source and destination registers and clocks for each detected CDC topology in your design. You may click on any row of this report. Clicking on a row that contains the name of a CDC category brings up the description for that category and associated Design Assistant rules that check for such topologies. Clicking on a row that contains a CDC displays detailed information on that CDC in the **CDC Statistics** table. The information available varies depending on the topology of the CDC.

1	logic_within_forced_chain synch_reg1	

In the Asynchronous CDC Full Report panel, the All Source Clocks (Synch/Asynch) column displays all clocks driving all source nodes of a synchronizer chain, regardless of whether the transfers are synchronous or asynchronous. There can be asynchronous and synchronous transfers into the head of a synchronizer chain if the paths go through combinational logic before the head of the synchronizer chain. For example, Figure xx shows a circuit with both asynchronous and synchronous transfers

into a synchronizer chain. For this example, the Asynchronous CDC Full Report lists both `clkA` and `clkB` as source clocks of the synchronizer chain, even though `clkB` is a synchronous transfer.

**Figure 165. Circuit with Asynchronous and Synchronous Transfers to a Synchronizer Chain**

### 2.5.11. Report Logic Depth

The Timing Analyzer's **Reports > Design Metrics > Report Logic Depth...** command allows you to report the number of logic levels within a clock domain. This value typically corresponds to the number of look-up tables (LUTs) that a path passes through.

The equivalent scripting command is `report_design_metrics -logic_depth`. **Report Logic Depth** shows the distribution of logic depth among the critical paths, allowing you to identify areas where you can reduce logic levels in your RTL.

**Figure 166. Report Logic Depth (Histogram)**

You can specify various options to customize the reporting.

**Table 33. Report Logic Depth Settings**

Option	Description
<b>Clocks</b>	<b>From Clock</b> and <b>To Clock</b> filter paths in the report to show only the launching or latching clocks you specify.
<b>Targets</b>	Specifies the target node for <b>From Clock</b> and <b>To Clock</b> to report logic depth with only those endpoints. Specify an I/O or register name or I/O port for this option. The field also supports wildcard characters. When the <b>From</b> , <b>To</b> , or <b>Through</b> boxes are empty, the Timing Analyzer assumes all possible targets in the device. The <b>Through</b> option limits the report for paths that pass through combinatorial logic, or a particular pin on a cell.
<b>Analysis type</b>	The <b>Setup</b> , <b>Hold</b> , <b>Recovery</b> , and <b>Removal</b> analyses report the logic depths of the top X paths by slack. <b>Topology</b> analysis reports the logic depths of the top X paths by logic depth.
<b>Paths</b>	Specifies the number of paths to display by endpoint and slack level. The default value for <b>Report number of paths</b> is 10, otherwise, the report can be very long. Enable <b>Pairs only</b> to list only one path for each pair of source and destination. Limit further with <b>Maximum number of paths per endpoints</b> . You can also filter paths by entering a value in the <b>Maximum slack limit</b> field.
<b>Detail</b>	Specify whether to display on <b>Histogram</b> or full <b>Path</b> level of detail.
<b>Report panel name</b>	Specifies the name of the report panel. You can optionally enable <b>File name</b> to write the information to a file. If you append .htm or .html as a suffix, the Timing Analyzer produces the report as HTML. If you enable <b>File name</b> , you can <b>Overwrite</b> or <b>Append</b> the file with latest data.
<b>Tcl command</b>	Displays the Tcl syntax that corresponds with the GUI options you select. You can copy the command from the <b>Console</b> into a Tcl file.

## 2.5.12. Report Neighbor Paths

The Timing Analyzer's **Reports > Design Metrics > Report Neighbor Paths...** command helps you to determine the root cause of critical paths (for example, high logic level, retiming limitation, sub-optimal placement, I/O column crossing, hold fix-up, time borrowing, or others). The equivalent scripting command is `report_design_metrics -neighbor_paths`.

**Figure 169. Report Neighbor Paths Report**

Report Neighbor Paths			
Command Info		Summary of Paths	
	Type	Slack	From Node To Node
1	Path	-0.390	[2]L
1	Path Before	0.435	[2]L
2	Path After	0.363	[2]L

Path #1			
Path Summary			
		Path Before	
1	From Node	[2]LDPC[decoder_main]decoder_core pcub llr_gen[152].compute_llr gv_out_s[1]	[2]LDPC[decoder_main]decod
2	To Node	[2]LDPC[decoder_main]decoder_core s...era_syncram_impl1 ram_block2a17~reg0	[2]LDPC[decoder_main]decod
3	Launch Clock	UPLL jopll_o_outclk0	UPLL jopll_o_outclk0
4	Latch Clock	UPLL jopll_o_outclk0	UPLL jopll_o_outclk0
5	Setup Slack	0.435	-0.390

**Report Neighbor Paths** reports the most timing-critical paths in the design, including associated slack, additional path summary information, and path bounding boxes. **Report Neighbor Paths** shows the most timing-critical **Path Before** and **Path After** each critical **Path**. You can optionally view multiple before and after paths. Retiming or logic balancing of the **Path** can simplify timing closure if there is negative slack on the **Path**, but positive slack on the **Path Before** or **Path After**.

**Table 34. Report Neighbor Path Dialog Box Settings**

Option	Description
<b>Clocks</b>	<b>From Clock</b> and <b>To Clock</b> filter paths in the report to show only the launching or latching clocks you specify.
<b>Targets</b>	Specifies the target node for <b>From Clock</b> and <b>To Clock</b> to report neighbor paths with only those endpoints. Specify an I/O or register name or I/O port for this option. The field also supports wildcard characters. When the <b>From</b> , <b>To</b> , or <b>Through</b> boxes are empty, the Timing Analyzer assumes all possible targets in the device. The <b>Through</b> option limits the report for paths that pass through combinatorial logic, or a particular pin on a cell.
<b>Analysis type</b>	The <b>Analysis type</b> options are <b>Setup</b> , <b>Hold</b> , <b>Recovery</b> , or <b>Removal</b> . The Timing Analyzer reports the results for the type of analysis you select.
<b>Paths</b>	Specifies the number of paths to display by endpoint and slack level. The default value for <b>Report number of paths</b> is 10, otherwise, the report can be very long. Enable <b>Pairs only</b> to list only one path for each pair of source and destination. Limit further with <b>Maximum number of paths per endpoints</b> . You can also filter paths by entering a value in the <b>Maximum slack limit</b> field.

*continued...*

Option	Description
<b>Report Number of Neighbor Paths</b>	Specifies the number of neighbor paths to report, allowing you to view a number of the top adjacent paths entering the critical path, and the top paths exiting the critical path.
<b>Report panel name</b>	Specifies the name of the report panel. You can optionally enable <b>File name</b> to write the information to a file. If you append <code>.htm</code> or <code>.html</code> as a suffix, the Timing Analyzer produces the report as HTML. If you enable <b>File name</b> , you can <b>Overwrite</b> or <b>Append</b> the file with latest data.
<b>Tcl command</b>	Displays the Tcl syntax that corresponds with the GUI options you select. You can copy the command from the <b>Console</b> into a Tcl file.
<b>Extra Info</b>	Specifies extra info.

### 2.5.13. Report Register Spread

The Timing Analyzer's **Reports > Design Metrics > Report Register Spread...** command analyzes the final placement to identify registers with sinks pulling them in various directions. These registers are potential candidates for duplication. The equivalent scripting command is `report_register_spread`.

Registers that drive in opposite directions and connect to high fan-out can have placement-warping effects on the floorplan that impact  $f_{MAX}$ . The placement-warping may not cause timing failures. Therefore, you can view this report to identify such registers. Taking steps to address the registers listed in the report can make placement of the design easier and improve  $f_{MAX}$  performance.

You can automate duplication of registers with the `DUPLICATE_REGISTER` and `DUPLICATE_HIERARCHY_DEPTH` .qsf assignments, or you can manually modify RTL to duplicate registers or refactor logic. Refer to "Automatic Register Duplication: Hierarchical Proximity" in *Quartus Prime Pro Edition User Guide: Design Optimization*.

**Figure 170. Report Register Spread Report**

Register Name	Register_Location	Number of Endpoints	Endpoint Centroid	Total Distance of Endpoints
counter_a[0]~ERTM	(69, 67)	78	(69, 67)	117.0
counter_a[1]~ERTM	(68, 67)	39	(68, 66)	21.4
counter_b[1]~ERTM	(70, 67)	39	(70, 67)	21.4
counter_b[2]~ERTM	(70, 67)	38	(70, 67)	20.9
counter_a[2]~ERTM	(68, 67)	38	(68, 66)	20.9
counter_b[3]~ERTM	(70, 67)	37	(70, 66)	20.4

You can specify various options to customize the report.

**Table 35. Report Register Spread Settings**

Option	Available Settings
<b>Spread Type</b>	Specifies the type of spread data in the report:
<i>continued...</i>	

Option	Available Settings
	<ul style="list-style-type: none"> <li><b>Tension</b>—reports the sum over each sink of the distance from it to the centroid of all the sinks.</li> <li><b>Angle</b>—reports how far around the source register the fan-outs wrap, expressed from 0 to 360 degrees. This value corresponds to 360 minus the maximum angle between any two angularly adjacent sinks. This metric complements <b>Tension</b> by identifying registers which are surrounded by their sinks in all directions, and not those registers only being pulled in a few directions.</li> <li><b>Span</b>—reports the maximum 1-dimensional delta between the left bottom-most sink and the right top-most sink.</li> <li><b>Area</b>—reports the coverage of the sinks by number of LABs on the FPGA device. This option multiplies the span of the sinks in both X- and Y- dimensions. This metric complements <b>Span</b> by incorporating both dimensional spans of the sinks, and not only the maximum sink.</li> <li><b>Count</b>—reports registers with the largest sink counts.</li> </ul>
<b>Sink Type</b>	Specifies the type of sink in the report: <ul style="list-style-type: none"> <li><b>Endpoint</b>—the nodes (usually registers) that terminate timing paths from a register.</li> <li><b>Immediate Fanout</b>—the immediately connected nodes of the register. For example, lookup tables, other registers, RAM, or DSP blocks.</li> </ul>
<b>From Clock</b>	Filters paths in the report to show only the launching clocks you specify.
<b>To Clock</b>	Filters paths in the report to show only the latching clocks you specify, allowing you to debug one clock at a time.
<b>Report number of registers</b>	Specifies the number of registers to display in the report. The default value for <b>Report number of registers</b> is 10.
<b>Report panel name</b>	Specifies the name of the report panel. You can optionally enable <b>File name</b> to write the information to a file. If you append <b>.htm</b> or <b>.html</b> as a suffix, the Timing Analyzer produces the report as HTML. If you enable <b>File name</b> , you can <b>Overwrite</b> or <b>Append</b> the file with latest data.
<b>Tcl command</b>	Displays the Tcl syntax that corresponds with the GUI options you select. You can copy the command from the <b>Console</b> into a Tcl file.

Automatic Register Duplication: Hierarchical Proximity, Quartus Prime Pro Edition

#### 2.5.13.1. Registers with High Timing Path Endpoint Tension

Timing path endpoints are the nodes (usually registers) that terminate timing paths from a register. The Timing path endpoint is equivalent to the nodes that the `get_fanouts` command returns, or the overall set of nodes that appear as a "From Node" after running the `report_timing` command. Register duplication is necessary, but not always sufficient, in helping to distribute the signal more efficiently. In addition, you may need to duplicate or restructure any intermediate logic before duplicating the register.

**Figure 173. Register A has 4 Timing Path Endpoints**

Tension is the sum over each sink of the distance from the sink to the centroid of all the sinks. The value of tension is therefore dependent on the number of sinks. Register duplication can help to break up these clouds, since they may be the result of the placement solution getting "warped" by the presence of the register.

**Figure 174. Register A has High Tension**

### 2.5.13.2. Registers with High Immediate Fan-Out Tension

There are two **Sink Type** options: **Endpoint** and **Immediate Fanout**. The immediate fan-outs are the immediately connected nodes (lookup tables, other registers, RAM or DSP blocks, and others) of the register. This fan-out is equivalent to fan-outs that the Chip Planner displays, and in various high fan-out reports. Register duplication directly distributes the immediate fan-outs of a register among the duplicates.

**Figure 175. Register A has High Immediate Fan-Out**

## 2.5.14. Report Route Net of Interest

The Timing Analyzer's **Reports > Design Metrics > Report Route Net of Interest...** command allows you to report the nets that require the most effort from the router. The report shows the percentage of total router effort for the nets reported. The equivalent scripting command is `report_route_net_of_interest`.

This report allows you to identify nets that should not require significant router effort. For example, you might expect that low speed management interface nets are not timing critical, and therefore not require much router effort. However, if **Report Route Net of Interest** reports that some nets in the low speed management interface require significant effort from the router, you can investigate that further. The investigation can determine whether the timing constraints are correct, whether the fan-out is significant and can reduce through driver duplication, or whether the net passes through congested areas.

**Figure 176. Report Route Net of Interest Report**

	Net Driver	Route Effort (%)
1	LED~2	3.559
2	reset	3.185
3	my_data_src7 myreg[19]	0.361
4	my_data_src10 myreg[8]	0.359
5	my_data_src6 myreg[17]	0.301
6	my_data_src7 i145~0	0.298
7	my_mlab_inst0 my_mlab_ins...ncram_impl1 rdaddr_reg[0]	0.298
8	my_mlab_inst0 my_mlab_ins...ncram_impl1 rdaddr_reg[1]	0.273
9	my_mlab_inst1 my_mlab_ins...ncram_impl1 rdaddr_reg[1]	0.260
10	my_mlab_inst0 my_mlab_ins...ncram_impl1 rdaddr_reg[1]	0.247

Tcl command: `report_route_net_of_interest -num_nets 50 -pane`

From the Route Net of Interest Report in the Timing Analyzer GUI, you can right-click on any net and run Report Timing for more details about the net, its slack, and any of the net's paths.

**Table 36. Report Route Net of Interest Settings**

Option	Available Settings
<b>Nets</b>	Specifies the <b>Maximum number of nets to report</b> . The default value is 50.
<b>Report panel name</b>	Specifies the name of the report panel. You can optionally enable <b>File name</b> to write the information to a file. If you append <code>.htm</code> or <code>.html</code> as a suffix, the Timing Analyzer produces the report as HTML. If you enable <b>File name</b> , you can <b>Overwrite</b> or <b>Append</b> the file with latest data.
<b>Tcl command</b>	Displays the Tcl syntax that corresponds with the GUI options you select. You can copy the command from the <b>Console</b> into a Tcl file.

## 2.5.15. Report Retiming Restrictions

The Timing Analyzer's **Reports > Design Metrics > Report Retiming Restrictions...** command allows you to report the occurrences of design conditions that restrict Hyper-Retiming, such as Power-up "Care" restrictions, and don't touch or preserve attributes for each port. You can refer to this report to improve the circuit and remove retiming restrictions that limit circuit performance.  
`report_retiming_restrictions` is the equivalent scripting command.

**Figure 178. Report Retiming Restrictions Report**

	Compilation Hierarchy Node	Register is part of a synchronization chain	Preserve assignment
1		114 (0)	292 (50)
1	my_data_src7	21 (21)	0 (0)
1	myreg[*]	20 (20)	0 (0)
2	enable_reg	1 (1)	0 (0)
2	my_data_src8	21 (21)	0 (0)
1	myreg[*]	20 (20)	0 (0)
2	enable_reg	1 (1)	0 (0)
3	my_data_src5	19 (19)	0 (0)
1	myreg[*]	18 (18)	0 (0)
2	enable_reg	1 (1)	0 (0)
4	my_data_src6	19 (19)	0 (0)

Note: For table entries with two numbers listed, the numbers in parentheses indicate the number of retiming restrictions in the specific entity alone. The numbers listed outside of parentheses indicate the number of retiming restrictions in the specific entity and all of its sub-entities in the hierarchy.

For table entries with two number values, the number in parentheses indicates the number of retiming restrictions in the specific entity alone. The number listed outside of parentheses indicates the number of retiming restrictions in the specific entity and all of its sub-entities in the hierarchy.

## 2.5.16. Report Register Statistics

The Timing Analyzer's **Reports > Design Metrics > Report Register Statistics** command allows you to report the number of synchronous and asynchronous resets, hyper registers, and registers with clock enables in the design. You can use this information, combined with timing slack, congestion, and other analysis reports, to identify timing-critical parts of your design that can have resets removed or control schemes changed to meet timing requirements more efficiently.

**Figure 179. Report Register Statistics (Report Truncated)**

Report Register Statistics							
Q <<Filter>> (use !<string> to invert filter)							
Compilation Hierarchy Node	Register Count	Without a Clock	Unique Clocks	Hyper-Register Count	Synchronous Reset	Asynchronous Reset	
1	3645 (0)	0 (0)	2 (0)	0 (0)	311 (0)	777 (0)	
1  auto_fab_0	88 (0)	0 (0)	1 (0)	0 (0)	7 (0)	38 (0)	
1  alt_sld_fab_0	88 (0)	0 (0)	1 (0)	0 (0)	7 (0)	38 (0)	
2  intel_niosv_m_0	2789 (0)	0 (0)	2 (0)	0 (0)	235 (0)	658 (0)	
2  intel_niosv_m_0	2789 (0)	0 (0)	2 (0)	0 (0)	235 (0)	658 (0)	

Truncated Report Columns:

Clock Enable	Synchronous Load	Without a Control Signal	Full Hierarchy Name
2472 (0)	0 (0)	726 (0)	
63 (0)	0 (0)	12 (0)	auto_fab_0
63 (0)	0 (0)	12 (0)	auto_fab...ld_fab_0
1961 (0)	0 (0)	454 (0)	intel_niosv_m_0
1961 (0)	0 (0)	454 (0)	intel_niosv_m_0

*Note:*

- This report works similarly in both post-synthesis Early Timing Analysis and post-fit timing analysis. However, the report's **Without a Clock** column is more helpful for Early Timing Analysis because you typically do not apply conventional SDCs for Early Timing Analysis.
- Clocks generated from `derive_clocks` commands do not count as user clocks.
- The report's **Without a Control Signal** column identifies registers that have no corresponding control signal.
- The report's **Synchronous Load** column identifies any synchronous load that can apply to Arria 10 devices only.

The **Without a Clock** column informs you of the number of registers where no defined clock feeds the registers in the hierarchy shown in the **Register Count** column. A value of 0 in this column suggests that your design has SDC-defined clocks feeding registers in the design. The **Unique Clocks** column indicates the number of unique SDC-defined clocks feeding registers in the hierarchy identified by the

**Register Count.** To view these columns, enable **Show registers without clocks** and **Show the number of unique clocks feeding registers** additional options in the dialog that displays when you run the report, as shown in the following image:

**Figure 180. Report Register Statistics Additional Options Dialog**

### 2.5.17. Report Pipelining Information

The Timing Analyzer's **Reports > Design Metrics > Report Pipelining Information...** command allows you to generate a report that can help you to identify potential areas of over-pipelining in your design. Excessive pipelining unnecessarily consumes area. The equivalent scripting command is `report_pipelining_info`.

**Report Pipelining Information...** does not perform any functional analysis in making the recommended pipeline stage adjustment. You must be aware of any potential functional changes from removing pipeline stages. There may be circumstances when all the stages in a register pipeline are necessary for functional reasons. The report helps to identify location with more registers than necessary for covering distance.

**Figure 181. Report Pipelining Information Report**

19	u_final_dat_hp GEN_REG_INPUT.R_data[18][0]	2.865	0	1
20	u_final_dat_hp GEN_REG_INPUT.R_data[19][0]	2.743	2	1
21	final_dat[0]~reg0	2.855	0	1

To help identify potential over-pipelining, **Report Pipelining Information** reports:

- The recommended pipeline stage adjustment across bus
- The minimum total slack of one bit across bus
- The minimum average slack of one bit across bus
- The distance between the registers
- The width of buses in your design
- The number of sequential registers
- The number of registers on the bus

The Recommended Pipeline Stage Adjustment Across Bus reports the number of registers that you can remove from the bus for each bit. The Average Distance Per Stage, Max Distance Per Stage, and Min Distance Per Stage columns report the Manhattan distance measured in logic array blocks (LABs). The Bus Average Depth, Bus Max Depth, and Bus Min Depth columns report the number of sequential, single fan-out registers. For registers that have more than one clock source, the report lists the fastest one.

The **1+** sign under Recommended Pipeline Stage Adjustment Across Bus column means that the bus might need to add more registers to meet timing requirement. Refer to the Fast Forward Timing Closure Recommendations report.

If the report identifies a large register chain with multiple sequential registers, and the distance between registers is low, that condition can suggest over-pipelining. You may be able to remove some registers to recover some of the device area and reduce congestion.

The following options are available for this report:

**Figure 184. Report Pipelining Information Dialog Box**

**Table 37. Report Pipelining Information Settings**

Option	Available Settings
<b>Pipeline</b>	Specifies the thresholds for reporting a register pipeline. You can define the <b>Minimum average bus depth</b> , the <b>Minimum bus width</b> , and the <b>Maximum number of rows</b> that the report includes.
<b>Report panel name</b>	Specifies the name of the report panel. You can optionally enable <b>File name</b> to write the information to a file. If you append <code>.htm</code> or <code>.html</code> as a suffix, the Timing Analyzer produces the report as HTML. If you enable <b>File name</b> , you can <b>Overwrite</b> or <b>Append</b> the file with latest data.
<b>Tcl command</b>	Displays the Tcl syntax that corresponds with the GUI options you select. You can copy the command from the <b>Console</b> into a Tcl file.

## 2.5.18. Report Time Borrowing Data

You can run the Timing Analyzer's **Reports > Timing Slack > Report Timing...** command to generate a report showing time borrowing data. The equivalent scripting command is `report_timing` (with specific arguments).

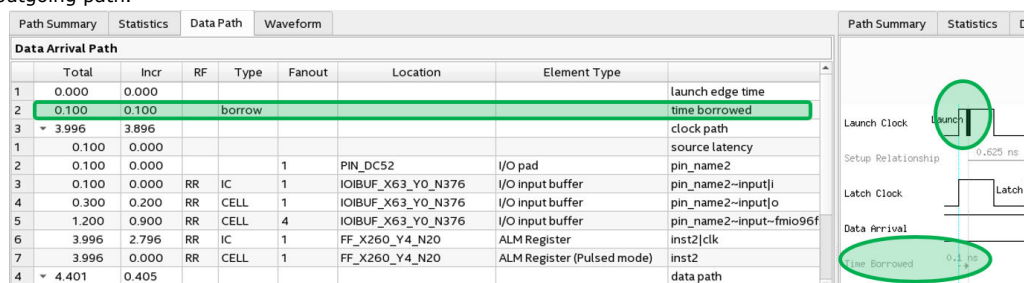

The Timing Analyzer reports time borrowing data for the **Data Arrival Path** or **Data Required Path**, according to whether borrowing occurs at the destination or the source.

**Figure 185. Report for Time Borrowing At Destination**

The following report shows 100ps borrowed on the Data Required path. The setup slack improves on incoming paths, at the expense of worse setup slack for outgoing paths.

**Figure 186. Report for Time Borrowing At Source**

The following report shows 100ps borrowed on the Data Arrival Path, worsening the setup relationship for the outgoing path.

### Related Information

Time Borrowing on page 19

## 2.5.19. Report Exceptions and Exceptions Reachability

The Timing Analyzer's **Reports > Constraint Diagnostics > Report Exceptions...** command allows you to report all exceptions to default timing analysis conditions, as specified by the **Set False Path**, **Set Multicycle Path**, **Set Minimum Delay**, or **Set Maximum Delay** commands (and the corresponding Tcl commands: `set_false_path`, `set_multicycle_path`, `set_min_delay`, and `set_max_delay`.)

**Figure 187. Report Exceptions Reachability Report**

Report Exceptions Reachability					
Show:	Visible	Hide	Q <<Filter>>		
	Status	Setup Reachability	Hold Reachability	Recovery Reachability	Removal Reachability
46	Invalid	n/a	n/a	n/a	n/a
47	Invalid	n/a	n/a	n/a	n/a
48	Invalid	n/a	n/a	n/a	n/a
49	Invalid	n/a	n/a	n/a	n/a
50	Invalid	n/a	n/a	n/a	n/a
51	Fully overridden	0.0%	n/a	0.0%	n/a
52	Fully overridden	n/a	0.0%	n/a	0.0%
53	Complete	n/a	0.0%	n/a	100.0%
54	Complete	n/a	0.4%	n/a	0.0%
55	Complete	0.0%	n/a	100.0%	n/a
56	Complete	n/a	0.0%	n/a	100.0%
57	Complete	0.0%	n/a	100.0%	n/a
58	Complete	n/a	0.0%	n/a	100.0%
59	Complete	0.0%	n/a	100.0%	n/a
60	Complete	0.0%	n/a	100.0%	n/a
61	Complete	85.7%	85.7%	100.0%	100.0%
62	Complete	0.0%	n/a	100.0%	n/a
63	Complete	0.0%	n/a	100.0%	n/a

Reachability Metrics	
Property	Value
1 Status	Exception is complete (not overridden)
2 Number of possible "-to-" targets	7
3 Number of unique "-to-" targets satisfied by the exception	
1 Setup analysis	n/a
2 Hold analysis	0
3 Recovery analysis	n/a
4 Removal analysis	7

Similarly, you can click on **Reports > Constraint Diagnostics > Report Exceptions Reachability...** to report the scope of exception constraints in your project. This report allows you to determine whether constraints apply fully or partially, are overridden, and whether the source and destination node are reachable for the constraint by providing a "reachability" percentage. Reachability is the percentage of paths to which the constraint applies. Low reachability indicates a constraint that may be too broad, potentially covering many unrelated items. High reachability indicates that the exception is very targeted.

## 2.5.20. Report Bottlenecks

You can run the Timing Analyzer's **Reports > Design Metrics > Report Bottlenecks...** command to list all nodes in a design ranked by specified criteria. The equivalent scripting command is `report_bottleneck`.

The following ranking criteria are pre-defined:

- `num_fpaths`—the number of paths that fail timing through a node.
- `num_fanins`—the number of fan-in edges from a node.
- `num_fanouts`—the number of fan-out edges from a node.
- `num_paths`—the number of paths through a node.
- `tns`—the total negative slack of all the paths through a node.

When using scripting, you can specify the paths for analysis by passing the result of any `get_timing_paths` call as the last argument to `report_bottleneck`. When using the GUI, the **Report Bottlenecks** dialog box handles this argument automatically. If you specify no paths, `report_bottleneck` analyzes the worst 1000 setup paths in the design by default.

You can direct the report output to the Tcl console (`-stdout`), the Timing Analyzer GUI (`-panel`), or to a combination of console and GUI.

**Figure 188. Report Bottlenecks Rated on Number of Failing Paths Through a Node**

	Rating	Node
1	2	bidir
2	2	dff2
3	1	tmpin combout
4	1	tmpin
5	1	dff3~feeder dataf
6	1	dff3~feeder combout
7	1	dff3 datain
8	1	dff3
9	0	clk combout
10	0	clk
11	0	bidir datain
12	0	dff1

### 2.5.20.1. Specifying Custom Bottleneck Criteria

You can optionally specify your own custom criteria for evaluating nodes based on the combination of the number of fan-outs, fan-ins, failing paths, and total paths.

To specify custom bottleneck criteria, follow these steps:

1. Create a Tcl procedure that takes one argument. For example, `arg`.
2. Use `upvar $arg metric` in the procedure.
3. Calculate the rating based on `$metric(tns)`, `$metric(num_fanouts)`, `$metric(num_fanins)`, and `$metric(num_fpaths)`.
4. Return the rating with `return $rating`.
5. Pass the name of your custom criteria procedure to `report_bottleneck` using the `-cmetric` option

### 2.5.21. Check Timing

The Timing Analyzer's **Reports > Constraint Diagnostics > Check Timing** command (`check_timing`) checks your design and constraint files for problems with design constraints.

**Check Timing** can perform a series of different checks based on the variables and options that you specify for the command. When using scripted methods, use the `-include` option to specify which checks to perform. You must run **Update Timing Netlist** (`update_timing_netlist`) before running **Check Timing** (`check_timing`).

**Figure 189. Check Timing Report and No Output Delay Subreport**

3	led_two_on	No output delay was set on output port.
4	led_three_on	No output delay was set on output port.

**Check Timing** can report the following data:

**Table 38. Check Timing Report Data**

Check Timing Data	Description
no_clock	Reports the registers that do not have at least one clock assignment at their clock pin, including any PLLs without a clock assignment.
multiple_clock	Reports the registers that have more than one clock at their clock pin. If multiple clocks reach a register clock pin, you must define which clock is used for analysis.
generated_clock	Reports the generated clocks that are invalid. Generated clocks must have a source that is triggered by a valid clock.
no_input_delay	Reports the input ports that are not clocks that have no input delay constraint.
no_output_delay	Reports the output ports that have no output delay constraint.
continued...	

Check Timing Data	Description
partial_input_delay	Reports the input delays that lack a <code>rise-min</code> , <code>fall-min</code> , <code>rise-max</code> , and <code>fall-max</code> constraint set.
partial_output_delay	Reports the output delays that lack a <code>rise-min</code> , <code>fall-min</code> , <code>rise-max</code> , and <code>fall-max</code> constraint set.
io_min_max_delay_consistency	Reports the minimum delay values that you specify in <code>set_input_delay</code> or <code>set_output_delay</code> constraints that are not less than maximum delay values.
reference_pin	Reports the reference pins that you specify with <code>set_input_delay</code> and <code>set_output_delay</code> using the <code>-reference_pin</code> that are invalid. A <code>reference_pin</code> is only valid if the <code>-clock</code> option in the same <code>set_input_delay</code> or <code>set_output_delay</code> command matches the clock that is in the direct fan-in of the <code>reference_pin</code> . Being in the direct fan-in of the <code>reference_pin</code> means that there must be no keepers between the clock and the <code>reference_pin</code> .
latency_override	Reports the instances where the clock latency that you set on a port or pin overrides the more generic clock latency set on a clock. You can set clock latency on a clock, where the latency applies to all keepers clocked by the clock. You can also set clock latency on a port or pin, where the latency applies to registers in the fan-out of the port or pin.
loops	Reports the instances where there are strongly connected components in the netlist. These loops prevent a design from properly analysis. The loops check also reports whether loops exist but are marked so that they are not traversed by timing analysis.
latches	Reports the instances where latches are present in the design and warns that latches may not be analyzed properly. For best results, change your design to remove latches whenever possible.
pos_neg_clock_domain	Reports the instances where any register is clocked by both the rising and falling edges of the same clock. If this scenario is necessary, such as in a clock multiplexer, create two separate clocks that have similar settings and are assigned to the same node.
pll_cross_check	Reports the instances where clocks that are assigned to a PLL do not correspond properly with the PLL settings you define in design files. The subreport specifies the inconsistent settings, or an unmatched number of clocks associated with the PLL.
uncertainty	Reports the clock-to-clock transfers that do not have a clock uncertainty assignment set between the two clocks. If the target device family has <code>derive_clock_uncertainty</code> support, this report also includes the number of user-defined <code>set_clock_uncertainty</code> assignments that have less than recommended clock uncertainty value.
virtual_clock	Reports the unreferenced virtual clocks without constraint.
partial_multicycle	Reports the setup multicycle assignments without a corresponding hold multicycle assignment, and whether each hold multicycle assignment has a corresponding setup multicycle assignment.
multicycle_consistency	Reports the multicycle instances where a setup multicycle does not equal one less than the hold multicycle. Appropriate Hold multicycle assignments are usually one cycle less than setup multicycle assignments.
partial_min_max_delay	Reports the minimum delay assignments without a corresponding maximum delay assignment, and vice versa.
clock_assignments_on_output_ports	Reports the output ports that have clock assignments.
input_delay_assigned_to_clock	Reports the clocks with input delay values set. The Timing Analyzer ignores input delays set on clock ports because clock-as-data analysis takes precedence.
internal_io_delay	Reports the I/O delay constraints that have no specification for <code>-reference_pin</code> and <code>-source_latency_included</code> , and where <code>-clock</code> is a clock that is not assigned to a top level input or output port.

## 2.5.22. Report SDC

The Timing Analyzer's **Reports > Constraint Diagnostics > Report SDC** command generates the **SDC Assignments** report folder.

The **SDC Assignments** folder contains separately named reports for any SDC constraints found in the current project. For example, the Create Clock report appears in the **SDC Assignments** folder if the project includes any `create_clock` SDC constraint.

**Figure 190. Create Clock Report Lists Clock Constraints in Current Project**

SDC Command	Name	Period	Waveform	Comments
1 create_clock	auto_f...erived	1.000	{ 0.000 0.500 }	
2 create_clock	clk_clk-derived	1.000	{ 0.000 0.500 }	

Other Info  
from Timing Analyzer  
(non-user-editable)

In **SDC Assignment** reports, the **Comments** column may contain non-user-editable information reported by the Timing Analyzer.

*Note:*

The **Comments** column in the **SDC Assignment** report has no relation to the SDC-on-RTL `-comment` argument that allows you to add comments to `.sdc` constraints. The SDC-on-RTL `-comment` does not appear in **SDC Assignment** reports.

The equivalent scripting command for **SDC Assignments** is `report_sdc`, for example:

```
report_sdc -panel_name sdc_report_panel
```

You can use the `-ignored` option to report any SDC constraints that the Timing Analyzer is ignoring and the reason for ignoring the constraint.

## 2.6. Scripting Timing Analysis

You can optionally use Tcl commands from the Quartus Prime software Tcl Application Programming Interface (API) to constrain, analyze, and collect timing information for your design. This section describes running the Timing Analyzer and setting constraints using Tcl commands. You can alternatively perform these same functions in the Timing Analyzer GUI. Tcl `.sdc` extensions provide additional methods for controlling timing analysis and reporting. The following Tcl packages support the Tcl timing analysis commands this chapter describes:

- `::quartus::sta`
- `::quartus::sdc`
- `::quartus::sdc_ext`

The Quartus Prime software provides the following two executables you can use for timing analysis and reporting:

- The `quartus_sta` executable—can perform timing analysis of your design without running the full Quartus Prime software GUI. If you use separate executables for various stages of design compilation (for example, `quartus_syn`, `quartus_fit`) you must use then use the `quartus_sta` executable to analyze timing for your placed and routed design. The `quartus_sta` executable also supports the interactive command-shell text-based timing reporting or scripted report generation.
- The `quartus_staw` executable—opens a GUI and supports interactive, graphical timing analysis and reporting.

#### Related Information

- [::quartus::staw](#)
- [::quartus::sdc](#)
- [::quartus::sdc\\_ext](#)

### 2.6.1. The quartus\_sta Executable

The `quartus_sta` executable allows you to run timing analysis without running the full Quartus Prime software GUI. The following methods are available:

- To run the Timing Analyzer in interactive command-shell mode, type the following at the command prompt:

```
quartus_sta -s
```

- To run timing analysis from a system command prompt, type the following command:

```
quartus_sta <options><project_name>
```

You can optionally use command line options available to perform iterative timing analysis on large designs. You can perform a less intensive analysis with `quartus_sta --mode=implement`. In this mode, the Quartus Prime software performs a reduced-corner timing analysis. When you achieve the desired result, you can use `quartus_sta --mode=finalize` to perform final Fitter optimizations and a full multi-corner timing analysis under all operating conditions.

**Table 39. quartus\_sta Command-Line Options**

Command-Line Option	Description
<code>-h   --help</code>	Provides help information on <code>quartus_sta</code> .
<code>-t &lt;script file&gt;   --script=&lt;script file&gt;</code>	Sources the <code>&lt;script file&gt;</code> .
<code>-s   --shell</code>	Enters shell mode.
<code>--tcl_eval &lt;tcl command&gt;</code>	Evaluates the Tcl command <code>&lt;tcl command&gt;</code> .
<i>continued...</i>	

Command-Line Option	Description
--do_report_timing	For all clocks in the design, run the following commands: <pre>report_timing -npaths 1 -to_clock \$clock report_timing -setup -npaths 1 -to_clock \$clock report_timing -hold -npaths 1 -to_clock \$clock report_timing -recovery -npaths 1 -to_clock \$clock report_timing -removal -npaths 1 -to_clock \$clock</pre>
--force_dat	Forces an update of the project database with new delay information.
--lower_priority	Lowest the computing priority of the quartus_sta process.
--post_map	Uses the post-map database results.
--sdc=<SDC file>	Specifies the .sdc file to use.
--report_script=<custom script>	Specifies a custom report script to call.
--speed=<value>	Specifies the device speed grade used for timing analysis.
-f <argument file>	Specifies a file containing additional command-line arguments.
-c <revision name>   --rev=<revision_name>	Specifies which revision and its associated Quartus Prime Settings File (.qsf) to use.
--multicorner	Specifies that the Timing Analyzer generates all slack summary reports for both slow- and fast-corners.
--multicorner[=on off]	Turns off multicorner timing analysis.
--voltage=<value_in_mV>	Specifies the device voltage, in mV used for timing analysis.
--temperature=<value_in_C>	Specifies the device temperature in degrees Celsius, used for timing analysis.
--parallel [= <num_processors>]	Specifies the number of computer processors to use on a multiprocessor system.
--mode=implement finalize	Regulates whether Timing Analyzer performs a reduced-corner analysis for intermediate operations (implement), or a four-corner analysis for final Fitter optimization and placement (finalize).

## 2.6.2. The quartus\_staw Executable

The quartus\_staw executable opens a graphical interface to perform interactive timing reporting and analysis of your Quartus Prime project. The following methods are available:

- To run the Timing Analyzer as a stand-alone GUI application, type the following at the command prompt:

```
quartus_staw
```

quartus\_staw can automatically open a project in the Timing Analyzer GUI if you specify the project name as an argument, as the following example shows. Specifying a project name as an argument saves you time because you do not have to browse to your project file after the GUI opens.

```
quartus_staw <project name>
```

You can specify a Tcl script that contains timing reporting and analysis commands to automatically run each time you open a project in the Timing Analyzer GUI. This feature allows you to easily define a uniform set of reports that the Timing Analyzer

GUI always generates, saving you time when you open a new project for interactive timing reporting. Use the `--report_script` option and specify a path to your report script:

```
quartus_staw --report_script=<custom script>
```

You must include only reporting and analysis commands in your report script. Do not include Tcl commands that open or close projects, create the timing netlist, read `.sdc` files, or update the timing netlist. The report script runs after the Timing Analyzer completely prepares the timing netlist for analysis.

You can optionally specify the directory and file names for the output of the reporting and analysis commands. The output of the reporting commands in the script are visible in the Timing Analyzer GUI, in the folder names you specify, when the reporting script completes. At that point, you can perform other reporting or analysis, as necessary.

### 2.6.3. Collection Commands

The Timing Analyzer supports collection commands that provide easy access to ports, pins, cells, or nodes in the design. Use collection commands with any constraints or Tcl commands specified in the Timing Analyzer.

**Table 40. Collection Commands**

Command	Collection Returned
<code>all_clocks</code>	All clocks in the design
<code>all_inputs</code>	All input ports in the design.
<code>all_outputs</code>	All output ports in the design.
<code>all_registers</code>	All registers in the design.
<code>get_cells</code>	Cells in the design. All cell names in the collection match the specified pattern. Wildcards can be used to select multiple cells at the same time.
<code>get_clocks</code>	Lists clocks in the design. When used as an argument to another command, such as the <code>-from</code> or <code>-to</code> of <code>set_multicycle_path</code> , each node in the clock represents all nodes clocked by the clocks in the collection. The default uses the specific node (even if the node is a clock) as the target of a command. The <code>-of_objects</code> option takes a node like a register and returns the clocks that drive it.
<code>get_nets</code>	Nets in the design. All net names in the collection match the specified pattern. You can use wildcards to select multiple nets at the same time.
<code>get_pins</code>	Pins in the design. All pin names in the collection match the specified pattern. You can use wildcards to select multiple pins at the same time.
<code>get_ports</code>	All ports (design inputs and outputs) in the design.
<code>get_registers</code>	Gets the specified registers in the design.
<code>get_keepers</code>	Gets the specified keepers in the design. Keepers are I/O ports or registers.

You can also examine collections and experiment with collections using wildcards in the Timing Analyzer by clicking **Name Finder** from the **View** menu.

### 2.6.3.1. Wildcard Characters

To apply constraints to many nodes in a design, use the "\*" and "?" wildcard characters. The "\*" wildcard character matches any string; the "?" wildcard character matches any single character.

If you apply a constraint to node `reg*`, the Timing Analyzer searches for and applies the constraint to all design nodes that match the prefix `reg` with any number of following characters, such as `reg`, `reg1`, `reg[2]`, `regbank`, and `reg12bank`.

If you apply a constraint to a node specified as `reg?`, the Timing Analyzer searches and applies the constraint to all design nodes that match the prefix `reg` and any single character following; for example, `reg1`, `rega`, and `reg4`.

### 2.6.3.2. Adding and Removing Collection Items

Wildcards that you use with collection commands define collection items that the command identifies. For example, if a design contains registers with the name `src0`, `src1`, `src2`, and `dst0`, the collection command `[get_registers src*]` identifies registers `src0`, `src1`, and `src2`, but not register `dst0`. To identify register `dst0`, you must use an additional command, `[get_registers dst*]`. To include `dst0`, you can also specify a collection command `[get_registers {src* dst*}]`.

To modify collections, use the `add_to_collection` and `remove_from_collection` commands. The `add_to_collection` command allows you to add additional items to an existing collection.

#### add\_to\_collection Command

`add_to_collection <first collection> <second collection>`

*Note:*

The `add_to_collection` command creates a new collection that is the union of the two collections you specify.

The `remove_from_collection` command allows you to remove items from an existing collection.

#### remove\_from\_collection Command

`remove_from_collection <first collection> <second collection>`

The following example shows use of `add_to_collection` to add items to a collection.

#### Adding Items to a Collection

```
#Setting up initial collection of registers
set regsl [get_registers a*]
#Setting up initial collection of keepers
set kprsl [get_keepers b*]
#Creating a new set of registers of $regsl and $kprsl
set regs_union [add_to_collection $kprsl $regsl]
#OR
#Creating a new set of registers of $regsl and b*
#Note that the new collection appends only registers with name b*
# not all keepers
set regs_union [add_to_collection $regsl b*]
```

In the Quartus Prime software, keepers are I/O ports or registers. An `.sdc` file that includes `get_keepers` is incompatible with third-party timing analysis flows.

#### Related Information

- [add\\_to\\_collection Command, Quartus Prime Help](#)
- [remove\\_from\\_collection Command, Quartus Prime Help](#)

### 2.6.3.3. Query of Collections

You can display the contents of a collection with the `query_collection` command. Use the `-report_format` option to return the contents in a format of one element per line. The `-list_format` option returns the contents in a Tcl list.

```
query_collection -report_format -all $regs_union
```

Use the `get_collection_size` command to return the number of items the collection contains. If your collection is in a variable with the name `col`, use `set num_items [get_collection_size $col]` rather than `set num_items [llength [query_collection -list_format $col]]` for more efficiency.

### 2.6.3.4. Using the get\_pins Command

The `get_pins` command supports options that control the matching behavior of the wildcard character (\*). Depending on the combination of options you use, you can make the wildcard character (\*) respect or ignore individual levels of hierarchy. The pipe character (|) indicates levels of hierarchy. By default, the wildcard character (\*) matches only a single level of hierarchy.

These examples filter the following node and pin names to illustrate function:

- `lv1` (a hierarchy level with the name `lv1`)
- `lv1|dataa` (an input pin in the instance `lv1`)
- `lv1|datab` (an input pin in the instance `lv1`)
- `lv1|cnod` (a combinational node with the name `cnod` in the `lv1` instance)
- `lv1|cnod|datac` (an input pin to the combinational node with the name `cnod`)
- `lv1|cnod|datad` (an input pin to the combinational node `cnod`)

**Table 41. Sample Search Strings and Search Results**

Search String	Search Result
<code>get_pins * dataa</code>	<code>lv1 dataa</code>
<code>get_pins * datac</code>	<code>&lt;empty&gt;</code> <sup>(6)</sup>
<code>get_pins * * datac</code>	<code>lv1 cnod datac</code>
<code>get_pins lv1* *</code>	<code>lv1 dataa, lv1 datab</code>
<i>continued...</i>	

<sup>(6)</sup> The search result is `<empty>` because the wildcard character (\*) does not match more than one hierarchy level, that a pipe character (|) indicates, by default. This command matches any pin with the name `datac` in instances at the top level of the design.

Search String	Search Result
<code>get_pins -hierarchical * * datac</code>	<code>&lt;empty&gt;</code> <sup>(6)</sup>
<code>get_pins -hierarchical lvl *</code>	<code>lvl dataa, lvl datab</code>
<code>get_pins -hierarchical * datac</code>	<code>lvl cnod datac</code>
<code>get_pins -hierarchical lvl * datac</code>	<code>&lt;empty&gt;</code> <sup>(6)</sup>
<code>get_pins -compatibility_mode * datac</code>	<code>lvl cnod datac</code> <sup>(7)</sup>
<code>get_pins -compatibility_mode * * datac</code>	<code>lvl cnod datac</code>

The default method separates hierarchy levels of instances from nodes and pins with the pipe character (|). A match occurs when the levels of hierarchy match, and the string values including wildcards match the instance or pin names. For example, the command `get_pins <instance_name>|*|datac` returns all the datac pins for registers in a given instance. However, the command `get_pins *|datac` returns an empty collection because the levels of hierarchy do not match.

Use the `-hierarchical` matching scheme to return a collection of cells or pins in all hierarchies of your design.

For example, the command `get_pins -hierarchical *|datac` returns all the datac pins for all registers in your design. However, the command `get_pins -hierarchical *|*|datac` returns an empty collection because more than one pipe character (|) is not supported.

The `-compatibility_mode` option returns collections matching wildcard strings through any number of hierarchy levels. For example, an asterisk can match a pipe character when using `-compatibility_mode`.

## 2.7. Using the Quartus Prime Timing Analyzer Document Revision History

Document Version	Quartus Prime Version	Changes
2024.04.01	24.1	<ul style="list-style-type: none"> <li>Added new <i>Using Timing Constraints throughout the Design Flow</i> topic.</li> <li>Revised the <i>Step 1: Specify General Timing Analyzer Settings</i> topic to add link to SDC-on-RTL info.</li> <li>Revised <i>Step 3: Run the Timing Analyzer</i> topic for Early Timing Analysis and SDC-on-RTL.</li> <li>Revised <i>Applying Timing Constraints</i> section for Early Timing Analysis and SDC-on-RTL.</li> <li>Revised <i>SDC File Precedence</i> topic for SDC-on-RTL.</li> <li>Revised <i>Iteratively Modifying Constraints</i> topic for SDC-on-RTL.</li> <li>Added new <i>Using Entity-based SDC-on-RTL Constraints</i> section.</li> <li>Revised <i>Using Entity-bound SDC Files</i> section for SDC-on-RTL.</li> <li>Renamed <i>Generate Timing Reports</i> topic to <i>Timing Report Descriptions</i> and relocated.</li> </ul>
continued...		

<sup>(7)</sup> When you use `-compatibility_mode`, the Timing Analyzer does not treat pipe characters (|) as special characters when you use the characters with wildcards.

## 1. Power Analysis

Power consumption is a critical design consideration. When designing a PCB, you must determine the power consumption of the FPGA device to develop an accurate power budget, and to design the power supplies, voltage regulators, heat sink, and cooling system.

The Quartus® Prime software includes the Power Analyzer to help you to estimate the power consumption of your compiled design.

**Figure 1. Power Analyzer Tool Settings**

The screenshot shows the 'Power Analyzer Settings' dialog box. On the left, four orange lines with labels point to specific settings: 'Specify Power Input Files' points to the 'Use input file(s) to initialize toggle rates and static probabilities during power analysis' checkbox; 'Write Out Signal Activities' points to the 'Write out signal activities used during power analysis' checkbox; 'PTC File Name' points to the 'Power and thermal calculator export file name' text field; and 'Specify Toggle Rates' points to the 'Default toggle rate used for remaining signals' radio button options.

**Power Analyzer Settings**  
Select the power analyzer options.

☐ Run Power Analyzer during compilation

☐ Use input file(s) to initialize toggle rates and static probabilities during power analysis

Input File(s)

File Name	Type	Entity	VCD Start Time	VCD End Time

☒ Perform glitch filtering on VCD files

☒ Write out signal activities used during power analysis

Output file name:

Power and thermal calculator export file name:

☐ Write signal activities to report file

☐ Write power dissipation by block to report file

Default toggle rates for unspecified signals

Default toggle rate used for input I/O signals:  %

Default toggle rate used for remaining signals

☒ Use default value:  %

☐ Use vectorless estimation

The Quartus Prime Design Suite also provides the Early Power Estimator (EPE) spreadsheet for Arria® 10 devices, and the Intel® FPGA Power and Thermal Calculator for Agilex™ FPGA portfolio and Stratix® 10 devices to estimate power consumption calculated from your predicted design characteristics.

Power estimation and analysis allows you to confirm that your design does not exceed thermal or power supply requirements throughout the design process:

- **Thermal**—Thermal power is the power that dissipates as heat from the FPGA. Devices use a heatsink or fan to act as a cooling solution. This cooling solution must be sufficient to dissipate the heat that the device generates. Additionally, the computed junction temperature must fall within normal device specifications.
- **Power supply**—Power supply is the power that the device needs to operate. Power supplies must provide adequate current to support device operation.

**Note:** Do not use the results of the Power Analyzer as design specifications. You must also verify the actual power during device operation to account for actual environmental operating conditions.

## 1.1. Power Analysis Tools

The Quartus Prime Design Suite provides tools to analyze the power consumption of your FPGA design at different stages of the design process.

- Intel FPGA Power and Thermal Calculator (PTC)—estimates power supply and system thermal requirements before compiling the design, or anytime during the design phase. Supports Agilex FPGA portfolio and Stratix 10 devices.
- Quartus Prime Power Analyzer (QPA)—estimates power consumption for a post-fit design, allowing you establish guidelines for the power budget.
- Early Power Estimator (EPE) spreadsheet—estimates power consumption for power supply planning before compiling the design. Supports Arria 10 and Stratix 10 devices. (For versions of the Quartus Prime software later than version 19.4, Stratix 10 devices are supported in the Intel FPGA Power and Thermal Calculator.)

**Figure 2. Estimation Accuracy for Different Inputs and Power Analysis Tools**

The accuracy of the power model is determined on a per-power-rail basis for the Quartus Prime Power Analyzer.

- For most Stratix 10 designs, the Quartus Prime Power Analyzer has the following accuracy, assuming final power models: Within 10% of silicon for the majority of power rails with higher power, assuming accurate inputs and toggle rates.
- For most Agilex FPGA portfolio designs, the Quartus Prime Power Analyzer has the following accuracy, assuming final power models: Within 10% of silicon for all power rails, assuming accurate inputs and toggle rates.

**Table 1. Comparison of EPE/Intel FPGA PTC and Quartus Prime Power Analyzer Capabilities**

Characteristic	EPE / PTC	Quartus Prime Power Analyzer
When to use	Any time <i>Note:</i> For post-fit power analysis, you get better results with the Quartus Prime Power Analyzer.	Post-fit
Software requirements	EPE: Spreadsheet program. Intel FPGA PTC: Integrated into the Quartus Prime software, and is also available as a standalone tool.	The Quartus Prime software
Accuracy	Medium	Medium to very high
Data inputs	<ul style="list-style-type: none"> <li>• Resource usage estimates</li> <li>• Clock requirements</li> <li>• Environmental conditions</li> <li>• Toggle rate</li> </ul>	<ul style="list-style-type: none"> <li>• Post-fit design</li> <li>• Clock requirements</li> <li>• Signal activity defaults</li> <li>• Environmental conditions</li> <li>• Register transfer level (RTL) simulation results (optional)</li> <li>• Post-fit simulation results (optional)</li> <li>• Signal activities per node or entity (optional)</li> </ul>
Data outputs <i>Note:</i> The EPE and Power Analyzer outputs vary by device family.	<ul style="list-style-type: none"> <li>• Total thermal power dissipation</li> <li>• Thermal static power</li> <li>• Thermal dynamic power</li> <li>• Off-chip power dissipation</li> <li>• Current drawn from voltage supplies</li> </ul>	<ul style="list-style-type: none"> <li>• Total thermal power</li> <li>• Thermal static power</li> <li>• Thermal dynamic power</li> <li>• Thermal I/O power</li> <li>• Thermal power by design hierarchy</li> <li>• Thermal power by block type</li> <li>• Thermal power dissipation by clock domain</li> <li>• Device supply currents</li> </ul>
Estimation of transceiver power for dynamic reconfiguration features	Includes an estimation of the incremental power consumption by these features.	Not included

**Note:** The Quartus Prime Power Analyzer does not support power analysis of the following Intel FPGA IP:

- Stratix 10 HBM2 IP
- Stratix 10 HPS IP
- Arria 10 HPS IP

In versions of the Quartus Prime software later than 19.4, you can obtain power estimations for the Stratix 10 HBM2 IP and Stratix 10 HPS IP using the Intel FPGA Power and Thermal Calculator (PTC).

For power estimation of Arria 10 HPS IP, and for power estimation in the Quartus Prime software version 19.4 or earlier, you can obtain power estimations using the Early Power Estimator spreadsheet (EPE).

## 1.2. Running the Power Analyzer

Before running the Power Analyzer you must run full compilation of your design to generate the post-fit netlist. In addition, you must either provide timing assignments for all clocks in the design, or specify signal activity data for power analysis. You must specify the I/O standard on each device input and output, and the board trace model on each output in the design.

To run the Power Analyzer:

1. To specify device power characteristics, operating voltage, and temperature conditions for power analysis, click **Assignments > Settings > Operating Settings and Conditions**, as [Settings for Power Analysis](#) on page 8 describes.
2. To run full compilation of your design, click **Processing > Start Compilation**.
3. Click **Assignments > Settings > Power Analyzer**.
4. Specify the source of signal activity data, as [Generating Signal Activity Data for Power Analysis](#) on page 12 describes.
5. To generate a Signal Activity (.saf) file during analysis, turn on **Write out signal activities used during power analysis**, and specify the file name.
6. You can customize the generated **Power and Thermal Calculator export file name**. This file summarizes the resource utilization and allows you to perform what-if analyses in PTC.
7. Specify the **Default toggle rates for unspecified signals**, as [Specifying the Default Toggle Rate](#) on page 17 describes.
8. To specify temperature range and cooling options, click **Cooling Solution and Temperature**.
9. To run full compilation of your design, click **Processing > Start > Start Power Analyzer**.
10. When power analysis is complete, click **Report** to open the Power Analyzer reports that [Viewing Power Analysis Reports](#) on page 19 describes.

### Related Information

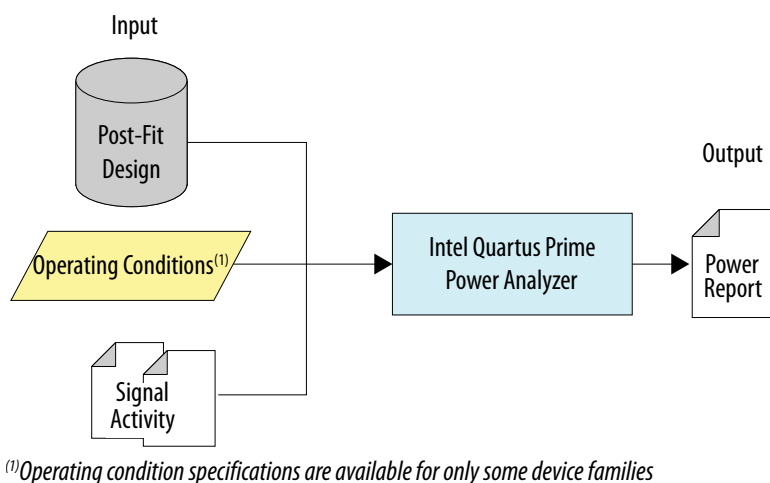

[Specifying Power Analyzer Input](#) on page 8

## 1.3. Specifying Power Analyzer Input

The Power Analyzer accuracy is driven by design factors, operating conditions, and signal activity data that affect power consumption. The following figure shows how the Power Analyzer interprets these inputs and generates results in the Power Analysis report:

**Figure 3. Power Analyzer High-Level Flow**

To obtain accurate I/O power estimates, the Power Analyzer requires full compilation of your design, in addition to specifying the following settings:

- The electrical standard on each I/O cell.
- The board trace model on each I/O standard in the design.
- Timing assignments for all the clocks in your design, or use a simulation-based flow to generate activity data.

**Note:** For accurate results, ensure that any .VCD file used with the Power Analyzer is the result of gate-level simulation.

### 1.3.1. Settings for Power Analysis

You can specify device power characteristics, operating voltage conditions, operating temperature conditions, Power Analyzer settings and thermal settings, in the **Operating Settings and Conditions**, **Power Analyzer Settings**, and **Thermal** pages of the **Settings** dialog box.

**Table 2. Operating Settings and Conditions**

Option	Settings
<b>Device power characteristics</b>	<ul style="list-style-type: none"> <li>• <b>Maximum</b>—specifies maximum power consumed by the worst-case device. This is the default value for Stratix 10 and Agilex devices.</li> <li>• <b>Typical</b>—specifies average power consumed by typical silicon at nominal operating conditions.</li> </ul>
<b>Voltage</b> tab	Specifies the operating voltage conditions for each power rail in the device, and the supply voltages for power rails with selectable supply voltages.
<b>Temperature</b> tab	Specifies the minimum and maximum junction temperature range.

**Figure 4. Operating Settings and Conditions**

**Figure 5. Power Analyzer Settings**

**Table 3. Power Analyzer Settings**

Option	Settings
<b>Power Analyzer Settings</b>	<p>Specifies the Power Analyzer options, including:</p> <ul style="list-style-type: none"> <li>• <b>Run Power Analyzer during compilation</b>—Check this box to turn on power analysis during compilation.</li> <li>• <b>Use input file(s) to initialize toggle rates and static probabilities during power analysis</b>—Check this box to use Signal Activity Files or VCD files to initialize toggle rates and static probabilities for power estimation.</li> <li>• <b>Write out signal activities used during power analysis</b>—Check this box to write the toggle rates and static probabilities used during power estimation to a file.</li> <li>• <b>Power and thermal calculator export file name</b>—specifies the export file name (.qptc) of the design summary that you can import into the Intel FPGA Power and Thermal Calculator. You can customize this name.</li> <li>• <b>Write signal activities to report file</b>—Check this box to have the Power Analyzer write a report file containing the signal activities used during power analysis.</li> </ul>

Option	Settings
	<ul style="list-style-type: none"> <li>• <b>Write power dissipation by block to report file</b>—Check this box to have the Power Analyzer report the thermal power dissipation calculated during power analysis, in the <b>Thermal Power Dissipation by Block</b> report panel.</li> <li>• <b>Default toggle rate used for input I/O signals</b>—Specify a default toggle rate for use on input I/O pins during power estimation. Can be expressed as a percentage or in transitions/second.</li> <li>• <b>Default toggle rate used for remaining signals</b> <ul style="list-style-type: none"> <li>— <b>Use default value</b>—Specify a default toggle rate for use during power estimation on all nodes except I/O pins. This value is used only if no toggle rate is specified through a Signal Activity File, VCD file, or user assignment. Can be expressed as a percentage or in transitions/second.</li> <li>— <b>Use vectorless estimation</b>—Turn on this control to use vectorless estimation to fill in undefined toggle rates and static probabilities. If this option is not available, the device family does not support vectorless estimation.</li> </ul> </li> </ul>

Valid values are 0–25%. The default value is 0%. The recommended margin for Agilex FPGA portfolio devices is 10%, and for Stratix 10 devices, 25%. <ul style="list-style-type: none"> <li><i>Note:</i> For a design compiled in an earlier version of the Quartus Prime software with the <b>Apply Recommended Margin</b> parameter set to Yes, the current version of Power Analyzer interprets this as an <b>Apply Additional Margin</b> setting of 25%.</li> </ul> </li> <li>• <b>Temperature measurement method</b>—Select the method to use for reporting temperature sensors for thermal analysis.</li> </ul>

### 1.3.2. Specifying Signal Activity Data

The accuracy of the power estimation depends on how representative signal activity data is during power analysis. The Power Analyzer allows you to specify signal activity data from the following sources:

- .vcd files from supported simulators
- User-entered node, entity, clock, and toggle rate assignments
- Vectorless estimation (selected devices)

You can mix and match the signal activity data sources on a signal-by-signal basis.

**Figure 7. Priority Scheme Applied to Each Signal**

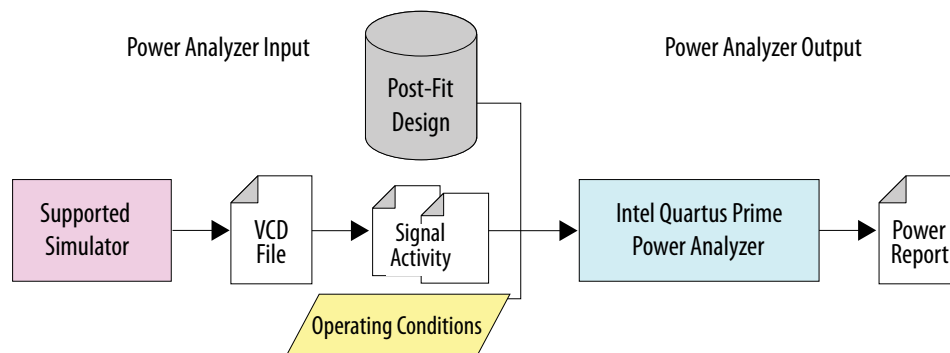

#### 1.3.2.1. Using Simulation Signal Activity Data in Power Analysis

You can specify a Verilog Value Change Dump File (.vcd) generated by simulating a placed and routed gate-level netlist in a supported simulator as the source of signal activity data for power analysis. Third-party simulators can output a .vcd that contains signal activity and static probability information for power analysis. The .vcd includes all routing resources and the logic array resource usage.

To improve the accuracy of power analysis, you can generate a Standard Delay Output (.sdo) file that includes back-annotated delay estimates of the instances of core atoms for ModelSim\* simulation. ModelSim simulation can then output a more accurate .vcd for use as power analysis input. You must run **Fitter (Finalize)** before generating the .sdo.

**Figure 8. Using Simulation Signal Activity Data in Power Analysis**

### 1.3.2.1.1. Generating Signal Activity Data for Power Analysis

To generate and use simulation signal activity data for power analysis:

1. To run full compilation on your design, click **Processing > Start Compilation**.
2. To specify settings for simulation output, click **Assignments > Settings > EDA Tool Settings > Simulation**. Select your simulator in **Tool name** and the **Format for output netlist** and **Output directory**.

**Figure 9. EDA Tool Settings for Simulation**

**EDA Tool Settings**

Specify options for generating output files for use with other EDA tools.

☐ Run EDA Netlist Writer during compilation (require Design entry/synthesis, Simulation, Design entry/synthesis)

Tool name: <None>

**Simulation**

Tool name: QuestaSim

Format for output netlist: Verilog HDL

Output directory: simulation/questa

☐ Map illegal HDL characters

3. Turn on **Map illegal HDL characters**. This setting directs the EDA Netlist Writer to map illegal characters for VHDL or Verilog HDL, and results in more accurate data for power analysis.
4. Click the **Power Analyzer Settings** page.
5. For Stratix 10 designs, to generate a Standard Delay Output (.sdo) file that includes back-annotation of delays for power analysis, refer to [Generating Standard Delay Output for Power Analysis](#) on page 13.
6. Under **Input file**, turn on **Use input files to initialize toggle rates and static probabilities during power analysis**.

**Figure 10. Specifying Power Analysis Input Files**

☒ Use input file(s) to initialize toggle rates and static probabilities during power analysis

Input File(s)

File Name	Type	Entity	VCD Start Time	VCD End Time

Add... Edit... Remove

☐ Perform glitch filtering on VCD files

7. To specify a .vcd for power analysis, click **Add** and specify the **File name**, **Entity**, and **Simulation period** for the .vcd, and click **OK**.
8. To enable glitch filtering during power analysis with the .vcd you generate, turn on **Perform glitch filtering on VCD files**.
9. To run the power analysis, click **Start** on the **Power Analysis** step in the Compilation Dashboard. View the toggle rates in the power analysis results.

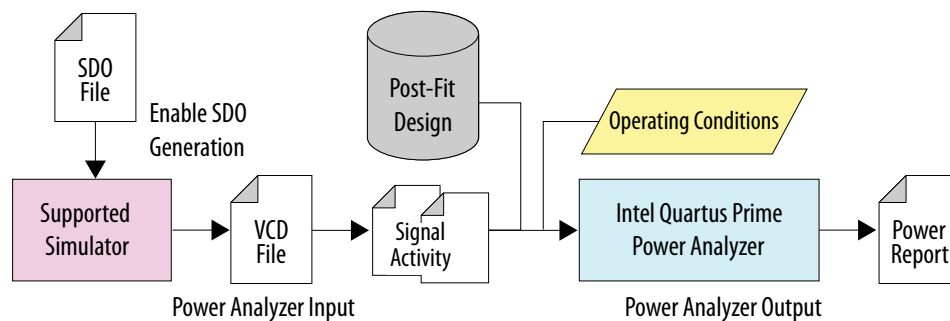

*Note:*

To improve accuracy of power analysis, the Quartus Prime EDA Netlist writer can generate a Standard Delay Output (.sdo) file that includes back-annotation of delays for a design's netlist for use during simulation in QuestaSim. Although the .sdo only contains delay estimates and imprecise timing information, including the .sdo in simulation results in a more accurate output .vcd for power analysis. The EDA Netlist Writer currently supports .sdo file generation only for Verilog .vo simulation in the QuestaSim simulator (not ModelSim - Intel FPGA Edition) for Stratix 10 designs. The EDA Netlist Writer does not currently support .sdo file generation for any other simulator or device family.

### 1.3.2.1.2. Generating Standard Delay Output for Power Analysis

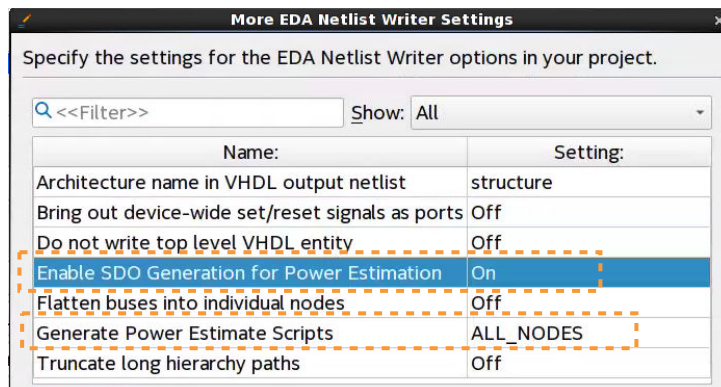

To improve accuracy of power analysis, you can generate a Standard Delay Output (.sdo) file that includes back-annotated delay estimates for QuestaSim simulation. QuestaSim simulation can then output a more accurate .vcd for use as power analysis input. You must run **Fitter (Finalize)** before generating the .sdo.

**Figure 11. Using an SDO in Power Analysis**

1. Click **Assignments > Settings > EDA Tool Settings > Simulation**. In **Tool name** select **QuestaSim** and **Verilog** for **Format for output netlist**.

**Figure 12. More EDA Netlist Writer Settings**

- Click **More EDA Netlist Writer Settings**. Set **Enable SDO Generation for Power Estimation** to **On**. Set **Generate Power Estimate Scripts** to **ALL\_NODES**.
- To run the Fitter, click **Processing > Start > Start Fitter (Finalize)**.
- Create a representative testbench (.vt) that exercises the design functions appropriately.
- To specify the appropriate hierarchy level for signals in the output .vcd, add the following line to the project .qsf file: <sup>(1)</sup>

```
set_global_assignment -name EDA_TEST_BENCH_DESIGN_INSTANCE_NAME
    <DUT instance path> -section_id eda_simulation
```
- After Fitter processing is complete, click **Processing > Start > Start EDA Netlist Writer**. EDA Netlist Writer generates the following files in /<project>/simulation/questa/power/:
  - <project>.vo (contains a reference to the .sdo file by default)
  - <project>\_dump\_all\_vcd\_nodes.tcl—specifies nodes to save in .vcd
  - <project>\_v.sdo—back-annotated delay estimates
- Create a QuestaSim script (.do) to load the design and testbench, start QuestaSim, and then source the .do script.
- To specify the signals QuestaSim includes in the .vcd file, source \*\_dump\_all\_vcd\_nodes.tcl in QuestaSim.
- To generate the .vcd file, simulate the test bench and netlist in QuestaSim. The .vcd file generates according to your specifications.
- Specify the .vcd as an input to power analysis, as [Generating Signal Activity Data for Power Analysis](#) describes.

<sup>(1)</sup> Specify the full hierarchical path in the testbench, not just the instance name. For example, specify a|b|c, not just c.

*Note:* The EDA Netlist Writer currently supports .sdo file generation only for Verilog .v0 simulation in the QuestaSim simulator (not ModelSim - Intel FPGA Edition) for Stratix 10 designs. The EDA Netlist Writer does not currently support .sdo file generation for any other simulator or device family.

### 1.3.2.1.3. Simulation Glitch Filtering

The Power Analyzer defines a glitch as two signal transitions so closely spaced in time that the pulse, or glitch, occurs faster than the logic and routing circuitry can respond. The output of a transport delay model simulator contains glitches for some signals. The logic and routing structures of the device form a low-pass filter that filters out glitches that are tens to hundreds of picoseconds long, depending on the device family.

Some third-party simulators use different models than the transport delay model as the default model. Different models cause differences in signal activity and power estimation. The inertial delay model, which is the ModelSim default model, filters out more glitches than the transport delay model and usually yields a lower power estimate.

*Note:* Intel FPGA recommends that you use the transport simulation model when using the Quartus Prime software glitch filtering support with third-party simulators. Simulation glitch filtering has little effect if you use the inertial simulation model.

Glitch filtering in a simulator can also filter a glitch on one logic element (LE) (or other circuit element) output from propagating to downstream circuit elements to ensure that the glitch does not affect simulated results. Glitch filtering prevents a glitch on one signal from producing non-physical glitches on all downstream logic, which can result in a signal toggle rate and a power estimate that are too high. Circuit elements in which every input transition produces an output transition, including multipliers and logic cells configured to implement XOR functions, are especially prone to glitches. Therefore, circuits with such functions can have power estimates that are too high when glitch filtering is not used.

*Note:* Intel FPGA recommends that you use the glitch filtering feature to obtain the most accurate power estimates. For .vcd files, the Power Analyzer flows support two levels of glitch filtering.

Enable glitch filtering in the .vcd that you generate for use in power analysis by turning on **Perform glitch filtering on VCD files**.

**Figure 13. Enabling Glitch Filtering for VCD**

**Power Analyzer Settings**

Select the power analyzer options.

☒ Run Power Analyzer during compilation

☒ Use input file(s) to initialize toggle rates and static probabilities during power analysis

Input File(s)

File Name	Type	Entity	VCD Start Time	VCD End Time

☒ Perform glitch filtering on VCD files

☐ Write out signal activities used during power analysis

Output file name:

The .vcd file reader performs glitch filtering that is complementary to simulation glitch filtering, but is often less precise. While the .vcd file reader has the ability to remove glitches on logic blocks, the file reader cannot determine how a given glitch potentially affects downstream logic and routing. Filtering the glitches during simulation avoids switching downstream routing and logic automatically.

**Note:** When running simulation for design verification (rather than to produce input to the Power Analyzer), Intel recommends that you turn off the glitch filtering option to produce the most rigorous and conservative simulation from a functionality viewpoint. When performing simulation to produce input for the Power Analyzer, Intel FPGA recommends that you turn on the glitch filtering to produce the most accurate power estimates.

### 1.3.2.2. Signal Activities from RTL (Functional) Simulation, Supplemented by Vectorless Estimation

In the functional simulation flow, simulation provides toggle rates and static probabilities for all pins and registers in your design. Vectorless estimation fills in the values for all the combinational nodes between pins and registers, giving good results. This flow usually provides a compilation time benefit when you use the third-party RTL simulator.

#### 1.3.2.2.1. RTL Simulation Limitation

RTL simulation may not provide signal activities for all registers in the post-fitting netlist because synthesis loses some register names. For example, synthesis might automatically transform state machines and counters, thus changing the names of registers in those structures. As a result, a large number of nodes in the .vcd file may not match the nodes in your design netlist, which can result in the power analysis results being less accurate or of lower confidence.

### 1.3.2.3. Signal Activities from Vectorless Estimation and User-Supplied Input Pin Activities

The vectorless estimation flow provides a low level of accuracy, because vectorless estimation for registers is not entirely accurate.

### 1.3.2.4. Signal Activities from User Defaults Only

The user defaults only flow provides the lowest degree of accuracy.

## 1.3.3. Specifying the Default Toggle Rate

You can specify the **Default toggle rates for unspecified signals** in your design for power analysis. The Power Analyzer uses the default toggle rate when no other method specifies the signal activity data.

**Figure 14. Specifying the Default Toggle Rate**

You specify the toggle rate in absolute terms (transitions per second), or as a fraction of the clock rate in effect for each node. The toggle rate for a clock derives from the timing settings for the clock. For example, if the Power Analyzer specifies a clock with an  $f_{\text{MAX}}$  constraint of 100 MHz and a default relative toggle rate of 20%, nodes in this clock domain transition in 20% of the clock periods, or 20 million transitions occur per second.

In some cases, the Power Analyzer cannot determine the clock domain for a node because the clock domain is ambiguous. For example, the Power Analyzer cannot determine a clock domain for a node unless you specify sufficient timing constraints for the clock domains. If the Power Analyzer cannot determine the clock domain for a node, the Power Analyzer substitutes and reports a toggle rate of zero.

**Note:** The transceiver I/O toggle rate is determined by the XCVR data rate value specified in your IP catalog settings. Do not include transceiver I/O toggle rate in the default toggle rates that you specify in the Power Analyzer.

### Related Information

[Toggle Rate](#) on page 34

## 1.3.4. Specifying Toggle Rates for Specific Nodes

You can assign toggle rates and static probabilities to individual nodes in the design. These assignments have the highest priority, overriding data from all other signal activity sources.

You must use the Assignment Editor or Tcl commands to create the **Power Toggle Rate** and **Power Static Probability** assignments. You can specify the power toggle rate as an absolute toggle rate in transitions per second using the **Power Toggle Rate** assignment, or you can use the **Power Toggle Rate Percentage** assignment to specify a toggle rate relative to the clock domain of the assigned node for a more specific assignment made in terms of hierarchy level.

**Note:** If you use the **Power Toggle Rate Percentage** assignment, and the node does not have a clock domain, the Quartus Prime software issues a warning and ignores the assignment.

Assigning toggle rates and static probabilities to individual nodes is appropriate for signals in which you have knowledge of the signal being analyzed. For example, if you know that a 100 MHz data bus or memory output produces data that is essentially random (uncorrelated in time), you can directly enter a 0.5 static probability and a toggle rate of 50 million transitions per second.

The Power Analyzer treats bidirectional I/O pins differently. The combinational input port and the output pad for a pin share the same name. However, those ports might not share the same signal activities. For reading signal activity assignments, the Power Analyzer creates a distinct name `<node_name~output>` when configuring the bidirectional signal as an output and `<node_name~result>` when configuring the signal as an input. For example, if a design has a bidirectional pin named `MYPIN`, assignments for the combinational input use the name `MYPIN~result`, and the assignments for the output pad use the name `MYPIN~output`.

**Note:** When you create the logic assignment in the Assignment Editor, you cannot find the `MYPIN~result` and `MYPIN~output` node names in the Node Finder. Therefore, to create the logic assignment, you must manually enter the two differentiating node names to create the assignment for the input and output port of the bidirectional pin.

#### 1.3.4.1. Clock Node Toggle Rates

For clock nodes, the Power Analyzer uses timing requirements to derive the toggle rate when neither simulation data nor user-entered signal activity data is available.  $f_{MAX}$  requirements specify full cycles per second, but each cycle represents a rising transition and a falling transition. For example, a clock  $f_{MAX}$  requirement of 100 MHz corresponds to 200 million transitions per second for the clock node.

#### 1.3.5. Avoiding Simulation Node Name Match

Node name mismatches happen when you have `.vcd` applied to entities other than the top-level entity. In a modular design flow, the gate-level simulation files created in different Quartus Prime projects might not match their node names with the current Quartus Prime project.

For example, you may have a file named `8b10b_enc.vcd`, which the Quartus Prime software generates in a separate project called `8b10b_enc` while simulating the `8b10b` encoder. If you import the `.vcd` into another project called `Top`, you might encounter name mismatches when applying the `.vcd` to the `8b10b_enc` module in the `Top` project. This mismatch happens because the Quartus Prime software might name all the combinational nodes in the `8b10b_enc.vcd` differently than in the `Top` project. To avoid such mismatches, Intel recommends using `.vcd` files generated from simulation of your top level project.

## 1.4. Viewing Power Analysis Reports

Following successful power analysis, click the **Power Analyzer** pulldown in the **Table of Contents** of the Compilation Report, to view the Power Analysis section of the report.

The Power Analysis reports contains the following sections:

### Summary

The Summary section of the report shows the estimated total thermal power consumption of your design. This includes dynamic, static, and I/O thermal power consumption. The I/O thermal power includes the total I/O power drawn from the  $V_{CCIO}$  and  $V_{CCPD}$  power supplies and the power drawn from  $V_{CCINT}$  in the I/O subsystem including I/O buffers and I/O registers. The report also includes a confidence metric that reflects the overall quality of the data sources for the signal activities. For example, a **Low** power estimation confidence value reflects that you have provided insufficient toggle rate data, or most of the signal activity information used for power estimation is from default or vectorless estimation settings. For more information about the input data, refer to the Power Analyzer Confidence Metric report.

### Power Savings Summary

Lists any savings (in mW) and the type of savings method, such as SmartVID Power Savings.

### Parallel Compilation

When you enable parallel compilation, the Parallel Compilation report list the number of processors you use during Power Analysis

## Settings

The Settings section of the report shows the Power Analyzer settings information of your design, including the default input toggle rates, operating conditions, and other relevant setting information.

## Simulation Files Read

The Simulation Files Read section of the report lists the simulation output file that the .vcd used for power estimation. This section also includes the file ID, file type, entity, VCD start time, VCD end time, the unknown percentage, and the toggle percentage. The unknown percentage indicates the portion of the design module unused by the simulation vectors.

## Operating Conditions Used

The Operating Conditions Used section of the report shows device characteristics, voltages, temperature, and cooling solution, if any, during the power estimation. This section also shows the entered junction temperature or auto-computed junction temperature during the power analysis.

## Thermal Map Visualization

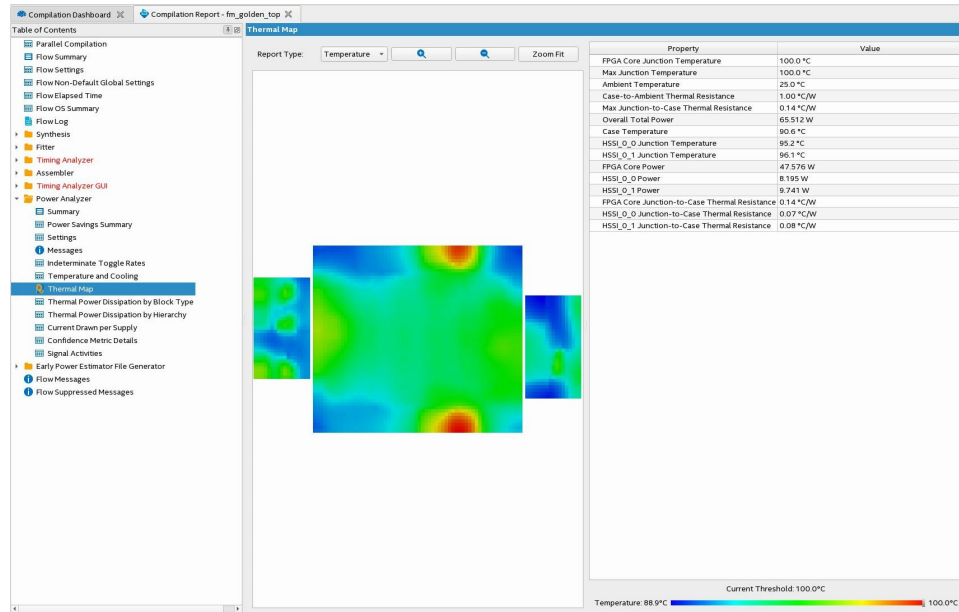

For Agilex FPGA portfolio designs, the Power Analyzer provides a visualization of the expected thermal distribution on the core die and the transceiver dies. This data is available when you run the Power Analyzer on your compiled Agilex FPGA portfolio design and **you have enabled the Thermal Map visualization by selecting one of the following options under the Thermal solver mode selection in the Thermal Settings dialog:**

- **Find available thermal margin for cooling solution**
- **Find cooling solution for maximum junction temperature limit**
- **Find ambient temperature for specified cooling solution**

**Figure 16. Thermal Settings to Enable Thermal Map Visualization**

After you run the Power Analyzer, select the **Thermal Map** section in the Power Analyzer report. You can set the threshold temperature you want to use, which is useful if you are making any what-if analyses based on your thermal design. You can adjust the threshold temperature in increments of 5°C, between the ambient temperature (or 50°C, whichever is lower), and an upper limit of 100°C.

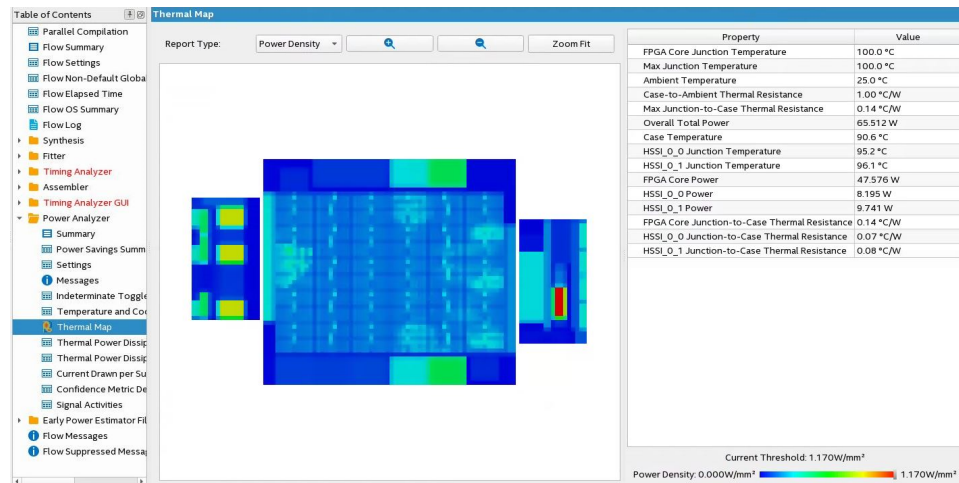

**Figure 17. Temperature View of the Thermal Map for an Agilex 7 FPGA Design**

Knowing the locations of hot spots in your design can help you make modifications as necessary for proper operation of the system.

The thermal map report can show two different views—a temperature view and a power density view. You can choose the view from a pulldown selection in the GUI, when you open the thermal map in the Power Analyzer.

**Figure 18. Power Density View of the Thermal Map for an Agilex 7 FPGA Design**

### Thermal Power Dissipated by Block

The Thermal Power Dissipated by Block section of the report shows estimated thermal dynamic power and thermal static power consumption categorized by atoms. This information provides you with estimated power consumption for each atom in your design.

By default, this section does not contain any data, but you can turn on the report with the **Write power dissipation by block to report file** option on the **Power Analyzer Settings** page.

### On-Chip Power Dissipation by Block Type

The On-Chip Power Dissipation by Block Type section of the report shows the estimated total on-chip power consumption by block type, and estimated on-chip dynamic power and estimated on-chip static power, by block type.

**Figure 19. On-Chip Power Dissipation by Block Type**

On-Chip Power Dissipation by Block Type				
Show:	All	Hide	Q <<Filter>>	...
	Block Type	Total On-Chip Power by Block Type (W)	Block On-Chip Dynamic Power (W)	Block On-Chip Static Power (W)
1	Clock	0.077	0.005	0.072
2	Crypto	0.035	0.000	0.035
3	DSP	0.026	0.004	0.022
4	IO	0.887	0.754	0.132
5	Logic	1.257	5.51E-04	1.257
6	Miscellaneous	2.520	0.709	1.811
7	PLL	0.010	0.000	0.010
8	RAM	0.521	0.092	0.429
9	Transceiver	1.963	0.397	1.566

### On-Chip Power Dissipation by Hierarchy

This On-Chip Power Dissipation by Hierarchy section of the report shows estimated cumulative and current-hierarchy-level on-chip dynamic power consumption by hierarchy node. This information is useful when locating modules with high power consumption in your design. (Available for Agilex FPGA portfolio devices.)

### Core Dynamic Thermal Power Dissipation by Clock Domain

The Core Dynamic Thermal Power Dissipation by Clock Domain section of the report shows the estimated total core dynamic power dissipation by each clock domain, which provides designs with estimated power consumption for each clock domain in the design. If the clock frequency for a domain is unspecified by a constraint, the clock frequency is listed as "unspecified." For all the combinational logic, the clock domain is listed as no clock with zero MHz.

### Current Drawn per Supply

The Current Drawn per Supply section of the report lists the current drawn from each voltage supply. The  $V_{CCIO}$  and  $V_{CCPD}$  voltage supplies are further categorized by I/O bank and by voltage. This section also lists the minimum safe power supply size (current supply ability) for each supply voltage. Minimum current requirement can be higher than user mode current requirement in cases in which the supply has a specific power up current requirement that goes beyond user mode requirement.

The I/O thermal power dissipation on the summary page does not correlate directly to the power drawn from the  $V_{CCIO}$  and  $V_{CCPD}$  voltage supplies listed in this report. This is because the I/O thermal power dissipation value also includes portions of the  $V_{CCINT}$  power, such as the I/O element (IOE) registers, which are modeled as I/O power, but do not draw from the  $V_{CCIO}$  and  $V_{CCPD}$  supplies.

The reported current drawn from the I/O Voltage Supplies (ICCIO and ICCPD) as reported in the Power Analyzer report includes any current drawn through the I/O into off-chip termination resistors. This can result in ICCIO and ICCPD values that are higher than the reported I/O thermal power, because this off-chip current dissipates as heat elsewhere and does not factor in the calculation of device temperature. Therefore, total I/O thermal power does not equal the sum of current drawn from each  $V_{CCIO}$  and  $V_{CCPD}$  supply multiplied by  $V_{CCIO}$  and  $V_{CCPD}$  voltage.

For SoC devices, there is no standalone ICC\_AUX\_SHARED current drawn information. The ICC\_AUX\_SHARED is reported together with ICC\_AUX.

### Confidence Metric Details

The Confidence Metric is defined in terms of the total weight of signal activity data sources for both combinational and registered signals. Each signal has two data sources allocated to it; a toggle rate source and a static probability source.

The Confidence Metric Details section also indicates the quality of the signal toggle rate data to compute a power estimate. The confidence metric is low if the signal toggle rate data comes from poor predictors of real signal toggle rates in the device during an operation. Toggle rate data that comes from simulation, user-entered assignments on specific signals or entities are reliable. Toggle rate data from default toggle rates (for example, 12.5% of the clock period) or vectorless estimation are relatively inaccurate. This section gives an overall confidence rating in the toggle rate data, from low to high. This section also summarizes how many pins, registers, and combinational nodes obtained their toggle rates from each of simulation, user entry, vectorless estimation, or default toggle rate estimations. This detailed information helps you understand how to increase the confidence metric, letting you determine your own confidence in the toggle rate data.

### Signal Activities

The Signal Activities section lists toggle rates and static probabilities assumed by power analysis for all signals with fan-out and pins. This section also lists the signal type (pin, registered, or combinational) and the data source for the toggle rate and static probability. By default, this section does not contain any data, but you can turn on the report with the **Write signal activities to report file** option on the **Power Analyzer Settings** page.

Intel recommends that you keep the **Write signal activities to report file** option turned off for a large design because of the large number of signals present. You can use the Assignment Editor to specify that activities for individual nodes or entities are reported by assigning an on value to those nodes for the **Power Report Signal Activities** assignment.

### Messages

The Messages section lists the messages that the Quartus Prime software generates during the analysis.

## 1.5. Power Analysis in Modular Design Flows

In modular or hierarchical design flows you develop each design block separately, and then instantiate these blocks into a higher-level design to form a complete design. The Intel Quartus Prime software supports simulation and power analysis of the top-level design or individual blocks with the design.

**Figure 20. Modular Simulation Flow**

You can associate multiple .vcd simulation output files with specific node names, enabling the integration of partial design simulations into a complete design power analysis. When specifying multiple .vcd files for a node, more than one simulation file can contain signal activity information for the same signal. In those cases, the Power Analyzer follows these rules:

- When you apply multiple .vcd files to the same design node, the Power Analyzer calculates the signal activity as the equal-weight arithmetic average of each .vcd.
- When you apply multiple simulation files to design nodes at different levels in the design hierarchy, the signal activity in the power analysis derives from the simulation file that applies to the most specific design node.

The following figure shows an example of a hierarchical design:

**Figure 21. Example Hierarchical Design**

The top-level module of the design, called `Top`, consists of three 8b/10b decoders, followed by a `mux`. The software encodes the output of the `mux` to produce the final output of the top-level module. An error-handling module handles any 8b/10b decoding errors. The `Top` module contains the top-level entity of the design and any logic not defined as part of another module. The design file for the top-level module can be a wrapper for the hierarchical entities or can contain its own logic.

The following usage scenarios show common ways that you can simulate the design and import the .vcd into the Power Analyzer:

### 1.5.1. Complete Design Simulation Power Analysis Flow

You can simulate the entire gate-level design and generate a .vcd from a third-party simulator. The Power Analyzer can then import the .vcd (specifying the top-level design). The resulting power analysis uses the signal activities information from the generated .vcd, including those that apply to submodules, such as decode [1-3], err1, mux1, and encode1.

### 1.5.2. Modular Design Simulation Power Analysis Flow

You can independently simulate the top-level design, and then import all the resulting .vcd files into the Power Analyzer. For example, you can simulate the 8b10b\_dec independent of the entire design and mux, 8b10b\_rxerr, and 8b10b\_enc. You can then import the .vcd files generated from each simulation by specifying the appropriate instance name. For example, if the files produced by the simulations are 8b10b\_dec.vcd, 8b10b\_enc.vcd, 8b10b\_rxerr.vcd, and mux.vcd, you can use the import specifications in the following table:

**Table 5. Import Specifications**

File Name	Entity
8b10b_dec.vcd	Top   8b10b_dec:decode1
8b10b_dec.vcd	Top   8b10b_dec:decode2
8b10b_dec.vcd	Top   8b10b_dec:decode3
8b10b_rxerr.vcd	Top   8b10b_rxerr:err1
8b10b_enc.vcd	Top   8b10b_enc:encode1
mux.vcd	Top   mux:mux1

The resulting power analysis applies the simulation vectors in each file to the assigned instance. Simulation provides signal activities for the pins and for the outputs of functional blocks. If the inputs to an instance are input pins for the entire design, the simulation file associated with that instance does not provide signal activities for the inputs of that instance. For example, an input to an instance such as mux1 has its signal activity specified at the output of one of the decode instances.

### 1.5.3. Multiple Simulation Power Analysis Flow

You can perform multiple simulations of an entire design or specific modules of a design. For example, in the process of verifying the top-level design, you can have three different simulation testbenches: one for normal operation, and two for corner cases. Each of these simulations produces a separate .vcd. In this case, apply the different .vcd file names to the same top-level entity, as shown in the following table.

**Table 6. Multiple Simulation File Names and Entities**

File Name	Entity
normal.vcd	Top
corner1.vcd	Top
corner2.vcd	Top

The resulting power analysis uses an arithmetic average of the signal activities calculated from each simulation file to obtain the final signal activities used. If a signal `err_out` has a toggle rate of zero transition per second in `normal.vcd`, 50 transitions per second in `corner1.vcd`, and 70 transitions per second in `corner2.vcd`, the final toggle rate in the power analysis is 40 transitions per second.

If you do not want the Power Analyzer to read information from multiple instances and take an arithmetic average of the signal activities, use a `.vcd` that includes only signals from the instance that you care about.

### 1.5.4. Overlapping Simulation Power Analysis Flow

You can perform a simulation on the entire design, and more exhaustive simulations on a submodule, such as `8b10b_rxerr`. The following table lists the import specification for overlapping simulations:

**Table 7. Overlapping Simulation Import Specifications**

File Name	Entity
full_design.vcd	Top
error_cases.vcd	Top 8b10b_rxerr:err1

In this case, the software uses signal activities from `error_cases.vcd` for all the nodes in the generated `.vcd` and uses signal activities from `full_design.vcd` for only those nodes that do not overlap with nodes in `error_cases.vcd`. In general, the more specific hierarchy (the most bottom-level module) derives signal activities for overlapping nodes.

### 1.5.5. Partial Design Simulation Power Analysis Flow

You can perform a simulation in which the entire simulation time is not applicable to signal activity calculation. For example, if you run a simulation for 10,000 clock cycles and reset the chip for the first 2,000 clock cycles. If the Power Analyzer performs the signal activity calculation over all 10,000 cycles, the toggle rates are only 80% of their steady state value (because the chip is in reset for the first 20% of the simulation). In this case, you must specify the useful parts of the `.vcd` for power analysis. The **Limit VCD Period** option enables you to specify a start and end time when performing signal activity calculations.

### 1.5.5.1. Specifying Start and End Time for Signal Activity Calculations

To specify a start and end time for signal activity calculations using the **Limit VCD period** option, follow these steps:

1. In the Quartus Prime software, click **Assignments** ► **Settings**.
2. Under the **Category** list, click **Power Analyzer Settings**.
3. Turn on the **Use input file(s) to initialize toggle rates and static probabilities during power analysis** option.
4. Click **Add**.
5. In the **File name** and **Entity** fields, browse to the necessary files.
6. Under **Simulation period**, turn on **VCD file** and **Limit VCD period** options.
7. In the **Start time** and **End time** fields, specify the desired start and end time.
8. Click **OK**.

You can also use the following Tcl or .qsf assignment to specify .vcd files:

```
set_global_assignment -name POWER_INPUT_FILE_NAME "test.vcd" -section_id test.vcd
set_global_assignment -name POWER_VCD_FILE_START_TIME "10 ns" -section_id
test.vcd
set_global_assignment -name POWER_VCD_FILE_END_TIME "1000 ns" -section_id
test.vcd
set_instance_assignment -name POWER_READ_INPUT_FILE test.vcd -to test_design
```

### 1.5.6. Vectorless Estimation Power Analysis Flow

For some device families, the Power Analyzer automatically derives estimates for signal activity on nodes with no simulation or user-entered signal activity data.

Vectorless estimation statistically estimates the signal activity of a node based on the signal activities of nodes feeding that node, and on the actual logic function that the node implements. Vectorless estimation cannot derive signal activities for primary inputs. Vectorless estimation is accurate for combinational nodes, but not for registered nodes. Therefore, the Power Analyzer requires simulation data for at least the registered nodes and I/O nodes for accuracy.

## 1.6. Scripting Support

You can run procedures and create settings described in this chapter in a Tcl script. Alternatively, you can run procedures at a command prompt. For more information about scripting command options, refer to the Quartus Prime Command-Line and Tcl API Help browser. To run the Help browser, type the following command at the command prompt:

```
quartus_sh --qhelp
```

### Related Information

[Quartus Prime Pro Edition Settings File Reference Manual](#)

### 1.6.1. Running the Power Analyzer from the Command-Line

The executable to run the Power Analyzer is `quartus_pow`. For a complete listing of all command-line options supported by `quartus_pow`, type the following command at a system command prompt:

```
quartus_pow --help
```

or

```
quartus_sh --qhelp
```

The following lists the examples of using the `quartus_pow` executable. Type the command listed in the following section at a system command prompt:

*Note:*

These examples assume that operations are performed on Quartus Prime project called *sample*.

- To customize the name of the generated EPE File:

```
quartus_pow sample --output_epe=sample.csv ←
```

- To customize the name of the generated Power and Thermal Calculator file:

```
quartus_pow sample --output_ptc=sample.qptc ←
```

- To instruct the Power Analyzer to use a .vcd as input (*sample.vcd*):

```
quartus_pow sample --input_vcd=sample.vcd ←
```

- To instruct the Power Analyzer to use two .vcd files as input files (*sample1.vcd* and *sample2.vcd*), perform glitch filtering on the .vcd and use a default input I/O toggle rate of 10,000 transitions per second:

```
quartus_pow sample --input_vcd=sample1.vcd --input_vcd=sample2.vcd \
--vcd_filter_glitches=on --\
default_input_io_toggle_rate=10000transitions/s
```

- To instruct the Power Analyzer not to use an input file, specify a default input I/O toggle rate of 60%, with vectorless estimation off, and a default toggle rate of 20% on all remaining signals:

```
quartus_pow sample --no_input_file --default_input_io_toggle_rate=60% \
--use_vectorless_estimation=off --default_toggle_rate=20%
```

*Note:*

No command-line options are available to specify the information found on the **Operating Settings and Conditions** and **Power Analyzer Settings ► Thermal** pages. Use the Quartus Prime GUI to specify these options.

The `quartus_pow` executable creates a report file, *<revision name>.pow.rpt*. You can locate the report file in the main project directory. The report file contains the same information that the Power Analyzer Compilation Report.

## 2. Power Optimization

---

The Quartus Prime software offers power-driven compilation to fully optimize device power consumption. Power-driven compilation focuses on reducing the design's total power consumption in synthesis and place-and-route stages.

This chapter focuses on design optimization options and techniques that help reduce core dynamic power and I/O power. In addition to these techniques, there are additional power optimization techniques available for specific devices, including Programmable Power Technology and Device Speed Grade Selection.

### 2.1. Factors Affecting Power Consumption

Understanding the following factors that affect power consumption allows you to use the Power Analyzer and interpret its results effectively:

[Design Activity and Power Analysis](#) on page 32

[Device Selection](#) on page 32

[Environmental Conditions](#) on page 33

[Device Resource Usage](#) on page 33

[Signal Activity](#) on page 34

#### 2.1.1. Design Activity and Power Analysis

Power consumption of a device also depends on the design's activity over time. Static power ( $P_{\text{STATIC}}$ ) is the thermal power that a chip dissipates independent of user clocks.  $P_{\text{STATIC}}$  includes leakage power from all FPGA functional blocks, except for I/O DC bias power and transceiver DC bias power, which are accounted for in the I/O and transceiver sections. Dynamic power is the additional power consumption of a device due to signal activity or switching.

#### 2.1.2. Device Selection

Device families have different power characteristics. Many parameters affect the device family power consumption, including choice of process technology, supply voltage, electrical design, and device architecture.

Power consumption also varies in a single device family. A larger device with more transistors consumes more static power than a smaller device in the same family. In devices that employ global routing architectures, dynamic power can also increase with device size.

The choice of device package also affects the ability of the device to dissipate heat, and you may need to use a different cooling solution to comply with junction temperature constraints.

Process variation can affect power consumption. Process variation primarily impacts static power, because sub-threshold leakage current varies exponentially with changes in transistor threshold voltage. Therefore, you must consult device specifications for static power, and not rely on empirical observation. Process variation has a weak effect on dynamic power.

### 2.1.3. Environmental Conditions

The main environmental parameters affecting junction temperature are operating temperature and the cooling solution. Operating temperature primarily affects device static power consumption. Higher junction temperatures result in higher static power consumption. The device thermal power and cooling solution that you use must keep the device junction temperature within the maximum operating range for the device.

The following table lists the environmental conditions that influence power consumption.

**Table 8. Environmental Conditions that Affect Power Consumption**

Environmental Condition	Description
Airflow	Measures how quickly the device replaces heated air from the vicinity of the device with air at ambient temperature. You can either specify airflow as "still air" when you are not using a fan, or as the linear feet per minute rating of the fan in the system. Higher airflow decreases thermal resistance.
Heat Sink and Thermal Compound	A heat sink allows more efficient heat transfer from the device to the surrounding area because of its large surface area exposed to the air. The thermal compound that interfaces the heat sink to the device also influences the rate of heat dissipation. The case-to-ambient thermal resistance ( $\theta_{CA}$ ) parameter describes the cooling capacity of the heat sink and thermal compound employed at a given airflow. Larger heat sinks and more effective thermal compounds reduce $\theta_{CA}$ .
Junction Temperature	The junction temperature of a device is equal to:  $T_{\text{Junction}} = T_{\text{Ambient}} + P_{\text{Thermal}} \cdot \theta_{JA}$ in which $\theta_{JA}$ is the total thermal resistance from the device transistors to the environment, in degrees Celsius per watt. The value $\theta_{JA}$ is equal to the sum of the junction-to-case (package) thermal resistance ( $\theta_{JC}$ ), and the case-to-ambient thermal resistance ( $\theta_{CA}$ ) of the cooling solution.
Board Thermal Model	The junction-to-board thermal resistance ( $\theta_{JB}$ ) is the thermal resistance of the path through the board, in degrees Celsius per watt. To compute junction temperature, you can use this board thermal model along with the board temperature, the top-of-chip $\theta_{JA}$ and ambient temperatures.

### 2.1.4. Device Resource Usage

Power consumption depends on the number and types of device resources that a design uses.

#### 2.1.4.1. Number, Type, and Loading of I/O Pins

Output pins drive off-chip components, resulting in high-load capacitance that leads to a high-dynamic power per transition. Terminated I/O standards require external resistors that draw constant (static) power from the output pin.

#### 2.1.4.2. Number and Type of Hard Logic Blocks

A design with more logic elements (LEs), multiplier elements, memory blocks, transceiver blocks, or HPS system tends to consume more power than a design with fewer circuit elements. The operating mode of each circuit element also affects its power consumption.

For example, a DSP block performing  $18 \times 18$  multiplications and a DSP block performing multiply-accumulate operations consume different amounts of dynamic power, because of different amounts of charging internal capacitance on each transition. The operating mode of a circuit element also affects static power.

#### 2.1.4.3. Number and Type of Global Signals

Global signal networks span large portions of the device and have high capacitance, resulting in significant dynamic power consumption. The type of global signal is important as well. Global clocks cover the entire device, whereas quadrant clocks only span one-fourth of the device. Clock networks that span smaller regions have lower capacitance and tend to consume less power. The location of the logic array blocks (LABs) driven by the clock network can also have an impact because the Quartus Prime software automatically disables unused branches of a clock.

### 2.1.5. Signal Activity

The behavior of each signal in the design is an important factor in estimating power consumption. To get accurate results from the power analysis, the signal activity must represent the actual operating behavior of the design.

The two most important behaviors of a signal are toggle rate and static probability.

#### 2.1.5.1. Toggle Rate

The toggle rate of a signal is the average number of times that the signal changes value per unit of time. The units for toggle rate are transitions per second, and a transition is a change from 1 to 0, or 0 to 1.

**Note:** Inaccurate signal toggle rate data is the largest source of power estimation error.

Dynamic power increases linearly with the toggle rate as you charge the board trace model more frequently for logic and routing. The Quartus Prime software models full rail-to-rail switching. For high toggle rates, especially on circuit output I/O pins, the circuit can transition before fully charging the downstream capacitance. The result is a slightly conservative prediction of power by the Power Analyzer.

**Note:** The transceiver I/O toggle rate is determined by the XCVR data rate value specified in your IP catalog settings. Do not include transceiver I/O toggle rate in the default toggle rates that you specify in the Power Analyzer.

### Related Information

[Specifying the Default Toggle Rate](#) on page 17

#### 2.1.5.2. Static Probability

The static probability of a signal is the fraction of time that the signal is logic 1 during device operation. Static probability ranges from 0 (always at ground) to 1 (always at logic-high).

The static probability of input signals impacts the design's static power consumption, due to state-dependent leakage in routing and logic. This effect becomes more important for smaller geometries. In output I/O standards that drive termination resistors, the static power also depends on the static probability on I/O pins.

## 2.2. Design Space Explorer II for Power-Driven Optimization

The Design Space Explorer II (DSE II) tool allows you to find and implement the project settings that result in best power behavior.

The DSE II offers two options in **Exploration mode** that target power optimization: **Power (High Effort)** and **Power (Aggressive)**. In both cases, the target is an overall improvement in the design's power; specifically, reducing the total thermal power in the design.

When the optimization targets power, the DSE II runs the Quartus Prime Power Analyzer for every group of settings. The resultant reports help you debug the design and determine trade-offs between power requirements and performance optimization.

## 2.3. Power-Driven Compilation

The standard Quartus Prime compilation flow consists of Analysis and Synthesis, placement and routing, Assembly, and Timing Analysis. Power-driven compilation takes place at the Analysis and Synthesis and Place-and-Route stages.

Quartus Prime software settings that control power-driven compilation are located in the **Power optimization during synthesis** list in the **Advanced Settings (Synthesis)** dialog box, and the **Power optimization during fitting** list on the **Advanced Fitter Settings** dialog box. The following sections describes these power optimization options at the Analysis and Synthesis and Fitter levels.

### 2.3.1. Power-Driven Synthesis

Synthesis netlist optimization occurs during the synthesis stage of the compilation flow. You can apply these settings on a project or entity level.

The **Power Optimization During Synthesis** logic option determines how aggressively Analysis & Synthesis optimizes the design for power. To access this option at a project level, click **Assignments > Settings > Compiler Settings > Advanced Settings (Synthesis)**.

**Table 9. Power Optimization During Synthesis Options**

Settings	Description	Optimization Techniques Included
<b>Off</b>	The Compiler does not perform netlist, placement, or routing optimizations to minimize power.	-
<b>Normal compilation</b> (Default)	The Compiler applies low compute effort algorithms to minimize power through netlist optimizations that do not reduce design performance.	<ul style="list-style-type: none"> <li>Memory block optimization</li> <li>Power-aware logic mapping</li> </ul>
<b>Extra effort</b>	Besides the techniques in the <b>Normal compilation</b> setting, the Compiler applies high-compute-effort algorithms to minimize power through netlist optimizations. Selecting this option might impact performance.	<ul style="list-style-type: none"> <li>Memory block optimization</li> <li>Power-aware logic mapping</li> <li>Power-aware memory balance</li> </ul>

You can also control memory optimization options from the Quartus Prime **Settings** dialog box. The **Default Parameters** page allows you to edit the **Low\_Power\_Mode** parameter. The settings for this parameter are equivalent to the values of the **Power Optimization During Synthesis** logic options. The **Low\_Power\_Mode** parameter always takes precedence over the **Optimize Power for Synthesis** option for power optimization on memory.

**Table 10. Low Power Mode Parameter Options**

Parameter Value	Equivalent Setting in Power Optimization During Synthesis Logic Option
<b>None</b>	<b>Off</b>
<b>Auto</b>	<b>Normal compilation</b>
<b>All</b>	<b>Extra effort</b>

#### Related Information

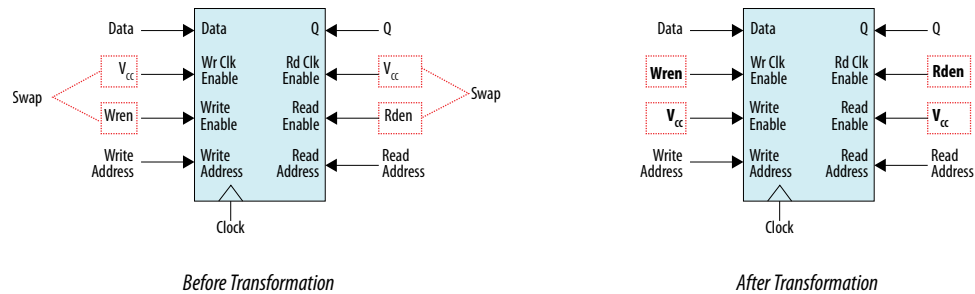

- [Clock Enable in Memory Blocks](#) on page 42
- [Quartus Prime Compiler Settings](#) on page 39

### 2.3.1.1. Memory Block Optimization

Memory optimization involves moving user-defined read/write enable signals to associated read-and-write clock enable signals for all memory types.

Memory blocks can represent a large fraction of total design dynamic power. Minimizing the number of memory blocks accessed during each clock cycle can significantly reduce memory power.

**Figure 22. Memory Block Transformation**

In the default implementation of a simple dual-port memory block, write-clock enable signals and read-clock enable signals connect to V<sub>CC</sub>, making both read and write memory ports active during each clock cycle.

Memory transformation moves the read-enable and write-enable signals to the respective read-clock enable and write-clock enable signals. This technique reduces the design's memory power consumption, because memory ports are shut down when they are not accessed.

### 2.3.1.2. Power-Aware Logic Mapping

Power-aware logic mapping reduces power by rearranging the logic during synthesis to eliminate nets with high switching rates.

### 2.3.1.3. Power-Aware Memory Balancing

Power-aware memory balancing chooses the best configuration for a memory implementation and provides optimal power saving by determining the required number of memory blocks, decoder, and multiplexer circuits. When the design does not specify target-embedded memory blocks for the design's memory functions, the power-aware balancer automatically selects them during memory implementation.

The Compiler includes this optimization technique when the **Power Optimization During Synthesis** logic option is set to **Extra effort**.

There is a trade-off between power saved by accessing fewer memories and power consumed by the extra decoder and multiplexer logic. The Quartus Prime software automatically balances the power savings against the costs to choose the lowest power configuration for each logical RAM. The benchmark data shows that the power-driven synthesis can reduce memory power consumption by as much as 60% in Stratix devices.

You can also set the **MAXIMUM\_DEPTH** parameter manually to configure the memory for low power optimization. This technique is the same as the power-aware memory balancer, but it is manual rather than automatic like the **Extra effort** setting in the **Power optimization** list. The **MAXIMUM\_DEPTH** parameter always takes precedence over the **Optimize Power for Synthesis** options for power optimization on memory optimization. You can set the **MAXIMUM\_DEPTH** parameter for memory modules manually in the Intel FPGA IP instantiation or in the IP Catalog.

### 2.3.2. Power-Driven Fitter

The Quartus Prime software allows you to control the power-driven compilation setting of the Fitter on a project-wide basis. The **Advanced Fitter Settings** dialog box page provides the **Power optimization during Fitting** logic option, that determines how aggressively the Fitter optimizes the design for power.

**Table 11. Power-Driven Fitter Option**

Option	Description
<b>Off</b>	The Fitter does not perform optimizations to minimize power.
<b>Normal compilation</b> (Default)	The Fitter applies low compute effort algorithms to minimize power through placement and routing optimizations. These techniques do not reduce design performance. Includes DSP optimizations that create power-efficient DSP block configurations for DSP functions.
<b>Extra effort</b>	Besides the optimization techniques of the <b>Normal Compilation</b> option, the Fitter applies high compute effort algorithms to minimize power through placement and routing optimizations. These techniques might impact performance. The <b>Extra effort</b> setting for the Fitter requires extensive effort to optimize the design for power and can increase compilation time.

The **Extra effort** setting the Fitter works to minimize power even after the design meets timing requirements by moving the logic closer during placement to localize high-toggling nets and choosing routes with low capacitance.

The **Extra effort** setting uses a Value Change Dump (.vcd) file that guides the Fitter to fully optimize the design for power, based on the signal activity of the design. The best power optimization during fitting results from using the most accurate signal activity information. If there is no .vcd file, the Quartus Prime software estimates the signal activities from the settings in the **Power Analyzer Settings** page in the **Settings** dialog box, such as assignments, clock assignments, and vectorless estimation values.

#### Related Information

[Assignment Editor Options](#) on page 40

### 2.3.3. Area-Driven Synthesis

Using area optimization rather than timing or delay optimization during synthesis saves power because you use fewer logic blocks. Using less logic usually means less switching activity.

The Quartus Prime software provides **Speed**, **Balanced**, or **Area** for the **Optimization Technique** option. You can also specify this logic option for specific modules in your design with the Assignment Editor in cases where you want to reduce area using the **Area** setting (potentially at the expense of register-to-register timing performance) while leaving the default **Optimization Technique** setting at **Balanced** (for the best trade-off between area and speed for certain device families). The **Speed Optimization Technique** can increase the resource usage of your design if the constraints are too aggressive and can also result in increased power consumption.

### Related Information

[Assignment Editor Options](#) on page 40

## 2.3.4. Gate-Level Register Retiming

You can also use gate-level register retiming to reduce circuit switching activity. Retiming shuffles registers across combinational blocks without changing design functionality.

The **Perform gate-level register retiming** option in the Quartus Prime software enables the movement of registers across combinational logic to balance timing, allowing the software to trade off the delay between critical and noncritical paths.

Retiming uses fewer registers than pipelining. In this example of gate-level register retiming, the 10 ns critical delay is reduced by moving the register relative to the combinational logic, resulting in the reduction of data depth and switching activity.

**Figure 23. Gate-Level Register Retiming**

Gate-level register retiming makes changes at the gate level. If you are using an atom netlist from a third-party synthesis tool, you must also select the **Perform WYSIWYG primitive resynthesis** option to undo the atom primitives to gates mapping (so that register retiming can be performed), and then to remap gates to Intel primitives.

## 2.3.5. Quartus Prime Compiler Settings

The Quartus Prime software provides settings that optimize power for the full design.

To set the optimization mode on the Quartus Prime software, click **Assignments > Settings > Compiler Settings**.

**Figure 24. Compiler Settings**

**Compiler Settings**

Specify high-level optimization settings for the Compiler (including design synthesis and fitting). These settings control the optimization focus and algorithms that will be performed throughout design compilation.

☐ Enable Intermediate Fitter Snapshots ?

Optimization Mode ?   Register Optimization ?   Incremental Compile ?

☐ **Balanced (normal flow)**

Performance:

- ☐ High performance effort
- ☐ High performance with maximum placement effort
- ☐ High performance with aggressive power effort
- ☐ Superior performance (adds synthesis optimizations for speed)
- ☐ Superior performance with maximum placement effort

Area:

- ☐ Aggressive Area (reduces performance)

Routability:

- ☐ High placement routability effort
- ☐ High packing routability effort
- ☒ Optimize netlist for routability

**Power:**

- ☒ Aggressive power (reduces performance)

Compile Time:

- ☐ Aggressive Compile Time (reduces performance)
- ☐ Fast Functional Test (hold-timing optimization only)

Advanced Settings (Synthesis)...   Advanced Settings (Fitter)...

Note: 2 Synthesis settings and 1 Fitter setting modify the current Optimization mode strategy.  
To review active optimization settings, open Advanced Settings and then Show Changed optimization settings.

### Aggressive Power (reduces performance)

Makes aggressive effort to optimize synthesis for low power. The Compiler further reduces the routing usage of signals with the highest specified or estimated toggle rates, saving additional dynamic power but potentially affecting performance.

## 2.3.6. Assignment Editor Options

The Assignment Editor allows you to select Optimization Technique & Synthesis Power Optimization for individual modules. With this feature, you can focus on the parts of the design that require more work.

The **Optimization Technique** logic option specifies the overall optimization goal for Analysis & Synthesis: attempt to maximize performance or minimize logic usage.

**Figure 25. Optimization Technique Options**

tatu	From	To	Assignment Name	Value	Enabled	Entity	Comment	Tag
1	!		Optimization Technique		Yes	mod_r...basic

## 2.4. Design Guidelines

During FPGA design implementation, you can apply the following design techniques to reduce power consumption. The results of these techniques are different from design to design.

### 2.4.1. Clock Power Management

Clocks represent a significant portion of dynamic power consumption due to their high switching activity and long paths. Actual clock-related power consumption is higher, because the power consumption of a block includes local clock distribution within logic, memory, and DSP or multiplier blocks.

The Quartus Prime software optimizes clock routing power automatically, enabling only those portions of the clock network that are necessary to feed downstream registers.

#### 2.4.1.1. Clock Gating

For designs containing logic that is not operational 100% of the time, you can reduce power consumption by gating (disabling) the clock that feeds that logic.

This solution requires that the logic in question have its own dedicated clock source. Clock duplication (such as introducing a duplicate PLL clock output) is necessary if the logic in question does not have its own dedicated clock source.

The following topics describe methods for gating clock networks.

#### 2.4.1.1.1. Root Clock Gate

You can gate each clock network dynamically at the root level, using the Clock Control Intel FPGA IP Core.

Refer to the *Root Clock Gate* section of the *Clocking and PLL User Guide* for your Intel device.

#### 2.4.1.1.2. Sector Clock Gate

You can gate each clock network dynamically at the clock sector level using the Clock Control Intel FPGA IP Core.

Refer to the *Sector Clock Gate* section of the *Clocking and PLL User Guide* for your Intel device.

#### 2.4.1.1.3. I/O PLL Clock Gate

You can dynamically gate each of the device's I/O PLL output counters, using I/O PLL Reconfiguration.

Refer to the *I/O PLL Clock Gate* section of the *Clocking and PLL User Guide* for your Intel device.

### 2.4.1.2. Clock Enable in Memory Blocks

In memory blocks, power consumption is tied to the clock rate, and is insensitive to the toggle rate on the data and address lines. Memory consumes approximately 20% of the core dynamic power in typical designs.

When a memory block is clocked, a sequence of timed events occur within the block to execute a read or write. The circuitry that the clock controls consumes the same amount of power, independent of changes in address or data from one cycle to the next. Thus, the toggle rate of input data and the address bus have no impact on memory power consumption.

The key to reducing memory power consumption is to reduce the number of memory clocking events. You can achieve this reduction through network-wide clock gating, or on a per-memory basis through use of the clock enable signals on the memory ports.

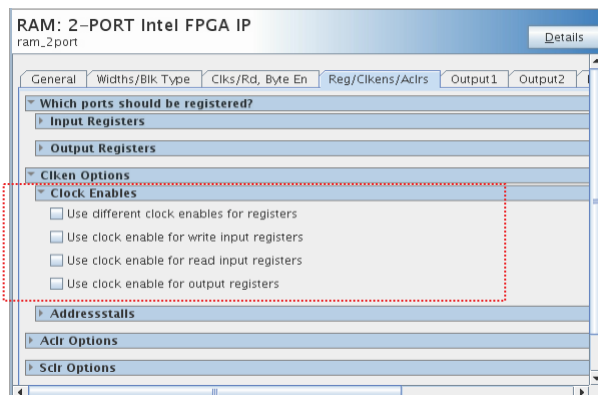

#### Figure 27. Memory Clock Enable Signal

Logical view of the internal clock of the memory block. Use the appropriate enable signals on the memory to make use of the clock enable signal instead of gating the clock.

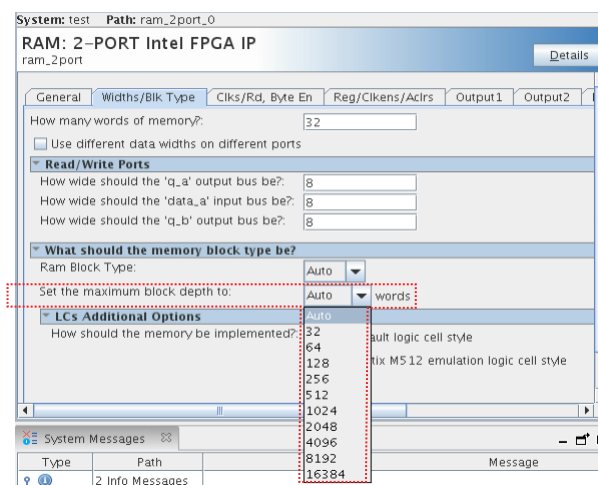

The clock enable signal enables the memory only when necessary, and shuts down for the rest of the time, reducing the overall memory power consumption. You include these enable signals when generating the memory block function.

**Figure 28. Clock Enable in RAM 2-Port**

The Quartus Prime software automatically chooses the best design memory configuration for optimal power. However, you can set the **MAXIMUM\_DEPTH** parameter for memory modules during the IP core instantiation.

**Figure 29. RAM 2-Port Maximum Depth**

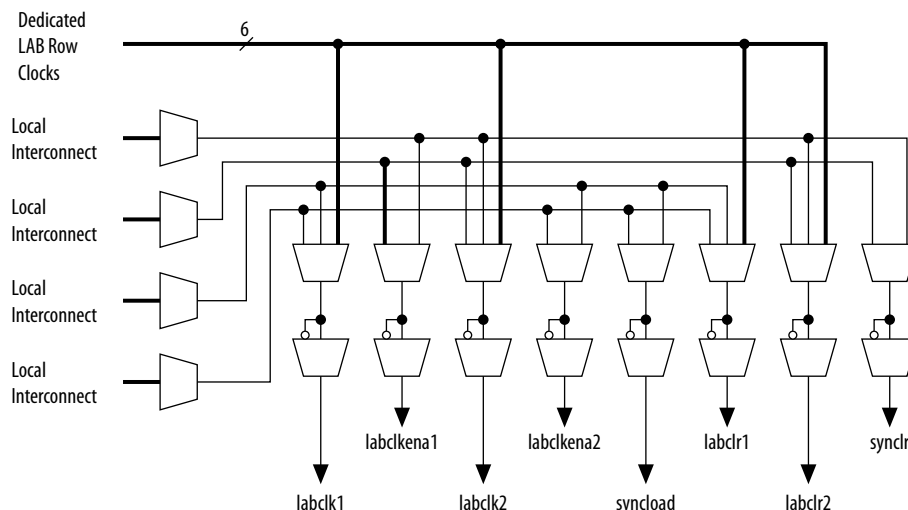

### Related Information

- [Clocking Modes and Clock Enable](#)  
In *Embedded Memory (RAM: 1-PORT, RAM: 2-PORT, ROM: 1-PORT, and ROM: 2-PORT) User Guide*

#### 2.4.1.3. LAB Clock Power

Another contributor to clock power consumption are LAB clocks, which distribute clock to the registers within a LAB. LAB clock power can be the dominant contributor to overall clock power.

**Figure 30. LAB-Wide Control Signals**

To reduce LAB-wide clock power consumption without disabling the entire clock tree, use the LAB-wide clock enable to gate the LAB-wide clock. The Quartus Prime software automatically promotes register-level clock enable signals to the LAB-level. A shared gated clock controls all registers within an LAB that share a common clock and clock enable. To take advantage of these clock enables, use a clock enable construct in the relevant HDL code for the registered logic.

#### 2.4.1.3.1. LAB-Wide Clock Enable Example

This VHDL code makes use of a LAB-wide clock enable. This clock-gating logic is automatically turned into an LAB-level clock enable signal.

```
IF clk'event AND clock = '1' THEN
    IF logic_is_enabled = '1' THEN
        reg <= value;
    ELSE
        reg <= reg;
    END IF;
END IF;
```

#### 2.4.1.4. Clock Enables

Use clock enables instead of the gated clocks shown below:

Avoid the following form of gated clocks:

```
assign clk_gate = clk1 & gateA & gateB;
always @ (posedge clk_gate) begin
    sr[N-1:1] <= sr[N-2:0];
    sr[0] <= din1;
end
```

Use clock enables, such as the following:

```
assign enable = gateA & gateB;
always @(posedge clk2) begin
    if (enable) begin
        sr[N-1:1] <= sr[N-2:0];
    end
end
```

```

        sr[0]<=din2;
    end
end

```

Altclkctrl

Altclkctrl represents clock buffers that drive the Global Clock Network, the Regional Clock Network, and the dedicated External Clock path.

How do you want to use the ALTCLKCTRL?: For global clock

How many clock inputs would you like?: 1

☐ Create 'ena' port to enable or disable the clock network driven by this buffer?

How do you want to register the 'ena' port?: Falling edge of input clock

☐ Ensure glitch-free switchover implementation

Reduce LAB-wide clock power consumption without disabling the entire clock tree, use the LAB-wide clock enable to gate the LAB-wide clock.

```

always @(posedge clk)
begin
    if (ena)
        temp <= dataaa;
    else
        temp <= temp;
    end
end
end

```

### 2.4.1.5. Global Signals

Intel FPGAs have different kinds of global signal resources available. Global signals can span the entire chip or smaller regions. Choose the clock networks that can cover all the fanout on a specific domain. For example, you can reduce clock power by switching from a clock network that spans the entire chip to one quarter of the chip, provided all the fanout for that clock is within that region of the chip.

#### 2.4.1.5.1. Viewing Clock Details in the Chip Planner

1. Open the Chip Planner (**Tools** ► **Chip Planner**).
2. In the **Task** pane, under **Clock Reports**, double-click **Report Clock Details**.

**Figure 33. Chip Planner Task Pane**

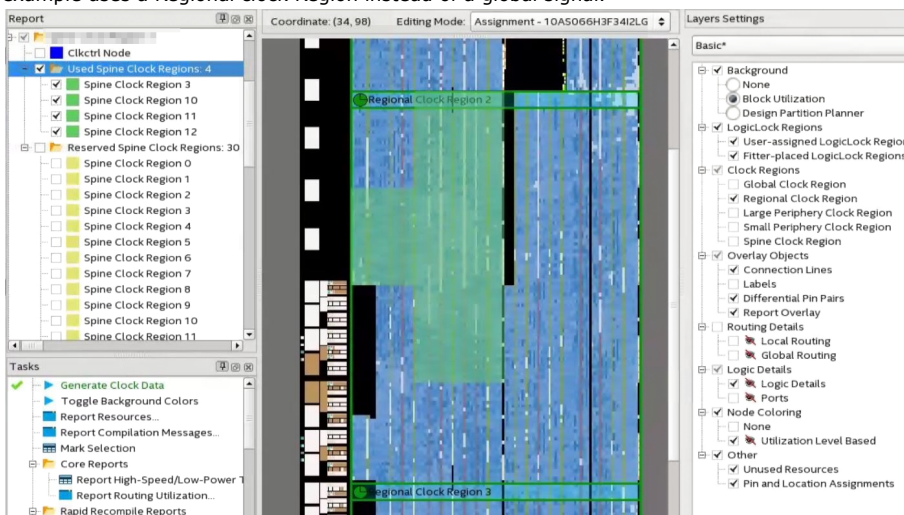

**Figure 34. Report Clock Details**

3. Click **OK**.  
The **Report** pane generates the **Clock** folder.
4. Expand the **Clock** folder and select **Used spine clock regions** to highlight on the Chip planner.
5. In the **Layers Settings** pane, turn on **Regional/Periphery clock region** to see whether used spine clock regions are within.

**Figure 35. Clock Highlight in Chip Planner**

This example uses a Regional clock Region instead of a global signal.

### 2.4.1.6. Merge Clocks

Evaluate the possibility of merging clocks and PLLs in the design.

Design	2clks & 2PLLs	1 Clk & 1 PLL
Oc_dma_stamp25	6.079W	5.46W

- 2clks & 2PLLs  
Clk1:350Mhz, Fanout 46788  
Clk2: 365Mhz, Fanout 2450
- 1Clk & 1PLL  
Merge clks  
clk: 365Mhz, Fanout 51277

### 2.4.2. Pipelining and Retiming

Glitches are unnecessary and unpredictable temporary logic switches at the output of combinational logic. Designs with glitches consume more power, because of faster switching activity. A glitch usually occurs when there is a mismatch in input signal timing, leading to unequal propagation delay.

For example, consider a 2-input XOR gate where one input changes from 1 to 0, and moments later the other input changes from 0 to 1. For a short time, both inputs become 1 (high), resulting in 0 (low) at the output of the XOR gate. Then, when the second input transition takes place, the XOR gate output becomes 1 (high). Therefore, before the output becomes stable, the input delay produces a glitch in the output.

**Figure 36. XOR Gate Showing Glitch at the Output**

A glitch can propagate to subsequent logic and create unnecessary switching activity, increasing power consumption. Circuits with many XOR functions, such as arithmetic circuits or cyclic redundancy check (CRC) circuits, tend to have many glitches if there are several levels of combinational logic between registers.

Registers stop glitches from propagating through combinational paths. Pipelining is a technique that breaks combinational paths by inserting registers. By reducing logic-level numbers between registers, pipelining can result in higher clock speed operations. However, pipelining increases the latency of a circuit in terms of the number of clock cycles to a first result.

The following figure shows how pipelining breaks a long combinational path.

**Figure 37. Pipelining Example**

This reduction in switching activity lowers power dissipation in combinational logic. However, for designs with few glitches, pipelining can increase power consumption by adding unnecessary registers. Pipelining can also increase resource utilization.

### 2.4.3. Architectural Optimization

Design-level architectural optimizations allow you to take advantage of device architecture features. These features include dedicated memory, DSPs, or multiplier blocks that can perform memory or arithmetic-related functions. You can reduce power consumption by choosing blocks in place of LUTs. For example, you can build large shift registers from RAM-based FIFO buffers instead of building the shift registers from the LE registers.

### 2.4.4. I/O Power Guidelines

The Power Analyzer calculates I/O power using the default capacitive load set for the I/O standard in the **Capacitive Loading** page of the **Device and Pin Options** dialog box. Any other components defined in the board trace model are not taken into account for the power measurement.

#### Nonterminated I/O Standards

Nonterminated I/O standards such as LVTTTL and LVCMOS have a rail-to-rail output swing. The voltage difference between logic-high and logic-low signals at the output pin is equal to the  $V_{CCIO}$  supply voltage. If the capacitive loading at the output pin is known, the following expression determines the dynamic power consumed in the I/O buffer:

$$P = \frac{F \cdot C \cdot V^2}{2}$$

where:

- F is the output transition frequency
- C is the total load capacitance being switched
- V is equal to  $V_{CCIO}$  supply voltage

Because of the quadratic dependence on  $V_{CCIO}$ , lower voltage standards consume significantly less dynamic power.

Transistor-to-transistor logic (TTL) I/O buffers consume very little static power. As a result, the total power that a LVTTTL or LVCMOS output consumes is highly dependent on load and switching frequency.

### Resistively Terminated I/O Standards

In resistively terminated I/O standards like SSTL and HSTL, the output load voltage swings by a small amount around a bias point. The dynamic power equation above is valid as well, but V is the actual load voltage swing. This voltage is much smaller than  $V_{CCIO}$ , resulting in lower dynamic power when comparing to nonterminated I/O under similar conditions.

Resistively terminated I/O standards dissipate significant static (frequency-independent) power, because the I/O buffer is constantly driving current into the resistive termination network. However, the lower dynamic power of these I/O standards means they often have lower total power than LVCMOS or LVTTTL for high-frequency applications. As a best practice, when using resistively terminated standards choose the lowest drive strength I/O setting that meets the speed and waveform requirements to minimize I/O power.

You can save a small amount of static power by connecting unused I/O banks to the lowest possible  $V_{CCIO}$  voltage.

## 2.4.5. Dynamically Controlled On-Chip Terminations (OCT)

Dynamic OCT enables series termination (RS) and parallel termination (RT) to dynamically turn on/off during the data transfer. This feature is especially useful in FPGAs with external memory interfaces, such as interfacing with DDR memories.

Dynamic OCT eliminates the constant DC power that parallel termination consumes when transmitting data, reducing power consumption when compared to conventional termination. Parallel termination is extremely useful for applications that interface with external memories where I/O standards, such as HSTL and SSTL, are used. Parallel termination supports dynamic OCT, which is useful for bidirectional interfaces.

For more information about dynamic OCT in specific devices, refer to the *Stratix 10 General Purpose I/O User Guide* or the *Arria 10 Core Fabric and General Purpose I/O Handbook*.

### Example 1. Example: Power Saving for a DDR3 Interface with OCT

The static current consumed by parallel OCT is equal to the  $V_{CCIO}$  voltage divided by 100 W. For DDR3 interfaces with SSTL-15, the static current per pin is:

$$\frac{1.5V}{100W} = 15mA$$

Therefore, the static power is:

$$1.5V \times 15mA = 22.5mW$$

For an interface with 72 DQ and 18 DQS pins, the static power is:

$$90pins \times 2.25mW = 2.025W$$

Dynamic parallel OCT disables parallel termination during write operations, so if writing occurs 50% of the time, the power saved by dynamic parallel OCT is:

$$50\% \times 2.025W = 1.0125W$$

For more information about dynamic OCT in Stratix IV devices, refer to the chapter in the *Stratix IV Device Handbook*.

## 2.4.6. Memory Optimization (M20K/MLAB)

M20K memory blocks represent a big part of the power consumption in a design. The Fitter RAM Summary Report displays the utilization of the memory blocks in different parts of the design.

**Figure 38. Fitter RAM Summary Report**

Fitter RAM Summary											
<<Filter>>											
	Port A Depth	rt A Width	rt B Depth	rt B Width	Input Register	Output Register	3 Input Register	rt B Output Register	Size	M20K blocks	Fits in MLABs ^
n1:FIFOram ALTSYNCRAM	32	1	32	1	yes	no	yes	yes	32	1	Yes
p_generated ALTSYNCRAM	16	2	16	2	yes	no	yes	no	32	1	Yes
v1:FIFOram ALTSYNCRAM	2	24	2	24	yes	no	yes	yes	48	1	Yes
v1:FIFOram ALTSYNCRAM	2	24	2	24	yes	no	yes	yes	48	1	Yes
v1:FIFOram ALTSYNCRAM	128	1	128	1	yes	no	yes	yes	128	1	Yes
sn1:FIFOram ALTSYNCRAM	16	9	16	9	yes	no	yes	yes	144	1	Yes

Some guidelines to optimize the use of memories are:

- Port shallow memories from M20K to MLAB.

For example, implement in HDL with `ramstyle` attribute:

```
(* ramstyle = "MLAB" *) reg [0:7] my_ram[0:63];
```

- Avoid read-during-write behavior and set to **Don't care** (at the HDL level) wherever possible.

Read-during-write behavior impact the power of single-port and bidirectional dual-port RAMs. **Don't care** allows an optimization that sets the read-enable signal to the inversion of the existing write-enable signal (if one exists). This allows the core of the RAM to shut down, which prevents switching, saving a significant amount of power.

- Pack input/output registers in M20K.

### 2.4.6.1. Implementation

**Table 13. Single-port Embedded Memory Configurations for Arria 10 Devices**

This table lists the maximum configurations that single-port RAM and ROM modes support.

Memory Block	Depth (bits)	Programmable Width
MLAB	32	x16, x18, or x20
	64 <sup>(2)</sup>	x8, x9, x10
M20K	512	x40, x32
	1K	x20, x16
	2K	x10, x8
	4K	x5, x4
	8K	x2
	16K	x1

**Figure 39. Power numbers from EPE**

### 2.4.6.2. Rd/Wr Enables

Dedicated RAM blocks dissipate most energy whenever the RAM is accessed for a read or write cycle. You can save power by adding Read/Write enable.

<sup>(2)</sup> Supported through software emulation and consumes additional MLAB blocks.

Module	RAM Type	# RAM Blocks	Data Width	RAM Depth	RAM Mode	Port A				Port B				Thermal Power (W)			
						Clock Freq (MHz)	Enable %	Read %	Write %	Clock Freq (MHz)	Enable %	Read %	Write %	Toggle %	Routing	Block	Total
168	M20K	144	40	512	Simple Dual Port	384.0	100%	0%	100%	384.0	100%	100%	0%	12.5%	0.046	0.668	0.714

### 2.4.7. DDR Memory Controller Settings

The External Memory Interfaces Arria 10 FPGA IP provides low power mode settings. These settings put DDR memory in power saving mode when the controller is idle, providing power savings on external memory DDR. The **Enable Auto Power-Down** and **Auto Power-Down Cycles** settings enable this capability.

#### Low Power Mode Settings

- **Enable Auto Power-Down**—directs the controller to place the memory device in power-down mode after a specific number of idle controller clock cycles. You can configure the idle wait time. All ranks must be idle to enter auto power-down.
- **Auto Power-Down Cycles**—specifies the number of cycles the controller must be IDLE before entering the power down state. You determine the number based on the traffic pattern. If the number is too small, the control enters power down too frequently, affecting efficiency. The Arria 10 device family supports from 1 to 65534 cycles.

**Figure 40. Arria 10 EMIF Controller Parameters**

#### Related Information

[Arria 10 EMIF IP DDR3 Parameters: Controller](#)

In *External Memory Interfaces Arria 10 FPGA IP User Guide*

### 2.4.8. DSP Implementation

When you maximize the packing of DSP blocks, you reduce Logic Utilization, power consumption, and increase efficiency. The HDL coding style grants you control of the DSP resources available in the FPGA.

#### Example 2. Implement Multiplier + Accumulator in 1 DSP

```
always @ (posedge clk)
begin
  if (ena)
  begin
    dataout <= dataaa * datab + dataac * datad;
  end
end
```

### Example 3. Implement multiplication in 2 DSPs and the adder in LABs

```
always @ (posedge clk)
begin
    if (ena)
    begin
        mult1 <= dataaa * datab;
        mult2 <= dataac * datad;
    end
end
always @(posedge clk)
begin
    if (ena)
    begin
        dataout <= mult1 + mult2
    end
end
```

### 2.4.9. Reducing High-Speed Tile (HST) Usage

High-Speed tiles are available in the Arria 10 design family.

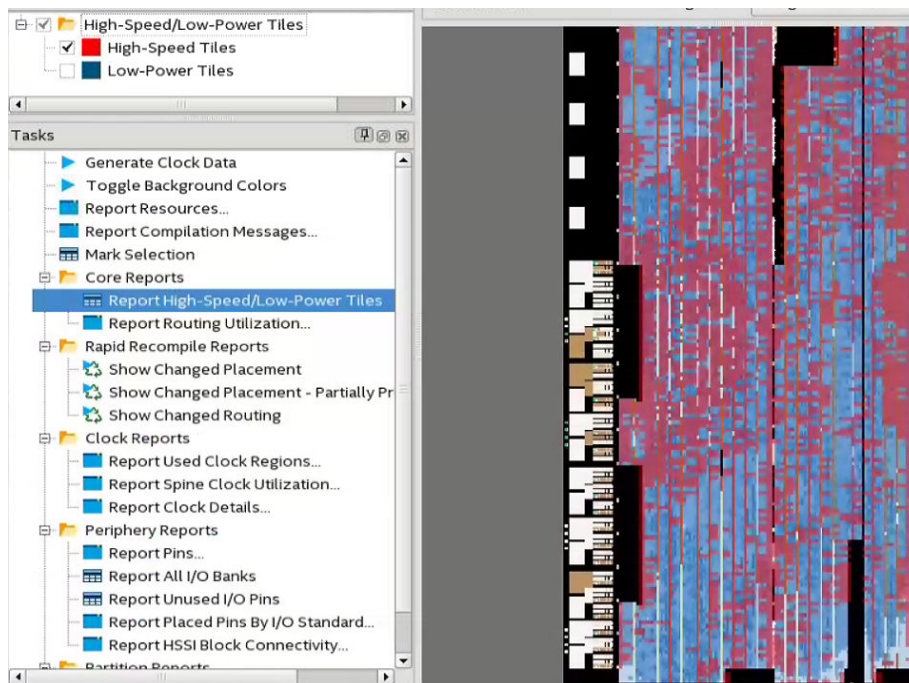

1. In the **Advanced Fitter Settings** pane, The **Programmable Power Technology Optimization** logic option controls how the fitter configures tiles to operate in high-speed mode or low-power mode. Select **Minimize Power Only**.

**Figure 41. Programmable Power Technology Optimization**

2. Identify entity modules that use HST by plotting entity modules and HST heatmap on the Chip Planner and modify the floorplan to reduce usage.

**Figure 42. Entity Modules and HST Heatmap on the Chip Planner**

## 2.4.10. Unused Transceiver Channels

Transceivers in the device degrade over time unless you preserve them. The Quartus Prime software generates a warning message if a design contains unused XCVRs.

You do not need to preserve transceivers under 8Gbps. For transceivers over 8Gbps, the best practice is to preserve if there is a possibility for future usage. Otherwise, you can turn the transceivers off. You enable unused transceivers through dynamic reconfiguration or a new device programming file.

## 2.4.11. Peripheral Power reduction XCVR Settings

### 2.4.11.1. Transceiver Settings

- Use min VCCR/T possible (depending on data rate).
- Certain devices have DFE ON by default. If possible, turn off the channel, This depends on the how lossy is the channel.
- Turn off PDN compensation.  
This setting induces jitter, which is necessary to check system tolerance.
- Use one equalizer stage.

DFE	Adaptation	Equalizer Stage	Transmitter High-Speed Compensation
Disabled	Disabled	Non-S1 Mode	Disabled
Disabled	Disabled	Non-S1 Mode	Enabled
Disabled	Disabled	N/A	Enabled

### 2.4.11.2. I/O Current Strength

As a best practice, choose a low voltage I/O standard and the lowest drive strength that meets the speed requirements.

## 2.5. Power Optimization Advisor

The Quartus Prime Power Optimization Advisor provides advice and recommendations based on the current design project settings and assignments. You run the Advisor after the Power Analyzer.

**Figure 43. Power Optimization Advisor**

The Power Optimization Advisor organizes the recommendations into stages that suggest the implementation order. Each recommendation includes a description, summary of the effect of the recommendation, and the action required to make the appropriate setting.

An icon indicates whether each recommended setting is made in the current project. Checkmark icons appear next to recommendations that are already implemented, warning icons appear next to recommendations that are not followed for this compilation. Information icons indicate general suggestions.

Recommendations include a link to the location in the Quartus Prime GUI where you can change the setting. After implementing the recommended changes, recompile your design. You can verify power results with the Power Analyzer.

### 2.5.1. Set Realistic Timing Constraints

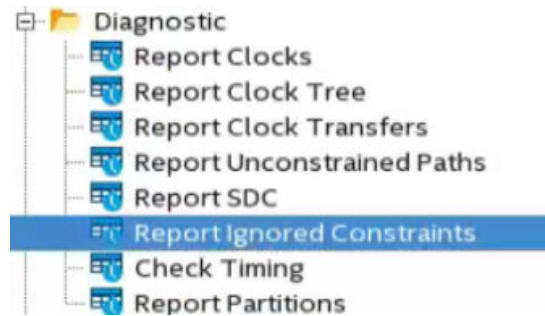

Timing requirements are too high, the Compiler increases HST Usage. In addition, the Fitter efforts focus more in timing than power optimization.

### 2.5.1.1. Find Timing Information

- To find False or Multi-Cycle Paths, click **Report Ignored Constraints** in the Timing Analyzer **Tasks** pane.

**Figure 44. Report Ignored Constraints**

- To see a list of the 10 paths with highest delay in the design, in the **Reports** pane find **Fitter Summary Report > Estimate Delay Added for Hold Timing > Details**.

The screenshot shows the 'Table of Contents' on the left with 'Estimated Delay Added for Hold Timing > Details' selected. The main pane displays a table titled 'Estimated Delay Added for Hold Timing Details'.

	rc	Reg	ation R	Delay Added in ns
1	rp...0]	rp...1]		11.415
2	rp...6]	rp...7]		11.403
3	rp...5]	rp...6]		11.387
4	rp...9]	rp...0]		11.383
5	rp...9]	rp...0]		11.378

### 2.5.2. Appropriate Device Family

Choose a device family with the dynamic and static power characteristics best suited to your application.

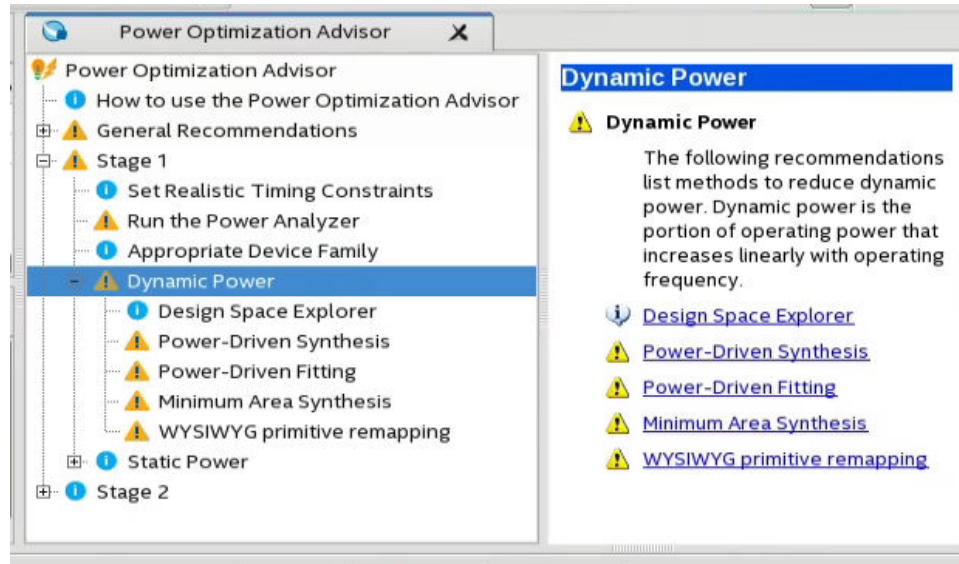

#### Related Information

[Device Selection](#) on page 32

### 2.5.3. Dynamic Power

The recommendations in this section can reduce dynamic power.

**Figure 45. Dynamic Power Recommendations in the Power Optimization Advisor**

### 2.5.4. Static Power

The recommendations in this section can reduce static power dissipation. Static power is the frequency independent power that a design dissipates, even when the design clocks are stopped.

#### Small Device

Use the smallest device which can fit your design.

#### Related Information

[Device Selection](#) on page 32

### 2.5.5. Appropriate I/O Standards

Choose appropriate I/O Standards to minimize design power.

#### Related Information

[I/O Power Guidelines](#) on page 48

### 2.5.6. Use RAM Blocks

Implement RAMs and medium to large shift registers in RAM blocks instead of logic cell registers.

### Related Information

[Memory Optimization \(M20K/MLAB\)](#) on page 50

## 2.5.7. Shut Down RAM Blocks

Use the clock enable, read enable and write enable ports on RAM blocks to shut them down during cycles in which the RAM is not read or written. If your design does not depend on a specific read result when reading and writing the same address, then specify "don't care" for the read-during-write parameter in the RAM IP Catalog.

### Related Information

- [Clock Enable in Memory Blocks](#) on page 42
- [Memory Optimization \(M20K/MLAB\)](#) on page 50

## 2.5.8. Clock Enables on Logic

Another technique for power reduction is gating clocks when the logic does not require them. Even though you can build clock-gating logic, this approach can generate clock glitches in FPGAs using ALMs or LEs.

## 2.5.9. Pipeline Logic to Reduce Glitching

Long chains of cascaded logic blocks can create glitches due to path delay differences between the input signals. Inserting Flip-Flops to cut these long chains terminates the propagation of glitches to consecutive logic cells.

Circuits that heavily use of XIO functions (for example, Cyclic redundancy check) tend to glitch significantly when cascaded. Add pipeline registers or re-architect to reduce signal toggling.

### Example 4. Glitch Prone Design

### 3. Power Analysis and Optimization Document Archive

---

For the latest and previous versions of this user guide, refer to [Quartus Prime Pro Edition User Guide: Power Analysis and Optimization](#). If a software version is not listed, the guide for the previous software version applies.

## A. Quartus Prime Pro Edition User Guides

---

Refer to the following user guides for comprehensive information on all phases of the Quartus Prime Pro Edition FPGA design flow.

### Related Information

- [Quartus Prime Pro Edition User Guide: Getting Started](#)  
Introduces the basic features, files, and design flow of the Quartus Prime Pro Edition software, including managing Quartus Prime Pro Edition projects and IP, initial design planning considerations, and project migration from previous software versions.
- [Quartus Prime Pro Edition User Guide: Platform Designer](#)  
Describes creating and optimizing systems using Platform Designer, a system integration tool that simplifies integrating customized IP cores in your project. Platform Designer automatically generates interconnect logic to connect intellectual property (IP) functions and subsystems.
- [Quartus Prime Pro Edition User Guide: Design Recommendations](#)  
Describes best design practices for designing FPGAs with the Quartus Prime Pro Edition software. HDL coding styles and synchronous design practices can significantly impact design performance. Following recommended HDL coding styles ensures that Quartus Prime Pro Edition synthesis optimally implements your design in hardware.
- [Quartus Prime Pro Edition User Guide: Design Compilation](#)  
Describes set up, running, and optimization for all stages of the Quartus Prime Pro Edition Compiler. The Compiler synthesizes, places, and routes your design before generating a device programming file.
- [Quartus Prime Pro Edition User Guide: Design Optimization](#)  
Describes Quartus Prime Pro Edition settings, tools, and techniques that you can use to achieve the highest design performance in Intel FPGAs. Techniques include optimizing the design netlist, addressing critical chains that limit retiming and timing closure, optimizing device resource usage, device floorplanning, and implementing engineering change orders (ECOs).
- [Quartus Prime Pro Edition User Guide: Programmer](#)  
Describes operation of the Quartus Prime Pro Edition Programmer, which allows you to configure Intel FPGA devices, and program CPLD and configuration devices, via connection with an Intel FPGA download cable.
- [Quartus Prime Pro Edition User Guide: Block-Based Design](#)  
Describes block-based design flows, also known as modular or hierarchical design flows. These advanced flows enable preservation of design blocks (or logic that comprises a hierarchical design instance) within a project, and reuse of design blocks in other projects.

- [Quartus Prime Pro Edition User Guide: Partial Reconfiguration](#)  
Describes Partial Reconfiguration, an advanced design flow that allows you to reconfigure a portion of the FPGA dynamically, while the remaining FPGA design continues to function. Define multiple personas for a particular design region, without impacting operation in other areas.
- [Quartus Prime Pro Edition User Guide: Third-party Simulation](#)  
Describes RTL- and gate-level design simulation support for third-party simulation tools by Aldec\*, Cadence\*, Siemens EDA, and Synopsys\* that allow you to verify design behavior before device programming. Includes simulator support, simulation flows, and simulating Intel FPGA IP.
- [Quartus Prime Pro Edition User Guide: Third-party Synthesis](#)  
Describes support for optional synthesis of your design in third-party synthesis tools by Siemens EDA, and Synopsys\*. Includes design flow steps, generated file descriptions, and synthesis guidelines.
- [Quartus Prime Pro Edition User Guide: Third-party Logic Equivalence Checking Tools](#)  
Describes support for optional logic equivalence checking (LEC) of your design in third-party LEC tools by OneSpin\*.
- [Quartus Prime Pro Edition User Guide: Debug Tools](#)  
Describes a portfolio of Quartus Prime Pro Edition in-system design debugging tools for real-time verification of your design. These tools provide visibility by routing (or “tapping”) signals in your design to debugging logic. These tools include System Console, Signal Tap logic analyzer, system debugging toolkits, In-System Memory Content Editor, and In-System Sources and Probes Editor.
- [Quartus Prime Pro Edition User Guide: Timing Analyzer](#)  
Explains basic static timing analysis principals and use of the Quartus Prime Pro Edition Timing Analyzer, a powerful ASIC-style timing analysis tool that validates the timing performance of all logic in your design using an industry-standard constraint, analysis, and reporting methodology.
- [Quartus Prime Pro Edition User Guide: Power Analysis and Optimization](#)  
Describes the Quartus Prime Pro Edition Power Analysis tools that allow accurate estimation of device power consumption. Estimate the power consumption of a device to develop power budgets and design power supplies, voltage regulators, heat sink, and cooling systems.
- [Quartus Prime Pro Edition User Guide: Design Constraints](#)  
Describes timing and logic constraints that influence how the Compiler implements your design, such as pin assignments, device options, logic options, and timing constraints. Use the Interface Planner to prototype interface implementations, plan clocks, and quickly define a legal device floorplan. Use the Pin Planner to visualize, modify, and validate all I/O assignments in a graphical representation of the target device.
- [Quartus Prime Pro Edition User Guide: PCB Design Tools](#)  
Describes support for optional third-party PCB design tools by Siemens EDA and Cadence\*. Also includes information about signal integrity analysis and simulations with HSPICE and IBIS Models.
- [Quartus Prime Pro Edition User Guide: Scripting](#)  
Describes use of Tcl and command line scripts to control the Quartus Prime Pro Edition software and to perform a wide range of functions, such as managing projects, specifying constraints, running compilation or timing analysis, or generating reports.

## 1. Constraining Designs

---

The design constraints, assignments, and logic options that you specify influence how the Quartus® Prime Compiler implements your design. The Compiler attempts to synthesize and place logic in a manner than meets your constraints. In addition, design constraints also have an impact on how the Timing Analyzer and the Power Analyzer influence synthesis, placement, and routing.

You can specify design constraints in the GUI, with scripts, or directly in the files that store the constraints. The Quartus Prime software preserves the constraints that you specify in the GUI in the following files:

- Quartus Prime Settings file (`<project_directory>/<revision_name>.qsf`)—contains project-wide and instance-level assignments for the current revision of the project, in Tcl syntax. Each revision of a project has a separate .qsf file.
- Synopsys\* Design Constraints file (`<project_directory>/<revision_name>.sdc`)—the Timing Analyzer uses industry-standard Synopsys Design Constraint format and stores those constraints in .sdc files.

By combining the syntax of the .qsf files and the .sdc files with procedural Tcl, you can automate iterations over several different settings, changing constraints and recompiling.

### What's New In This Version

- For designs with supported HSSI IP targeting Agilex™ 5 FPGAs only, you can now use the HSSI Dual Simplex IP Generation Flow to enable placing supported simplex transceiver-based IPs in the same transceiver channel (using dual simplex mode) using the DS Assignment Editor, as [Specify Dual Simplex Assignments in DS Assignment Editor](#) describes.

### Related Information

- [Quartus Prime Pro Edition Settings File Reference Manual](#)

### 1.1. Specifying Design Constraints in the GUI

Quartus Prime software provides tools that help you manually implement your project. These tools can also support design visualization, pre-filled parameters, and window cross probing, facilitating design exploration and debugging.

When you create or update a constraint in the Quartus Prime software, the **System** tab of the **Messages** window displays the equivalent Tcl command. Utilize these commands as references for future scripted design definition and compilation.

### 1.1.1. Global Constraints and Assignments

Global constraints and project settings affect the entire Quartus Prime project and all the applicable logic in the design. You often define global constraints in early project development; for example, when running the New Project Wizard. Quartus Prime software stores global constraints in .qsf files, one for each project revision.

**Table 1. Quartus Prime Tools to Set Global Constraints**

Setting Type	New Project Wizard	Device Dialog Box	Settings Dialog Box
Project-wide	X	X	X
Synthesis	X	X	X
Fitter	X	X	X
Simulation			X
Third-party Tools			X
IP Settings			X

#### Related Information

[Managing Project Settings](#)

*In Quartus Prime Pro Edition User Guide: Getting Started*

### 1.1.2. Node, Entity, and Instance-Level Constraints

Node, entity, and instance-level constraints apply to a subset of the design hierarchy. These constraints take precedence over any global assignment that affects the same sections of the design hierarchy. The following tools are available in the Quartus Prime software to specify node, entity, and instance-level constraints:

**Table 2. Quartus Prime Pro Edition Tools to Set Node, Entity and Instance Level Constraints**

Assignment Type	Assignment Editor	Interface Planner	DS Assignment Editor	NoC Assignment Editor	Chip Planner	Pin Planner
Pin		X				X
Location	X	X			X	
Routing	X				X	
NoC				X		
Dual Simplex IP			X			
Simulation	X				X	X

Although you can specify constraints using a variety of tools, the following table shows the most effective constraint tools at each design phase:

**Table 3. Constraint Tools per Design Phase**

Design Phase	Assignment Editor	NoC Assignment Editor	Interface Planner	Tile Interface Planner	Chip Planner	Timing Analyzer	Pin Planner
Pre-Synthesis	X	X		X			X
Post-Synthesis	X	X	X		X		
Post-Fit	X	X			X	X	

### 1.1.2.1. Specify Instance-Specific Constraints in Assignment Editor

Quartus Prime Assignment Editor (**Assignments** ► **Assignment Editor**) provides a spreadsheet-like interface for assigning all instance-specific settings and constraints. To help you explore your design, the Assignment Editor allows you to filter assignments by node name or category.

**Figure 1. Quartus Prime Assignment Editor**

From	To	Assignment Name	Value	Enabled	Entity	Comment	Tag
ff1[4]	Location	FF_X1...56_N4	Yes				
ff1[5]	Location	FF_X1...6_N31	Yes				
ff1[6]	Location	FF_X1...6_N43	Yes				
ff1[7]	Location	FF_X1...7_N49	Yes				
out[...tput]	Location	IOOBU...6_N33	Yes				
out[0]	Location	PIN_K1	Yes				
out[0]	I/O Standard	1.8 V	Yes	clktldr_pice_0			
out[...tput]	Location	IOOBU...2_N48	Yes				
out[1]	Location	PIN_L4	Yes				
out[1]	I/O Standard	1.8 V	Yes	clktldr_pice_0			
out[...tput]	Location	IOOBU...9_N63	Yes				
out[2]	Location	PIN_T6	Yes				
out[2]	I/O Standard	1.8 V	Yes	clktldr_pice_0			
out[...tput]	Location	IOOBU...2_N33	Yes				
out[3]	Location	PIN_G1	Yes				
out[3]	I/O Standard	1.8 V	Yes	clktldr_pice_0			
out[...tput]	Location	IOOBU...N63	Yes				

Use the Assignment Editor to:

- Add, edit, or delete assignments for selected nodes
- Display information about specific assignments
- Enable or disable individual assignments
- Add comments to an assignment

Additionally, you can export assignments to a Comma-Separated Value File (.csv).

#### 1.1.2.1.1. Specifying Multi-Dimensional Bus Constraints

The Quartus Prime Pro Edition software traditionally supports only 1- and 2-dimensional bus names for specifying constraints. The Quartus Prime Pro Edition version 19.3 and later now supports multi-dimensional bus names for more efficient constraints.

For example, you can specify the following assignment to apply a constraint to all bits in the reg [31:0] r [0:2][4:5] three-dimensional bus:

```
set_instance_assignment -name PRESERVE_REGISTER ON -to r
```

The constraint then applies to all bits r: [0][4][31], r[0][4][30], ... , r[1][5][0].

#### 1.1.2.2. Specify NoC Constraints in NoC Assignment Editor

For designs targeting Agilex 7 M-Series FPGAs only, the NoC Assignment Editor in the Quartus Prime Pro Edition software allows you to make logical assignments for hard memory NoC-related blocks in your design. These assignments include grouping, connectivity, address mapping, and bandwidth requirements.

The hard memory NoC facilitates high-bandwidth data movement between the FPGA core logic and memory resources, such as HBM2E and DDR5 memories. Refer to [Interface Planner NoC Tool Flow](#) on page 40 and the *Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide* for details on the complete NoC flow including Interface Planner.

The Quartus Prime software supports the following two flows for NoC design:

- **Platform Designer Connection Flow**—you use Platform Designer to configure and instantiate your NoC-related IP. You also use Platform Designer to make connections between NoC initiator bridges and NoC target bridges and to define the addressing mapping for these connections. Once you generate HDL for your Platform Designer system, your design is ready for RTL simulation. You must use the NoC Assignment Editor to create additional assignments, such as specifying NoC groupings and optional performance targets. You can use Interface Planner to make physical location assignments for your NoC elements. Then you compile your design and review the results.
- **NoC Assignment Editor Connection Flow**—you can configure and instantiate your NoC-related IP in either Platform Designer or directly in RTL. You then use the NoC Assignment Editor to make all NoC assignments including grouping, connectivity, address mapping, and optional performance targets. After completing the assignments and rerunning Analysis & Elaboration, your design is ready for RTL simulation. You can use Interface Planner to make physical location assignments for your NoC elements. Then compile your design and review the results.

Using the NoC Assignment Editor is similar to using the Assignment Editor, but the NoC Assignment Editor is optimized for making NoC assignments only. You must successfully complete Quartus Prime Analysis & Elaboration before using the NoC Assignment Editor. After Analysis & Elaboration, you can access the NoC Assignment Editor by clicking **Assignments > Network on Chip (NoC) Assignment Editor**.

Specify assignments on the following NoC Assignment Editor tabs:

- **Group** tab—specifies the **Group Name** of the NoC initiators and targets.
- **Connection** tab—specifies the connections between NoC initiators and targets or SSM elements.
- **Attributes** tab—specifies address mapping, bandwidth requirements, and transaction sizes for each connection.

**Figure 2. Network on Chip (NoC) Assignment Editor Group Tab**

The assignments made on the **Group** tab affect the assignments available in the **Connection** tab. The assignments made on the **Connection** tab affect the assignments available in the **Attributes** tab.

Complete the assignments on each tab in order before moving to the next tab.

After making assignments in the NoC Assignment Editor, you click **Validate** to validate the assignments, and then click **Save** to store the assignments in the Quartus Prime settings file (.qsf).

### Related Information

[Agilex 7 M-Series FPGA Network-on-Chip \(NoC\) User Guide](#)

#### 1.1.2.2.1. NoC Assignment Editor Interface Controls

For designs targeting Agilex 7 M-Series FPGAs only, you can use the following interface controls of the NoC Assignment Editor to specify NoC assignments:

**Table 4. NoC Assignment Editor Interface Controls**

NoC Assignment Editor GUI	Description
<b>Group</b> Tab	After completing Analysis & Elaboration and opening the NoC Assignment Editor, the <b>Group</b> tab displays two columns. The <b>Network Interface Unit</b> column displays a list of all NoC initiator, target, PLL, and SSM elements in your design. The <b>Group Name</b> column allows you to assign each of the elements to one of two NoC groups by entering the name of the group. You can define a custom, case-insensitive <b>Group Name</b> . Default names are NOC_GROUP_0 and NOC_GROUP_1. Each group must contain the NoC initiators and targets
<i>continued...</i>	

NoC Assignment Editor GUI	Description
	that you connect through that high-speed interconnect NoC, as well as one NoC PLL, and one NoC SSM. You must complete all assignments on the <b>Group</b> tab before proceeding to the <b>Connections</b> tab.
<b>Connections</b> Tab	You use the <b>Connections</b> tab to define connection assignments between NoC initiators and targets. Specify connections between a NoC initiator and a target or SSM by enabling the corresponding checkbox in the connection table. The group subtab includes a connection table with all the NoC initiators for that group listed on the left-hand side, and of all the NoC targets and SSM elements for the group listed across the top. You must complete all assignments on the <b>Connections</b> tab before proceeding to the <b>Attributes</b> tab.
<b>Attributes</b> Tab	You use the NoC Assignment Editor to create attribute assignments between initiators and targets. You specify assignments for address mapping and bandwidth requirements for each connection on the <b>Attributes</b> tab. The <b>Attributes</b> tab includes a subtab for each group that you specify on the <b>Group</b> tab. Each subtab lists each initiator to target connection. You must complete all assignments on the <b>Attributes</b> tab before you can <b>Save</b> the assignments.

#### 1.1.2.2.2. Troubleshooting NoC Assignment Editor

Use the following FAQs to help you understand conditions and resolve conflicts in the NoC Assignment Editor:

**Table 5. NoC Assignment Editor FAQs**

FAQs	Explanation/Resolution
Why are some assignments in NoC Assignment Editor 'read-only'?	<ul style="list-style-type: none"> <li>Any NoC assignment that you make in Platform Designer appears as read-only in NoC Assignment Editor. You cannot modify these read-only assignments inside the NoC Assignment Editor.</li> <li>To modify such read-only NoC assignments, modify the corresponding elements in Platform Designer and regenerate HDL for the system.</li> </ul>
Why are there conflicting assignments between Platform Designer and NoC Assignment Editor?	<ul style="list-style-type: none"> <li>This condition can occur if you first make assignments in NoC Assignment Editor, and then later make similar NoC assignments in Platform Designer. If you make Platform Designer assignments first, and then later make assignments in NoC Assignment Editor, those Platform Designer assignments appear as read-only in NoC Assignment Editor.</li> <li>This condition can also occur if you first make NoC assignments in Platform Designer, and then later manually specify NoC assignments in the .qsf file. To avoid this condition, only use Platform Design or only use NoC Assignment Editor to specify NoC connectivity and addressing assignments. Avoid using the .qsf to specify NoC connectivity and addressing assignments.</li> </ul>
How do I identify conflicting assignments between Platform Designer and NoC Assignment Editor?	<ul style="list-style-type: none"> <li>The NoC Assignment Editor cell containing any assignment conflict is highlighted in yellow.</li> <li>The last assignment in the list takes precedence and is displayed. If the last assignment is a Platform Designer assignment, the cell is also read-only.</li> </ul>
How can I resolve conflicting assignments between Platform Designer and NoC Assignment Editor?	<p>You can use either of the following methods to replace a conflicting .qsf assignment with the Platform Designer assignment:</p> <ul style="list-style-type: none"> <li>Right-click in the highlighted cell with a conflict, and then click <b>Delete</b>.</li> <li>Manually delete any conflicting assignment from the .qsf. Avoid manually editing the .qsf if you can resolve issues in the NoC Assignment Editor.</li> </ul>

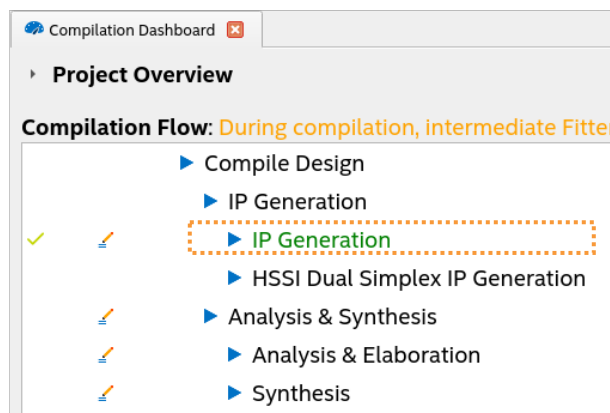

### 1.1.2.3. Specify Dual Simplex Assignments in DS Assignment Editor

For designs with supported HSSI IP targeting Agilex 5 FPGAs only, the Dual Simplex (DS) Assignment Editor in the Quartus Prime Pro Edition software allows you to create and view dual simplex logical assignments according to your channel arrangement. After defining dual simplex groups in the DS Assignment Editor, you run the HSSI Dual Simplex IP Generation stage of the Compiler to generate the dual simplex IP for synthesis.

To use the DS Assignment Editor to assign DS groups, follow these steps:

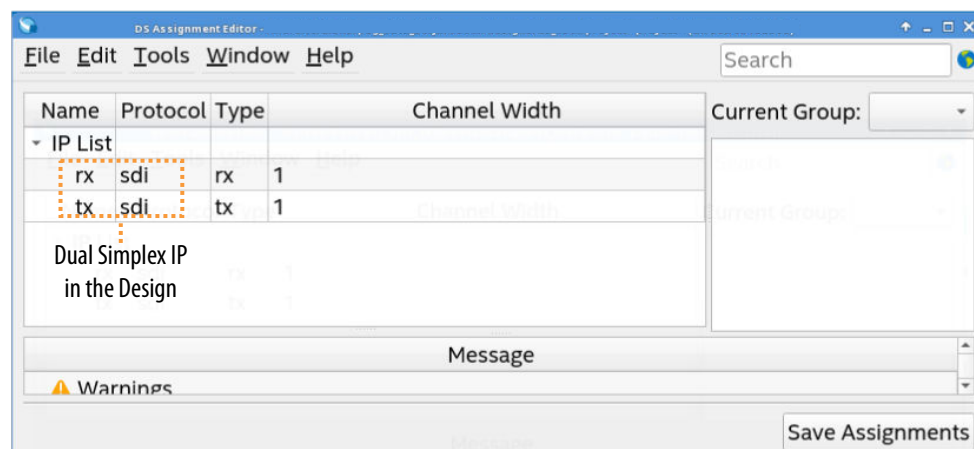

1. Open a Quartus Prime Pro Edition project that targets the Agilex 5 device and includes a Platform Designer system that contains HSSI IP that support dual simplex mode.
2. In Compilation Dashboard, click the **IP Generation** stage. The Messages window reports when generation is complete.

**Figure 3. IP Generation Stage in Compilation Dashboard**

3. Click **Assignments > Dual Simplex (DS) Assignment Editor**. The DS Assignment Editor opens listing all supported dual simplex IP in your design in the **IP List** and any existing DS assignments under **DS Groups**.

**Figure 4. DS Assignment Editor Before Creating DS Groups**

4. Create dual simplex groups and assign IP instances in DS Assignment Editor:

- Right-click any instance under **IP List** and click **Create instance in ➤ New DS group**.
- Double-click the **Name** cell under **DS Groups** and type a new group name.
- Right-click the **DS Groups** row and select **Create DS Group**.
- Double-click any **DS Group** name to specify a unique DS group name that becomes the module name for the Verilog output.

**Figure 5. Dual Simplex (DS) Assignment Editor**

The screenshot shows the 'Dual Simplex (DS) Assignment Editor' window. It has a 'Current Group' dropdown set to 'my'. The main area is divided into two panes. The left pane has a tree view with 'IP List' and 'DS Groups'. Under 'IP List', there are 'rx' and 'tx' instances, both of type 'sdi' with a channel width of 1. A right-click context menu is open over the 'tx' instance, showing options like 'Copy', 'Ctrl+C', 'Create Instance in...', 'my\_dual\_simplex', and 'New DS Group...'. The 'DS Groups' pane shows a group named 'my\_dual\_simplex' containing 'rx\_inst0' and 'tx\_inst0' instances. The 'Assignment Visualizer' on the right shows a diagram of two channels, 'rx\_inst0' and 'tx\_inst0', connected to a central '0'.

Name	Protocol	Type	Channel Width
rx	sdi	rx	1
tx	sdi	tx	1

Name	Protocol	Type	Relative Offset	Channel Width	Loopback
my_dual_simplex				1	NO_LOOPBACK
rx_inst0	sdi	rx	0	1	
tx_inst0	sdi	tx	0	1	

- To place instances in a DS group, right-click the instance name and click **Move to group**. The visualizer shows the assigned channels and indicates any illegal assignments.
- Under **Loopback Mode**, double-click in the cell to optionally enable an available loopback mode for debug. **NO\_LOOPBACK** is the default setting.

**Figure 6. Available Loopback Modes**

The screenshot shows the 'Available Loopback Modes' dropdown menu. The menu is open, showing a list of loopback modes. The 'NO\_LOOPBACK' mode is selected. The list includes: NO\_LOOPBACK, XCVR\_ELANE\_MAC\_TXPLD\_RXMAC, XCVR\_ELANE\_MAC\_TXMAC\_RXMAC, XCVR\_ELANE\_PCS\_TXPLD\_RXPCS, XCVR\_ELANE\_PCS\_TXPCS\_RXPCS, XCVR\_FEC, XCVR\_IF, PAD, UX\_PRE\_SERDES, UX\_PARALLEL, UX\_REVERSE\_PARALLEL, UX\_SERIAL\_INTERNAL, and UX\_REVERSE\_SERIAL\_INTERNAL. The 'Specify Relative Offset' label is visible below the table.

Name	Protocol	Type	Relative Offset	Channel Width	Loopback Mode
my_dual_simplex				1	NO_LOOPBACK
rx_inst0	sdi	rx	0	1	
tx_inst0	sdi	tx	0	1	

- For any IP instance, double-click the **Name** cell to optionally specify a new instance name for the IP, and a **Relative Offset** from the origin location in units of channels.
- To specify shared clock properties within a DS group, select the instance under **DS Groups**, turn on **Shared Clock**, and specify the **IP Port** and **Merge Port**

**Figure 7. Specifying Shared Clock Properties**

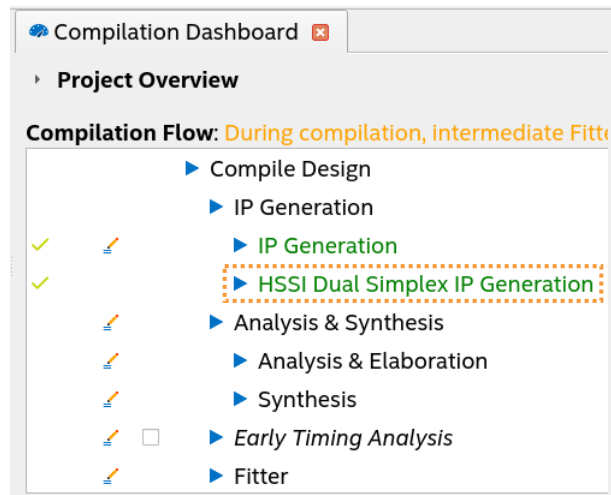

- View the DS assignments in the visualizer display of the **Current Group**. The visualizer and the **Message** panel indicate any illegal assignments. The visualizer display shows two rectangles that represent the simplex IP in two channels. These rectangles represent the Tx and Rx channels, respectively. You can select the **Current Group** that you want to visualize. Illegal assignments appear with red shading in the rectangle, and an error message displays in the **Message** panel.

**Figure 8. Illegal DS Group Assignment in the Assignment Visualizer**

- When your DS assignments are complete, click the **Save Assignments** button to save the DS assignments to the .qsf for application during subsequent compilation stages.
- In the Compilation Dashboard, click **HSSI Dual Simplex IP Generation** to generate the dual simplex IP.

**Figure 9. HSSI Dual Simplex IP Generation Stage in Compilation Dashboard**

*Note:* HSSI Dual Simplex IP Generation is present in Compilation Dashboard only when targeting Agilex 5 FPGAs. For more information about dual simplex mode, refer to *GTS Transceiver Dual-Simplex Interfaces User Guide*.

#### 1.1.2.4. Specify I/O Constraints in Pin Planner

Quartus Prime Pin Planner allows you to assign design elements to I/O pins. You can also plan and assign IP interface or user nodes not yet defined in the design.

**Figure 10. Quartus Prime Pin Planner GUI**

## Related Information

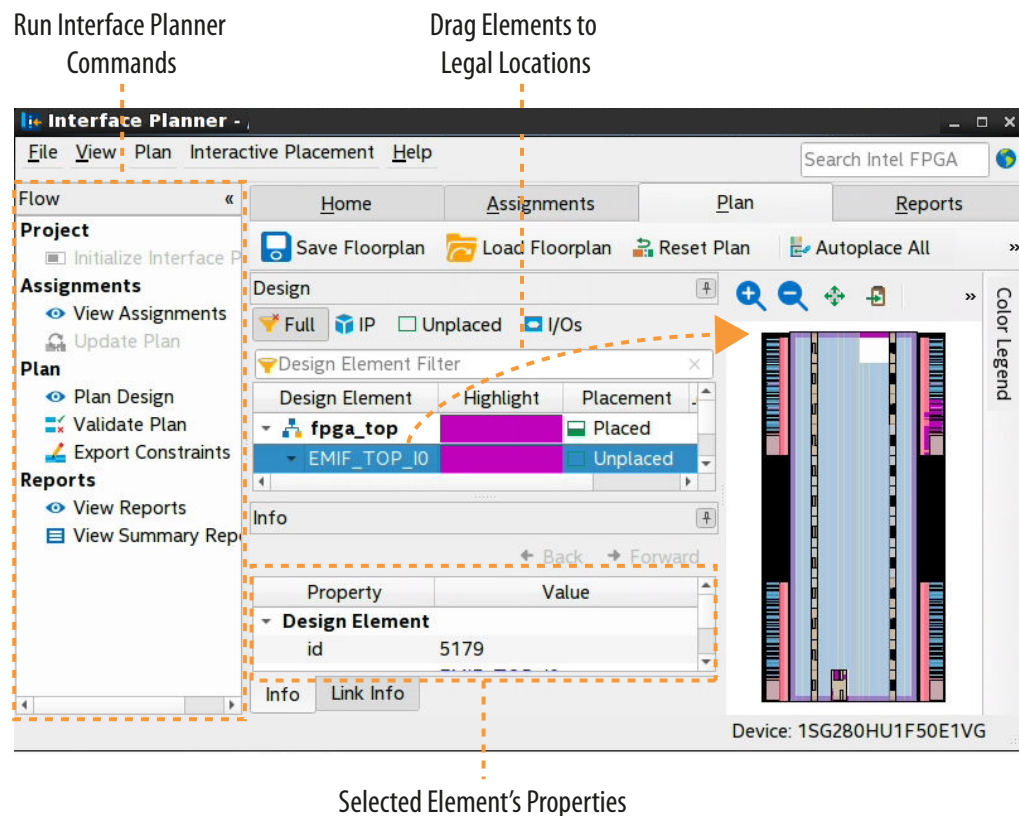

[Managing Device I/O Pins](#) on page 72

### 1.1.2.5. Plan Interface Constraints in Interface Planner and Tile Interface Planner

The Interface Planner simplifies the planning of accurate constraints for physical implementation. Similarly, you can use the Tile Interface Planner to build a plan for placement of IP components in each tile available on Agilex 7 F-tile devices. Use Interface Planner to prototype interface implementations, plan clocks, and rapidly define a legal device floorplan.

Interface Planner and Tile Interface Planner interact dynamically with the Quartus Prime Fitter to accurately verify placement legality while you plan. You can evaluate different floorplans, using interactive reports to accurately plan the best implementation without iterative compilation. Fitter verification ensures the highest correlation between your interface plan and actual implementation results. You can apply the interface plan constraints to your project with high confidence in the final implementation.

**Figure 11. Interface Planner GUI**

## Related Information

- [Using Interface Planner](#) on page 26
- [Using Tile Interface Planner](#) on page 50

### 1.1.2.6. Adjust Constraints with the Chip Planner

With the Chip Planner you can adjust existing assignments to device resources, such as pins, logic cells, and LABs in a graphical representation of the device floorplan. You can also view equations and routing information and demote assignments by dragging and dropping to Logic Lock regions in the **Logic Lock Regions Window**.

**Figure 12. Chip Planner GUI**

#### Related Information

- [Design Floorplan Analysis in the Chip Planner](#)  
In *Quartus Prime Pro Edition User Guide: Design Optimization*
- [Defining Logic Lock Placement Constraints, Quartus Prime Pro Edition User Guide: Design Optimization](#)

### 1.1.2.7. Constraining Designs with the Design Partition Planner

The Design Partition Planner allows you to view design connectivity and hierarchy and can assist you in creating effective design partitions.

Additionally, the Design Partition Planner allows you to optimize design performance by isolating and resolving failing paths on a partition-by-partition basis.

#### Related Information

[Creating Partitions and Logic Lock Regions with the Design Partition Planner and the Chip Planner](#)  
In *Quartus Prime Pro Edition User Guide: Design Optimization*

### 1.1.3. Probing Between Components of the Quartus Prime GUI

The Quartus Prime software allows you to locate nodes and instances within the compilation database from any of the following:

- Project Navigator
- Assignment Editor
- Chip Planner
- Timing Analyzer
- Resource Property Viewer
- RTL Viewer
- Technology Map Viewer
- Fast Forward Viewer
- Design Partition Planner
- Pin Planner
- HDL design files

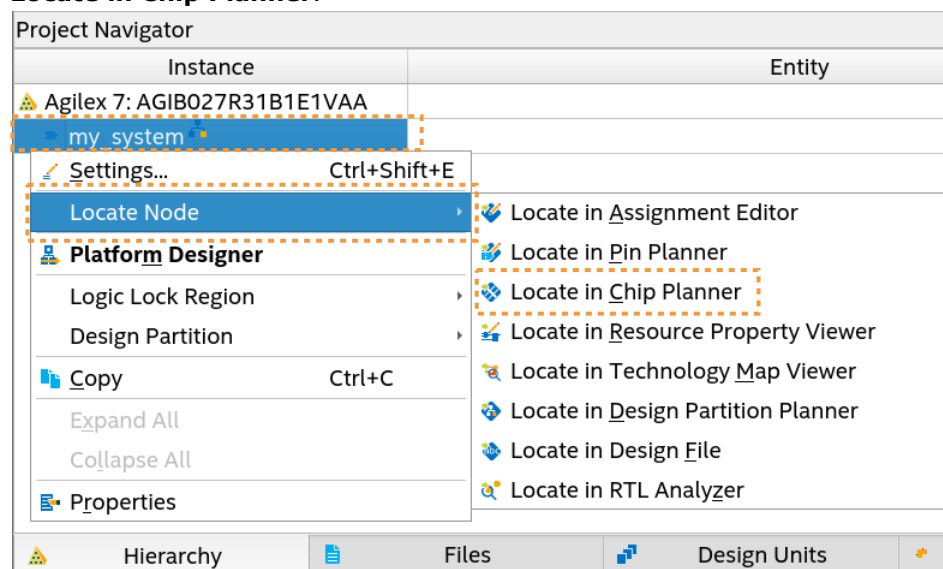

To locate nodes or instances, follow these steps:

1. Right-click the resource you want to display.
2. Click **Locate Node**, and then click any of the available menu options.

The corresponding window opens—or appears in the foreground if it is already open—and shows the element you clicked.

#### Example 1. Locate a Resource Selected in the Project Navigator

In the **Entity** list of the **Hierarchy** tab, right-click any object, and click **Locate** ➤ **Locate in Chip Planner**.

The Chip Planner opens and displays the instance you selected.

### 1.1.4. Specifying Timing Constraints

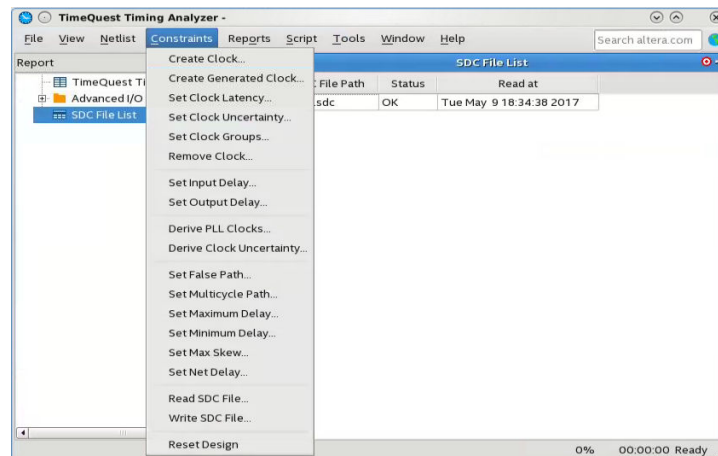

You must specify timing constraints that describe the clock frequency requirements, timing exceptions, and I/O timing requirements of your design for comparison against actual conditions observed during timing analysis. You define timing constraints in one or more Synopsys\* Design Constraints (.sdc) files that you add to the project.

You can specify timing constraints in the Timing Analyzer GUI, which automatically generates an .sdc based on your inputs. Click the **Constraints** menu in the Timing Analyzer to specify timing constraints that you can apply to your project.

Alternatively, you can create an initial .sdc with provided .sdc file templates, or manually in any text editor and then add the .sdc to the project.

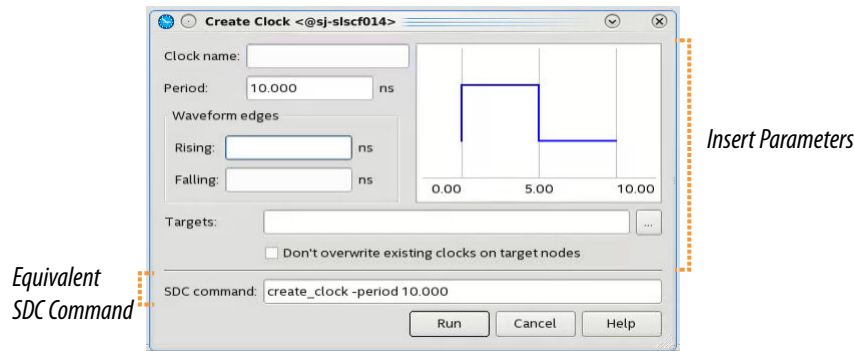

In addition, generation of Intel FPGA IP or Platform Designer systems may also automatically generate and add to your project .sdc constraints.

**Figure 13. Constraint menu in Timing Analyzer**

When you specify a constraint in the GUI, the dialog box displays the equivalent SDC command syntax.

## Example 2. Create Clock Dialog Box

Individual timing assignments override project-wide requirements.

- To avoid reporting incorrect or irrelevant timing violations, you can assign timing exceptions to nodes and paths.
- The Timing Analyzer supports point-to-point timing constraints, wildcards to identify specific nodes when making constraints, and assignment groups to make individual constraints to groups of nodes.

Refer to the following Related Information:

### Related Information

[Applying Timing Constraints, Quartus Prime Pro Edition User Guide: Timing Analyzer](#)

## 1.2. Constraining Designs with Tcl Scripts

You can perform all your design assignments using `.sdc` and `.qsf` setting files. To integrate these files in compilation and optimization flows, use Tcl scripts. Even though `.sdc` and `.qsf` files are written in Tcl syntax, they are not executable by themselves.

When you use Quartus Prime Tcl packages, your scripts can open projects, make the assignments, compile the design, and compare compilation results against known goals and benchmarks. Furthermore, such a script can automate the iterative design process by modifying constraints and recompiling the design.

### 1.2.1. Create a Project and Apply Constraints

The command-line executables include options for common global project settings and commands. You can use a Tcl script to apply constraints such as pin locations and timing assignments. You can write a Tcl constraint file, or generate one for an existing project by clicking **Project > Generate Tcl File for Project**.

The example creates a project with a Tcl script and applies project constraints using the tutorial design files in the <Quartus Prime *installation directory*>/qdesigns/fir\_filter/ directory.

```
project_new filtref -overwrite
# Assign family, device, and top-level file
set_global_assignment -name FAMILY "Arria 10"
set_global_assignment -name DEVICE <Device>
set_global_assignment -name VERILOG_FILE filtref.v
# Assign pins
set_location_assignment -to clk Pin_28
set_location_assignment -to clkx2 Pin_29
set_location_assignment -to d[0] Pin_139
set_location_assignment -to d[1] Pin_140
#
project_close
```

Save the script in a file called `setup_proj.tcl` and type the commands illustrated in the example at a command prompt to create the design, apply constraints, compile the design, and perform fast-corner and slow-corner timing analysis. Timing analysis results are saved in two files, `filtref_sta_1.rpt` and `filtref_sta_2.rpt`.

```
quartus_sh -t setup_proj.tcl
quartus_syn filtref
quartus_fit filtref
quartus_asm filtref
quartus_sta filtref --model=fast --export_settings=off
mv filtref_sta.rpt filtref_sta_1.rpt
quartus_sta filtref --export_settings=off
mv filtref_sta.rpt filtref_sta_2.rpt
```

Type the following commands to create the design, apply constraints, and compile the design, without performing timing analysis:

```
quartus_sh -t setup_proj.tcl
quartus_sh --flow compile filtref
```

The `quartus_sh --flow compile` command performs a full compilation, and is equivalent to clicking the **Start Compilation** button in the toolbar.

### 1.2.2. Assigning a Pin

To assign a signal to a pin or device location, use the Tcl command shown in this example:

```
set_location_assignment -to <signal name> <location>
```

Valid locations are pin location names. Some device families also support edge and I/O bank locations. Edge locations are `EDGE_BOTTOM`, `EDGE_LEFT`, `EDGE_TOP`, and `EDGE_RIGHT`. I/O bank locations include `IOBANK_1` to `IOBANK_n`, where `n` is the number of I/O banks in a device.

### 1.2.3. Generating Quartus Prime Settings Files

Quartus Prime software allows you to generate `.qsf` files from your revision. You can embed these constraints in a scripted compilation flow, and even create sets of `.qsf` files for design optimization.

To generate a .qsf file from the Quartus Prime software, click **Assignments** ➤ **Export Assignments**.

To organize the .qsf in a human readable form, **Project** ➤ **Organize Quartus Prime Settings File**.

### Example 3. Organized .qsf File

This example shows how .qsf files characterize a design revision. The `set_global_assignment` command makes all global constraints and software settings and `set_location_assignment` constrains each I/O node in the design to a physical pin on the device.

```
# Project-Wide Assignments

## 1.2.4. Synopsys Design Constraint (.sdc) Files

Quartus Prime software keeps timing constraints in .sdc files, which use Tcl syntax. You can embed these constraints in a scripted compilation flow, and even create sets of .sdc files for timing optimization.

### Example 4. .sdc File

The example shows the timing constraints of a small design.

```

## 1.2.5. Tcl-only Script Flows

As an alternative to .sdc and .qsf files, you can perform all design assignments and timing constraints inside the Tcl scripts. In this case, the script that automates compilation and custom results reporting also contains the design constraints.

You can export a design's contents to a procedural, executable Tcl (.tcl) file, and then use the generated script to restore settings after experimenting with other constraints.

To export your constraints as an executable Tcl script, click **Project ► Generate Tcl File for Project**.

### Example 5. `blinking_led_generated.tcl` File

```
# Quartus Prime: Generate Tcl File for Project
# File: blinking_led_generated.tcl
# Generated on: Wed May 10 10:14:44 2017
# Load Quartus Prime Tcl Project package

package require ::quartus::project
set need_to_close_project 0
set make_assignments 1
# Check that the right project is open
if {[is_project_open]} {
    if {[string compare $quartus(project) "blinking_led"]} {
        puts "Project blinking_led is not open"
        set make_assignments 0
    }
} else {

May 2008	8.0	Updated Quartus II software 8.0 revision and date.

## 2. Interface Planning

---

Interface planning—the feasibility analysis of interface physical constraints—is a fundamental early step in advanced FPGA design. Periphery placement can be a complex process involving many variables. The Quartus Prime Interface Planner simplifies the planning of accurate constraints for physical implementation.

You can use the Interface Planner to prototype interface implementations, plan clocks, and rapidly define a legal device floorplan.

Similarly, when targeting the Agilex 7 F-tile devices, you can use the Tile Interface Planner build a plan for placement of IP components in each tile available on the FPGA device.

Interface Planner and Tile Interface Planner (launched from the Tools menu) interact dynamically with the Quartus Prime Fitter to accurately verify placement legality while placing elements. You can evaluate different floorplans, using interactive reports to accurately plan the best implementation without iterative compilation. Fitter verification ensures the highest correlation between your interface plan or tile interface plan and actual implementation results. You can apply the interface plan or tile interface plan constraints to your project with high confidence in the final implementation.

### Related Information

- [Video Demo: Using Interface Planner to Place DDR-3 and PCI Express Gen3](#)
- [Video Demo: Using the Tile Interface Planner](#)

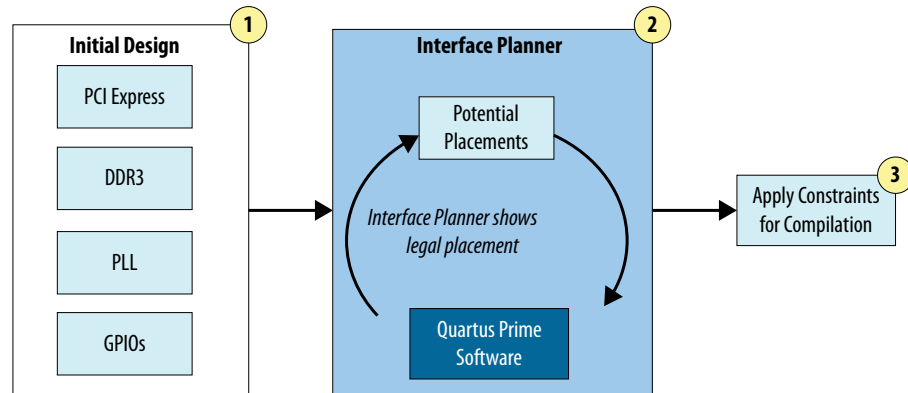

### 2.1. Using Interface Planner

After design synthesis, you can use Interface Planner to help you to rapidly define a legal device floorplan.

Interface Planner displays your project's logical hierarchy, post-synthesis design elements, and Fitter-created design elements, alongside a view of target device locations. The GUI supports a variety of methods for placing design elements in the floorplan. As you place elements in the floorplan, the Fitter verifies legality in real time to ensure accurate correlation with the final implementation.

Intel® FPGAs contain core and periphery device locations. The device core locations are adaptive look-up tables (ALUTs), core flip-flops, RAMs, and digital signal processors (DSPs). Device periphery locations include I/O elements, phase-locked loops (PLLs), clock buffers, and hard processor systems (HPS).

**Figure 14. Interface Planner Streamlines Legal Placement**

Intel FPGAs contain many silicon features in the device periphery, such as hard PCI Express® IP cores, high speed transceivers, hard memory interface circuitry, and embedded processors. Interactions among these periphery elements can be complex. Interface Planner simplifies this complexity and allows you to quickly visualize and place I/O interface and periphery elements, such as:

- I/O elements
- LVDS interfaces
- PLLs
- Clocks
- Hard interface IP Cores
- High-Speed Transceivers
- Hard Memory Interface IP Cores
- The Hard Memory Network-on-Chip (NoC)<sup>(1)</sup>
- Embedded Processors

### 2.1.1. Interface Planner User Interface

The Interface Planner user interface includes the following controls for planning your design platform.

[Flow Controls](#) on page 28

[Home Tab Controls](#) on page 28

[Assignments Tab Controls](#) on page 28

[Plan Tab Controls](#) on page 29

[Reports Tab Controls](#) on page 30

---

<sup>(1)</sup> For designs targeting Agilex 7 M-Series FPGAs only.

### 2.1.1.1. Flow Controls

The **Flow** control panel provides immediate access to common Interface Planner commands from anywhere within Interface Planner. The **Flow** controls appear in order of a typical interface planning flow.

**Table 7. Flow Controls**

Command	Description
<b>Open Project</b>	Allows you to select and open an Quartus Prime project in Interface Planner. Use of <b>Open Project</b> command is only required when using Interface Planner in standalone mode.
<b>Initialize Interface Planner</b>	Loads the synthesis netlist, starts the Fitter verification engine, and imports assignments from your Quartus Prime project.
<b>View Assignments</b>	Opens the <b>Assignments</b> tab, which allows you to review and reconcile any conflicting assignments that Interface Planner imports from your project. Enable or disable specific project assignments to resolve any conflicts.
<b>Update Plan</b>	Applies the enabled project assignments to your interface plan. You cannot perform periphery planning on the <b>Plan</b> tab until you update the plan.
<b>Plan Design</b>	Opens the <b>Plan</b> tab for placing logic in the interface plan.
<b>Validate plan</b>	Verifies that all constraints in the interface plan are compatible with placement of all remaining unplaced design elements. You can then directly locate and resolve the source of any reported validation errors. You must successfully validate the plan before running <b>Write Plan File</b> .
<b>Export Constraints</b>	Saves your interface plan as a Tcl script file for subsequent application in your project. This command is available only after successfully running <b>Validate Plan</b> .
<b>View Reports</b>	Opens the <b>Reports</b> tab for filtering data and finding entities and locations.
<b>View Summary Reports</b>	Opens the <b>Interface Planner Summary</b> report that summarizes the percentage of placed and unplaced periphery cells.

### 2.1.1.2. Home Tab Controls

The Interface Planner **Home** tab contains controls for opening projects in Interface Planner. You only need the **Home** tab when Interface Planner is in standalone mode.

**Table 8. Home Tab Controls**

Command	Description
<b>Recent Projects</b>	Provides quick access to recently opened Quartus Prime projects. A named tile represents each project. Click the tile to display <b>Details</b> about the project. Double-click the tile to open the project in Interface Planner.
<b>Browse</b>	Allows you to locate and open an Quartus Prime project in Interface Planner. Interface Planner requires the project's synthesized netlist for operation.
<b>Details</b>	Provides project and file details such as the file path, revision, and creation date of the Quartus Prime project. You can select a specific project revision.

### 2.1.1.3. Assignments Tab Controls

The **Assignments** tab contains controls for resolving potential conflicts with project assignments. Click **View Assignments** to display the **Assignments** tab. You can enable or disable specific or classes of assignments until you resolve all potential conflicts. After you are satisfied with the status of all project assignments, click **Update Plan** to update your interface plan with the enabled project assignments. Interface Planner reports an error for any remaining assignment conflicts.

**Table 9. Assignments Tab Controls**

Command	Description
<b>Filter</b> field	Supports creation of wildcard expressions for assignment targets. <b>Enabled</b> and <b>Disabled</b> buttons filter only enabled or disabled assignments in the list.
<b>Enable All Project Assignments</b>	Enables all imported project assignments in your interface plan.
<b>Disable All Project Assignments</b>	Disables all imported project assignments in the plan.
<b>Clear</b>	Clears any filter from the <b>Assignments</b> list.

#### 2.1.1.4. Plan Tab Controls

The **Plan** tab contains the following controls to help you locate and place logic in the interface plan. Click **Plan Design** to display the **Plan** tab. Placement or unplacement in the interface plan does not apply to your Quartus Prime project until you add the generated Interface Planner constraints script to your project.

**Table 10. Plan Tab Controls**

Command	Description
	Lists legal locations for placement.
<b>Locate Node</b>	Display a list of Quartus Prime Pro Edition tools where the selected design element is referenced in the hierarchical database. If the <b>Locate Node</b> command is disabled for a specific element in the <b>Design Elements</b> list, it is because that element is not represented as an element in the design.
<b>Autoplace All</b>	Attempts to place all unplaced design elements in legal locations in the interface plan.
<b>Autoplace Fixed</b>	Attempts to place all unplaced design elements that have only one legal location into the interface plan.
<b>Unplace All</b>	Unplaces all placed design elements in the interface plan.
<b>Right-click ► Auto-place selected element</b>	Attempts to place the selected design element and all its children in a legal location in the interface plan.
<b>Chip View</b>	Displays the target device chip. Zoom in to display chip details.
<b>Package View</b>	Displays the target device package. Zoom in to display chip details.
<b>NoC View</b>	Displays a filtered view of NoC initiators and targets. Refer to <a href="#">Interface Planner NoC Tool Flow</a>
<b>Show I/O Banks</b>	Selects and color codes the I/O banks in the <b>Plan</b> tab.
<b>Show Differential Pin Pair Connections</b>	In <b>Package View</b> , displays a red connection line between a pair of differential pins. The Package View labels the positive and negative pins with the letters p and n, respectively.
<b>Show PCIe Hard IP Interface Pins</b>	In <b>Package View</b> , selects and color codes the PCIe Hard IP interface pins in the <b>Plan</b> tab. To access this command, right-click in the <b>Plan</b> tab package view, and select <b>x1 Lanes</b> , <b>x2 Lanes</b> , <b>x4 Lanes</b> , <b>x8 Lanes</b> , or <b>by 16 Lanes</b> . After enabling, view color coding in the <b>Color Legend</b> .
<b>Show DQ/DQS Pins</b>	In <b>Package View</b> , selects and color codes the PCIe Hard IP interface pins in the <b>Plan</b> tab. To access this command, right-click in the <b>Plan</b> tab package view, and select <b>x4 Mode</b> , <b>x8/x9 Mode</b> , <b>x16/x16 Mode</b> , or <b>x32/x36 Mode</b> . After enabling, view color coding in the <b>Color Legend</b> .
<b>Right-click ► Report Placeability of Selected Element</b>	After selecting a low level element, displays detailed information on the <b>Reports</b> tab, showing legal locations in the interface plan for the selected cell in order of suitability for fitting.
<i>continued...</i>	

Command	Description
<b>Right-click ► Report Legal Locations of Selected Element</b>	After selecting a low level element, displays the legal locations in the interface plan for the selected cell in order of suitability for fitting.
	Copies the current interface plan to the clipboard for pasting into other files, such as word processing or presentation files.
<b>Reset Plan</b>	Unplaces all placed design elements and removes applied project assignments from the interface plan. Resets all project assignments to the enabled state. You must subsequently run <b>Update Plan</b> prior to placing design elements. This command only applies to your interface plan and does not impact your Quartus Prime project assignments until you apply the Interface Planner script.
<b>Load Floorplan</b>	Allows you to select and load an Interface Planner Floorplan Format (.plan) file. You can save Interface Planner floorplan files in the format by clicking <b>Save Floorplan</b> .
<b>Save Floorplan</b>	Allows you to save your Interface Planner floorplan as a .plan file.

### 2.1.1.5. Reports Tab Controls

The Interface Planner **Reports** tab contains the following **Task** pane controls to help you filter data and find entities and locations.

**Table 11. Reports Tab Controls**

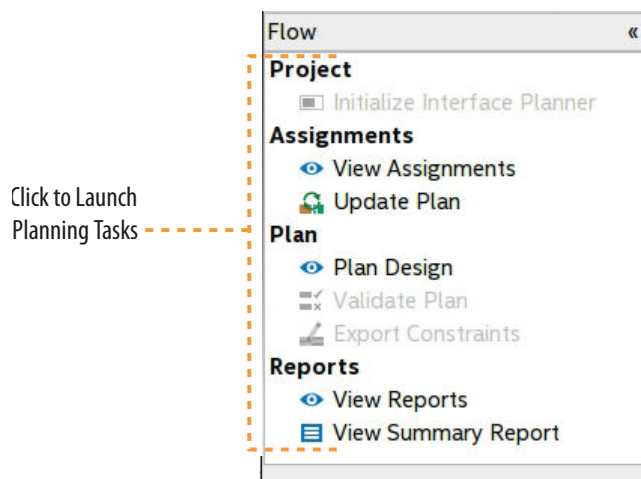

Command	Description
<b>Create all Summary Reports</b>	Creates the following summary reports: <ul style="list-style-type: none"> <li>• <b>Interface Planner Summary</b></li> <li>• <b>All Periphery Cells</b></li> <li>• <b>Placed/Unplaced Periphery Cells</b></li> <li>• <b>Periphery Location Types.</b></li> </ul>
<b>Report All Placed/Unplaced Pins</b>	Reports the name, parent (if any), and type of all placed ( <b>Report All Placed Pins</b> ) or unplaced ( <b>Report All Unplaced Pins</b> ) pins in the interface plan, respectively. The Placed Pins report includes the placement location name. The Unplaced Pins report includes the number of potential placement locations. Right-click any cell to place, unplace, or report connectivity or location information.
<b>Report All Placed/Unplaced HSSI Channels</b>	Reports the name, parent (if any), and type of all placed ( <b>Report All Placed HSSI Channels</b> ) or unplaced ( <b>Report All Unplaced HSSI Channels</b> ) channels in the interface plan, respectively. The Placed HSSI Channels report includes the placement location name. The Unplaced HSSI Channels report includes the number of potential placement locations. Right-click any cell to place, unplace, or report connectivity or location information.
<b>Right-click ► Report Placed/Unplaced Periphery Cells of Selected Type</b>	Reports the name, parent (if any), and type of placed ( <b>Report Placed Periphery Cells of Selected Type</b> ) or unplaced ( <b>Report Unplaced Periphery Cells of Selected Type</b> ) cells matching the selected type. The placed cells report includes the placement location name. The unplaced cells report includes the number of potential placement locations. Right-click any cell to place, unplace, or report connectivity or location information.
<b>Right-click ► Report Periphery Locations of Selected Type</b>	Reports all locations in the device of the selected type, and whether the location supports merging.
<b>Right-click ► Report Periphery Cell Connectivity</b>	Reports the source port and type, destination port and type, of connections to the selected cell. Right-click any cell to report the individual cell connectivity.
<b>Right-click ► Place/Unplace Cell</b>	Places the cell in the selected location of the interface plan. Similarly, you can right-click any cell and then click <b>Place Cell of Selected Type</b> or <b>Unplace Cell of Selected Type</b> to place or unplace multiple cells of the same type.
<i>continued...</i>	

Command	Description
<b>Right-click ► Report Cell Locations for Custom Placement</b>	Reports the preferred legal locations for the selected cell in the interface plan in the Legal Location report. Right-click to immediately place the cell in a location or report all periphery location of the selected type.
<b>Remove Invalid Reports</b>	Removes outdated Interface Planner reports that you invalidate by changes to the interface plan.
<b>Report Instance Assignments</b>	Shows all imported project assignments in the interface plan. You can delete these assignments from the plan.
<b>Report NoC Performance</b>	Performs a static analysis of the NoC initiator and target locations to evaluate whether the placement allows your design to meet the bandwidth requirements and transaction sizes that you specify in the NoC Assignment Editor. You can review the report, and then make changes in the <b>Plan</b> tab based on the results. Refer to <a href="#">Report NoC Performance</a> .

### 2.1.2. Interface Planner General Tool Flow

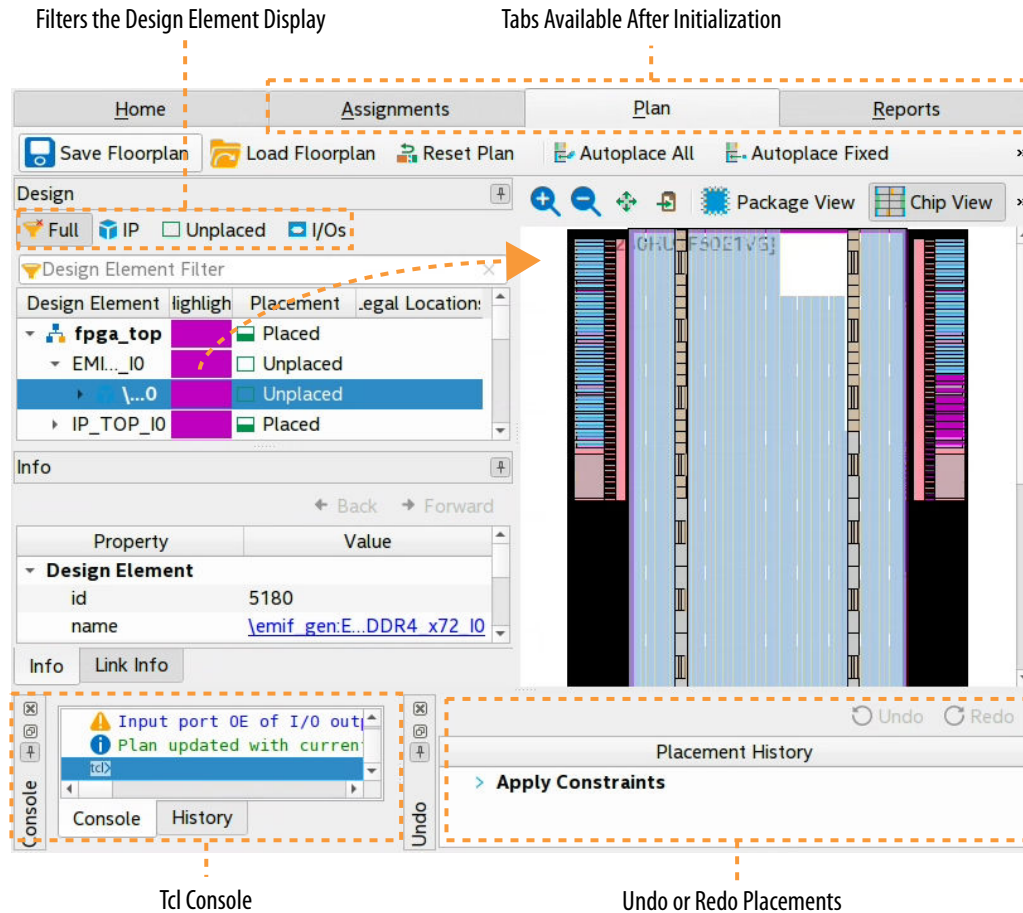

Interface Planner's user interface guides you through the design planning steps. Use Interface Planner's **Flow** control to execute the main initialization, planning, and validation functions of the flow in sequence.

**Figure 15. Interface Planner Flow Control**

As you run each step in the **Flow** control, downstream commands and the **Assignments**, **Plan**, and **Reports** tabs become available. Interface Planner only allows you to run commands after completing any prerequisite steps in the flow. After you **Initialize Interface Planner**, you are prompted to confirm any project assignments that you made before planning starts. Disable or enable any imported project assignments on the **Assignments** tab to resolve any conflicts and evaluate different implementations.

**Figure 16. Interface Planner GUI**

After you **Update Plan** with the project assignments, you are ready to place design elements onto the target device **Chip View** or **Package View** on the **Plan** tab. As you place design elements in the **Plan** tab, the Fitter verifies placement legality in real-time. Once planning is complete and validated, you export the constraints as a Tcl script for application in your project.

**Note:** The Interface Planner constraints you define do not apply to your project until you export and source them with the generated Tcl script.

**Figure 17. Interface Planner Chip View**

**Figure 18. Interface Planner Package View**

The following topics describe these interface planning flow steps in detail:

[Step 1: Setup and Synthesize the Project](#) on page 34

[Step 2: Initialize Interface Planner](#) on page 34

[Step 3: Update Plan with Project Assignments](#) on page 35

[Step 4: Plan Periphery Placement](#) on page 35

[Step 5: Report Placement Data](#) on page 39

[Step 6: Validate and Export Plan Constraints](#) on page 40

### 2.1.2.1. Step 1: Setup and Synthesize the Project

Interface Planner requires at least a partially complete, synthesized Quartus Prime project as input. You can also use Interface Planner to adjust placement for a fully complete design project.

Follow these steps to setup the project and run synthesis:

1. Complete at least the following steps for your design:
  - Fully define known device periphery interfaces.
  - Instantiate all known interface IP cores.
  - Declare all general purpose I/Os.
  - Define the I/O standard, voltage, drive strength, and slew rate for all general purpose I/Os.
  - Define the core clocking (optional, but recommended).
  - Connect all interfaces of the periphery IP to virtual pins or test logic. This technique creates loop backs on any interfaces in the shell design, helping to ensure that periphery interfaces persist after synthesis optimization.
2. To synthesize the design, click **Processing > Start > Start Analysis & Synthesis**. You must run at least Analysis & Synthesis before running Interface Planner.

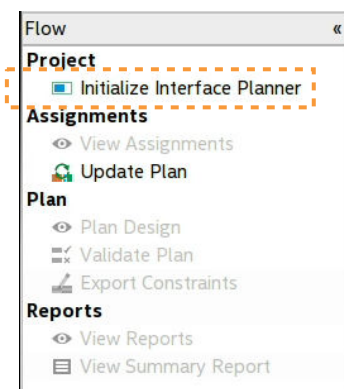

### 2.1.2.2. Step 2: Initialize Interface Planner

Initializing Interface Planner loads the compilation database for the synthesis snapshot, and enables the **View Assignments** command and **Assignments** tab for reconciling project assignments.

To initialize Interface Planner:

1. Click **Tools > Interface Planner**. The Interface Planner opens, displaying the **Home** tab.
2. On the **Flow** control, click **Initialize Interface Planner**. After initialization, the Fitter dynamically validates your interface plan as you make changes.

**Figure 19. Interface Planner Home Tab**

### 2.1.2.3. Step 3: Update Plan with Project Assignments

Before peripheral planning in Interface Planner, you must reconcile any conflicting imported project assignments and **Update Plan** with the assignments you want to retain in the plan.

Follow these steps to review imported project assignments and reconcile any conflicts:

1. On the **Flow** control, click **View Assignments**.
2. On the **Assignments** tab, enable or disable specific or groups of project assignments to resolve any conflicts or experiment with different settings. You can filter the list of assignments by assignment name or status.
3. After resolving all conflicts, click **Update Plan** on the **Flow** control to apply the enabled project assignments to your interface plan.

**Figure 20. Interface Planner (Assignments Tab)**

Enable All Assignments      Filter Assignments      Disable All Assignments

Home      Assignments      Plan      Reports

Enable All Project Assignments      Disable All Project Assignments

Filter      Disabled      Clear

### 2.1.2.4. Step 4: Plan Peripheral Placement

Click **Plan Design** on the **Flow** control to interactively place IP cores and other design elements in legal locations in the device periphery. The **Plan** tab displays a list of your project's design elements, alongside a graphical abstraction of the target device architecture.

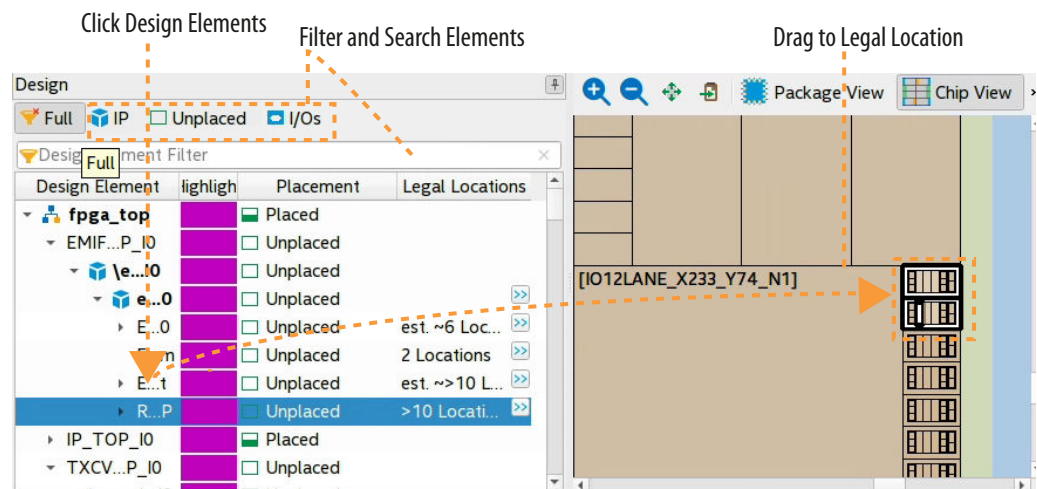

For efficiency, place design elements in the following order in Interface Planner:

1. Place all I/O pins or elements, such as PLLs, that have known, specific location requirements.
2. Place all known periphery interface IP.
3. (Optional) Place all remaining unplaced cells.

Use the following controls to place design elements in the Interface Planner floorplan:

1. Locate design elements that you want to place in the **Design Element** list. You can search and filter the list by name, IP, placement status, I/Os, and other criteria.
2. To customize design element color coding definitions, click the **Highlight** column.

**Figure 21. Interface Planner (Plan Tab)**

3. Use any of the following methods to place design elements in the floorplan:
  - Drag elements from the **Design Elements** list and drop them onto available device resources in the **Chip** or **Package** view. Use Ctrl+Click to drag and pan across the **Chip** or **Package** views. You may experience a small delay while dragging as Interface Planner calculates the legal locations.
  - To allow Interface Planner to place an unplaced design element in a legal location, right-click and select **Autoplace Selected**. You must use **Autoplace Selected** for all unplaced clocks.
  - Click the  button next to the **Design Elements** to display a list of **Legal Locations**. Click any legal location in the list to highlight the location in the floorplan. Double-click any location in the list to place the element in the location.

**Figure 22. Listing Legal Locations**

4. To step forward and backward through your plan changes, click the **Undo** and **Redo** buttons.
5. To visualize and traverse design connectivity (for example, to view the reference clock pin and driven destination cells of a PLL), select any design element and then click the **Link Info** tab. Click the **Back** and **Forward** buttons to traverse design connectivity.
6. To generate a report that shows the placement locations the Fitter prefers, select a design element and click **Report Placeability of Selected Element**.

**Figure 23. Link Info Tab for Traversing Connectivity**

Link Info	
<div> <div>Back</div> <div>Forward</div> </div>	
Property	Value
External memory interface	<a href="#">EMIF 0 ed synth emif s10 0</a>
▼ Fanin	
I/O AUX	<a href="#">EMIF TOP I0\...sm inst\io_ssm</a>
Impedance control block	<a href="#">EMIF TOP I0\...rmination inst</a>
CLK_REGION	<a href="#">CLK REGION EM...i nonabphy[0]</a>
I/O PLL reference clock network	<a href="#">REFCLK_GRP</a>
▼ Fanout	
CLK_REGION	<a href="#">CLK REGION EM...i nonabphy[0]</a>

**Note:** Changes made in Interface Planner do not apply to your Quartus Prime project until you apply the generated interface plan constraints script to your project.

### Related Information

[Plan Tab Controls](#) on page 29

### 2.1.2.4.1. Plan Clock Networks

Interface Planner allows you to visualize and plan clock networks. For Arria® 10 and Cyclone® 10 GX devices, you can locate, highlight, place, and edit the type of clock elements in the **Plan** tab.

**Note:** The Stratix® 10 device family does not support the **Clocking** filter in Interface Planner. For Stratix 10 designs, use the **Autoplace Selected** command to place all unplaced clock elements.

Interface Planner generates a Clocks report that details the signals using low-skew routing networks (clock networks) in the device.

To identify and place clocking elements in your design, click the **Clocking** filter in the **Plan** tab. You can refine the list further by entering search text in the **Design Element Filter**. Interface Planner represents clock networks as groupings of the clock source, clock mux, and the clock region.

**Figure 24. Clocking Design Elements**

You can place an entire clock group or individual clock elements by dragging into the location, or using the **Report Legal Locations of Selected Element** or the **Autoplace Selected** commands. After placement, hover the cursor over the item in the **Design Element** list to highlight the placement. The placement of clock elements impacts the placement of dependent core and periphery elements.

You can edit the clock type for clocking design elements. The clock type impacts the placement of dependent core and periphery elements. Right-click any clock element to specify one of the available clock types.

### 2.1.2.4.2. Saving & Loading Floorplans

You can save the state of your Interface Planner floorplan for use in subsequent Interface Planner sessions. Interface Planner saves your plan in Interface Planner Floorplan Format (.plan). You can load a .plan file in Interface Planner to reopen the floorplan.

1. To save an Interface Planner floorplan, click **File > Save Floorplan** and specify a file name.
2. To load an Interface Planner floorplan, click **File > Load Floorplan** and browse for the .plan file.

**Note:** .plan files are for use only in Interface Planner and are not for use directly in the Quartus Prime software. Interface Planner generates an error if you attempt to load a .plan file that is not associated with the current Interface Planner project.

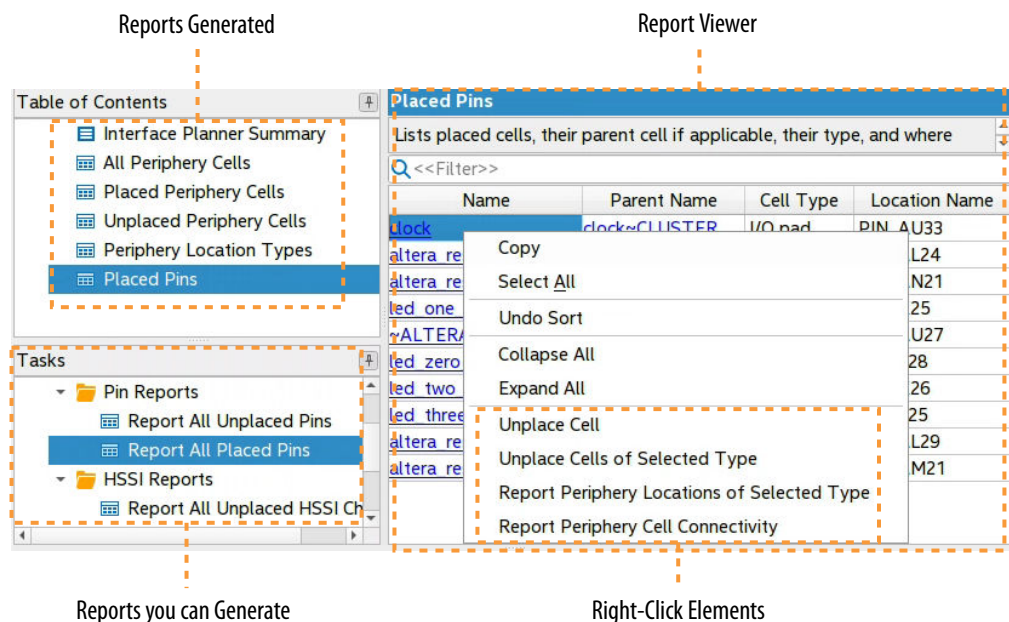

### 2.1.2.5. Step 5: Report Placement Data

Generate Interface Planner placement and connectivity reports to help locate cells and make the best decisions about placement for the interfaces and elements in your design. Click **View Reports** on the **Flow** control to open the **Reports** tab from which you can generate a range of reports.

Follow these steps to report Interface Planner placement data:

1. In the **Flow** control, click **View Reports**. The list of reports appears in the **Tasks** pane.
2. In the **Tasks** pane, double-click any report name to generate the report in the **Table of Contents** pane.
3. Select design elements in the report and click **Place**, **Unplace**, or report detailed data about the selected elements or locations.

**Figure 25. Reports Tab**

### Related Information

- [Reports Tab Controls](#) on page 30
- [Interface Planner Reports](#) on page 41

### 2.1.2.6. Step 6: Validate and Export Plan Constraints

You must validate your interface plan before exporting the plan constraints to your project as a generated Tcl script. Validation must confirm that the Fitter can place all remaining unplaced design elements before you can generate the script. When you are satisfied with your interface plan, follow these steps to validate and apply the interface plan to your Quartus Prime project:

1. In the **Flow** control, click **Validate Plan**. The Fitter confirms placement of all remaining unplaced design elements. You must correct any errors before you can export constraints.
2. After validation, click **Export Constraints** to generate a Tcl script that applies the plan to your project. The output Tcl file contains instructions to apply the interface plan to your Quartus Prime project.
3. Close Interface Planner.
4. To apply the exported interface plan constraints to your Quartus Prime project, click **Tools > Tcl Scripts** and select the `<project name>.pdp_assignments.tcl` script file.
5. Click **Run**. The script runs, applying the Interface Planner constraints to the project. Alternatively, you can run the script from the project directory:

```
quartus_sh -t <assignments_file>.tcl
```

6. To run synthesis and apply the interface plan in your project, click **Start > Start Analysis & Synthesis**.
7. Confirm the implementation of your plan by reviewing the Compilation Report.

### 2.1.3. Interface Planner NoC Tool Flow

For designs targeting Agilex 7 M-Series FPGAs only, you can use Interface Planner to assign physical locations for Network-on-Chip (NoC) initiators, PLLs, and SSMS. The Hard Memory NoC facilitates high-bandwidth data movement between the FPGA core logic and memory resources, such as HBM2e and DDR5 memories.

You can use Interface Planner to assign physical locations for NoC initiators, targets (as part of the HBM2e or external memory interfaces), PLLs, and SSMS. If you do not make physical assignments for NoC elements, the Fitter places NoC elements automatically during compilation.

You use the floorplan view in Interface Planner to place hard memory NoC and periphery elements. There are three floorplan views available:

- **NoC View**—shows a filtered view of NoC initiators and targets.
- **Chip View**—shows the placeable locations for hard memory NoC elements, including NoC initiators, targets, PLLs, and SSMS.
- **Package View**—NoC elements are not visible in the **Package View**.

Refer to *Making NoC Physical Assignments Using Interface Planner* in the *Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide* for details.

#### Related Information

[Making NoC Physical Assignments Using Interface Planner, Agilex 7 M-Series FPGA Network-on-Chip \(NoC\) User Guide](#)

## 2.1.4. Interface Planner Reports

Use Interface Planner reports to locate cells and assign suitable placement locations for specific interfaces and elements in your design. Interface Planner reports provide detailed, actionable feedback to help you quickly implement the best plan for your design. You can access placement and further reporting functions directly from Interface Planner reports. Interface Planner generates the following reports that provide detailed planning information:

[Report Summary](#) on page 41

[Report Pins](#) on page 43

[Report HSSI Channels](#) on page 44

[Report Clocks](#) on page 45

[Report Periphery Locations](#) on page 45

[Report Cell Connectivity](#) on page 46

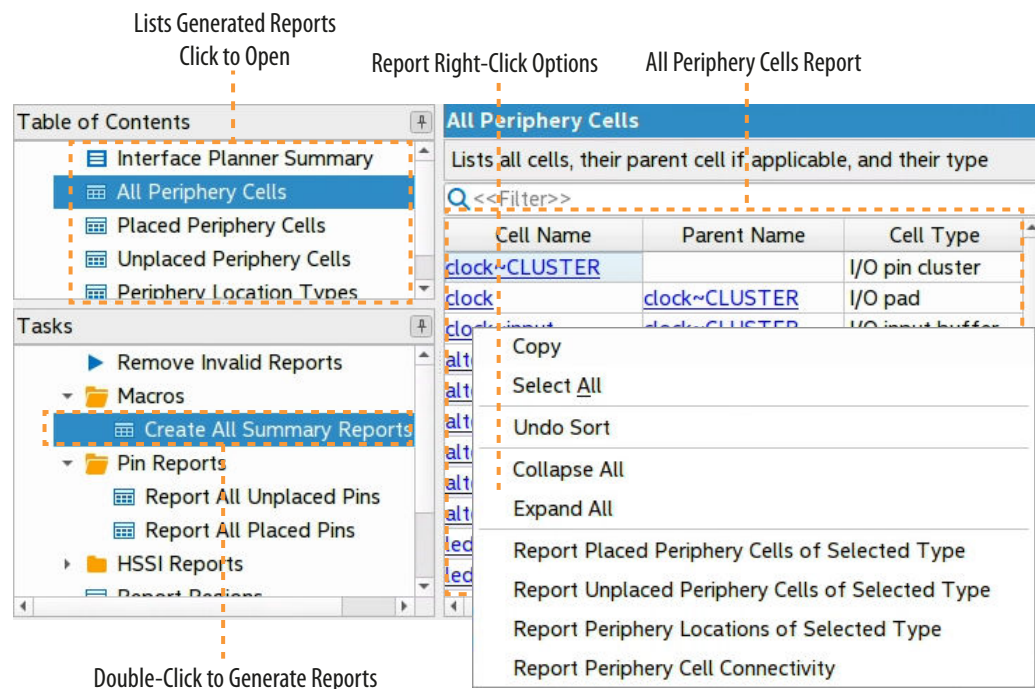

[Report Instance Assignments](#) on page 47

[Report NoC Performance](#) on page 48

### 2.1.4.1. Report Summary

Click **Create all Summary Reports** on the **Reports** tab to generate summary reports about periphery cells in the interface plan. Right-click any cell type to report placed, unplaced, connectivity, or location information.

**Figure 26. Summary Reports**

**Table 12. Report Summary**

Command	Description
<b>Create all Summary Reports</b>	<p>Creates the following summary reports:</p> <ul style="list-style-type: none"> <li>• <b>Interface Planner Summary</b>—reports software version and total number of periphery and top-level periphery cells.</li> <li>• <b>All Periphery Cells</b>— reports the name, parent, and type of all periphery cells in the design.</li> <li>• <b>Placed/Unplaced Periphery Cells</b>—reports the name, parent, and type of all placed and unplaced periphery cells in the interface plan.</li> <li>• <b>Periphery Location Types</b>—reports the number of each type of periphery location available in the target device and the number required by your design.</li> </ul>

### 2.1.4.2. Report Pins

Generate reports about I/O pins in the design. Right-click any cell type to place, unplace, or report connectivity or location information.

**Table 13. Report Pin Commands**

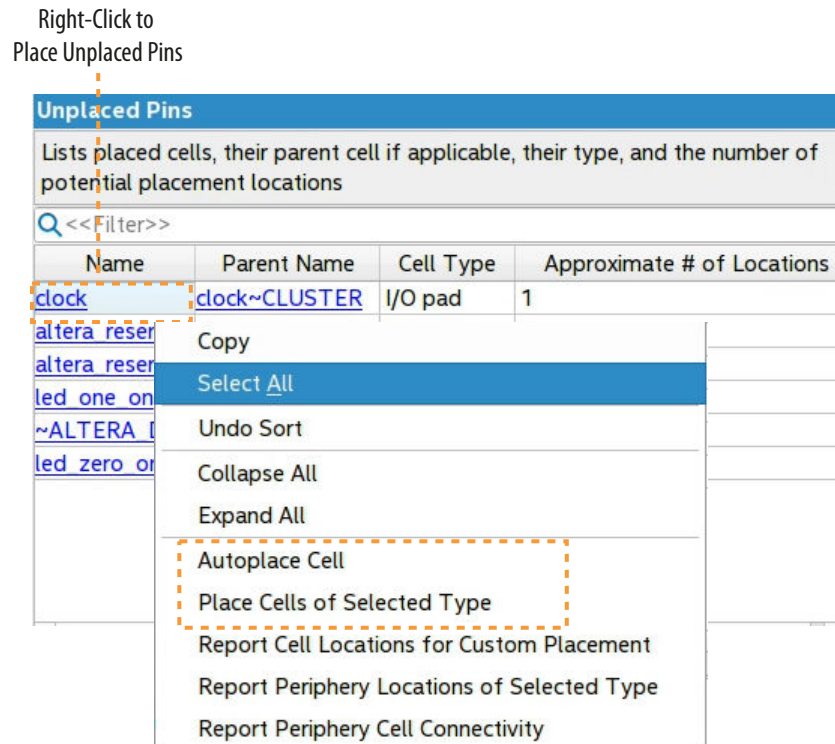

Command	Description
<b>Report All Placed Pins</b>	Generates the Placed Pins report. This report lists the name, parent, type, and location of all placed pins in the interface plan.
<b>Report All Unplaced Pins</b>	Generates the Unplaced Pins report. This report lists the name, parent, type, and the number of potential placements for all unplaced pins in the interface plan.

**Figure 27. Placed Pins Report**

#### 2.1.4.5. Report Periphery Locations

Generate reports that show the status of periphery cells in the interface plan.

**Table 16. Report Periphery Locations Commands**

Command	Description
<b>Right-click ► Report Placed Periphery Cells of Selected Type</b>	Accessible from the <b>All Periphery Cells</b> report. This command reports the name, parent (if any), type, and location of the selected placed periphery cells matching the selected type. Right-click any cell to place, unplace, or report connectivity or location information.
<b>Right-click ► Report Unplaced Periphery Cells of Selected Type</b>	Accessible from the <b>All Periphery Cells</b> report. This command reports the name, parent (if any), type, and number of suitable locations for the selected unplaced periphery cells matching the selected type. Right-click any cell to place, unplace, or report connectivity or location information.
<b>Right-click ► Report Periphery Locations of Selected Type</b>	Reports all locations in the device of the selected type, and whether the location supports merging.

### 2.1.4.8. Report NoC Performance

For designs that include the Hard Memory NoC, you can interactively generate a NoC Performance Report in Interface Planner.

The NoC Performance Report generation performs a static analysis of the NoC initiator and target locations to evaluate whether the placement allows your design to meet the bandwidth requirements and transaction sizes that you specify in the NoC Assignment Editor. You can review the report, and then make changes in the **Plan** tab based on the results.

To access the NoC Performance Report in Interface Planner, click the **Reports** tab, and then double-click **Report NoC Performance** in the **Tasks** pane.

**Figure 34. Sample NoC Performance Report**

23	noc_initiator_b256[noc_initiator_b256]iniu_1[initiator_inst_0	hbm2e_nst_0	0.0	...	34.6	...
24	noc_initiator_b256[noc_initiator_b256]iniu_1[initiator_inst_0	hbm2e_nst_0	0.0	...	41.1	...
25	noc_initiator_b256[noc_initiator_b256]iniu_1[initiator_inst_0	hbm2e_nst_0	0.0	...	46.8	...

The NoC Performance Report reports performance data for each initiator to target connection. The latencies in this report are based on the minimum structural latency with respect to the initiator and target placement. These latencies are for the NoC portion of the path only. These latencies do not include any latency of, for instance, external memory access. Nor do these latencies account for potential delay due to congestion on the NoC. You can achieve lower minimum structural latency by placing the NoC initiators and targets closer together.

**Table 19. NoC Performance Report Data**

NoC Performance Report Column	Description
<b>Requested RD BW</b>	The requested read bandwidth.
<b>Requested WR BW</b>	The requested write bandwidth.
<b>NoC Req latency</b>	The requested request latency.
<b>NoC Res latency</b>	The requested response latency.
<i>continued...</i>	

NoC Performance Report Column	Description
Initiator placement	The placement location of the initiator element.
Target placement	The placement location of the target element.
Message	Text message that identifies the reason that the current placement cannot meet the requested bandwidth.

One possible reason the **Message** reports that the current placement cannot meet the requested bandwidth is because of over-saturation of an initiator or a target. For example, if the sum of all bandwidth requirements through a particular initiator is greater than the bandwidth that the initiator can support, based on the data width and operating frequency of its AXI4 interface. To avoid this problem, either reduce bandwidth requirements or increase bandwidth capability.

Another possible reason that the current placement cannot meet the requested bandwidth is over-saturation of the horizontal bandwidth available in the NoC. This condition is the result of multiple initiator to target connections requesting bandwidth in the same direction through a horizontal section of the NoC. The NoC Performance Report message reports the congested segments. You can adjust initiator placement to alleviate congestion.

*Note:* For important considerations when choosing initiator interface placement, refer to the tables in *Horizontal Bandwidth Considerations*, along with tables in *High-Speed Interconnect NoC Locations in Interface Planner* in the *Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide* to translate location choices into physical placements.

You can also view NoC elements in the Quartus Prime Chip Planner, and view connectivity of NoC elements in following fitting in the NoC Connectivity Report, as the *Agilex 7 M-Series FPGA Network-on-Chip (NoC) User Guide*.

[Agilex 7 M-Series FPGA Network-on-Chip \(NoC\) User Guide](#)

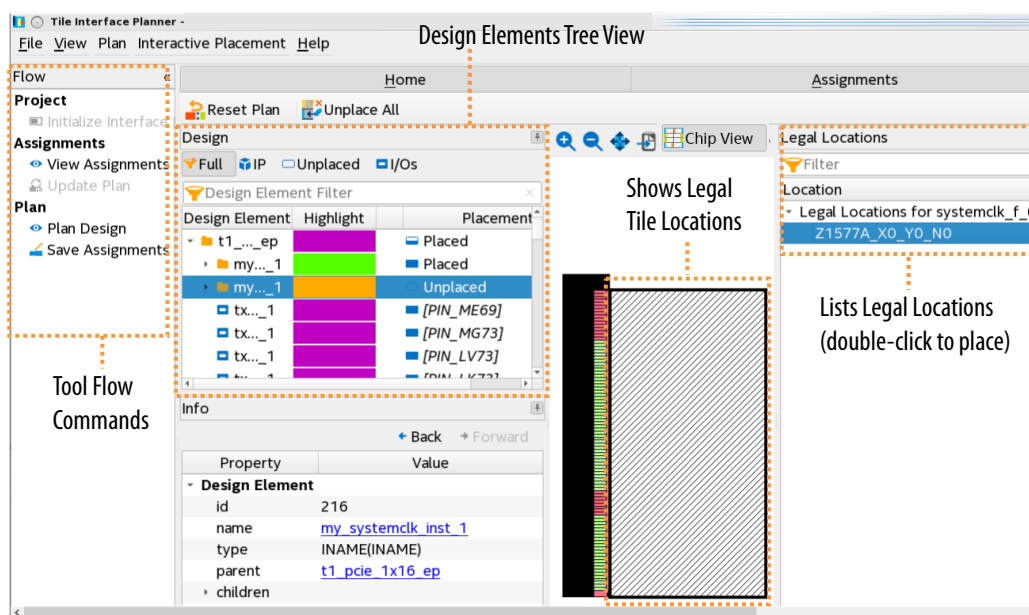

## 2.2. Using Tile Interface Planner

The Quartus Prime Tile Interface Planner helps you to quickly place component IP in legal tile locations of device F-tiles. Tile Interface Planner is an interactive floorplanning tool that simplifies this process.

Tile Interface Planner displays your project's component IP in a hierarchical tree view, next to a visual representation of the device tile segments. You can then locate the potential legal locations for each IP within the tile, place each IP at one of these locations, and apply generated placement constraints to the project for downstream Compiler stages.

As you place elements in the tile floorplan, the legality engine verifies that the placement is legal in real-time, thus ensuring correlation with your intent in the final implementation.

**Figure 35. Tile Interface Planner GUI**

In contrast with Interface Planner, Tile Interface Planner is specifically for placing component IP on the F-tile, and requires you to run an initial Design Analysis stage before you define a legal tile floorplan for all component IP targeting device tiles.

- [Tile Interface Planner Tool Flow](#) on page 52
- [Tile Interface Planner GUI Reference](#) on page 66

### 2.2.1. Tile Interface Planner Terminology

Tile Interface Planner refers to the following terminology:

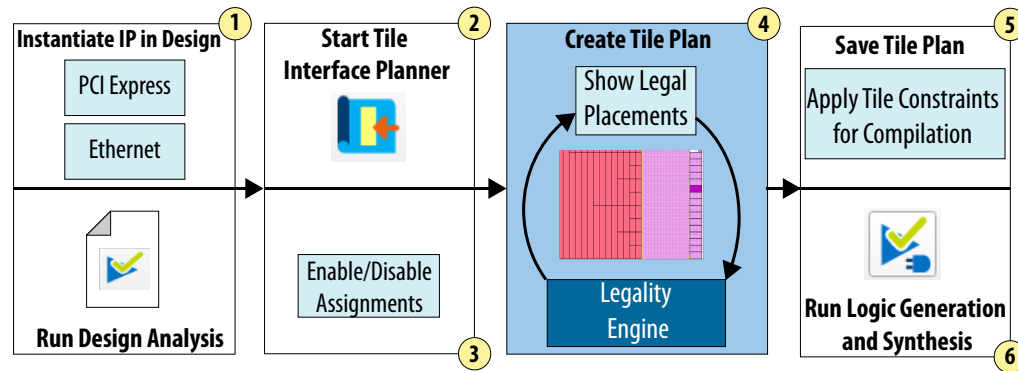

**Table 20. Tile Interface Planner Terminology**

Term	Description
<b>Dynamic Reconfiguration</b>	Intel FPGA IP technology that allows you to modify some features of a supported multi-rate Intel FPGA IP interface in real time while the FPGA remains in operation. For example, you can dynamically reconfigure the settings in the F-tile CPRI PHY Multi-Rate Intel FPGA IP to run your design at different data rates and features for different IP "profiles."
<b>Floorplan</b>	The layout of physical resources on the device. Creating a design floorplan, or floorplanning, is the process of mapping the logical design hierarchy to physical regions in the device. Tile Interface Planner is a tile IP floorplanning tool.
<b>IP building block</b>	<p>Intel FPGA IP cores are comprised of building blocks that combine to provide all functionality of the IP. The Design Tree view in Tile Interface Planner displays each IP's building blocks. Building blocks can be movable, fixed, or always movable types.</p> <ul style="list-style-type: none"> <li>• <b>Movable building blocks</b>—building blocks are initially movable. Movable building blocks can be re-placed by the legality engine in potentially one of several legal locations to accommodate other building blocks. You can convert a movable building block to fixed by specifying a fixed placement location. The legality engine cannot change the placement of fixed building blocks. Movable building block placements appear in italic text in the Design Tree view. Movable building blocks have a dithered fill in <b>Chip View</b>.</li> <li>• <b>Fixed building blocks</b>—building blocks that you place in a fixed, legal location that the legality engine cannot change. You can convert a movable building block to fixed, and a fixed building block to movable. Fixed building block placements appear in plain text in the Design Tree view. Fixed building blocks have a solid fill in the <b>Chip View</b>.</li> <li>• <b>Always movable building blocks</b>—building blocks that are always movable by the legality engine and cannot be fixed. These building blocks must remain movable to prevent inadvertent conflicting constraints. Always movable building blocks appear in gray italic text in the Design Tree view.</li> </ul>
<b>Quartus Prime Settings File (.qsf)</b>	Quartus Prime software file that preserves project settings and assignments, including the placement of fixed IP building blocks and fixed tile assignments that you specify in Tile Interface Planner.
<b>JSON file</b>	Quartus Prime software internal file that preserves the most recent placement from the Logic Generation stage of the Compiler. You can load this placement when you click <b>Update Assignments</b> if you want the starting point for planning to include the last Logic Generation assignments.
<b>Legal location</b>	Tile Interface Planner legality engine identifies the legal locations in the tile floorplan for placement of the IP or building block that you select in the Design Tree.
<b>Legality engine</b>	Tile Interface Planner function that generates valid legal locations for tile placement, and places movable and always movable building blocks in the tile plan.
<b>Placed design element</b>	IP or building block that you or the legality engine has assigned to a fixed or movable legal location.
<b>Support-Logic Generation stage</b>	<p>A Compiler stage, preceding Analysis &amp; Synthesis, that includes the Design Analysis and Logic Generation sub-stages. This stage is only present when targeting F-tile.</p> <ul style="list-style-type: none"> <li>• <b>Design Analysis stage</b>—A Compiler stage, preceding Analysis &amp; Synthesis, that elaborates the design RTL to extract design information about component IP targeting F-tile. You must run this stage before running Tile Interface Planner. This stage is not present for other FPGA device families or for designs without required IP.</li> <li>• <b>Logic Generation stage</b>—A Compiler stage, following Design Analysis, that uses your Tile Interface Plan to generate logic for synthesis and implementation of your tile configuration plan. You must run Logic Generation after Design Analysis before you can synthesize your tile plan.</li> </ul>
<b>Tile plan</b>	One or more fixed placements that you define and save in Tile Interface Planner using the (.qsf).
<b>Unplaced design element</b>	IP or building blocks that are unassigned to a fixed or movable legal location.

## 2.2.2. Tile Interface Planner Tool Flow

The Tile Interface Planner user interface guides you through each step in the tile interface planning process.

**Figure 36. Tile Interface Planner Tool Flow**

- [Step 1: Instantiate IP and Run Design Analysis](#) on page 52—Tile Interface Planner first requires a design with component IP, targeting the Agilex 7 FPGA with F-tile. After initial design setup, you run Design Analysis to elaborate the component IP in the design.
- [Step 2: Initialize Tile Interface Planner](#) on page 53—launch Tile Interface Planner, component IP and existing assignment data loads, and the legality engine initializes.
- [Step 3: Update Plan with Project Assignments](#) on page 54—enable or disable any existing placement assignments and optionally load placement data from previous planning sessions for the current tile planning session.
- [Step 4: Create a Tile Plan](#) on page 55—use the **Plan** tab to locate the potential legal locations for each unplaced component IP, place the IP in the tile location, and verify that the placement is legal in real-time to ensure correlation in the final implementation.
- [Step 5: Save Tile Plan Assignments](#) on page 59—save the tile IP plan assignments to the project for design compilation.
- [Step 6: Run Logic Generation and Design Synthesis](#) on page 60—run the Compiler Logic Generation stage to implement your tile plan and continue synthesis and the remaining design compilation stages.

### 2.2.2.1. Step 1: Instantiate IP and Run Design Analysis

Tile Interface Planner requires an Quartus Prime project that includes component IP targeting the Agilex 7 FPGA with F-tile.

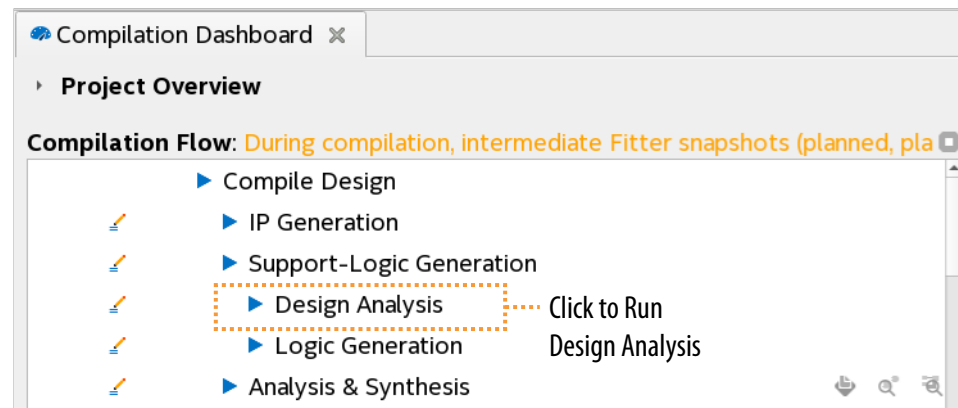

After instantiating the component IP in a top-level project design file (for example, `top.v`), you run the Design Analysis compilation stage to elaborate the design RTL to extract component IP and target device information. Upon launch, Tile Interface Planner initializes and displays this component IP information in the Design Tree view.

Follow these steps to instantiate IP and run Design Analysis:

1. Open or create an Quartus Prime project that includes component IP targeting F-tile:

- Create a new project, add design files, and specify the target Agilex 7 FPGA by clicking **File > New Project Wizard**.
  - Or
  - Parameterize and instantiate component IP with IP Catalog (**View > IP Catalog**) or Platform Designer (**Tools > Platform Designer**).
2. To run the Design Analysis stage of the Compiler, double-click **Design Analysis** on the Compilation Dashboard (**Processing > Compilation Dashboard**).

**Figure 37. Design Analysis Stage in Compilation Dashboard**

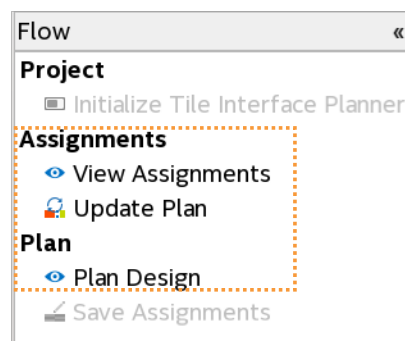

3. Initialize Tile Interface Planner, as [Step 2: Initialize Tile Interface Planner](#) on page 53 describes.

#### 2.2.2.2. Step 2: Initialize Tile Interface Planner

When you launch Tile Interface Planner, the tool initializes the placement legality engine and loads component IP and target device data extracted by Design Analysis. Tile Interface Planner then displays the component IP information in the Design Tree view and enables the **Flow** control.

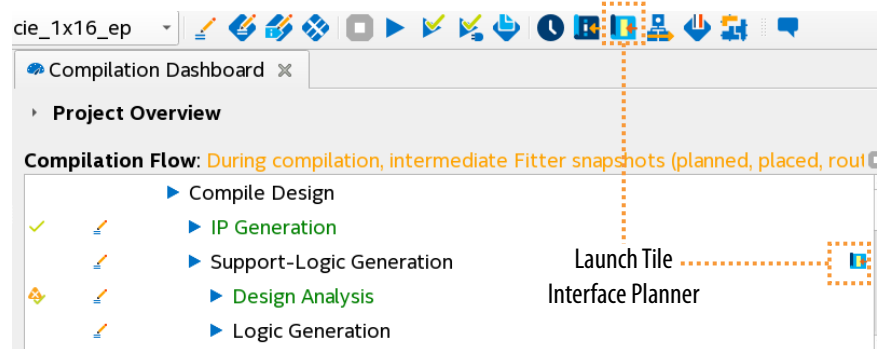

**Figure 38. Tile Interface Planner Flow Control**

To initialize Tile Interface Planner:

1. Run the Design Analysis stage of the Compiler, as [Step 1: Instantiate IP and Run Design Analysis](#) on page 52 describes.
2. When Design Analysis is complete, launch Tile Interface Planner by clicking the Tile Interface Planner icon in the Compilation Dashboard, the main toolbar, or by clicking **Tools > Tile Interface Planner**.

**Figure 39. Launching Tile Interface Planner**

Tile Interface Planner launches and initializes with the legality engine and the component IP and target device data that Design Analysis extracts.

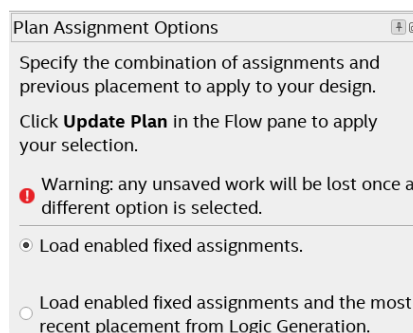

3. Load existing project assignments, as [Step 3: Update Plan with Project Assignments](#) on page 54 describes.

### 2.2.2.3. Step 3: Update Plan with Project Assignments

You can determine which fixed assignments to load from the project settings .qsf, and optionally load the latest placement from Logic Generation. The enabled assignments become the starting point for the tile plan. Follow these steps to update the plan with existing assignments:

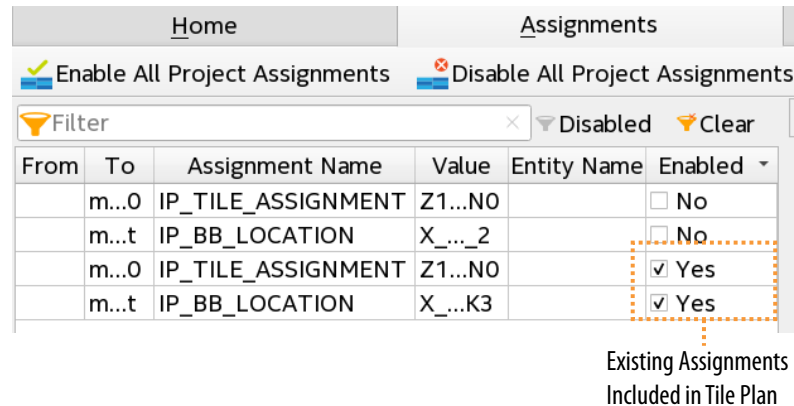

1. On the **Flow** control, click **View Assignments**.

**Figure 40. Plan Assignment Options**

2. On the **Assignments** tab, select the assignment types to load for the current planning session, as [Assignments Tab Controls](#) on page 67 describes.
3. On the **Assignments** tab, enable or disable assignments to resolve any conflicts or experiment with alternative placements. Filter the list of assignments by assignment name or status.

**Figure 41. Enable or Disable Existing Assignments for Current Planning Session**

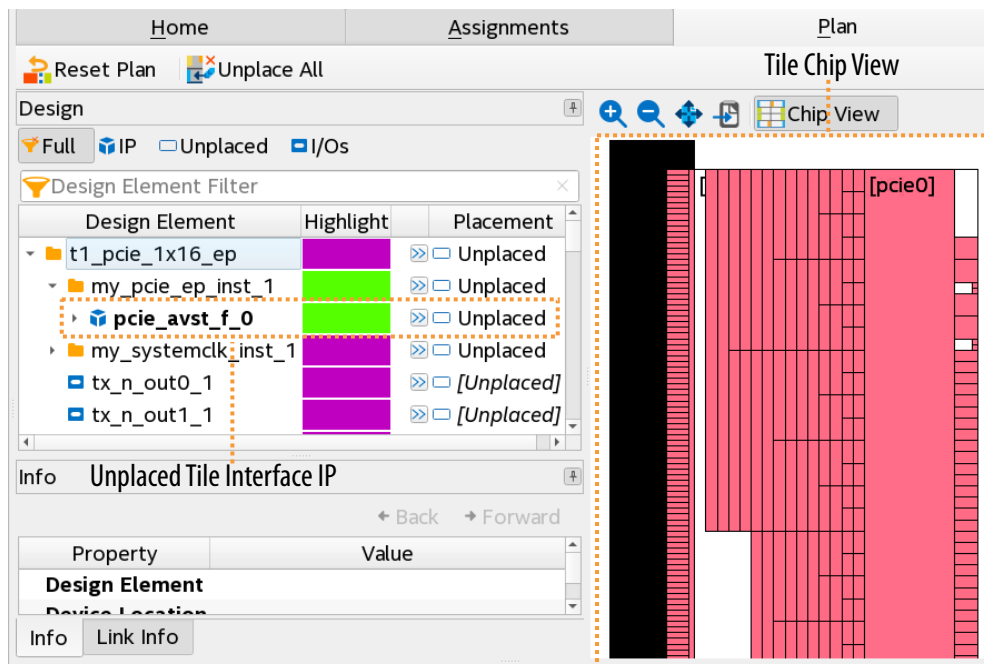

- When assignment selections are complete, or if you have no existing assignments, click **Update Plan** on the **Flow** control to apply the enabled project assignments to your current tile interface plan.
- Place IP components and building blocks on the **Plan** tab, as [Step 4: Create a Tile Plan](#) on page 55 describes.

#### 2.2.2.4. Step 4: Create a Tile Plan

Click **Plan Design** on the **Flow** control to interactively place component IP in legal locations on device tiles. The **Plan** tab displays a hierarchical list of your project component IP design elements, alongside a graphical abstraction of the target device tile architecture. Place IP (and IP building blocks) in legal tile locations within the graphical tile floorplan.

**Figure 42. Tile Interface Planner Design Elements and Chip View**

## Recommended Two-Stage Tile IP Placement

Handle IP tile placement in two stages for the most efficiency:

**Table 21. Two-Stage Tile IP Placement**

Tile IP Placement	Description
<b>Stage 1</b>	<ul style="list-style-type: none"> <li>Place all of the IPs targeting the same tile to ensure that all IP can be placed within the tile, as <a href="#">Placing IP Components</a> on page 56 describes.</li> <li>Fill each tile with the desired IP, before refining any IP building block placement for any specific placement requirements you may have for a particular building block.</li> </ul>
<b>Stage 2</b>	<ul style="list-style-type: none"> <li>Review the placement of IP building blocks.</li> <li>Refine any building block placement to meet any specific placement requirements, as <a href="#">Constraining IP Building Blocks</a> on page 58 describes.</li> </ul>

**Note:** Changes made in Tile Interface Planner do not apply to your Quartus Prime project until you apply the generated tile interface plan constraints to your project, as [Step 5: Save Tile Plan Assignments](#) on page 59 describes.

[Placing IP Components](#) on page 56

[Constraining IP Building Blocks](#) on page 58

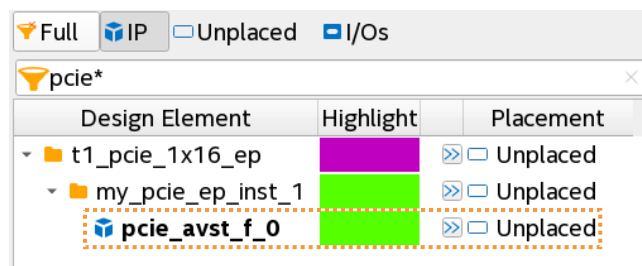

### 2.2.2.4.1. Placing IP Components

To place IP components and create a tile plan, follow these steps:

**Note:** For placing multi-rate IP components, refer to [Constraining Dynamic Reconfiguration IP](#) on page 61.

1. Update the plan with existing assignments, as [Step 3: Update Plan with Project Assignments](#) on page 54 describes.
2. In Tile Interface Planner, click the **Plan** tab. Tile Interface Planner displays the **Design Element** hierarchy, alongside a graphical representation of the tile chip or package view.
3. In the **Design Element** list, locate the tile interface IP that you want to place. You can search and filter the list by name, IP, placement status, I/Os, and other criteria.

**Figure 43. Unplaced PCIe Tile Interface IP in Plan Tab**

4. To customize design element color coding, double-click a color in the **Highlight** column to specify a new color.
5. Use any of the following methods to locate legal tile placements for component IP:

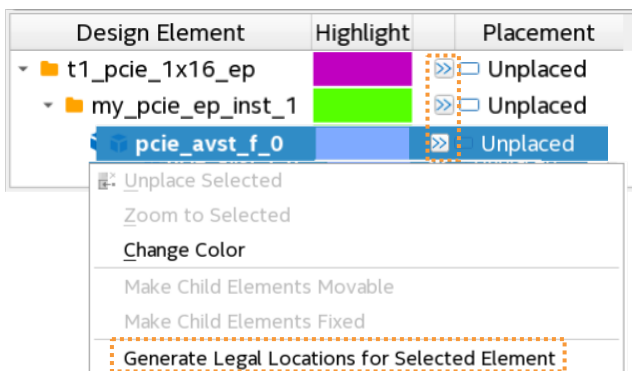

- In the **Design Element** list, right-click the tile interface IP that you want to place, and then click **Generate Legal Locations for Selected Element**.

*Note:* You can select multiple IP targeting the same tile to generate legal locations for all IP at once.

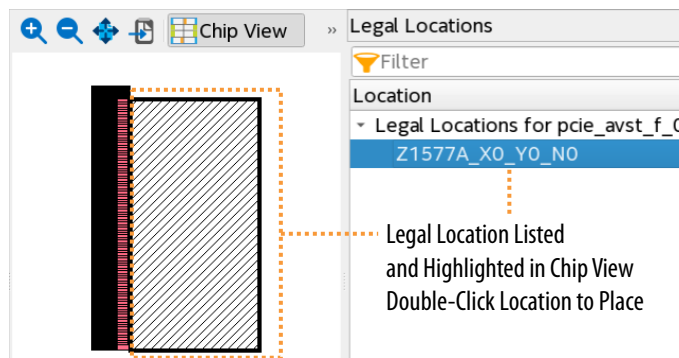

- Click the  button next to the **Design Element** to display a list of **Legal Locations**.

**Figure 44. Listing Legal Locations for Tile Placement**

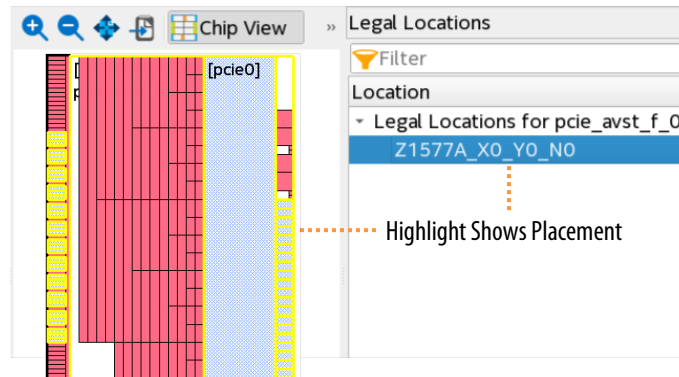

- In **Legal Locations**, click any location in the list to highlight the location in the floorplan.

**Figure 45. Highlighting Legal Locations for Tile Placement**

- Double-click any location in **Legal Locations** to place the element in a legal location. Tile Interface Planner places the IP in the legal location on the device tile, as indicated by color highlighting in the Chip View. When listing legal locations for multiple IPs at once, you can also place multiple IPs at once.

**Figure 46. IP Placed In Legal Tile Location**

#### 2.2.2.4.2. Constraining IP Building Blocks

Intel FPGA IP cores are comprised of building blocks that combine to provide all functionality of the IP. The Design Tree view displays each IP building block hierarchy.

When you place component IP, Tile Interface Planner also places the corresponding IP building blocks in the tile. Each building block has a movable, fixed, or always movable state. You can review the building block placement and determine whether to refine any building block placement, or allow the legality engine to determine the best building block placement.

**Figure 47. IP Core Comprised of IP Building Blocks in Design Tree View**

	Design Element	Highlight	Placement
IP core	<b>pcie_avst_f_0</b>		Z15..._N0
	pcie_hip_top_f_inst		Placed
	pcie_hip_bb_f_inst		Placed
Fixed Building Blocks (no italics)	my_pcie_ep_i...lf_pcie_inst		pcie0
	f_ux_inst0		Placed
Moveable Building Blocks (italics)	my_pcie_ep...bb_f_ux_rx		[ux_q...0_rx]
	my_pcie_ep...bb_f_ux_tx		[ux_q...0_tx]
	f_ux_inst10		Placed
	f_ux_inst11		Placed

The placement column indicates the movable, fixed, and always-movable state of the design element. In general, use movable building block placement to allow placement flexibility. Only apply fixed building blocks if a specific building block placement is essential.

Follow these steps to constrain or relax the placement of IP building blocks:

1. Place all IP on the tile, as [Placing IP Components](#) on page 56 describes.
2. To the left of the **Placement** column, click the List Legal Locations button to display all legal locations for a building block.
3. To constrain building blocks to specific placement:

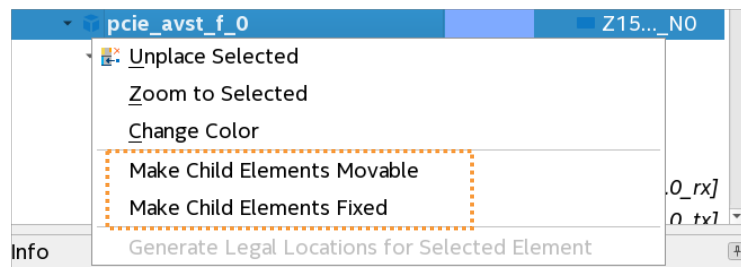

- To fix a movable building block, right-click one or more movable building blocks and click **Make Selected Element Fixed**. The building block is fixed and does not move to accommodate other components.
- To fix an IP component's building blocks, right-click the IP component and click **Make Child Elements Fixed**. The IP and child building blocks are fixed and do not move to accommodate other components.

**Figure 48. Make Selected Element Fixed**

4. To remove specific building block placement constraints from fixed building blocks:
  - To make fixed building blocks movable, right-click one or more fixed building blocks and click **Make Selected Element Movable**. The building block can move to accommodate other components.
  - To make all of an IP component's fixed building blocks movable, right-click the IP component and click **Make Child Elements Movable**. All child building blocks can move automatically to accommodate other components.

**Figure 49. Make Child Elements Movable**

5. When all tile IP placement is complete, save the tile plan, as [Step 5: Save Tile Plan Assignments](#) on page 59 describes.

### 2.2.2.5. Step 5: Save Tile Plan Assignments

Once you have placed all IP components, and fixed any movable building blocks that you want to constrain, you save the constraints in Tile Interface Planner. Tile Interface Planner saves the fixed tile constraints to the project .qsf. The Compiler reads the .qsf assignments during the Logic Generation stage.

To save the tile plan assignments, follow these steps:

1. Review and consider constraining any IP building blocks. To guarantee placement to exact locations, you must fix the IP building blocks connected to the IP pins to preserve those constraints in the .qsf, as [Constraining IP Building Blocks](#) on page 58 describes.

**Figure 50. Save Assignments from Tile Interface Planner**

2. In Tile Interface Planner, click **Save Assignments** on the Flow control, and then click **OK**.
3. Close Tile Interface Planner and return to the Quartus Prime GUI. The tile IP assignments are visible in the Assignment Editor (**Assignments** ► **Assignment Editor**) and in the .qsf file.

**Figure 51. Tile IP Assignments in Assignment Editor**

tatu	From	To	Assignment Name	Value	Enabled
1 ✓		my_systemclk_inst_1 ...	IP Tile Assignment	Z1577A_X0_Y0_N0	Yes
2 ✓		my_pcie_ep_inst_1 ...	IP Tile Assignment	Z1577A_X0_Y0_N0	Yes

4. Run the Logic Generation stage, as [Step 6: Run Logic Generation and Design Synthesis](#) on page 60 describes.

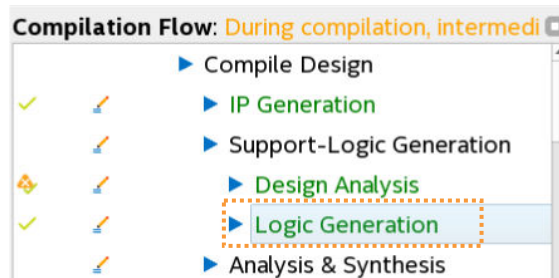

#### 2.2.2.6. Step 6: Run Logic Generation and Design Synthesis

After saving your tile plan assignments, run the Compiler's Logic Generation stage to implement your tile plan and run the remaining design compilation stages.

To run Logic Generation and design synthesis, follow these steps:

1. Save your tile interface plan, as [Step 5: Save Tile Plan Assignments](#) on page 59 describes.
2. In the Quartus Prime software, double-click the **Logic Generation** stage in the Compilation Dashboard. Logic Generation reads the tile plan assignments from the .qsf.

**Figure 52. Run Logic Generation Stage Before Synthesis**

3. Once Logic Generation completes, double-click **Analysis & Synthesis** on the dashboard.
4. Once Analysis & Synthesis complete, run the other remaining downstream stages in the compilation flow when ready.

### 2.2.3. Constraining Dynamic Reconfiguration IP

Tile Interface Planner and Tile Assignment Editor provide support for constraining IP instances that are part of a dynamic reconfiguration group.

Dynamic reconfiguration allows you to modify some features of an Intel FPGA IP interface in real time, while the FPGA remains in continuous operation. This dynamic reconfiguration capability allows you to change your design to run at different data rates, and with different features, for different IP "profiles."

When you generate a dynamically reconfigurable IP instance, the IP includes a .mif file that specifies the base and secondary profiles that you define. Each profile contains the delta programming sequences for the dynamic reconfiguration of the IP in a linked-list format.

#### Related Information

- [F-Tile Dynamic Reconfiguration Suite Intel FPGA IP User Guide](#)
- [F-Tile Dynamic Reconfiguration Design Example User Guide](#)
- [F-tile CPRI PHY IP User Guide](#)
- [F-tile CPRI Multi-rate PHY Dynamic Reconfiguration Design Example User Guide](#)

#### 2.2.3.1. Defining a Dynamic Reconfiguration Group

You can define a dynamic reconfiguration group to declare the tree structure that defines how dynamic reconfiguration operates for all of the IP instances that you assign to the group. The reconfiguration group can be either **Exclusive** (only one DR group IP instance is active at any time), or **Inclusive** (any combination of DR group IP instances can be active at any time).

You define the members and properties of the group, and then assign the tile placement of the group members. The Tile Assignment Editor allows you to easily create a dynamic reconfiguration group scheme in a unified GUI. You can then visualize and interactively place the dynamic reconfiguration group in the Tile Interface Planner floorplan.

When you place or unplace any member IPs of a multirate DR group, Tile Interface Planner also appropriately places or unplaces the children and sibling IPs in the DR group automatically. You can then expand and refine the placement of member IPs individually.

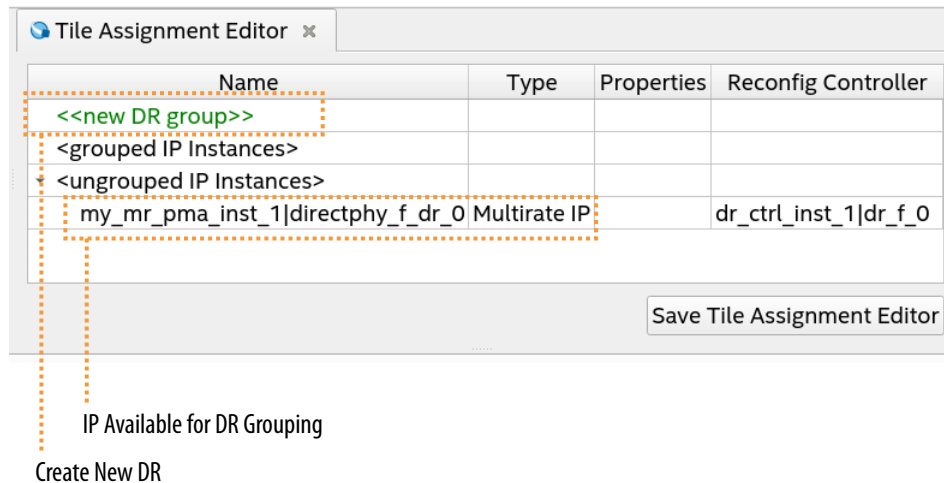

1. Define and add to your project all of the dynamically reconfigurable IP instances to be included in the dynamic reconfiguration group or groups, as [Step 1: Instantiate IP and Run Design Analysis](#) on page 52 describes. Connect the IP instances in a manner that is compatible with the dynamic reconfiguration scheme that you want to create.

**Figure 53. Dynamically Reconfigurable IP In Project Navigator**

Project Navigator	
Entity	IP Component
dr_ctrl	F-Tile Dynamic Reconfiguration Suite Intel FPGA IP
reset_ip	Reset Release Intel FPGA IP
my_systemclk	F-Tile Reference and System PLL Clocks Intel FPGA IP
my_mr_pma	F-Tile PMA/FEC Direct PHY Multirate Intel FPGA IP

2. To run the Design Analysis stage of the Compiler, double-click **Design Analysis** on the Compilation Dashboard. Design Analysis discovers your project's dynamically reconfigurable IP instance information for use in Tile Assignment Editor and Tile Interface Planner.
3. To open Tile Assignment Editor, click **Assignments > Tile Assignment Editor**. Tile Assignment Editor displays the **Name**, **Type**, and other **Properties** of the ungrouped and any grouped IP instances that are valid for dynamic reconfiguration grouping within your project.

**Figure 54. Tile Assignment Editor GUI**

4. To define a new DR group, double-click **<<new DR group>>** in the Tile Assignment Editor **Name** column. The **Create New DR Group** dialog box appears.
5. In the **Group name** box, specify a name for the DR group, along with the following options:

**Table 22. Create New DR Group Options**

Option	Description
<b>Group parent</b>	Specifies that the DR group is the <b>&lt;root&gt;</b> (parent), or allows you to select an existing DR group as the parent to newly created dynamic reconfiguration group..
<b>Group type</b>	Specifies that the group is <b>Exclusive</b> (only one IP instance is active at any given time) or <b>Inclusive</b> (Any combination of IP instances may be active at any given time). Default value is <b>Exclusive</b> .
<b>Reconfig controller</b>	Allows you to select the appropriate reconfiguration controller for the group. You may have multiple reconfiguration controllers in your project. <sup>(2)</sup>
<b>Has master clock channel</b>	By default, the group inherits this value from the Specifies <b>On</b> if your IP group has a master clock channel, or <b>Off</b> if your IP group does not have a master clock channel. When <b>On</b> , you can also specify the <b>Building block instance name</b> and the <b>Clock port</b> of the master clock channel.

**Figure 55. Create New DR Group Dialog Box**

- To add IP instances to a DR group, right-click the DR instance name and then click **Move IP Instance**. In **Move to group**, select the DR group to add the IP instance and click **OK**.

**Figure 56. Move Item To Group**

- To specify the startup instance, right click any instance and then click **Toggle as startup IP instance**.

<sup>(2)</sup> If you do not specify this option child DR groups inherit this value from the parent.

**Figure 57. Moved Item Within DR Group**

Name	Type	per	Reconfig Controller
<<new DR group>>			
<grouped IP Instances>			
DRG_A	Exclusive DR Group		dr_ctrl_inst_1 dr_f_0
my_mr_pma_inst_1 directphy_f_...	Multirate IP		dr_ctrl_inst_1 dr_f_0
<ungrouped IP Instances>			

Instance Added to DRG\_A

- Once you are done defining the DR groups for the project, click **Save Tile Assignment Editor** to save the tile assignments to the project .qsf.

**Figure 58. DR Group Assignments in QSF**

```

23 set_global_assignment -name IP_RECONFIG_GROUP_TYPE "DRG_A:EXCLUSIVE" -entity dr_mr_pma_inst_1x50g_2_2x25g_1
24 set_global_assignment -name IP_RECONFIG_GROUP_PARENT "DRG_A:MY_MR_PMA_INST_1|DIRECTPHY_F_DR_0/RG_A_E" -er
25 set_instance_assignment -name IP_RECONFIG_GROUP_STARTUP_INSTANCE OFF -to my_mr_pma_inst_1|directphy_f_dr
26 set_instance_assignment -name IP_RECONFIG_GROUP_MASTER_CLOCK_CHANNEL OFF -to my_mr_pma_inst_1|directphy_f

```

- Use the DR groups to place DR groups in Tile Interface Planner, as [Assigning Dynamic Reconfiguration Group Placement](#) on page 64 describes.

### 2.2.3.2. Assigning Dynamic Reconfiguration Group Placement

Once you load a design that includes dynamic reconfiguration groups, Tile Interface Planner displays the tile location of the dynamically reconfigurable IP instances and related building blocks. You can dynamically assign the tile location of IP instances within each dynamic reconfiguration group, and place other IP components in relation to the dynamic reconfiguration group. When placing other components, Tile Interface Planner takes all of the dynamic reconfiguration group placements into account.

**Figure 59. Reconfiguration Groups Tree View**

Name	Type	Properties	Placement
MY_MR_CPRI24G_Y_MR_F_0/RG_A	Exclusive group		
RG_A	Exclusive group		
RG_A1	Inclusive group		
my_e25g_1_1_inst_1 eth_f_0	IP Instance		<input type="checkbox"/> Unplaced
my_e25g_1_2_inst_1 eth_f_0	IP Instance		<input type="checkbox"/> Unplaced
my_e25g_1_3_inst_1 eth_f_0	IP Instance		<input type="checkbox"/> Unplaced
my_e25g_1_4_inst_1 eth_f_0	IP Instance		<input type="checkbox"/> Unplaced
RG_A2	Inclusive group		
my_cpri24g_1_...rphy_f_tile_0	IP Instance		<input type="checkbox"/> Unplaced
my_cpri24g_2_...rphy_f_tile_0	IP Instance		<input type="checkbox"/> Unplaced
RG_A3	Exclusive group		
RG_A4	Exclusive group		
RG_B	Exclusive group		
RG_B1	Inclusive group		
RG_B2	Inclusive group		
RG_B3	Exclusive group		
RG_C	Exclusive group		
RG_D	Exclusive group		

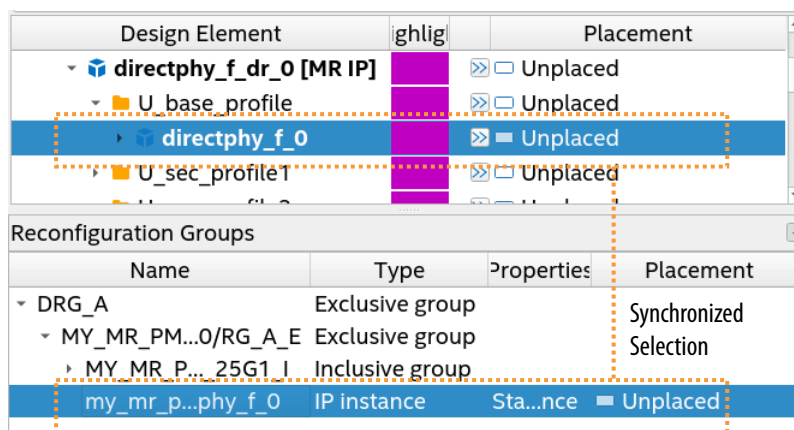

The **Reconfiguration Groups** view shows the members and placement of the dynamic reconfiguration groups that you create. Use the **Reconfiguration Groups** view to select the dynamic reconfiguration group that you want to assign. You can only modify the DR groupings in Tile Assignment Editor, not in Tile Interface Planner.

To assign DR groups to tile locations, follow these steps:

1. Define one or more dynamic reconfiguration groups, as [Defining a Dynamic Reconfiguration Group](#) on page 61 describes.
2. To run Logic Generation, double-click **Logic Generation** on the Compilation Dashboard.
3. To start Tile Interface Planner, click the **Tile Interface Planner** icon on Compilation Dashboard, as [Step 2: Initialize Tile Interface Planner](#) on page 53 describes.
4. In Tile Interface Planner, click the **Plan** tab. Tile Interface Planner displays the dynamic reconfiguration IP profiles in the **Design Element** hierarchy.
5. Select an instance in the **Reconfiguration Groups** tree view, the selection synchronizes with the selection in the **Design Elements** lists.

**Figure 60. Reconfiguration Groups and Design Elements Selection Synchronization**

6. Click the  button next to the **Design Element** to display a list of **Legal Locations** for the selected DR group.
7. Double-click any location in **Legal Locations** to place the element in a legal location. Tile Interface Planner places the IP in the legal location on the device tile.

**Figure 61. Placing One Member Automatically Places All Others in DR Group**

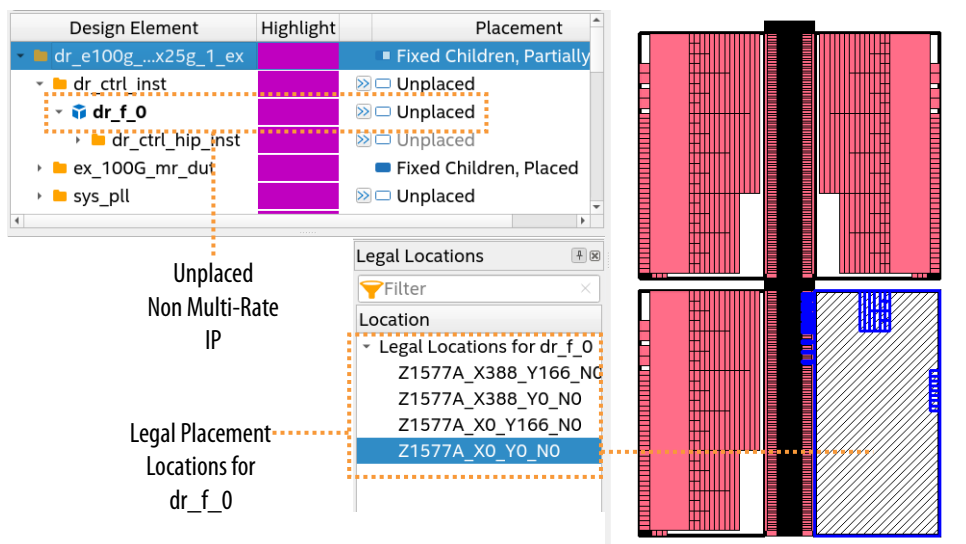

Placing Any Single Member Places All Members in Group

*Note:* When you place or unplace any member IPs of a multirate DR group, Tile Interface Planner also appropriately places or unplaces the children and sibling IPs in the DR group automatically. You can then expand and refine the placement of member IPs individually.

8. Place other IP components in relation to the DR group location, as [Placing IP Components](#) on page 56 describes. Tile Interface Planner takes the dynamic reconfiguration group placement into account when you place other IP components.

**Figure 62. Placing Other IP Components**

## 2.2.4. Tile Interface Planner GUI Reference

The Tile Interface Planner user interface includes the following controls for floorplanning your design.

### 2.2.4.1. Flow Controls

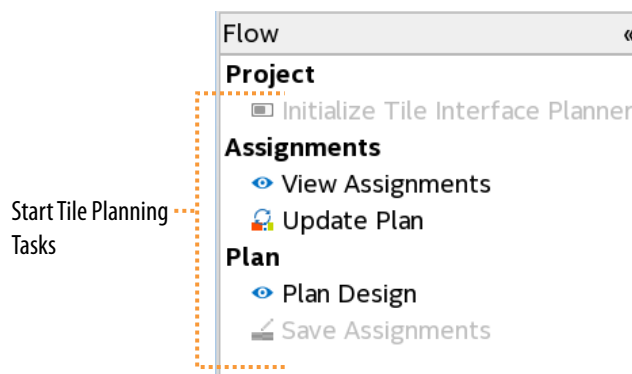

The **Flow** control panel provides immediate access to common Tile Interface Planner commands from anywhere within Tile Interface Planner.

**Table 23. Flow Controls**

Command	Description
<b>Initialize Tile Interface Planner</b>	Launches the placement legality engine and loads the component IP and target device data that Design Analysis extracts.
<b>View Assignments</b>	Opens the <b>Assignments</b> tab, which allows you to review and enable or disable any existing placement assignments for the current planning session.
<b>Update Plan</b>	Optionally applies a previous tile planning session fixed placement assignments from the .qsf, and movable placements from a .json to the current tile interface plan.
<b>Plan Design</b>	Opens the <b>Plan</b> tab for placing component IP in the tile interface plan.
<b>Save Assignments</b>	Opens the <b>Save Assignments</b> dialog box for saving the fixed tile constraints to the project .qsf and the movable building block constraints to a .json file.

The **Flow** controls appear in order of a typical tile interface planning flow.

**Figure 63. Tile Interface Planner Flow Control**

#### 2.2.4.2. Home Tab

The Tile Interface Planner **Home** tab is the default tab that displays the **Flow** control and an introductory interface planning infographic. There are no controls specific to the Tile Interface Planner **Home** tab.

#### 2.2.4.3. Assignments Tab Controls

The **Assignments** tab allows you to review and enable or disable any existing placement assignments for the current tile interface planning session. Click **View Assignments** on the **Flow** control to display the **Assignments** tab.

You can enable or disable any placement assignments that Design Analysis finds. After you are satisfied with the status of all project assignments, click **Update Plan** on the **Flow** control to update your tile interface plan with the enabled project assignments.

**Table 24. Assignments Tab Controls**

Command	Description
<b>Filter</b> field	Supports creation of wildcard expressions for assignment targets. <b>Enabled</b> and <b>Disabled</b> buttons filter only enabled or disabled assignments in the list.
<b>Enable All Project Assignments</b>	Enables all existing assignments for the current tile interface planning session. These assignments then become the starting point for your tile plan.
<b>Disable All Project Assignments</b>	Disables all existing assignments for the current tile interface planning session.
<b>Clear</b>	Clears any filter from the <b>Assignments</b> list.
<b>Plan Assignment Options</b>	The following options are mutually exclusive: <ul style="list-style-type: none"> <li><b>Load enabled fixed assignments</b>—loads fixed assignments from .qsf. These assignments then become the starting point for your tile plan.</li> <li><b>Load enabled fixed assignments and the most recent placement from Logic Generation</b>—loads fixed assignments from .qsf and the most recent placement data from the last Logic Generation stage of the Compiler.</li> </ul>

#### 2.2.4.4. Plan Tab Controls

The **Plan** tab contains the Design Tree and tile visualization panes. The Design Tree lists design elements for placement. The tile visualization pane displays a graphical view of the target device tile to help you visualize the appropriate legal locations for placement of component IP.

Click **Plan Design** on the **Flow** control to display the **Plan** tab.

**Table 25. Plan Tab Controls**

Command	Description
	Lists legal locations for placement in the Legal Locations pane.
<b>Unplace All</b>	Unplaces all placed design elements in the interface plan.
<b>Chip View</b>	Displays the target device at the chip level of detail, showing a representation of the divisions of device resources spread across the device. Zoom in to display chip details.
<b>Package View</b>	Displays the target device package at the package level of detail, showing the I/O pin details of the device package. Zoom in to display package details.
<b>Birdseye View</b>	Displays the target device chip or package view at maximum <b>Zoom Out</b> .
<b>Reset Plan</b>	Unplaces all placed design elements and removes applied project assignments from the tile interface plan.
<b>Zoom In</b> and <b>Zoom Out</b>	Increases or decreases the magnification of the tile view to show more or less detail.
<b>Fit in Window</b>	Increases or decreases the magnification of the tile view to fit in the current window.

##### 2.2.4.4.1. Design Tree and Filters

The Design Tree View displays a hierarchy of the IP components and building block design elements found during the Design Analysis compilation stage. You can locate the IP and building blocks in the design tree, and then assign the elements to legal locations in the tile floorplan on the **Plan** tab.

The Design Tree view includes these columns:

- **Design Element**—lists all component IP and building blocks that Design Analysis identifies. IP cores and building blocks are distinguished by different icons. Fixed IP building blocks are shown in plain text. Movable IP building blocks are shown in italic text. Always movable building blocks are shown in gray italic text.
- **Highlight**—indicates the color for display of design elements in the tile visualization pane.
- **Placement**—indicates the placement status (placed, unplaced) or placement tile location for design elements.

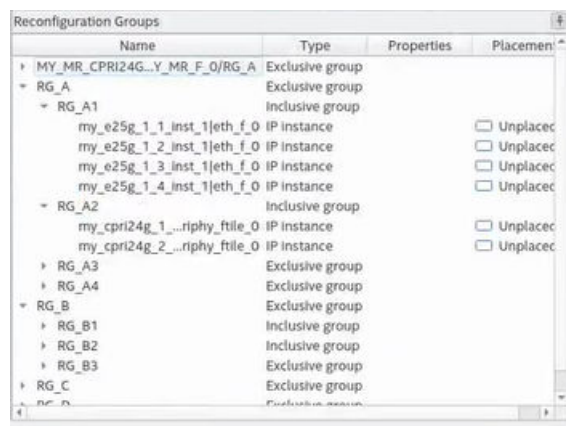

You can type a partial or complete name in the design element filter field to refine the list of elements displayed.

- Click the **Full** icon to show all design elements in the tree.
- Click the **IP** icon to show only IP level hierarchy in the tree.
- Click the **Unplaced** icon to show only unplaced design elements in the tree.
- Click the **I/Os** icon to show only I/O design elements in the tree.

#### 2.2.4.4.2. Reconfiguration Groups View

The **Reconfiguration Groups** view shows all IP instances that are part of a dynamic reconfiguration group, or in a multi-rate IP instance. Use this view to readily display the dynamic reconfiguration group hierarchy in the current design. The **Reconfiguration Groups** view shows you which IP instances in the dynamic reconfiguration group are placed, and identifies the tile placement location.

**Figure 64. Reconfiguration Groups View (Multi-Rate IP Design)**

#### 2.2.4.4.3. Legal Locations Pane

The Legal Locations pane lists the legal locations for tile placement that the legality engine determines. You can enter a text string in the **Filter** field to limit the list.

- Click any legal location in the list to highlight that location in the tile visualization pane.
- Double-click any legal location in the list to assign placement to that tile location.

#### 2.2.4.5. Tcl Console Window

The Tcl Console Window echoes the commands that you run in the Tile Interface Planner GUI. The Tile Interface Planner GUI operates on top of the Tile Interface Planner API. You can alternatively execute Tile Interface Planner commands in the Tcl console.

## 3. Managing Device I/O Pins

This chapter describes efficient planning and assignment of I/O pins in your target device. Consider I/O standards, pin placement rules, and your PCB characteristics early in the design phase.

**Figure 65. Quartus Prime Pin Planner GUI**

**Table 27. Quartus Prime I/O Pin Planning Tools**

I/O Planning Task	Click to Access
Plan interfaces and device periphery	<b>Tools &gt; Interface Planner</b>
Edit, validate, or export pin assignments	<b>Assignments &gt; Pin Planner</b>

For more information about special pin assignment features for the Arria 10 SoC devices, refer to *Instantiating the HPS Component* in the *Arria 10 Hard Processor System Technical Reference Manual*.

### Related Information

#### Instantiating the HPS Component

In *Arria 10 Hard Processor System Technical Reference Manual*

## 3.1. I/O Planning Overview

On FPGA design, I/O planning includes creating pin-related assignments and validating them against pin placement guidelines. This process ensures a successful fit in your target device. When you plan and assign I/O pins in the initial stages of your project, you design for compatibility with your target device and PCB characteristics. As a result, your design process goes through fewer iterations, and you develop an accurate PCB layout sooner.

You can plan your I/O pins even before defining design files. Assign expected nodes not yet defined in design files, including interface IP core signals, and then generate a top-level file. The top-level file instantiates the next level of design hierarchy and includes interface port information like memory, high-speed I/O, device configuration, and debugging tools.

Assign design elements, I/O standards, interface IP, and other properties to the device I/O pins by name or by dragging to cells. You can then generate a top-level design file for I/O validation.

Use I/O assignment validation to fully analyze I/O pins against VCCIO, VREF, electromigration (current density), Simultaneous Switching Output (SSO), drive strength, I/O standard, PCI\_IO clamp diode, and I/O pin direction compatibility rules.

Quartus Prime software provides the Pin Planner tool to view, assign, and validate device I/O pin logic and properties. Alternatively, you can enter I/O assignments in a Tcl script, or directly in HDL code.

### 3.1.1. Basic I/O Planning Flow

The following steps describe the basic flow for assigning and verifying I/O pin assignments:

1. Click **Assignments** ► **Device** and select a target device that meets your logic, performance, and I/O requirements. Consider and specify I/O standards, voltage and power supply requirements, and available I/O pins.
2. Click **Assignments** ► **Pin Planner**.
3. Assign I/O properties to match your device and PCB characteristics, including assigning logic, I/O standards, output loading, slew rate, and current strength.
4. Click **Run I/O Assignment Analysis** in the **Tasks** pane to validate assignments and generate a synthesized design netlist. Correct any problems reported.
5. Click **Processing** ► **Start Compilation**. During compilation, the Quartus Prime software runs I/O assignment analysis.

### 3.1.2. Integrating PCB Design Tools

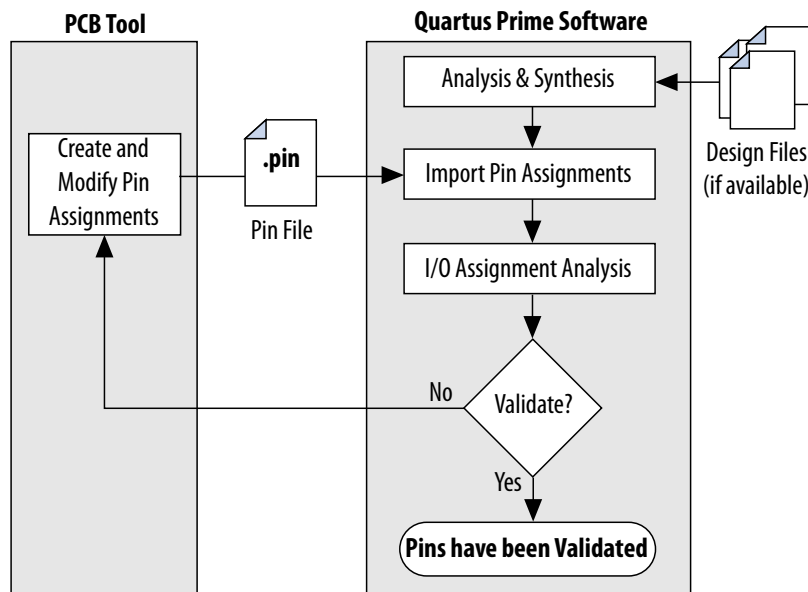

You can integrate PCB design tools into your work flow to map pin assignments to symbols in your system circuit schematics and board layout.

The Quartus Prime software integrates with board layout tools by allowing import and export of pin assignment information in Quartus Prime Settings Files (`.qsf`) or Pin-Out Files (`.pin`).

**Table 28. Integrating PCB Design Tools**

PCB Tool Integration	Supported PCB Tool
Define and validate I/O assignments in the Pin Planner, and then export the assignments to the PCB tool for validation	Cadence Allegro
Define I/O assignments in your PCB tool, and then import the assignments into the Pin Planner for validation	Cadence Allegro

**Figure 66. PCB Tool Integration**

### 3.1.3. Intel FPGA Device and I/O Terminology

The following terms describe Intel FPGA device and I/O structures:

Terms	Description	Diagram
Device Package (BGA example)	Ceramic or plastic heat sink surface mounted with FPGA die and I/O pins or solder balls. In a wire bond BGA example, copper wires connect the bond pads to the solder balls of the package. Click <b>View &gt; Show &gt; Package Top</b> or <b>View &gt; Show &gt; Package Bottom</b> in Pin Planner.	
I/O Bank	I/O pins are grouped in I/O banks for assignment of I/O standards. Each numbered bank has its own voltage source pins, called VCCIO pins, for high I/O performance. The specified VCCIO pin voltage is between 1.5 V and 3.3 V. Each bank supports multiple pins with different I/O standards. All pins in a bank must use the same VCCIO signal. Click <b>View &gt; Show &gt; I/O Banks</b> in Pin Planner.	
I/O Pin	A wire lead or small solder ball on the package bottom or periphery. Each pin has an alphanumeric row and column number. I, O, Q, S, X, and Z are never used. The alphabet is repeated and prefixed with the letter A when exceeded. All I/O pins display by default.	
Pad	I/O pins are connected to pads located on the perimeter of the top metal layer of the silicon die. Each pad is numbered with an ID starting at 0, and increments by one in a counterclockwise direction around the device. Click <b>View &gt; Pad View</b> in Pin Planner.	
VREF Pin Group	A group of pins including one dedicated VREF pin required by voltage-referenced I/O standards. A VREF group contains a smaller number of pins than an I/O bank. This maintains the signal integrity of the VREF pin. One or more VREF groups exist in an I/O bank. The pins in a VREF group share the same VCCIO and VREF voltages.	

## 3.2. Assigning I/O Pins

Use the Pin Planner to visualize, modify, and validate I/O assignments in a graphical representation of the target device. You can increase the accuracy of I/O assignment analysis by reserving specific device pins to accommodate undefined but expected I/O.

To assign I/O pins in the Pin Planner, follow these steps:

1. Open an Quartus Prime project, and then click **Assignments > Pin Planner**.
2. Click **Processing > Start Analysis & Elaboration** to elaborate the design and display **All Pins** in the device view.
3. To locate or highlight pins for assignment, click **Pin Finder** or a pin type under **Highlight Pins** in the **Tasks** pane.
4. (Optional) To define a custom group of nodes for assignment, select one or more nodes in the **Groups** or **All Pins** list, and click **Create Group**.

5. Enter assignments of logic, I/O standards, interface IP, and properties for device I/O pins in the **All Pins** spreadsheet, or by dragging into the package view.
6. To assign properties to differential pin pairs, click **Show Differential Pin Pair Connections**. A red connection line appears between positive (p) and negative (n) differential pins.
7. (Optional) To create board trace model assignments:
  - a. Right-click an output or bidirectional pin, and click **Board Trace Model**. For differential I/O standards, the board trace model uses a differential pin pair with two symmetrical board trace models.
  - b. Specify board trace parameters on the positive end of the differential pin pair. The assignment applies to the corresponding value on the negative end of the differential pin pair.
8. To run a full I/O assignment analysis, click **Run I/O Assignment Analysis**. The Fitter reports analysis results. Only reserved pins are analyzed prior to design synthesis.

### 3.2.1. Assigning to Exclusive Pin Groups

You can designate groups of pins for exclusive assignment. When you assign pins to an **Exclusive I/O Group**, the Fitter does not place the signals in the same I/O bank with any other exclusive I/O group. For example, if you have a set of signals assigned exclusively to `group_a`, and another set of signals assigned to `group_b`, the Fitter ensures placement of each group in different I/O banks.

### 3.2.2. Assigning Slew Rate and Drive Strength

You can designate the device pin slew rate and drive strength. These properties affect the pin's outgoing signal integrity. Use either the **Slew Rate** or **Slow Slew Rate** assignment to adjust the drive strength of a pin with the **Current Strength** assignment.

**Note:** The slew rate and drive strength apply during I/O assignment analysis.

### 3.2.3. Assigning I/O Banks

Some Intel FPGA devices support assignments to I/O banks. I/O banks are a logical grouping of I/O pins for convenience in making certain types of assignments, such as I/O standard assignments.

When targeting a device family that supports I/O bank assignments, the **I/O Bank** cell value automatically populates in Pin Planner once you select a corresponding pin **Location**. The rows for various I/O banks are color coded for easy visual identification.

**Figure 67. Pin Location and I/O Bank Cells in Pin Planner**

Node Name	Direction	Location	I/O Bank
out ddr4_emif_mem_mem_a[7]	Output	PIN_CE34	2B
out ddr4_emif_mem_mem_a[3]	Output	PIN_CE32	2B
out pio_0_external_connection_export[3]	Output	PIN_C30	3C
out pio_0_external_connection_export[0]	Output	PIN_B31	3C

When you save your Pin Planner constraints, the pin location saves to the project .qsf that also saves the I/O bank locations as a comment. Command-line users can use this comment to identify I/O bank locations for the placed pins without launching the Quartus Prime software GUI.

**Figure 68. I/O Bank Location Saved As Comment in QSF**

```
set_location_assignment PIN_C30 -to pio_0_external_connection_export[3] -comment IOBANK_3C
set_location_assignment PIN_B31 -to pio_0_external_connection_export[0] -comment IOBANK_3C

```

### 3.2.4. Changing Pin Planner Highlight Colors

The Pin Planner **Task** window provides one-click access to execute common pin planning tasks. After clicking a pin planning task, you can view and highlight the results in the **Report** window by selecting or deselecting I/O types.

You can highlight the various pin types in the current device view for easy visualization and assignment to specific types of pins. You can optionally customize the highlight color for each item in the report window to suit your preferences.

To change the default color for any item in the Pin Planner Report panel, follow these steps:

1. Right-click on any item in the **Report** window, and then click **Change Color**.
2. From the color pallet, specify the highlight color for the item.
3. Click **OK**. The highlight color changes for the selected items in Pin Planner.

**Figure 69. 2A I/O Bank Green Before Highlight Color Change**

**Figure 70. 2A I/O Bank Red After Highlight Color Change**

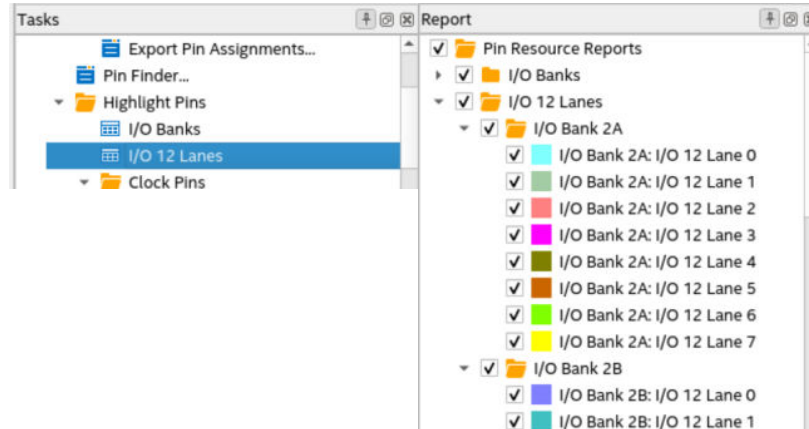

### 3.2.5. Showing I/O Lanes

You can use the **Report** window **I/O 12 Lanes** command to generate a report that displays all I/O lanes in an I/O bank.

You can highlight the various I/O lanes and change color coding for easy visualization and assignment.

**Note:** Alternatively, you can generate this report by clicking **View** ► **Show** ► **Show I/O 12 Lanes** in Pin Planner.

**Figure 71. Showing I/O Lanes in Pin Planner**

### 3.2.6. Assigning Differential Pins

When you assign a differential I/O standard to a single-ended top-level pin in your design, the Pin Planner automatically recognizes the negative pin as part of the differential pin pair assignment and creates the negative pin for you. The Quartus Prime software writes the location assignment for the negative pin to the `.qsf`; however, the I/O standard assignment is not added to the `.qsf` for the negative pin of the differential pair.

The following example shows a design with `lvds_in` top-level pin, to which you assign a differential I/O standard. The Pin Planner automatically creates the differential pin, `lvds_in(n)` to complete the differential pin pair.

**Note:** If you have a single-ended clock that feeds a PLL, assign the pin only to the positive clock pin of a differential pair in the target device. Single-ended pins that feed a PLL and are assigned to the negative clock pin device cause the design to not fit.

**Figure 72. Creating a Differential Pin Pair in the Pin Planner**

	Node Name	Differential Pair	I/O Standard	Direction
5	input_data[4]		3.3-V LVTTL (default)	Input
6	input_data[3]		3.3-V LVTTL (default)	Input
7	input_data[2]		3.3-V LVTTL (default)	Input
8	input_data[1]		3.3-V LVTTL (default)	Input
9	input_data[0]		3.3-V LVTTL (default)	Input
10	lvds_in	lvds_in(n)	LVDS	Input
11	output_data[7]		3.3-V LVTTL (default)	Output
12	output_data[6]		3.3-V LVTTL (default)	Output
13	output_data[5]		3.3-V LVTTL (default)	Output
14	output_data[4]		3.3-V LVTTL (default)	Output
15	output_data[3]		3.3-V LVTTL (default)	Output
16	output_data[2]		3.3-V LVTTL (default)	Output
17	output_data[1]		3.3-V LVTTL (default)	Output
18	output_data[0]		3.3-V LVTTL (default)	Output
19	reset		3.3-V LVTTL (default)	Input

If your design contains a large bus that exceeds the pins available in a particular I/O bank, you can use edge location assignments to place the bus. Edge location assignments improve the circuit board routing ability of large buses, because they are close together near an edge. The following figure shows Intel device package edges.

**Figure 73. Die View and Package View of the Four Edges on an Intel Device**

When you assign differential pin pairs in **Package View**, a red connection line displays between the pair of differential pins. The Package View labels the positive and negative pins with the letters p and n, respectively.

**Figure 74. Differential Pin Pair Color Coding**

### 3.2.6.1. Overriding I/O Placement Rules on Differential Pins

I/O placement rules ensure that noisy signals do not corrupt neighboring signals. Each device family has predefined I/O placement rules.

I/O placement rules define, for example, the allowed placement of single-ended I/O with respect to differential pins, or how many output and bidirectional pins you can place within a VREF group when using voltage referenced input standards.

Use the **IO\_MAXIMUM\_TOGGLE\_RATE** assignment to override I/O placement rules on pins, such as system reset pins that do not switch during normal design activity. Setting a value of 0 MHz for this assignment causes the Fitter to recognize the pin at a DC state throughout device operation. The Fitter excludes the assigned pin from placement rule analysis. Do not assign an **IO\_MAXIMUM\_TOGGLE\_RATE** of 0 MHz to any actively switching pin, or your design may not function as you intend.

### 3.2.7. Entering Pin Assignments with Tcl Commands

You can apply pin assignments with Tcl scripts, by either entering individual Tcl commands in the Tcl Console, or creating a `.tcl` script and the typing the following in the command line:

#### Example 6. Applying Tcl Script Assignments

```
quartus_sh -t <my_tcl_script>.tcl
```

#### Example 7. Scripted Pin Assignment

The following example uses `set_location_assignment` and `set_instance_assignment` Tcl commands to assign a pin to a specific location, I/O standard, and drive strength.

```
set_location_assignment PIN_M20 -to address[10]  
set_instance_assignment -name IO_STANDARD "2.5 V" -to address[10]  
set_instance_assignment -name  
    CURRENT_STRENGTH_NEW "MAXIMUM CURRENT" -to address[10]
```

#### Related Information

### 3.2.8. Entering Pin Assignments in HDL Code

You can use synthesis attributes or low-level I/O primitives to embed I/O pin assignments directly in your HDL code. When you analyze and synthesize the HDL code, the information is converted into the appropriate I/O pin assignments. You can use either of the following methods to specify pin-related assignments with HDL code:

- Assigning synthesis attributes for signal names that are top-level pins
- Using low-level I/O primitives, such as `ALT_BUF_IN`, to specify input, output, and differential buffers, and for setting parameters or attributes

#### 3.2.8.1. Using Low-Level I/O Primitives

You can alternatively enter I/O pin assignments using low-level I/O primitives. You can assign pin locations, I/O standards, drive strengths, slew rates, and on-chip termination (OCT) value assignments. You can also use low-level differential I/O primitives to define both positive and negative pins of a differential pair in the HDL code for your design.

Primitive-based assignments do not appear in the Pin Planner until after you perform a full compilation and back-annotate pin assignments (**Assignments > Back Annotate Assignments**).

### 3.3. Importing and Exporting I/O Pin Assignments

The Quartus Prime software supports transfer of I/O pin assignments across projects, or for analysis in third-party PCB tools. You can import or export I/O pin assignments in the following ways:

**Table 29. Importing and Exporting I/O Pin Assignments**

	Import Assignments	Export Assignments
<b>Scenario</b>	<ul style="list-style-type: none"> <li>From your PCB design tool or spreadsheet into Pin Planner during early pin planning or after optimization in PCB tool</li> <li>From another Quartus Prime project with common constraints</li> </ul>	<ul style="list-style-type: none"> <li>From Quartus Prime project for optimization in a PCB design tool</li> <li>From Quartus Prime project for spreadsheet analysis or use in scripting assignments</li> <li>From Quartus Prime project for import into another Quartus Prime project with similar constraints</li> </ul>
<b>Command</b>	<b>Assignments &gt; Import Assignments</b>	<b>Assignments &gt; Export Assignments</b>
<b>File formats</b>	.qsf, .csv, .txt, .sdc	.pin, .csv, .tcl, .qsf
<b>Notes</b>	N/A	Exported .csv files retain column and row order and format. Do not modify the row of column headings if importing the .csv file

#### 3.3.1. Importing and Exporting for PCB Tools

The Pin Planner supports import and export of assignments with PCB tools. You can export valid assignments as a .pin file for analysis in other supported PCB tools. You can also import optimized assignment from supported PCB tools. The .pin file contains pin name, number, and detailed properties.

**Table 30. Contents of .pin File**

File Column Name	Description
Pin Name/Usage	The name of the design pin, or whether the pin is GND or V <sub>CC</sub> pin
Location	The pin number of the location on the device package
Dir	The direction of the pin
I/O Standard	The name of the I/O standard to which the pin is configured
Voltage	The voltage level that is required to be connected to the pin
I/O Bank	The I/O bank to which the pin belongs
User Assignment	Y or N indicating if the location assignment for the design pin was user assigned (Y) or assigned by the Fitter (N)

#### 3.3.2. Migrating Assignments to Another Target Device

Click **View > Pin Migration Window** to verify whether pin assignments are compatible with migration to a different Intel device.

You can migrate compatible pin assignments from one target device to another. You can migrate to a different density and the same device package. You can also migrate between device packages with different densities and pin counts.

The Quartus Prime software ignores invalid assignments and generates an error message during compilation. After evaluating migration compatibility, modify any incompatible assignments, and then click **Export** to export the assignments to another project.

**Figure 75. Device Migration Compatibility (AC24 does not exist in migration device)**

Device... Pin Finder... ☐ Show only highlighted pins ☐ Show migration differences Export...

The migration result for the pin function of highlighted PIN\_AC23 is not an NC but a voltage reference VREFB1N2 even though the pin is an NC in the migration device. VREF standards have a higher priority than an NC, thus the migration result displays the voltage reference. Even if you do not use that pin for a port connection in the design, you must use the VREF standard for I/O standards that require it on the actual board for the migration device.

If one of the migration devices has pins intended for connection to V<sub>CC</sub> or GND and these same pins are I/O pins on a different device in the migration path, the Quartus Prime software ensures these pins are not used for I/O. Ensure that these pins are connected to the correct PCB plane.

When migrating between two devices in the same package, pins that are not connected to the smaller die may be intended to connect to V<sub>CC</sub> or GND on the larger die. To facilitate migration, you can connect these pins to V<sub>CC</sub> or GND in the original design because the pins are not physically connected to the smaller die.

## 3.4. Validating Pin Assignments

The Quartus Prime software validates I/O pin assignments against predefined I/O rules for your target device. You can use the following tools to validate your I/O pin assignments throughout the pin planning process:

**Table 31. I/O Validation Tools**

I/O Validation Tool	Description	Click to Run
Advanced I/O Timing	Fully validates I/O assignments against all I/O and timing checks during compilation	<b>Processing ► Start Compilation</b>

### 3.4.1. I/O Assignment Validation Rules

I/O Assignment Analysis validates your assignments against the following rules:

**Table 32. Examples of I/O Rule Checks**

Rule	Description	HDL Required?
I/O bank capacity	Checks the number of pins assigned to an I/O bank against the number of pins allowed in the I/O bank.	No
I/O bank VCCIO voltage compatibility	Checks that no more than one VCCIO is required for the pins assigned to the I/O bank.	No
I/O bank VREF voltage compatibility	Checks that no more than one VREF is required for the pins assigned to the I/O bank.	No
I/O standard and location conflicts	Checks whether the pin location supports the assigned I/O standard.	No
I/O standard and signal direction conflicts	Checks whether the pin location supports the assigned I/O standard and direction. For example, certain I/O standards on a particular pin location can only support output pins.	No
Differential I/O standards cannot have open drain turned on	Checks that open drain is turned off for all pins with a differential I/O standard.	No
I/O standard and drive strength conflicts	Checks whether the drive strength assignments are within the specifications of the I/O standard.	No
Drive strength and location conflicts	Checks whether the pin location supports the assigned drive strength.	No
BUSHOLD and location conflicts	Checks whether the pin location supports BUSHOLD. For example, dedicated clock pins do not support BUSHOLD.	No
WEAK_PULLUP and location conflicts	Checks whether the pin location supports WEAK_PULLUP (for example, dedicated clock pins do not support WEAK_PULLUP).	No
Electromigration check	Checks whether combined drive strength of consecutive pads exceeds a certain limit. For example, the total current drive for 10 consecutive pads on a Stratix II device cannot exceed 200 mA.	No
PCI_IO clamp diode, location, and I/O standard conflicts	Checks whether the pin location along with the I/O standard assigned supports PCI_IO clamp diode.	No
SERDES and I/O pin location compatibility check	Checks that all pins connected to a SERDES in your design are assigned to dedicated SERDES pin locations.	Yes
PLL and I/O pin location compatibility check	Checks whether pins connected to a PLL are assigned to the dedicated PLL pin locations.	Yes

**Table 33. Signal Switching Noise Rules**

Rule	Description	HDL Required?
I/O bank cannot have single-ended I/O when DPA exists	Checks that no single-ended I/O pin exists in the same I/O bank as a DPA.	No
A PLL I/O bank does not support both a single-ended I/O and a differential signal simultaneously	Checks that there are no single-ended I/O pins present in the PLL I/O Bank when a differential signal exists.	No
Single-ended output is required to be a certain distance away from a differential I/O pin	Checks whether single-ended output pins are a certain distance away from a differential I/O pin.	No
Single-ended output must be a certain distance away from a VREF pad	Checks whether single-ended output pins are a certain distance away from a VREF pad.	No
Single-ended input is required to be a certain distance away from a differential I/O pin	Checks whether single-ended input pins are a certain distance away from a differential I/O pin.	No
Too many outputs or bidirectional pins in a VREFGROUP when a VREF is used	Checks that there are no more than a certain number of outputs or bidirectional pins in a VREFGROUP when a VREF is used.	No
Too many outputs in a VREFGROUP	Checks whether too many outputs are in a VREFGROUP.	No

### 3.4.2. I/O Assignment Analysis

I/O assignment analysis validates I/O assignments against the complete set of I/O system and board layout rules. Full I/O assignment analysis validates blocks that directly feed or are fed by resources such as a PLL, LVDS, or gigabit transceiver blocks. In addition, the checker validates the legality of proper VREF pin use, pin locations, and acceptable mixed I/O standards

Run I/O assignment analysis during early pin planning to validate initial reserved pin assignments before compilation. Once you define design files, run I/O assignment analysis to perform more thorough legality checks with respect to the synthesized netlist. Run I/O assignment analysis whenever you modify I/O assignments.

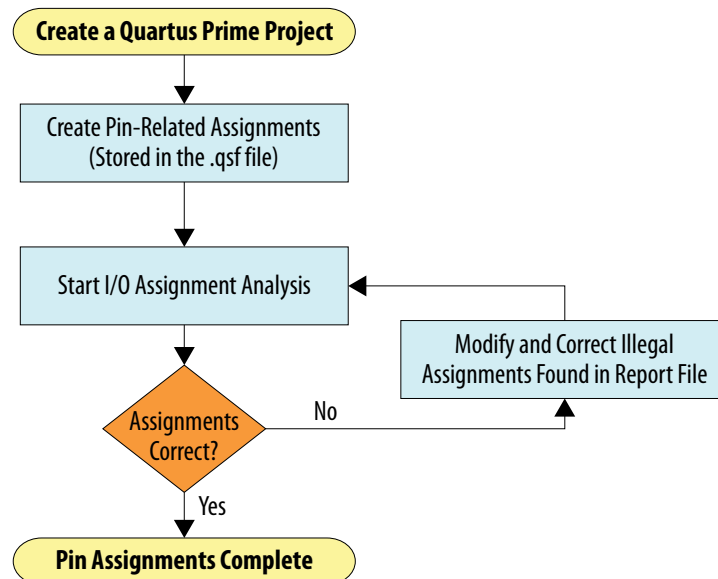

The Fitter assigns pins to accommodate your constraints. For example, if you assign an edge location to a group of LVDS pins, the Fitter assigns pin locations for each LVDS pin in the specified edge location and then performs legality checks. To display the Fitter-placed pins, click **Show Fitter Placements** in the Pin Planner. To accept these suggested pin locations, you must back-annotate your pin assignments.

View the I/O Assignment Warnings report to view and resolve all assignment warnings. For example, a warning that some design pins have undefined drive strength or slew rate. The Fitter recognizes undefined, single-ended output and bidirectional pins as non-calibrated OCT. To resolve the warning, assign the **Current Strength**, **Slew Rate** or **Slow Slew Rate** for the reported pin. Alternatively, can assign the **Termination** to the pin. You cannot assign drive strength or slew rate settings when a pin has an OCT assignment.

### 3.4.2.1. Early I/O Assignment Analysis Without Design Files

You can perform basic I/O legality checks before defining HDL design files. This technique produces a preliminary board layout. For example, you can specify a target device and enter pin assignments that correspond to PCB characteristics. You can reserve and assign I/O standards to each pin, and then run I/O assignment analysis to ensure that there are no I/O standard conflicts in each I/O bank.

**Figure 76. Assigning and Analyzing Pin-Outs without Design Files**

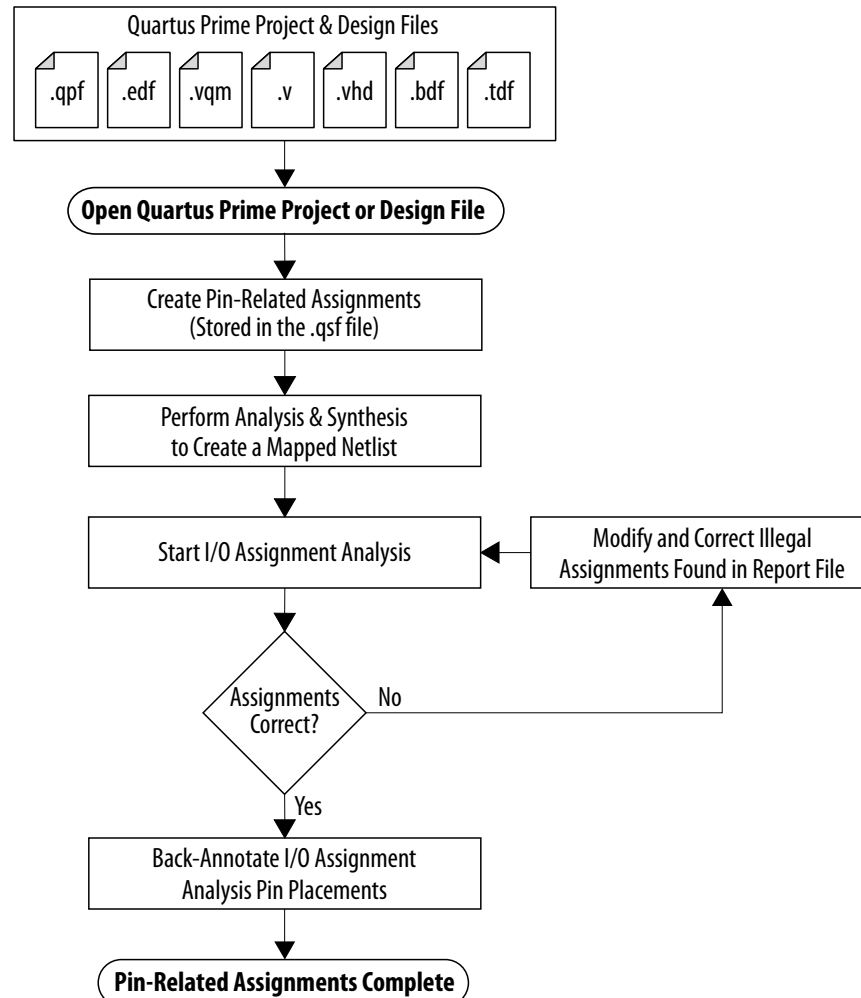

You must reserve all pins you intend to use as I/O pins, so that the Fitter can determine each pin type. After performing I/O assignment analysis, correct any errors reported by the Fitter and rerun I/O assignment analysis until all errors are corrected. A complete I/O assignment analysis requires all design files.

### 3.4.2.2. I/O Assignment Analysis With Design Files

I/O assignment analysis allows you to perform full I/O legality checks after fully defining HDL design files. When you run I/O assignment analysis on a complete design, the tool verifies all I/O pin assignments against all I/O rules. When you run I/O assignment analysis on a partial design, the tool checks legality only for defined portions of the design. The following figure shows the work flow for analyzing pin-outs with design files.

**Figure 77. I/O Assignment Analysis Flow**

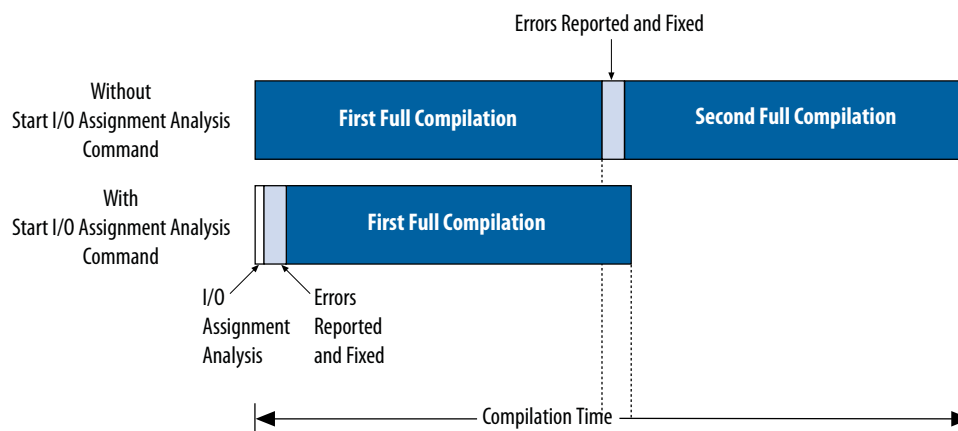

Even if I/O assignment analysis passes on incomplete design files, you may still encounter errors during full compilation. For example, you can assign a clock to a user I/O pin instead of assigning to a dedicated clock pin, or design the clock to drive a PLL that you have not yet instantiated in the design. This issues occur because I/O assignment analysis does not account for the logic that the pin drives and does not verify that only dedicated clock inputs can drive the a PLL clock port.

To obtain better coverage, analyze as much of the design as possible over time, especially logic that connects to pins. For example, if your design includes PLLs or LVDS blocks, define these files prior to full analysis. After performing I/O assignment analysis, correct any errors reported by the Fitter and rerun I/O assignment analysis until all errors are corrected.

The following figure shows the compilation time benefit of performing I/O assignment analysis before running a full compilation.

**Figure 78. I/O Assignment Analysis Reduces Compilation Time**

### 3.4.2.3. Overriding Default I/O Pin Analysis

You can override the default I/O analysis of pins to accommodate I/O rule exceptions, such as for analyzing VREF or inactive pins.

Each device contains VREF pins, each supporting one or more I/O pins. A VREF pin and its I/O pins comprise a VREF bank. The VREF pins are typically assigned inputs with VREF I/O standards, such as HSTL- and SSTL-type I/O standards. Conversely, VREF outputs do not require the VREF pin. When a voltage-referenced input is present in a VREF bank, only a certain number of outputs can be present in that VREF bank. I/O assignment analysis treats bidirectional signals controlled by different output enables as independent output enables.

To assign the **Output Enable Group** option to bidirectional signals to analyze the signals as a single output enable group, follow these steps:

1. To access this assignment in the Pin Planner, right-click the **All pins** list and click **Customize Columns**.
2. Under **Available columns**, add **Output Enable Group** to **Show these columns in this order**. The column appears in the **All Pins** list.
3. Enter the same integer value for the **Output Enable Group** assignment for all sets of signals that are driving in the same direction.

### 3.4.3. Understanding I/O Analysis Reports

The detailed I/O assignment analysis reports include the affected pin name and a problem description. The Fitter section of the Compilation report contains information generated during I/O assignment analysis, including the following reports:

- I/O Assignment Warnings—lists warnings generated for each pin
- Resource Section—quantifies use of various pin types and I/O banks
- I/O Rules Section—lists summary, details, and matrix information about the I/O rules tested

The **Status** column indicates whether rules passed, failed, or were not checked. A severity rating indicates the rule's importance for effective analysis. "Inapplicable" rules do not apply to the target device family.

Figure 79. I/O Rules Matrix

### 3.5. Verifying I/O Timing

You must verify board-level signal integrity and I/O timing when assigning I/O pins. High-speed interface operation requires a quality signal and low propagation delay at the far end of the board route. Click **Tools ► Timing Analyzer** to confirm timing after making I/O pin assignments.

For example, if you change the slew rates or drive strengths of some I/O pins with ECOs, you can verify timing without recompiling the design. You must understand I/O timing and what factors affect I/O timing paths in your design. The accuracy of the output load specification of the output and bidirectional pins affects the I/O timing results.

The Quartus Prime software supports three different methods of I/O timing analysis:

Table 34. I/O Timing Analysis Methods

I/O Timing Analysis	Description
Advanced I/O timing analysis	Analyze I/O timing with your board trace model to report accurate, “board-aware” simulation models. Configures a complete board trace model for each I/O standard or pin. Timing Analyzer applies simulation results of the I/O buffer, package, and board trace model to generate accurate I/O delays and system level signal information. Use this information to improve timing and signal integrity.
I/O timing analysis	Analyze I/O timing with default or specified capacitive load without signal integrity analysis. Timing Analyzer reports tCO to an I/O pin using a default or user-specified value for a capacitive load.
Full board routing simulation	Use Intel-provided or Quartus Prime software-generated IBIS or HSPICE I/O models for simulation in Mentor Graphics* HyperLynx* and Synopsys HSPICE.

For more information about advanced I/O timing support, refer to the appropriate device handbook for your target device. For more information about board-level signal integrity and tips on how to improve signal integrity in your high-speed designs, refer to the Signal Integrity and Power Integrity – Support Center website.

For information about creating IBIS and HSPICE models with the Quartus Prime software and integrating those models into HyperLynx and HSPICE simulations, refer to the *Signal Integrity Analysis with Third Party Tools* chapter.

### **Related Information**

[Signal Integrity and Power Integrity – Support Center](#)

## **3.5.1. Running Advanced I/O Timing**

Advanced I/O timing analysis uses your board trace model and termination network specification to report accurate output buffer-to-pin timing estimates, FPGA pin and board trace signal integrity and delay values. Advanced I/O timing runs automatically for supported devices during compilation.

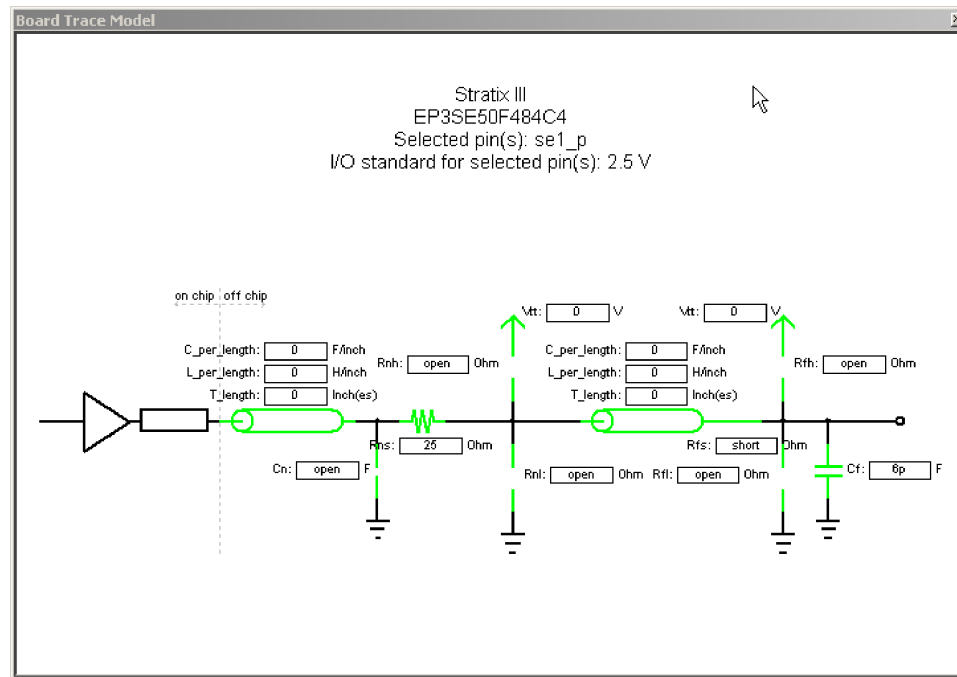

### **3.5.1.1. Board Trace Models**

The Quartus Prime software provides board trace model templates for various I/O standards.

The following figure shows the template for a **2.5 V** I/O standard. This model consists of near-end and far-end board component parameters.

Near-end board trace modeling includes the elements which are close to the device. Far-end modeling includes the elements which are at the receiver end of the link, closer to the receiving device. Board trace model topology is conceptual and does not necessarily match the actual board trace for every component. For example, near-end model parameters can represent device-end discrete termination and breakout traces. Far-end modeling can represent the bulk of the board trace to discrete external memory components, and the far end termination network. You can analyze the same circuit with near-end modeling of the entire board, including memory component termination, and far-end modeling of the actual memory component.

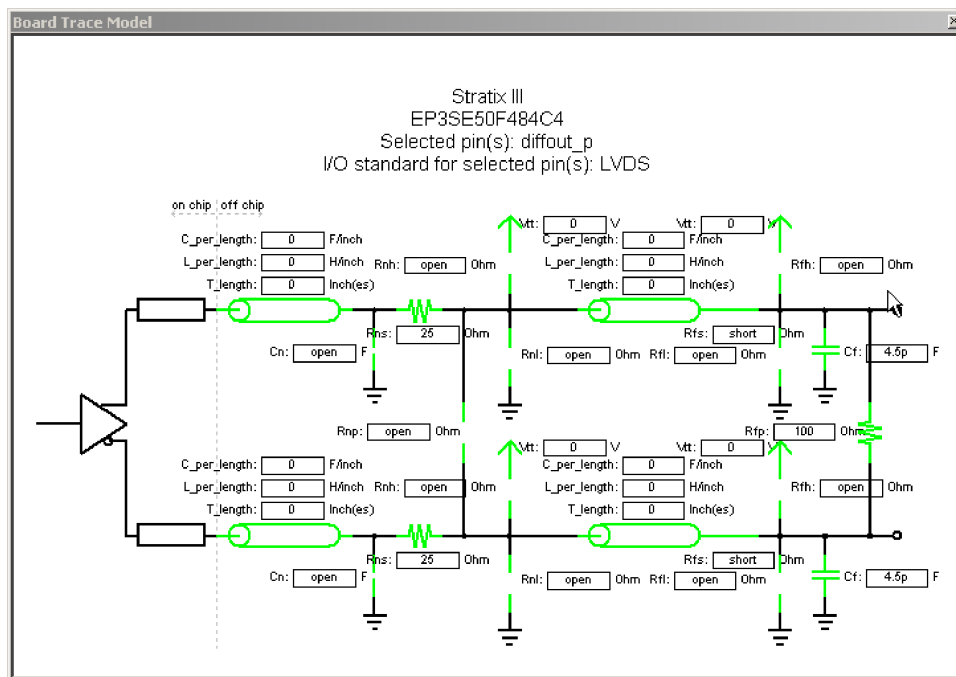

**Figure 80. 2.5-V I/O Standard Board Trace Model**

The following figure shows the template for the **LVDS** I/O standard. The far-end capacitance ( $C_f$ ) represents the external-device or multiple-device capacitive load. If you have multiple devices on the far-end, you must find the equivalent capacitance at the far-end, taking into account all receiver capacitances. The far-end capacitance can be the sum of all the receiver capacitances.

The Quartus Prime software models of transmission lines do not consider transmission-line resistance (lossless models). You only need to specify distributed inductance ( $L$ ) and capacitance ( $C$ ) values on a per-inch basis, which you can obtain from the PCB vendor or manufacturer, the CAD Design tool, or a signal integrity tool, such as the Mentor Graphics HyperLynx software.

**Figure 81. LVDS Differential Board Trace Model**

### 3.5.1.2. Defining the Board Trace Model

The board trace model describes a board trace and termination network as a set of capacitive, resistive, and inductive parameters.

Advanced I/O Timing uses the model to simulate the output signal from the output buffer to the far end of the board trace. You can define the capacitive load, any termination components, and trace impedances in the board routing for any output pin or bidirectional pin in output mode. You can configure an overall board trace model for each I/O standard or for specific pins. Define an overall board trace model for each I/O standard in your design. Use that model for all pins that use the I/O standard. You can customize the model for specific pins using the **Board Trace Model** window in the Pin Planner.

1. Click **Assignments** ► **Device** ► **Device and Pin Options**.
2. Click **Board Trace Model** and define board trace model values for each I/O standard.
3. Click **I/O Timing** and define default I/O timing options at board trace near and far ends.
4. Click **Assignments** ► **Pin Planner** and assign board trace model values to individual pins.

#### Example 8. Specifying Board Trace Model

```
## setting the near end series resistance model of sel_p output pin to 25 ohms
set_instance_assignment -name BOARD_MODEL_NEAR_SERIES_R 25 -to sel_p
## Setting the far end capacitance model for sel_p output signal to 6 picofarads
set_instance_assignment -name BOARD_MODEL_FAR_C 6P -to sel_p
```

### 3.5.1.3. Modifying the Board Trace Model

To modify the board trace model, click **View ► Board Trace Model** in the Pin Planner.

You can modify any of the board trace model parameters within a graphical representation of the board trace model.

The **Board Trace Model** window displays the routing and components for positive and negative signals in a differential signal pair. Only modify the positive signal of the pair, as the setting automatically applies to the negative signal. Use standard unit prefixes such as *p*, *n*, and *k* to represent pico, nano, and kilo, respectively. Use the **short** or **open** value to designate a short or open circuit for a parallel component.

### 3.5.1.4. Specifying Near-End vs Far-End I/O Timing Analysis

You can select a near-end or far-end point for I/O timing analysis. Near-end timing analysis extends to the device pin. You can apply the `set_output_delay` constraint during near-end analysis to account for the delay across the board.

With far-end I/O timing analysis, the advanced I/O timing analysis extends to the external device input, at the far-end of the board trace. Whether you choose a near-end or far-end timing endpoint, the board trace models are taken into account during timing analysis.

### 3.5.1.5. Advanced I/O Timing Analysis Reports

The following reports show advanced I/O timing analysis information:

**Table 35. Advanced I/O Timing Reports**

I/O Timing Report	Description
Timing Analyzer Report	Reports signal integrity and board delay data.
Board Trace Model Assignments report	Summarizes the board trace model component settings for each output and bidirectional signal.
Signal Integrity Metrics report	Contains all the signal integrity metrics calculated during advanced I/O timing analysis based on the board trace model settings for each output or bidirectional pin. Includes measurements at both the FPGA pin and at the far-end load of board delay, steady state voltages, and rise and fall times.

**Note:** By default, the Timing Analyzer generates the Slow-Corner Signal Integrity Metrics report. To generate a Fast-Corner Signal Integrity Metrics report you must change the delay model by clicking **Tools ► Timing Analyzer**.

### 3.5.2. Adjusting I/O Timing and Power with Capacitive Loading

When calculating  $t_{CO}$  and power for output and bidirectional pins, the Timing Analyzer and the Power Analyzer use a bulk capacitive load. You can adjust the value of the capacitive load per I/O standard to obtain more precise  $t_{CO}$  and power measurements, reflecting the behavior of the output or bidirectional net on your PCB. The Quartus Prime software ignores capacitive load settings on input pins. You can adjust the capacitive load settings per I/O standard, in picofarads (pF), for your entire design. During compilation, the Compiler measures power and  $t_{CO}$  measurements based on your settings. You can also adjust the capacitive load on an individual pin with the **Output Pin Load** logic option.

## 3.6. Viewing Routing and Timing Delays

Right-click any node and click **Locate > Locate in Chip Planner** to visualize and adjust I/O timing delays and routing between user I/O pads and  $V_{CC}$ , GND, and  $V_{REF}$  pads. The Chip Planner graphically displays logic placement, Logic Lock regions, relative resource usage, detailed routing information, fan-in and fan-out, register paths, and high-speed transceiver channels. You can view physical timing estimates, routing congestion, and clock regions. Use the Chip Planner to change connections between resources and make post-compilation changes to logic cell and I/O atom placement. When you select items in the Pin Planner, the corresponding item is highlighted in Chip Planner.

## 3.7. Scripting API

The Quartus Prime software allows you to access I/O management functions through Tcl commands, rather than with the GUI. For detailed information about scripting command options and Tcl API packages, type the following at a system command prompt to view the Tcl API Help browser:

```
quartus_sh --qhelp
```

### Related Information

[Quartus Prime Pro Edition User Guide: Scripting](#)

### 3.7.1. Generate Mapped Netlist

Enter the following in the Tcl console or in a Tcl script:

```
execute_module -tool map
```

The `execute_module` command is in the flow package.

Type the following at a system command prompt:

```
quartus_syn <project name>
```

### 3.7.2. Reserve Pins

Use the following Tcl command to reserve a pin:

```
set_instance_assignment -name RESERVE_PIN <value> -to <signal name>
```

Use one of the following valid reserved pin values:

- "AS BIDIRECTIONAL"
- "AS INPUT TRI STATED"
- "AS OUTPUT DRIVING AN UNSPECIFIED SIGNAL"
- "AS OUTPUT DRIVING GROUND"
- "AS SIGNALPROBE OUTPUT"

**Note:** You must include the quotation marks when specifying the reserved pin value.

### 3.7.3. Set Location

Use the following Tcl command to assign a signal to a pin or device location:

```
set_location_assignment <location> -to <signal name>
```

Valid locations are pin locations, I/O bank locations, or edge locations. Pin locations include pin names, such as PIN\_A3. I/O bank locations include IOBANK\_1 up to IOBANK\_ *n*, where *n* is the number of I/O banks in the device.

Use one of the following valid edge location values:

- EDGE\_BOTTOM
- EDGE\_LEFT
- EDGE\_TOP
- EDGE\_RIGHT

### 3.7.4. Exclusive I/O Group

The following Tcl command creates an exclusive I/O group assignment:

```
set_instance_assignment -name "EXCLUSIVE_IO_GROUP" -to pin
```

### 3.7.5. Slew Rate and Current Strength

Use the following Tcl commands to create a slew rate and drive strength assignments:

```
set_instance_assignment -name CURRENT_STRENGTH_NEW 8MA -to e[0]
set_instance_assignment -name SLEW_RATE 2 -to e[0]
```

## 3.8. Managing Device I/O Pins Revision History

The following table shows the revision history for this chapter:

Document Version	Quartus Prime Version	Changes
2024.04.01	24.1	<ul style="list-style-type: none"> <li>Applied initial Altera rebranding throughout.</li> <li>Updated Pin Planner screenshot in <i>Importing and Exporting I/O Pin Assignments</i> topic for current list of file formats supported.</li> </ul>

## 4. Quartus Prime Pro Edition User Guide: Design Constraints Document Archives

---

For the latest and previous versions of this user guide, refer to [Quartus Prime Pro Edition User Guide: Design Constraints](#). If an IP or software version is not listed, the user guide for the previous IP or software version applies.

## A. Quartus Prime Pro Edition User Guides

---

Refer to the following user guides for comprehensive information on all phases of the Quartus Prime Pro Edition FPGA design flow.

### Related Information

- [Quartus Prime Pro Edition User Guide: Getting Started](#)  
Introduces the basic features, files, and design flow of the Quartus Prime Pro Edition software, including managing Quartus Prime Pro Edition projects and IP, initial design planning considerations, and project migration from previous software versions.
- [Quartus Prime Pro Edition User Guide: Platform Designer](#)  
Describes creating and optimizing systems using Platform Designer, a system integration tool that simplifies integrating customized IP cores in your project. Platform Designer automatically generates interconnect logic to connect intellectual property (IP) functions and subsystems.
- [Quartus Prime Pro Edition User Guide: Design Recommendations](#)  
Describes best design practices for designing FPGAs with the Quartus Prime Pro Edition software. HDL coding styles and synchronous design practices can significantly impact design performance. Following recommended HDL coding styles ensures that Quartus Prime Pro Edition synthesis optimally implements your design in hardware.
- [Quartus Prime Pro Edition User Guide: Design Compilation](#)  
Describes set up, running, and optimization for all stages of the Quartus Prime Pro Edition Compiler. The Compiler synthesizes, places, and routes your design before generating a device programming file.
- [Quartus Prime Pro Edition User Guide: Design Optimization](#)  
Describes Quartus Prime Pro Edition settings, tools, and techniques that you can use to achieve the highest design performance in Intel FPGAs. Techniques include optimizing the design netlist, addressing critical chains that limit retiming and timing closure, optimizing device resource usage, device floorplanning, and implementing engineering change orders (ECOs).
- [Quartus Prime Pro Edition User Guide: Programmer](#)  
Describes operation of the Quartus Prime Pro Edition Programmer, which allows you to configure Intel FPGA devices, and program CPLD and configuration devices, via connection with an Intel FPGA download cable.
- [Quartus Prime Pro Edition User Guide: Block-Based Design](#)  
Describes block-based design flows, also known as modular or hierarchical design flows. These advanced flows enable preservation of design blocks (or logic that comprises a hierarchical design instance) within a project, and reuse of design blocks in other projects.

- [Quartus Prime Pro Edition User Guide: Partial Reconfiguration](#)  
Describes Partial Reconfiguration, an advanced design flow that allows you to reconfigure a portion of the FPGA dynamically, while the remaining FPGA design continues to function. Define multiple personas for a particular design region, without impacting operation in other areas.
- [Quartus Prime Pro Edition User Guide: Third-party Simulation](#)  
Describes RTL- and gate-level design simulation support for third-party simulation tools by Aldec\*, Cadence\*, Siemens EDA, and Synopsys that allow you to verify design behavior before device programming. Includes simulator support, simulation flows, and simulating Intel FPGA IP.
- [Quartus Prime Pro Edition User Guide: Third-party Synthesis](#)  
Describes support for optional synthesis of your design in third-party synthesis tools by Siemens EDA, and Synopsys. Includes design flow steps, generated file descriptions, and synthesis guidelines.
- [Quartus Prime Pro Edition User Guide: Third-party Logic Equivalence Checking Tools](#)  
Describes support for optional logic equivalence checking (LEC) of your design in third-party LEC tools by OneSpin\*.
- [Quartus Prime Pro Edition User Guide: Debug Tools](#)  
Describes a portfolio of Quartus Prime Pro Edition in-system design debugging tools for real-time verification of your design. These tools provide visibility by routing (or “tapping”) signals in your design to debugging logic. These tools include System Console, Signal Tap logic analyzer, system debugging toolkits, In-System Memory Content Editor, and In-System Sources and Probes Editor.
- [Quartus Prime Pro Edition User Guide: Timing Analyzer](#)  
Explains basic static timing analysis principals and use of the Quartus Prime Pro Edition Timing Analyzer, a powerful ASIC-style timing analysis tool that validates the timing performance of all logic in your design using an industry-standard constraint, analysis, and reporting methodology.
- [Quartus Prime Pro Edition User Guide: Power Analysis and Optimization](#)  
Describes the Quartus Prime Pro Edition Power Analysis tools that allow accurate estimation of device power consumption. Estimate the power consumption of a device to develop power budgets and design power supplies, voltage regulators, heat sink, and cooling systems.
- [Quartus Prime Pro Edition User Guide: Design Constraints](#)  
Describes timing and logic constraints that influence how the Compiler implements your design, such as pin assignments, device options, logic options, and timing constraints. Use the Interface Planner to prototype interface implementations, plan clocks, and quickly define a legal device floorplan. Use the Pin Planner to visualize, modify, and validate all I/O assignments in a graphical representation of the target device.
- [Quartus Prime Pro Edition User Guide: PCB Design Tools](#)  
Describes support for optional third-party PCB design tools by Siemens EDA and Cadence\*. Also includes information about signal integrity analysis and simulations with HSPICE and IBIS Models.
- [Quartus Prime Pro Edition User Guide: Scripting](#)  
Describes use of Tcl and command line scripts to control the Quartus Prime Pro Edition software and to perform a wide range of functions, such as managing projects, specifying constraints, running compilation or timing analysis, or generating reports.

## 1. Signal Integrity Analysis with Third-Party Tools

---

### 1.1. Signal Integrity Analysis with Third-Party Tools

With the ever-increasing operating speed of interfaces in traditional FPGA design, the timing and signal integrity margins between the FPGA and other devices on the board must be within specification and tolerance before building a PCB.

If the board trace design is poor, or the route is too heavily loaded, noise in the signal can cause data corruption, while overshoot and undershoot can potentially damage input buffers over time.

As FPGA devices are used in high-speed applications, signal integrity and timing margin between the FPGA and other devices on the PCB are important for proper system operation. To avoid time-consuming and costly board respins, you must simulate the topology and routing of critical signals. You must accurately model the high-speed interfaces available on FPGA devices.

The Quartus® Prime software provides methodologies, resources, and tools to ensure good signal integrity and timing margin between Intel® FPGA devices and other components on the board. Three types of analysis are possible with the Quartus Prime software:

- I/O timing with a default or user-specified capacitive load and no signal integrity analysis (default)
- Full board routing simulation in third-party tools using Intel-provided or generated Input/Output Buffer Information Specification (IBIS) or HSPICE I/O models

I/O timing using a specified capacitive test load requires no special configuration other than setting the size of the load. The Quartus Prime Timing Analyzer generates I/O timing reports based only on point-to-point delays within the I/O buffer. The Timing Analyzer assumes the presence of the capacitive test load without specifying any other details about the board. The default size of the load derives from the I/O standard that you select for the pin. Timing analysis measures to the FPGA pin without signal integrity analysis details.

The signal integrity information in this chapter refers to board-level signal integrity based on I/O buffer configuration and board parameters, not simultaneous switching noise (SSN).<sup>(1)</sup> SSN is a product of multiple output drivers switching at the same time, causing an overall drop in the voltage of the chip's power supply. This condition can cause temporary glitches in the specified level of ground or  $V_{CC}$  for the device.

---

<sup>(1)</sup> Also known as ground bounce or  $V_{CC}$  sag.

This chapter provides FPGA and board designers with the concepts and steps necessary to perform signal integrity simulation and adjust designs to improve board-level timing and signal integrity. This chapter also includes information about how to obtain and customize simulation models, and how to use those models in simulation software.

### 1.1.1. What's New In This Version

- The current version of the Quartus Prime Pro Edition software supports generation of custom IBIS models for Agilex™ FPGA portfolio devices using the EDA Netlist Writer GUI, as [Generate Custom IBIS Models with the EDA Netlist Writer GUI](#) describes.
- The current version of the Quartus Prime Pro Edition software no longer includes the Enable Advanced I/O Timing option, as reflected throughout this document.

### 1.1.2. Signal Integrity Simulations with HSPICE and IBIS Models

The Quartus Prime software can export accurate HSPICE models with the built-in HSPICE Writer. You can run signal integrity simulations with these complete HSPICE models in Synopsys\* HSPICE. You can also easily create and customize IBIS models of the FPGA I/O buffers in the Quartus Prime software.

You can run signal integrity simulations with these complete HSPICE models in Synopsys HSPICE.

You can integrate IBIS models into any third-party simulation tool that supports IBIS models. With the ability to create industry-standard model definition files quickly, you can build accurate simulations that can provide data to help improve board-level signal integrity.

Creating and running accurate simulations can be difficult and time consuming. The Quartus Prime software tools automate the I/O model setup and creation process by generating custom models for your design. These tools allow you to set up and run accurate simulations that guide FPGA and board design.

For a more information about SSN and ways to prevent it, refer to *AN 315: Guidelines for Designing High-Speed FPGA PCBs*.

For information about basic signal integrity concepts and signal integrity details pertaining to Intel FPGA devices, visit the Intel Signal & Power Integrity Center.

## 1.2. I/O Model Selection: IBIS or HSPICE

The Quartus Prime software can export two different types of I/O models that are useful for different simulation situations, IBIS models and HSPICE models.

IBIS models define the behavior of input or output buffers through voltage-current (V-I) and voltage-time (V-t) data tables. HSPICE models, or decks, include complete physical descriptions of the transistors and parasitic capacitances that make up an I/O buffer along with all the parameter settings that you require to run a simulation.

The Quartus Prime software generates HSPICE decks, and adds preconfigured I/O standard, voltage, and pin loading settings for each pin in your design.

The choice of I/O model type is based on many factors.

**Table 1. IBIS and HSPICE Model Comparison**

Feature	IBIS Model	HSPICE Model
I/O Buffer Description	<b>Behavioral</b> —I/O buffers are described by voltage-current and voltage-time tables in typical, minimum, and maximum supply voltage cases.	<b>Physical</b> —I/O buffers and all components in a circuit are described by their physical properties, such as transistor characteristics and parasitic capacitances, as well as their connections to one another.
Model Customization	<b>Simple and limited</b> —The model completely describes the I/O buffer and does not usually have to be customized.	<b>Fully customizable</b> —Unless connected to an arbitrary board description, the description of the board trace model must be customized in the model file. All parameters of the simulation are also adjustable.
Simulation Set Up and Run Time	<b>Fast</b> —Simulations run quickly after set up correctly.	<b>Slow</b> —Simulations take time to set up and take longer to run and complete.
Simulation Accuracy	<b>Good</b> —For most simulations, accuracy is sufficient to make useful adjustments to the FPGA or board design to improve signal integrity.	<b>Excellent</b> —Simulations are highly accurate, making HSPICE simulation almost a requirement for any high-speed design where signal integrity and timing margins are tight.
Third-Party Tool Support	<b>Excellent</b> —Almost all third-party board simulation tools support IBIS.	<b>Good</b> —Most third-party tools that support SPICE support HSPICE. However, Synopsys HSPICE is required for simulations of Intel's encrypted HSPICE models.

### 1.3. FPGA to Board Signal Integrity Analysis Flow

Board signal integrity analysis can take place at any point in the FPGA design process and is often performed before and after board layout. If it is performed early in the process as part of a pre-PCB layout analysis, the models used for simulations can be more generic.

These models can be changed as much as required to see how adjustments improve timing or signal integrity and help with the design and routing of the PCB. Simulations and the resulting changes made at this stage allow you to analyze “what if” scenarios to plan and implement your design better. To assist with early board signal integrity analysis, you can download generic IBIS model files for each device family and obtain HSPICE buffer simulation kits from the “Board Level Tools” section of the EDA Tool Support Resource Center.

Typically, if board signal integrity analysis is performed late in the design, it is used for a post-layout verification. The inputs and outputs of the FPGA are defined, and required board routing topologies and constraints are known. Simulations can help you find problems that might still exist in the FPGA or board design before fabrication and assembly. In either case, a simple process flow illustrates how to create accurate IBIS and HSPICE models from a design in the Quartus Prime software and transfer them to third-party simulation tools.

Your design depends on the type of model, IBIS or HSPICE, that you use for your simulations. When you understand the steps in the analysis flow, refer to the section of this chapter that corresponds to the model type you are using.

**Figure 1. Third-Party Board Signal Integrity Analysis Flow**

### Related Information

#### [EDA Tool Support Resource Center](#)

For more information, generic IBIS model files for each device family, and to obtain HSPICE buffer simulation kits.

### 1.3.1. Create I/O and Board Trace Model Assignments

You can configure a board trace model for output signals or for bidirectional signals in output mode. You can then automatically transfer its description to HSPICE decks generated by the HSPICE Writer. This helps improve simulation accuracy.

To configure a board trace model, specify the board trace model assignment settings for each I/O standard used in your design. You can add series or parallel termination, specify the transmission line length, and set the value of the far-end capacitive load. You can configure these parameters in the Board Trace Model view of the Pin Planner (**Assignments > Pin Planner**).

The Quartus Prime software can generate IBIS models and HSPICE decks without having to configure a board trace model. Generated IBIS models ignore any board trace model settings other than the far-end capacitive load. If any load value is set other than the default, the delay given by IBIS models generated by the IBIS Writer cannot be used to account correctly for the double counting problem.

The load value mismatch between the IBIS delay and the  $t_{CO}$  measurement of the Quartus Prime software prevents the delays from being safely added together. Warning messages displayed when the EDA Netlist Writer runs indicate when this mismatch occurs.

### 1.3.2. Customize the Output Files

You can readily customize the files that the IBIS Writer and HSPICE Writer generate. You must customize any generic IBIS files with the correct RLC values for your specific device package before running signal integrity simulations.

If you generate IBIS files with the EDA Netlist Writer or IBIS Writer script, the IBIS Writer automatically customizes the files with the RLC values for the current target device. For details, refer to [Simulation with IBIS Models](#).

You can make additions or adjustments to the default simulation in the generated files to change the parameters of the default simulation or to perform additional measurements. For details, refer to [Simulation with HSPICE Models](#).

### 1.3.3. Set Up and Run Simulations in Third-Party Tools

When you have generated the files, you can use them to perform simulations in your selected simulation tool.

With IBIS models, you can apply them to input, output, or bidirectional buffer entities and quickly set up and run simulations. For HSPICE decks, the simulation parameters are included in the files. Open the files in Synopsys HSPICE and run simulations for each pin as required.

With HSPICE decks generated from the HSPICE Writer, the double counting problem is accounted for, which ensures that your simulations are accurate.

Simulations that involve IBIS models created with anything other than the default loading settings in the Quartus Prime software must take into account the change in the size of the load between the IBIS delay and the Quartus Prime  $t_{CO}$  measurement. Warning messages during compilation alert you to this change.

### 1.3.4. Interpret Simulation Results

If you encounter timing or signal integrity issues with your high-speed signals after running simulations, you can make adjustments to I/O assignment settings in the Quartus Prime software.

You can adjust drive strength or I/O standard, or make changes to the board routing or topology. After regenerating models in the Quartus Prime software based on the changes you have made, rerun the simulations to check whether your changes corrected the problem.

## 1.4. Simulation with IBIS Models

IBIS models provide a way to run accurate signal integrity simulations quickly. IBIS models describe the behavior of I/O buffers with voltage-current and voltage-time data curves.

Because of their behavioral nature, IBIS models do not have to include any information about the internal circuit design of the I/O buffer. Intel provides free IBIS models for use with Intel FPGA designs in signal integrity analysis simulation tools. You can obtain and customize these models for signal integrity design simulation.

### 1.4.1. IBIS Model Access and Customization Flows

There are different methods of accessing and customizing the IBIS models, depending on your target device family.

**Table 2. IBIS Model Access and Customization**

## 1.4.2. Elements of an IBIS Model

An IBIS model file (.ibs) is a text file that describes the behavior of an I/O buffer across minimum, typical, and maximum temperature and voltage ranges with a specified test load.

The tables and values specified in the IBIS file describe five basic elements of the I/O buffer.

The following elements correspond to each numbered block.

1. **Pulldown**—A voltage-current table describes the current when the buffer is driven low based on a pull-down voltage range of  $-V_{CC}$  to  $2 V_{CC}$ .
2. **Pullup**—A voltage-current table describes the current when the buffer is driven high based on a pull-up voltage range of  $-V_{CC}$  to  $V_{CC}$ .
3. **Ground and Power Clamps**—Voltage-current tables describe the current when clamping diodes for electrostatic discharge (ESD) are present. The ground clamp voltage range is  $-V_{CC}$  to  $V_{CC}$ , and the power clamp voltage range is  $-V_{CC}$  to ground.
4. **Ramp and Rising/Falling Waveform**—A voltage-time (dv/dt) ratio describes the rise and fall time of the buffer during a logic transition. Optional rising and falling waveform tables can be added to more accurately describe the characteristics of the rising and falling transitions.
5. **Total Output Capacitance and Package RLC**—The total output capacitance includes the parasitic capacitances of the output pad, clamp diodes (if present), and input transistors. The package RLC is device package-specific and defines the resistance, inductance, and capacitance of the bond wire and pin of the I/O.

**Figure 2. Five Basic Elements of an I/O Buffer in IBIS Models**

### 1.4.3. Customizing IBIS Models

There are different options for obtaining and customizing Intel FPGA IBIS models, depending on your target device family, as [IBIS Model Access and Customization Flows](#) describes. The following topics describe these different options for obtaining and customizing Intel FPGA IBIS models.

The IBIS file that the Quartus Prime EDA Netlist Writer GUI generates contains models of both input and output termination, and is supported for IBIS model versions of 4.2 and later.

The Quartus Prime IBIS dynamic OCT IBIS model names end in g50c\_r50c. For example : sst115i\_ctnio\_g50c\_r50c.

In the simulation tool, the IBIS model is attached to a buffer.

- When the buffer is assigned as an output, use the series termination r50c.
- When the buffer is assigned as an input, use the parallel termination g50c.

#### 1.4.3.1. Generate Custom IBIS Models with the EDA Netlist Writer GUI

You can use the Quartus Prime EDA Netlist Writer GUI to generate custom IBIS models.

IBIS files that you generate with the EDA Netlist Writer automatically include the RLC values for your current target device.

Before generating the custom IBIS model, you can specify I/O constraints to define things like drive strength, enabling of clamping diodes for ESD protection, and other settings. The custom IBIS models that EDA Netlist Writer generates then reflect the I/O assignments.

To generate custom IBIS models with the EDA Netlist Writer GUI, follow these steps:

1. To specify the format, version, and output location of the generated model files, click **Assignments > Settings > EDA Tool Settings**.
2. Under **Board Level signal integrity analysis**, specify **IBIS** for the **Format**, the supported **IBIS version** that you want, and the location of the **Output directory** for the generated files.
3. Click **Assignments > Device**. In the **Device** dialog box, click the **Device and Pin Options** button and review and specify any optional IBIS settings, as [Board Level Signal Integrity Analysis Settings](#) describes.
4. To run the EDA Netlist Writer to generate the custom IBIS model files, click **Processing > Start > Start EDA Netlist Writer**.

**Figure 3. Board Level Signal Integrity Analysis Settings**

The screenshot shows a dialog box titled "Board-level signal integrity analysis". It contains the following settings:

- Format: IBIS
- IBIS version: 5.0
- Output directory: board/ibis
- ☐ Enable model selector
- ☐ Enable extended model selector
- ☒ Print per pin RLC package model with mutual coupling
- ☐ Enable IBIS AMI (GPIO only)

#### 1.4.3.1.1. Board Level Signal Integrity Analysis Settings

The following settings are available for generation of custom IBIS models using the EDA Netlist Writer GUI:

**Table 3. Board Level Signal Integrity Analysis Settings**

Setting	Description
<b>Format</b>	Specifies <b>IBIS</b> as the format for output generation of custom IBIS models for board level signal integrity analysis in supported third-party tools.
<b>IBIS version</b>	Specifies the IBIS version <b>5.0</b> or <b>4.2</b> for the custom IBIS model you generate. Only version <b>5.0</b> is available for Agilex FPGA portfolio devices.
<b>Output directory</b>	Specifies the directory path for custom IBIS model generation. By default, the path is <code>&lt;project&gt;/board/ibis</code> .
<b>Enable model selector</b>	Enables the model selector feature that lists all the possible models for each I/O cell in the design. This setting is turned off by default.
<b>Enable extended model selector</b>	Enables the extended model selector feature. This setting is an extension of the <b>Enable model selector</b> setting. The extension lists additional models for I/O standards with Class I and II. This setting is turned off by default.
<b>Enable per pin RLC package model with mutual coupling</b>	Allows you to generate the per pin RLC package model with mutual coupling. The lumped RLC package model information appears in the IBIS output file. This setting is turned off by default except for Agilex FPGA portfolio devices.
<b>Enable IBIS-AMI (GPIO Only)</b>	Enables generation of IBIS-AMI models that you can use to model high-speed serial and parallel links that include transmitter and receiver equalization algorithms. This setting is available for only Agilex 5 devices and Agilex 7 M-Series devices. This setting is turned off by default for all applicable devices.

#### 1.4.3.2. Customizing Downloaded or Installed IBIS Model Files for Agilex FPGA Portfolio Devices

The current Quartus Prime Pro Edition software installation includes the Intel FPGA IBIS models and IBIS writer script for Agilex FPGA portfolio devices in `/quartus/common/misc/ibis_writer/`. In addition, you can download the latest models (without the script) from: [IBIS Models for Intel FPGA Devices](#).

The downloaded or installed IBIS models have the RLC package values set to only one particular device in each device family. These generic models describe the full set of models listed for and supported by each device family at: [IBIS Models for Intel FPGA Devices](#).

Alternatively, you can generate custom IBIS models for Agilex FPGA portfolio devices by using the Quartus Prime EDA Netlist Writer GUI, as [Generate Custom IBIS Models with the EDA Netlist Writer GUI](#) describes.

To simulate your design with the most accurate model, you must customize the `.ibs` files to adjust the RLC values for accurate device package data using the IBIS Writer script. Use the script to customize the IBIS model file to match the values for your particular device package.

To use the IBIS Writer script, refer to the step by step instructions in the `/quartus/common/misc/ibis_writer/README.txt` file.

### 1.4.3.3. Customizing Downloaded IBIS Models for Stratix 10 Devices, Arria 10 Devices, and Cyclone 10 GX Devices

You can download the IBIS models for Stratix 10 devices, Arria 10 devices, and Cyclone 10 GX devices from the Intel website. You can use these IBIS models directly to perform early simulations of the I/O buffers that you expect to use in your design as part of a pre-layout analysis.

These downloaded IBIS models have the RLC package values set to only one particular device in each device family. These generic models describe only a certain set of models listed for each device at: [IBIS Models for Intel FPGA Devices](#).

To simulate your design with the most accurate model, you must customize the .ibs files to adjust the RLC values for accurate device package data. Customize the IBIS model file to match the values for your particular device package by performing the following steps:

1. Download and expand the ZIP file (.zip) of the IBIS model for the device family you are using for your design. The .zip file contains the .ibs file along with an IBIS model user guide and a model data correlation report.
2. Download the Package RLC Values spreadsheet for the same device family.
3. Open the spreadsheet and locate the row that describes the device package used in your design.
4. From the package's **I/O** row, copy the minimum, maximum, and typical values of resistance, inductance, and capacitance for your device package.
5. Open the .ibs file in a text editor and locate the [Package] section of the file.
6. Overwrite the listed values copied with the values from the spreadsheet and save the file.

#### Related Information

### 1.4.4. Design Simulation Using the Siemens EDA HyperLynx\* Software

You must integrate IBIS models into board design simulations to accurately model timing and signal integrity.

The Siemens EDA HyperLynx\* software is an industry standard tool for PCB analysis and simulation of high-speed designs. The HyperLynx software makes it easy to integrate IBIS models into simulations.

The HyperLynx software consists of the LineSim and BoardSim products. LineSim is an early simulation tool. Before any board routing takes place, you can use LineSim to simulate "what if" scenarios that assist in creating routing rules and defining board parameters.

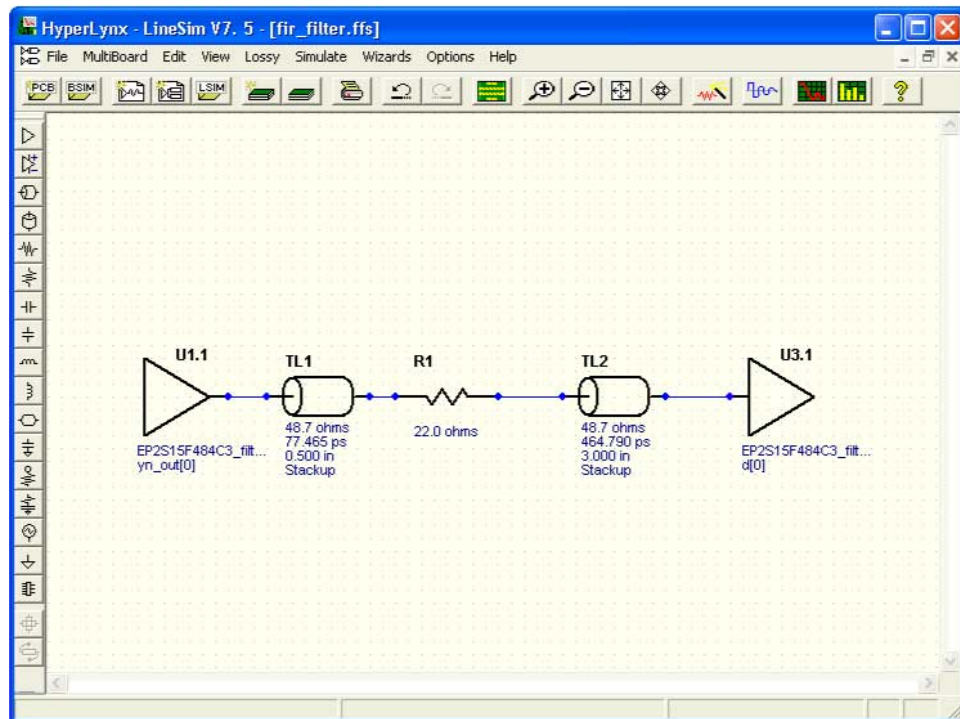

BoardSim is a post-layout tool that you can use to analyze existing board routing. You select one or more nets from a board layout file and BoardSim simulates those nets in a manner similar to LineSim. With board and routing parameters, and surrounding signal routing known, highly accurate simulations of the final fabricated PCB are possible.

This document section focuses on LineSim. Because the process of creating and running simulations is very similar for both LineSim and BoardSim, the details of IBIS model use in LineSim also apply to simulations in BoardSim.

You configure simulations in LineSim using a schematic GUI to create connections and topologies between I/O buffers, route trace segments, and termination components. LineSim provides two methods for creating routing schematics: cell-based and free-form. Cell-based schematics are based on fixed cells consisting of typical placements of buffers, trace impedances, and components. Parts of the grid-based cells are filled with the desired objects to create the topology. A topology in a cell-based schematic is limited by the available connections within and between the cells.

A more robust and expandable way to create a circuit schematic for simulation is to use the free-form schematic format in LineSim. The free-form schematic format makes it easy to place parts into any configuration and edit them as required. This section describes the use of IBIS models with free-form schematics, but the process is nearly identical for cell-based schematics.

**Figure 4. HyperLynx LineSim Free-Form Schematic Editor**

When you use HyperLynx software to perform simulations, you typically perform the following steps:

1. Create a new LineSim free-form schematic document and set up the board stackup for your PCB using the Stackup Editor. In this editor, specify board layer properties including layer thickness, dielectric constant, and trace width.
2. Create a circuit schematic for the net you want to simulate. The schematic represents all the parts of the routed net including source and destination I/O buffers, termination components, transmission line segments, and representations of impedance discontinuities such as vias or connectors.
3. Assign IBIS models to the source and destination I/O buffers to represent their behavior during operation.
4. Attach probes from the digital oscilloscope that is built in to LineSim to points in the circuit that you want to monitor during simulation. Typically, at least one probe is attached to the pin of a destination I/O buffer. For differential signals, you can attach a differential probe to both the positive and negative pins at the destination.
5. Configure and run the simulation. You can simulate a rising or falling edge and test the circuit under different drive strength conditions.
6. Interpret the results and make adjustments. Based on the waveforms captured in the digital oscilloscope, you can adjust anything in the circuit schematic to correct any signal integrity issues, such as overshoot or ringing. If necessary, you can make I/O assignment changes in the Quartus Prime software, regenerate the IBIS file with the IBIS Writer, and apply the updated IBIS model to the buffers in your HyperLynx software schematic.
7. Repeat the simulations and circuit adjustments until you are satisfied with the results.
8. When the operation of the net meets your design requirements, implement changes to your I/O assignments in the Quartus Prime software and optionally adjust your board routing constraints, component values, and placement to match the simulation.

For more information about HyperLynx software, including schematic creation, simulation setup, model usage, product support, licensing, and training, refer to the Siemens EDA webpage.

### 1.4.5. Configuring LineSim to Use Intel IBIS Models

You must configure LineSim to find and use the IBIS models for your design. To do this, add the location of your `.ibs` file or files to the LineSim Model Library search path. Next, you apply a selected model to a buffer in your schematic.

To add the Quartus Prime software's default IBIS model location, `<project directory>/board/ibis`, to the HyperLynx LineSim model library search path, perform the following steps in LineSim:

1. From the Options menu, click **Directories**. The **Set Directories** dialog box appears. The **Model-library file path(s)** list displays the order in which LineSim searches file directories for model files.

**Figure 5. LineSim Set Directories Dialog Box**

2. Click **Edit**. A dialog box appears where you can add directories and adjust the order in which LineSim searches them.

**Figure 6. LineSim Select Directories Dialog Box**

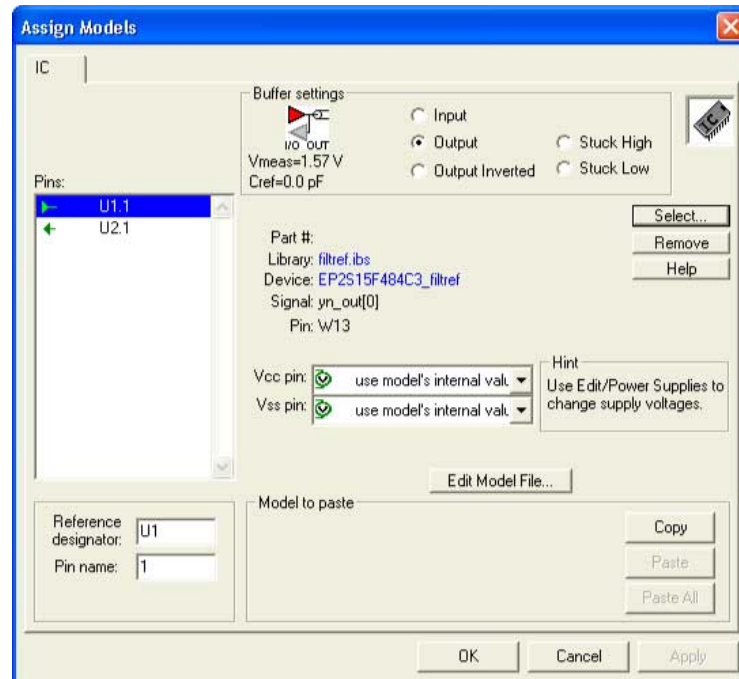

3. Click **Add**
4. Browse to the default IBIS model location, *<project directory>/board/ibis*. Click **OK**.
5. Click **Up** to move the IBIS model directory to the top of the list. Click **Generate Model Index** to update LineSim's model database with the models found in the added directory.
6. Click **OK**. The IBIS model directory for your project is added to the top of the Model-library file path(s) list.
7. To close the **Set Directories** dialog box, click **OK**.

### 1.4.6. Integrating Intel IBIS Models into LineSim Simulations

When the location for IBIS files has been set, you can assign the downloaded or generated IBIS models to the buffers in your schematic. To do this, perform the following steps:

1. Double-click a buffer symbol in your schematic to open the **Assign Models** dialog box. You can also click **Assign Models** from the buffer symbol's right-click menu.

**Figure 7. LineSim Assign Model Dialog Box**

2. The pin of the buffer symbol you selected should be highlighted in the **Pins** list. If you want to assign a model to a different symbol or pin, select it from the list.
3. Click **Select**. The **Select IC Model** dialog box appears.

Figure 8. LineSim Select IC Model Dialog Box

4. To filter the list of available libraries to display only IBIS models, select **.IBS**. Scroll through the **Libraries** list, and click the name of the library for your design. By default, this is `<project name>.ibs`.
5. The device for your design should be selected as the only item in the **Devices** list. If not, select your device from the list.
6. From the **Signal** list, select the name of the signal you want to simulate. You can also choose to select by device pin number.
7. Click **OK**. The **Assign Models** dialog box displays the selected `.ibs` file and signal.
8. If applicable to the signal you chose, adjust the buffer settings as required for the simulation.
9. Select and configure other buffer pins from the **Pins** list in the same manner.
10. Click **OK** when all I/O models are assigned.

### 1.4.7. Running and Interpreting LineSim Simulations

You can run any simulation and make adjustments to the I/O assignments or simulation parameters as required.

For example, if you see too much overshoot in the simulated signal at the destination buffer after running a simulation, you can adjust the drive strength I/O assignment setting to a lower value. Regenerate the `.ibs` file, and run the simulation again to verify whether the change fixes the problem.

**Figure 9. Example of Overshoot in HyperLynx with IBIS Models**

If you see a discontinuity or other anomalies at the destination, such as slow rise and fall times, adjust the termination scheme or termination component values. After making these changes, rerun the simulation to check whether your adjustments solved the problem. In this case, it is not necessary to regenerate the .ibs file.

**Figure 10. Example of Signal Integrity Anomaly in HyperLynx with IBIS Models**

For more information about board-level signal integrity, and to learn about ways to improve it with simple changes to your design, visit the Intel FPGA Signal & Power Integrity Support Center.

[Intel Signal & Power Integrity Center](#)

## 1.5. Simulation with HSPICE Models

HSPICE decks are used to perform highly accurate simulations by describing the physical properties of all aspects of a circuit precisely. HSPICE decks describe I/O buffers, board components, and all the connections between them, as well as defining the parameters of the simulation to be run.

By their nature, HSPICE decks are highly customizable and require a detailed description of the circuit under simulation. The HSPICE decks generated by the Quartus Prime HSPICE Writer automatically include board components and topology defined in the Board Trace Model. Configure the board components and topology in the Pin Planner or in the **Board Trace Model** tab of the **Device and Pin Options** dialog box. All HSPICE decks generated by the Quartus Prime software include compensation for the double count problem. You can simulate with the default simulation parameters built in to the generated HSPICE decks or make adjustments to customize your simulation.

### Related Information

[The Double Counting Problem in HSPICE Simulations](#) on page 22

### 1.5.1. Supported Devices and Signaling

The HSPICE Writer in the Quartus Prime software supports Arria, Cyclone, and Stratix devices for the creation of a board trace model in the Quartus Prime software for automatic inclusion in an HSPICE deck.

The HSPICE files include the board trace description you create in the Board Trace Model view in the Pin Planner or the **Board Trace Model** tab in the **Device and Pin Options** dialog box.

**Note:** Note that for Arria 10 devices, you may need to download the Encrypted HSPICE model from the Intel website.

### Related Information

For information about how to use the **Enable Advanced I/O Timing** option and configure board trace models for the I/O standards used in your design.
- [SPICE Models for Intel FPGAs](#)  
For more information about the Encrypted HSPICE model.

### 1.5.2. Accessing HSPICE Simulation Kits

You can access the available HSPICE models with the Quartus Prime software's HSPICE Writer tool and also at the Spice Models for Intel Devices web page.

The Quartus Prime software HSPICE Writer tool removes many common sources of user error from the I/O simulation process. The HSPICE Writer tool automatically creates preconfigured I/O simulation spice decks that only require the addition of a user board model. All the difficult tasks required to configure the I/O modes and interpret the timing results are handled automatically by the HSPICE Writer tool.

### Related Information

For more information about the Encrypted HSPICE model.

### 1.5.3. The Double Counting Problem in HSPICE Simulations

Simulating I/Os using accurate models is extremely helpful for finding and fixing FPGA I/O timing and board signal integrity issues before any boards are built. However, the usefulness of such simulations is directly related to the accuracy of the models used and whether the simulations are set up and performed correctly.

To ensure accuracy in models and simulations created for FPGA output signals you must consider the timing hand-off between  $t_{CO}$  timing in the Quartus Prime software and simulation-based board delay. If this hand-off is not handled correctly, the calculated delay could either count some of the delay twice or even miss counting some of the delay entirely.

#### 1.5.3.1. Defining the Double Counting Problem

The double counting problem is inherent to the difference between the method to analyze output timing in the Quartus Prime software versus the method HSPICE models use. The timing analyzer tools in the Quartus Prime software measure delay timing for an output signal from the core logic of the FPGA design through the output buffer, ending at the FPGA pin with a default capacitive load or a specified value for the I/O standard you selected. This measurement is the  $t_{CO}$  timing variable.

**Figure 11. Double Counting Problem**

HSPICE models for board simulation measure  $t_{PD}$  (propagation delay) from an arbitrary reference point in the output buffer, through the device pin, out along the board routing, and ending at the signal destination. If you add these two delays, the delay between the output buffer and the device pin appears twice in the calculation. A model or simulation that does not account for this double count creates overly pessimistic simulation results, because the double-counted delay can limit I/O performance artificially.

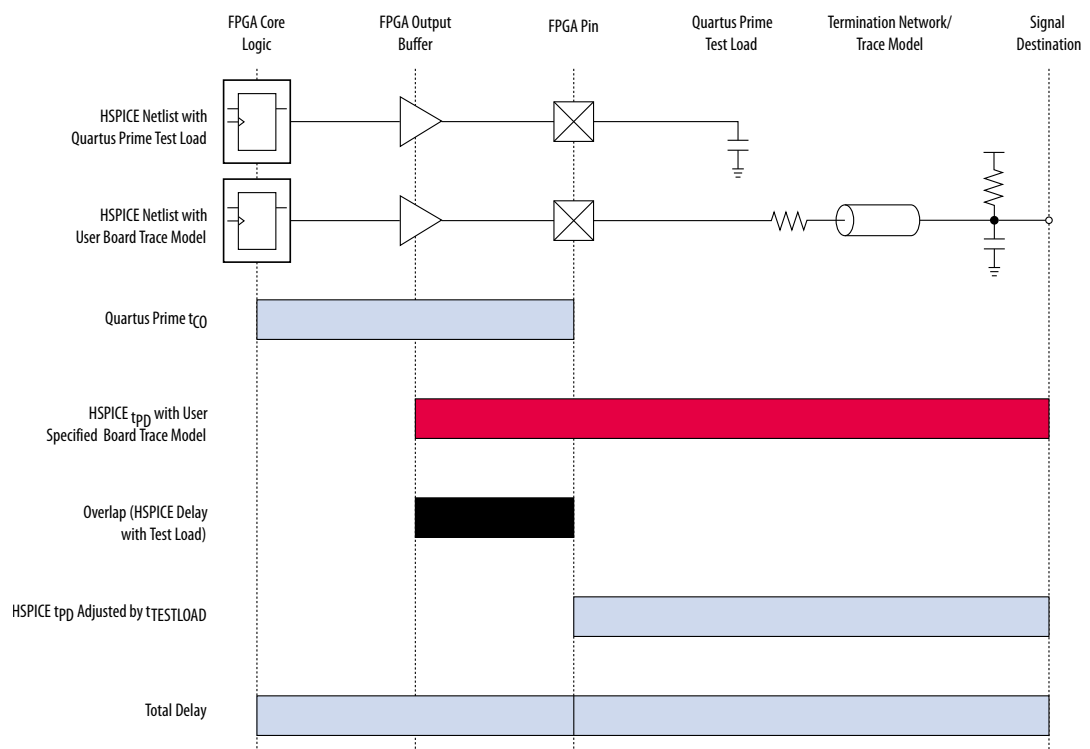

One approach to fix the problem is subtracting the overlap between  $t_{CO}$  and  $t_{PD}$  to account for the double count. However, this adjustment is not accurate, because each measurement considers a different load.

**Note:** Input signals do not exhibit this problem, because the HSPICE models for inputs stop at the FPGA pin instead of at the input buffer. In this case, adding the delays together produces an accurate measurement of delay timing.

### 1.5.3.2. The Solution to Double Counting

To adjust the measurements to account for the double-counting, the delay between the arbitrary point in the output buffer selected by the HSPICE model and the FPGA pin must be subtracted from either  $t_{CO}$  or  $t_{PD}$  before adding the results together. The subtracted delay must also be based on a common load between the two measurements. This is done by repeating the HSPICE model measurement, but with the same load used by the Quartus Prime software for the  $t_{CO}$  measurement.

**Figure 12. Common Test Loads Used for Output Timing**

With  $t_{TESTLOAD}$  known, the total delay is calculated for the output signal from the FPGA logic to the signal destination on the board, accounting for the double count.

$$t_{\text{delay}} = t_{CO} + (t_{PD} - t_{TESTLOAD})$$

The preconfigured simulation files generated by the HSPICE Writer in the Quartus Prime software are designed to account for the double-counting problem based on this calculation automatically.

## 1.5.4. HSPICE Writer Tool Flow

This section includes information to help you get started using the Quartus Prime software HSPICE Writer tool. The information in this section assumes you have a basic knowledge of the standard Quartus Prime software design flow, such as project and assignment creation, compilation, and timing analysis.

### 1.5.4.1. Applying I/O Assignments

The first step in the HSPICE Writer tool flow is to configure the I/O standards and modes for each of the pins in your design properly. In the Quartus Prime software, these settings are represented by assignments that map I/O settings, such as pin selection, and I/O standard and drive strength, to corresponding signals in your design.

The Quartus Prime software provides multiple methods for creating these assignments:

- Using the Pin Planner
- Using the assignment editor
- Manually editing the .qsf file
- By making assignments in a scripted Quartus Prime flow using Tcl

### 1.5.4.2. Enabling HSPICE Writer Using Assignments

You can also use HSPICE Writer in conjunction with a scripted Tcl flow. To enable HSPICE Writer during a full compile, include the following lines in your Tcl script.

#### Enable HSPICE Writer

```
set_global_assignment -name EDA_BOARD_DESIGN_SIGNAL_INTEGRITY_TOOL \
    "HSPICE (Signal Integrity)"
set_global_assignment -name EDA_OUTPUT_DATA_FORMAT HSPICE \
    -section_id eda_board_design_signal_integrity
set_global_assignment -name EDA_NETLIST_WRITER_OUTPUT_DIR <output_directory> \
    -section_id eda_board_design_signal_integrity
```

As with command-line invocation, specifying the output directory is optional. If not specified, the output directory defaults to board/hspice.

### 1.5.4.3. Naming Conventions for HSPICE Files

HSPICE Writer automatically generates simulation files and names them using the following naming convention: <device>\_<pin #>\_<pin\_name>\_<in/out>.sp.

For bidirectional pins, two spice decks are produced; one with the I/O buffer configured as an input, and the other with the I/O buffer configured as an output.

The Quartus Prime software supports alphanumeric pin names that contain the underscore (\_) and dash (-) characters. Any illegal characters used in file names are converted automatically to underscores.

#### Related Information

- [Sample Output for I/O HSPICE Simulation Deck](#) on page 35

- [Sample Input for I/O HSPICE Simulation Deck](#) on page 31

#### 1.5.4.4. Invoking HSPICE Writer

After HSPICE Writer is enabled, the HSPICE simulation files are generated automatically each time the project is completely compiled. The Quartus Prime software also provides an option to generate a new set of simulation files without having to recompile manually. In the Processing menu, click **Start EDA Netlist Writer** to generate new simulation files automatically.

*Note:* You must perform both Analysis & Synthesis and Fitting on a design before invoking the HSPICE Writer tool.

#### 1.5.4.5. Invoking HSPICE Writer from the Command Line

If you use a script-based flow to compile your project, you can create HSPICE model files by including the following commands in your Tcl script (.tcl file).

##### Create HSPICE Model Files

```
set_global_assignment -name EDA_BOARD_DESIGN_SIGNAL_INTEGRITY_TOOL \
    "HSPICE (Signal Integrity)"
set_global_assignment -name EDA_OUTPUT_DATA_FORMAT HSPICE \
    -section_id eda_board_design_signal_integrity
set_global_assignment -name EDA_NETLIST_WRITER_OUTPUT_DIR <output_directory> \
    -section_id eda_board_design_signal_integrity
```

The <output\_directory> option specifies the location to save HSPICE model files. By default, the <project\_directory>/board/hspice directory is used.

##### Invoke HSPICE Writer

To invoke the HSPICE Writer tool through the command line, type:

```
quartus_eda.exe <project_name> --board_signal_integrity=on --format=HSPICE \
    --output_directory=<output_directory>
```

<output\_directory> specifies the location where the tool writes the generated spice decks, relative to the design directory. This is an optional parameter and defaults to board/hspice.

#### 1.5.4.6. Customizing Automatically Generated HSPICE Decks

HSPICE models generated by the HSPICE Writer can be used for simulation as generated.

A default board description is included, and a default simulation is set up to measure rise and fall delays for both input and output simulations, which compensates for the double counting problem. However, Intel recommends that you customize the board description to more accurately represent your routing and termination scheme.

The sample board trace loading in the generated HSPICE model files must be replaced by your actual trace model before you can run a correct simulation. To do this, open the generated HSPICE model files for all pins you want to simulate and locate the following section.

### Sample Board Trace Section

```
* I/O Board Trace and Termination Description
* - Replace this with your board trace and termination description
```

You must replace the example load with a load that matches the design of your PCB board. This includes a trace model, termination resistors, and, for output simulations, a receiver model. The spice circuit node that represents the pin of the FPGA package is called **pin**. The node that represents the far pin of the external device is called **load-in** (for output SPICE decks) and **source-in** (for input SPICE decks).

For an input simulation, you must also modify the stimulus portion of the spice file. The section of the file that must be modified is indicated in the following comment block.

### Sample Source Stimulus Section

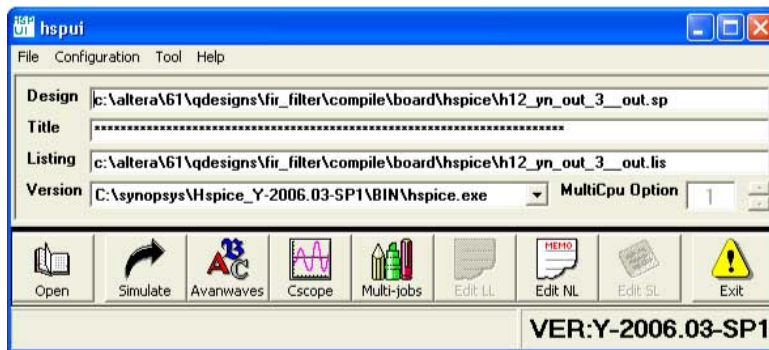

```
* Sample source stimulus placeholder
* - Replace this with your I/O driver model
```

Replace the sample stimulus model with a model for the device that drives the FPGA.

## 1.5.5. Running an HSPICE Simulation

Because simulation parameters are configured directly in the HSPICE model files, running a simulation requires only that you open an HSPICE file in the HSPICE user interface and start the simulation.

**Figure 13. HSPICE User Interface Window**

Click **Open** and browse to the location of the HSPICE model files generated by the Quartus Prime HSPICE Writer. The default location for HSPICE model files is *<project directory>/board/hspice*. Select the .sp file generated by the HSPICE Writer for the signal you want to simulate. Click **OK**.

To run the simulation, click **Simulate**. The status of the simulation is displayed in the window and saved in an .lis file with the same name as the .sp file when the simulation is complete. Check the .lis file if an error occurs during the simulation requiring a change in the .sp file to fix.

### 1.5.6. Interpreting the Results of an Output Simulation

By default, the automatically generated output simulation spice decks are set up to measure three delays for both rising and falling transitions. Two of the measurements, `tpd_rise` and `tpd_fall`, measure the double-counting corrected delay from the FPGA pin to the load pin. To determine the complete clock-edge to load-pin delay, add these numbers to the Quartus Prime software reported default loading  $t_{CO}$  delay.

The remaining four measurements, `tpd_uncomp_rise`, `tpd_uncomp_fall`, `t_dblcnt_rise`, and `t_dblcnt_fall`, are required for the double-counting compensation process and are not required for further timing usage.

#### Related Information

[Simulation Analysis](#) on page 35

### 1.5.7. Interpreting the Results of an Input Simulation

By default, the automatically generated input simulation SPICE decks are set up to measure delays from the source's driver pin to the FPGA's input pin for both rising and falling transitions.

The propagation delay is reported by HSPICE measure statements as `tpd_rise` and `tpd_fall`. To determine the complete source driver pin-to-FPGA register delay, add these numbers to the Quartus Prime software reported  $T_H$  and  $T_{SU}$  input timing numbers.

### 1.5.8. Viewing and Interpreting Tabular Simulation Results

The `.lis` file stores the collected simulation data in tabular form. The default simulation configured by the HSPICE Writer produces delay measurements for rising and falling transitions on both input and output simulations.

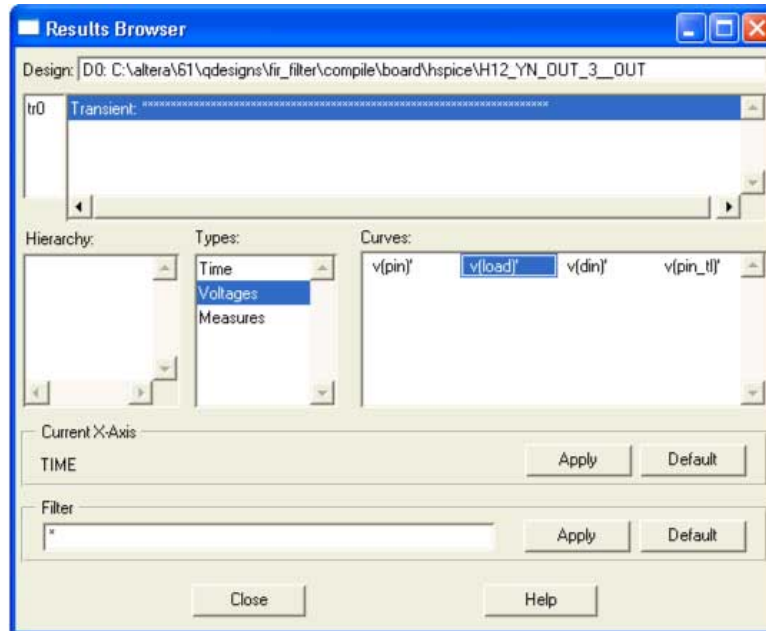

These measurements are found in the `.lis` file and named `tpd_rise` and `tpd_fall`. For output simulations, these values are already adjusted for the double count. To determine the complete delay from the FPGA logic to the load pin, add either of these measurements to the Quartus Prime  $t_{CO}$  delay. For input simulations, add either of these measurements to the Quartus Prime  $t_{SU}$  and  $t_H$  delay values to calculate the complete delay from the far end stimulus to the FPGA logic. Other values found in the `.lis` file, such as `tpd_uncomp_rise`, `tpd_uncomp_fall`, `t_dblcnt_rise`, and `t_dblcnt_fall`, are parts of the double count compensation calculation. These values are not necessary for further analysis.

### 1.5.9. Viewing Graphical Simulation Results

You can view the results of the simulation quickly as a graphical waveform display using the AvanWaves viewer included with HSPICE. With the default simulation configured by the HSPICE Writer, you can view the simulated waveforms at both the source and destination in input and output simulations.

To see the waveforms for the simulation, in the HSPICE user interface window, click **AvanWaves**. The AvanWaves viewer opens and displays the **Results Browser**.

**Figure 14. HSPICE AvanWaves Results Browser**

The **Results Browser** lets you select which waveform to view quickly in the main viewing window. If multiple simulations are run on the same signal, the list at the top of the **Results Browser** displays the results of each simulation. Click the simulation description to select which simulation to view. By default, the descriptions are derived from the first line of the HSPICE file, so the description might appear as a line of asterisks.

Select the type of waveform to view, by performing the following steps:

1. To see the source and destination waveforms with the default simulation, from the **Types** list, select **Voltages**.
2. On the **Curves** list, double-click the waveform you want to view. The waveform appears in the main viewing window.

You can zoom in and out and adjust the view as desired.

**Figure 15. AvanWaves Waveform Viewer**

### 1.5.10. Making Design Adjustments Based on HSPICE Simulations

Based on the results of your simulations, you can make adjustments to the I/O assignments or simulation parameters if required. For example, after you run a simulation and see overshoot or ringing in the simulated signal at the destination buffer, you can adjust the drive strength I/O assignment setting to a lower value. Regenerate the HSPICE deck, and run the simulation again to verify that the change fixed the problem.

**Figure 16. Example of Overshoot in the AvanWaves Waveform Viewer**

If there is a discontinuity or any other anomalies at the destination, adjust the board description in the Quartus Prime Board Trace Model, or in the generated HSPICE model files to change the termination scheme or adjust termination component values. After making these changes, regenerate the HSPICE files if necessary, and rerun the simulation to verify whether your adjustments solved the problem.

**Figure 17. Example of Signal Integrity Anomaly in the AvanWaves Waveform Viewer**

For more information about board-level signal integrity and to learn about ways to improve it with simple changes to your FPGA design, visit the [Intel Signal & Power Integrity Center](#)

#### **Related Information**

### **1.5.11. Sample Input for I/O HSPICE Simulation Deck**

The following sections examine a typical HSPICE simulation spice deck for an I/O of type input. Each section presents the simulation file one block at a time.

#### **1.5.11.1. Header Comment**

The first block of an input simulation spice deck is the header comment. The purpose of this block is to provide an easily readable summary of how the simulation file has been automatically configured by the Quartus Prime software.

This block has two main components: The first component summarizes the I/O configuration relevant information such as device, speed grade, and so on. The second component specifies the exact test condition that the Quartus Prime software assumes for the given I/O standard.

### Sample Header Comment Block

```
* Intel Quartus Prime HSPICE Writer I/O Simulation Deck*
* This spice simulation deck was automatically generated by
* Quartus for the following IO settings:
*
* Device: EP2S60F1020C3
* Speed Grade: C3
* Pin: AA4 (out96)
* Bank: IO Bank 6 (Row I/O)
* I/O Standard: LVTTTL, 12mA
* OCT: Off
*
* Intel Quartus Prime's default I/O timing delays assume the following slow
* corner simulation conditions.
*
* Specified Test Conditions For Intel Quartus Prime Tco
* Temperature: 85C (Slowest Temperature Corner)
* Transistor Model: TT (Typical Transistor Corner)
* Vccn: 3.135V (Vccn_min = Nominal - 5%)
* Vccpd: 2.97V (Vccpd_min = Nominal - 10%)
* Load: No Load
* Vtt: 1.5675V (Voltage reference is Vccn/2)
*
* Note: The I/O transistors are specified to operate at least as
* fast as the TT transistor corner, actual production
* devices can be as fast as the FF corner. Any simulations
* for hold times should be conducted using the fast process
* corner with the following simulation conditions.
* Temperature: 0C (Fastest Commercial Temperature Corner **)
* Transistor Model: FF (Fastest Transistor Corner)
* Vccn: 1.98V (Vccn_hold = Nominal + 10%)
* Vccpd: 3.63V (Vccpd_hold = Nominal + 10%)
* Vtt: 0.95V (Vtt_hold = Vccn/2 - 40mV)
* Vcc: 1.25V (Vcc_hold = Maximum Recommended)
* Package Model: Short-circuit from pad to pin (no parasitics)
*
* Warnings:
```

#### 1.5.11.2. Simulation Conditions

The simulation conditions block loads the appropriate process corner models for the transistors. This condition is automatically set up for the slow timing corner and is modified only if other simulation corners are desired.

#### Simulation Conditions Block

```
* Process Settings
.options brief
.inc 'sii_tt.inc' * TT process corner
```

#### 1.5.11.3. Simulation Options

The simulation options block configures the simulation temperature and configures HSPICE with typical simulation options.

#### Simulation Options Block

```
* Simulation Options
.options brief=0
.options badchr co=132 scale=1e-6 acct ingold=2 nomod dv=1.0
+ dcstep=1 absv=1e-3 absi=1e-8 probe csdf=2 accurate=1
+ converge=1
.temp 85
```

**Note:** For a detailed description of these options, consult your *HSPICE* manual.

#### 1.5.11.4. Constant Definition

The constant definition block of the simulation file instantiates the voltage sources that controls the configuration modes of the I/O buffer.

##### Constant Definition Block

```
* Constant Definition
voeb oeb 0 vc * Set to 0 to enable buffer output
vopdrain opdrain 0 0 * Set to vc to enable open drain
vrambh rambh 0 0 * Set to vc to enable bus hold
vrpullup rpullup 0 0 * Set to vc to enable weak pullup
vpmdp5 rpmdp5 0 rp5 * Set the IO standard
vpmdp4 rpmdp4 0 rp4
vpmdp3 rpmdp3 0 rp3
vpmdp2 rpmdp2 0 rp2
vpmdp1 rpmdp1 0 rp1
vpmdp0 rpmdp0 0 rp0
vpmdn4 rpmdn4 0 rn4
vpmdn3 rpmdn3 0 rn3
vpmdn2 rpmdn2 0 rn2
vpmdn1 rpmdn1 0 rn1
vpmdn0 rpmdn0 0 rn0
vdin din 0 0
```

Where:

- Voltage source voeb controls the output enable of the buffer and is set to disabled for inputs.
- vopdrain controls the open drain mode for the I/O.
- vrambh controls the bus hold circuitry in the I/O.
- vrpullup controls the weak pullup.
- The next 11 voltages sources control the I/O standard of the buffer and are configured through a later library call.
- vdin is not used on input pins because it is the data pin for the output buffer.

#### 1.5.11.5. Buffer Netlist

The buffer netlist block of the simulation spice deck loads all the load models required for the corresponding input pin.

##### Buffer Netlist Block

```
* IO Buffer Netlist
.include 'vio_buffer.inc'
```

#### 1.5.11.6. Drive Strength

The drive strength block of the simulation SPICE deck loads the configuration bits necessary to configure the I/O into the proper I/O standard and drive strengths.

Although these settings are not relevant to an input buffer, they are provided to allow the SPICE deck to be modifiable to support bidirectional simulations.

### Drive Strength Block

```
* Drive Strength Settings
.lib 'drive_select_hio.lib' 3p3ttl_12ma
```

### 1.5.11.7. I/O Buffer Instantiation

The I/O buffer instantiation block of the simulation SPICE deck instantiates the necessary power supplies and I/O model components that are necessary to simulate the given I/O.

#### I/O Buffer Instantiation

```
I/O Buffer Instantiation
* Supply Voltages Settings
.param vcn=3.135
.param vpd=2.97
.param vc=1.15
* Instantiate Power Supplies|
vvcc vcc 0 vc * FPGA core voltage
vvss vss 0 0 * FPGA core ground
vvccn vccn 0 vcn * IO supply voltage
vvssn vssn 0 0 * IO ground
vvccpd vccpd 0 vpd * Pre-drive supply voltage
* Instantiate I/O Buffer
xvio_buf din oeb opdrain die rambh
+ rpcdn4 rpcdn3 rpcdn2 rpcdn1 rpcdn0
+ rpcdp5 rpcdp4 rpcdp3 rpcdp2 rpcdp1 rpcdp0
+ rpullup vccn vccpd vcpad0 vio_buf
* Internal Loading on Pad
* - No loading on this pad due to differential buffer/support
* circuitry
* I/O Buffer Package Model
* - Single-ended I/O standard on a Row I/O
.lib 'lib/package.lib' hio
xpkg die pin hio_pkg
```

### 1.5.11.8. Board Trace and Termination

The board trace and termination block of the simulation SPICE deck is provided only as an example. Replace this block with your own board trace and termination models.

#### Board Trace and Termination Block

```
* I/O Board Trace and Termination Description
* - Replace this with your board trace and termination description
wtline pin vssn load vssn N=1 L=1 RLGCMODEL=tlinemodel
.MODEL tlinemodel W MODELTYPE=RLGC N=1 Lo=7.13n Co=2.85p
Rterm2 load vssn 1x
```

### 1.5.11.9. Stimulus Model

The stimulus model block of the simulation spice deck is provided only as a placeholder example. Replace this block with your own stimulus model. Options for this include an IBIS or HSPICE model, among others.

#### Stimulus Model Block

```
* Sample source stimulus placeholder
* - Replace this with your I/O driver model
Vsource source 0 pulse(0 vcn 0s 0.4ns 0.4ns 8.5ns 17.4ns)
```

#### 1.5.11.10. Simulation Analysis

The simulation analysis block of the simulation file is configured to measure the propagation delay from the source to the FPGA pin. Both the source and end point of the delay are referenced against the 50%  $V_{CCN}$  crossing point of the waveform.

##### Simulation Analysis Block

```
* Simulation Analysis Setup
* Print out the voltage waveform at both the source and the pin
.print tran v(source) v(pin)
.tran 0.020ns 17ns
* Measure the propagation delay from the source pin to the pin
* referenced against the 50% voltage threshold crossing point
.measure TRAN tpd_rise TRIG v(source) val='vcn*0.5' rise=1
+ TARG v(pin) val='vcn*0.5' rise=1
.measure TRAN tpd_fall TRIG v(source) val='vcn*0.5' fall=1
+ TARG v(pin) val='vcn*0.5' fall=1
```

#### 1.5.12. Sample Output for I/O HSPICE Simulation Deck

A typical HSPICE simulation SPICE deck for an I/O-type output has several sections. Each section presents the simulation file one block at a time.

##### 1.5.12.1. Header Comment

The first block of an output simulation SPICE deck is the header comment. The purpose of this block is to provide a readable summary of how the simulation file has been automatically configured by the Quartus Prime software.

This block has two main components:

- The first component summarizes the I/O configuration relevant information such as device, speed grade, and so on.
- The second component specifies the exact test condition that the Quartus Prime software assumes when generating  $t_{CO}$  delay numbers. This information is used as part of the double-counting correction circuitry contained in the simulation file.

The SPICE decks are preconfigured to calculate the slow process corner delay but can also be used to simulate the fast process corner as well. The fast corner conditions are listed in the header under the notes section.

The final section of the header comment lists any warning messages that you must consider when you use the SPICE decks.

##### Header Comment Block

```
* Intel Quartus Prime HSPICE Writer I/O Simulation Deck
*
* This spice simulation deck was automatically generated by
* Intel Quartus Prime for the following IO settings:
*
* Device: EP2S60F1020C3
* Speed Grade: C3
* Pin: AA4 (out96)
* Bank: IO Bank 6 (Row I/O)
* I/O Standard: LVTTL, 12mA
* OCT: Off
*
* Quartus' default I/O timing delays assume the following slow
* corner simulation conditions.
* Specified Test Conditions For Intel Quartus Prime Tco
```

```
* Temperature: 85C (Slowest Temperature Corner)
* Transistor Model: TT (Typical Transistor Corner)
* Vccn: 3.135V (Vccn_min = Nominal - 5%)
* Vccpd: 2.97V (Vccpd_min = Nominal - 10%)
* Load: No Load
* Vtt: 1.5675V (Voltage reference is Vccn/2)
* For C3 devices, the TT transistor corner provides an
* approximation for worst case timing. However, for functionality
* simulations, it is recommended that the SS corner be simulated
* as well.
*
* Note: The I/O transistors are specified to operate at least as
* fast as the TT transistor corner, actual production
* devices can be as fast as the FF corner. Any simulations
* for hold times should be conducted using the fast process
* corner with the following simulation conditions.
* Temperature: 0C (Fastest Commercial Temperature Corner **)
* Transistor Model: FF (Fastest Transistor Corner)
* Vccn: 1.98V (Vccn_hold = Nominal + 10%)
* Vccpd: 3.63V (Vccpd_hold = Nominal + 10%)
* Vtt: 0.95V (Vtt_hold = Vccn/2 - 40mV)
* Vcc: 1.25V (Vcc_hold = Maximum Recommended)
* Package Model: Short-circuit from pad to pin
* Warnings:
```

### 1.5.12.2. Simulation Conditions

The simulation conditions block loads the appropriate process corner models for the transistors. This condition is automatically set up for the slow timing corner and must be modified only if other simulation corners are desired.

#### Simulation Conditions Block

```
* Process Settings
.options brief
.inc 'sii_tt.inc' * typical-typical process corner
```

**Note:** Two separate corners cannot be simulated at the same time. Instead, simulate the base case using the Quartus corner as one simulation and then perform a second simulation using the desired customer corner. The results of the two simulations can be manually added together.

### 1.5.12.3. Simulation Options

The simulation options block configures the simulation temperature and configures HSPICE with typical simulation options.

#### Simulation Options Block

```
* Simulation Options
.options brief=0
.options badchr co=132 scale=1e-6 acct ingold=2 nomod dv=1.0
+ dcstep=1 absv=1e-3 absi=1e-8 probe csdf=2 accurate=1
+ converge=1
.temp 85
```

**Note:** For a detailed description of these options, consult your *HSPICE* manual.

### 1.5.12.4. Constant Definition

The constant definition block of the output simulation SPICE deck instantiates the voltage sources that controls the configuration modes of the I/O buffer.

### Constant Definition Block

```
* Constant Definition
voeb oeb 0 0 * Set to 0 to enable buffer output
vopdrain opdrain 0 0 * Set to vc to enable open drain
vrambh rambh 0 0 * Set to vc to enable bus hold
vrpullup rpullup 0 0 * Set to vc to enable weak pullup
vpci rpci 0 0 * Set to vc to enable pci mode
vpcdp4 rpcdp4 0 rp4 * These control bits set the IO standard
vpcdp3 rpcdp3 0 rp3
vpcdp2 rpcdp2 0 rp2
vpcdp1 rpcdp1 0 rp1
vpcdp0 rpcdp0 0 rp0
vpcdn4 rpcdn4 0 rn4
vpcdn3 rpcdn3 0 rn3
vpcdn2 rpcdn2 0 rn2
vpcdn1 rpcdn1 0 rn1
vpcdn0 rpcdn0 0 rn0
vdin din 0 pulse(0 vc 0s 0.2ns 0.2ns 8.5ns 17.4ns)
```

Where:

- Voltage source voeb controls the output enable of the buffer.
- vopdrain controls the open drain mode for the I/O.
- vrambh controls the bus hold circuitry in the I/O.
- vrpullup controls the weak pullup.
- vpci controls the PCI clamp.
- The next ten voltage sources control the I/O standard of the buffer and are configured through a later library call.
- vdin is connected to the data input of the I/O buffer.
- The edge rate of the input stimulus is automatically set to the correct value by the Quartus Prime software.

#### 1.5.12.5. I/O Buffer Netlist

The I/O buffer netlist block loads all of the models required for the corresponding pin. These include a model for the I/O output buffer, as well as any loads that might be present on the pin.

##### I/O Buffer Netlist Block

```
*IO Buffer Netlist
.include 'hio_buffer.inc'
.include 'lvds_input_load.inc'
.include 'lvds_oct_load.inc'
```

#### 1.5.12.6. Drive Strength

The drive strength block of the simulation spice deck loads the configuration bits for configuring the I/O to the proper I/O standard and drive strength. These options are set by the HSPICE Writer tool and are not changed for expected use.

##### Drive Strength Block

```
* Drive Strength Settings
.lib 'drive_select_hio.lib' 3p3ttl_12ma
```

### 1.5.12.7. Slew Rate and Delay Chain

Stratix and Cyclone devices have sections for configuring the slew rate and delay chain settings.

#### Slew Rate and Delay Chain Settings

```
* Programmable Output Delay Control Settings
.lib 'lib/output_delay_control.lib' no_delay
* Programmable Slew Rate Control Settings
.lib 'lib/slew_rate_control.lib' slow_slow
```

### 1.5.12.8. I/O Buffer Instantiation

The I/O buffer instantiation block of the output simulation spice deck instantiates the necessary power supplies and I/O model components that are necessary to simulate the given I/O.

#### I/O Buffer Instantiation Block

```
* I/O Buffer Instantiation
* Supply Voltages Settings
.param vcn=3.135
.param vpd=2.97
.param vc=1.15
* Instantiate Power Supplies
vcc vcc 0 vc * FPGA core voltage
vss vss 0 0 * FPGA core ground
vccn vccn 0 vcn * IO supply voltage
vssn vssn 0 0 * IO ground
vccpd vccpd 0 vpd * Pre-drive supply voltage
* Instantiate I/O Buffer
xhio_buf din oeb opdrain die rambh
+ rpcdn4 rpcdn3 rpcdn2 rpcdn1 rpcdn0
+ rpcdp4 rpcdp3 rpcdp2 rpcdp1 rpcdp0
+ rpullup vccn vccpd vcpad0 hio_buf
* Internal Loading on Pad
* - This pad has an LVDS input buffer connected to it, along
* with differential OCT circuitry. Both are disabled but

```

### 1.5.12.9. Board and Trace Termination

The board trace and termination block of the simulation SPICE deck is provided only as an example. Replace this block with your specific board loading models.

#### Board Trace and Termination Block

```
* I/O Board Trace And Termination Description
* - Replace this with your board trace and termination description
wtline pin vssn load vssn N=1 L=1 RLGCMODEL=tlinemodel
.MODEL tlinemodel W MODELTYPE=RLGC N=1 Lo=7.13n Co=2.85p
Rterm2 load vssn 1x
```

### 1.5.12.10. Double-Counting Compensation Circuitry

The double-counting compensation circuitry block of the simulation SPICE deck instantiates a second I/O buffer that is used to measure double-counting. The buffer is configured identically to the user I/O buffer but is connected to the Quartus Prime software test load. The simulated delay of this second buffer can be interpreted as the amount of double-counting between the Quartus Prime software and HSPICE Writer simulated results.

As the amount of double-counting is constant for a given I/O standard on a given pin, consider separating the double-counting circuitry from the simulation file. In doing so, you can perform any number of I/O simulations while referencing the delay only once.

#### (Part of )Double-Counting Compensation Circuitry Block

```
* Double Counting Compensation Circuitry
*
* The following circuit is designed to calculate the amount of
* double counting between Intel Quartus Prime and the HSPICE models. If
* you have not changed the default simulation temperature or
* transistor corner this spice deck automatically compensates the double
counting.
* In the event you wish to
* simulate an IO at a different temperature or transistor corner
* you need to remove this section of code and manually
* account for double counting. A description of Intel's
* recommended procedure for this process can be found in the
* Intel Quartus Prime HSPICE Writer AppNote.

#### Related Information

[The Double Counting Problem in HSPICE Simulations](#) on page 22

### 1.5.12.11. Simulation Analysis

The simulation analysis block is set up to measure double-counting corrected delays. This is accomplished by measuring the uncompensated delay of the I/O buffer when connected to the user load, and when subtracting the simulated amount of double-counting from the test load I/O buffer.

## Simulation Analysis Block

```
* Simulation Analysis Setup
*Print out the voltage waveform at both the pin and far end load
.print tran v(pin) v(load)
.tran 0.020ns 17ns
* Measure the propagation delay to the load pin. This value
* includes some double counting with Intel Quartus Prime's Tco
.measure TRAN tpd_uncomp_rise TRIG v(din) val='vc*0.5' rise=1+ TARG v(load)
val='vcn*0.5' rise=1
.measure TRAN tpd_uncomp_fall TRIG v(din) val='vc*0.5' fall=1
+ TARG v(load) val='vcn*0.5' fall=1
* The test load buffer can calculate the amount of double counting
.measure TRAN t_dbcnt_rise TRIG v(din) val='vc*0.5' rise=1
+ TARG v(pin_t1) val='vcn_t1*0.5' rise=1
.measure TRAN t_dbcnt_fall TRIG v(din) val='vc*0.5' fall=1
+ TARG v(pin_t1) val='vcn_t1*0.5' fall=1
* Calculate the true propagation delay by subtraction
.measure TRAN tpd_rise PARAM='tpd_uncomp_rise-t_dbcnt_rise'
.measure TRAN tpd_fall PARAM='tpd_uncomp_fall-t_dbcnt_fall'
```

### 1.5.13. Advanced Topics

The information in this section describes some of the more advanced topics and methods employed when setting up and running HSPICE simulation files.

#### 1.5.13.1. PVT Simulations

The automatically generated HSPICE simulation files are set up to simulate the slow process corner using low voltage, high temperature, and slow transistors. To ensure a fully robust link, Intel recommends that you run simulations over all process corners.

To perform process, voltage, and temperature (PVT) simulations, manually modify the spice decks in a two step process:

1. Remove the double-counting compensation circuitry from the simulation file. This is required as the amount of double-counting is dependent upon how the Quartus Prime software calculates delays and is not based on which PVT corner is being simulated. By default, the Quartus Prime software provides timing numbers using the slow process corner.
2. Select the proper corner for the PVT simulation by setting the correct HSPICE temperature, changing the supply voltage sources, and loading the correct transistor models.

A more detailed description of HSPICE process corners can be found in the family-specific HSPICE model documentation.

#### Related Information

[Accessing HSPICE Simulation Kits](#) on page 21

#### 1.5.13.2. Hold Time Analysis

Intel recommends performing worst-case hold time analysis using the fast corner models, which use fast transistors, high voltage, and low temperature. This involves modifying the SPICE decks to select the correct temperature option, change the supply voltage sources, and load the correct fast transistor models. The values of these parameters are located in the header comment section of the corresponding simulation deck files.

For a truly worst-case analysis, combine the HSPICE Writer hold time analysis results with the Quartus Prime software fast timing model. This requires that you change the double-counting compensation circuitry in the simulations files to also simulate the fast process corners, as this is what the Quartus Prime software uses for the fast timing model.

**Note:** This method of hold time analysis is recommended only for globally synchronous buses. Do not apply this method of hold-time analysis to source synchronous buses. This is because the source synchronous clocking scheme is designed to cancel out some of the PVT timing effects. If this is not taken into account, the timing results are not accurate. Proper source synchronous timing analysis is beyond the scope of this document.

### 1.5.13.3. I/O Voltage Variations

Use each of the FPGA family datasheets to verify the recommended operating conditions for supply voltages. For current FPGA families, the maximum recommended voltage corresponds to the fast corner, while the minimum recommended voltage corresponds to the slow corner. These voltage recommendations are specified at the power pins of the FPGA and are not necessarily the same voltage that are seen by the I/O buffers due to package IR drops.

The automatically generated HSPICE simulation files model this IR effect pessimistically by including a 50-mV IR drop on the  $V_{CCPD}$  supply when a high drive strength standard is being used.

### 1.5.13.4. Correlation Report

Correlation reports for the HSPICE I/O models are located in the family-specific HSPICE I/O buffer simulation kits.

#### Related Information

[Accessing HSPICE Simulation Kits](#) on page 21

## 2. Reviewing Printed Circuit Board Schematics with the Quartus Prime Software

---

Intel FPGAs and CPLDs offer a multitude of configurable options to allow you to implement a custom application-specific circuit on your PCB.

Your Quartus Prime project provides important information specific to your programmable logic design, which you can use in conjunction with the device literature available on the Intel website to ensure that you implement the correct board-level connections in your schematic.

Refer to the **Settings** dialog box options, the Fitter report, and **Messages** window when creating and reviewing your PCB schematic. The Quartus Prime software also provides the Pin Planner to assist you during your PCB schematic review process.

### Related Information

[Schematic Review Worksheets](#)

### 2.1. Reviewing Quartus Prime Software Settings

Review these settings in the Quartus Prime software to help you review your PCB schematic.

The **Device** dialog box in the Quartus Prime software allows you to specify device-specific assignments and settings. You can use the **Device** dialog box to specify general project-wide options, including specific device and pin options, which help you to implement correct board-level connections in your PCB schematic.

The **Device** dialog box provides project-specific device information, including the target device and any migration devices you specify. Using migration devices can impact the number of available user I/O pins and internal resources, as well as require connection of some user I/O pins to power/ground pins to support migration.

If you want to use vertical migration, which allows you to use different devices with the same package, you can specify your list of migration devices in the **Migration Devices** dialog box. The Fitter places the pins in your design based on your targeted migration devices, and allows you to use only I/O pins that are common to all the migration devices.

If a migration device has pins that are power or ground, but the pins are also user I/O pins on a different device in the migration path, the Fitter ensures that these pins are not used as user I/O pins. You must ensure that these pins are connected to the appropriate plane on the PCB.

If you are migrating from a smaller device with NC (no-connect) pins to a larger device with power or ground pins in the same package, you can safely connect the NC pins to power or ground pins to facilitate successful migration.

### Related Information

[Migration Devices Dialog Box](#)  
In Quartus Prime Help

## 2.1.1. Device and Pins Options Dialog Box Settings

You can set device and pin options and verify important design-specific data in the **Device and Pin Options** dialog box, including options found on the **General**, **Configuration**, **Unused Pin**, **Dual-Purpose Pins**, and **Voltage** pages.

### 2.1.1.1. Configuration Settings

The **Configuration** page of the **Device and Pin Options** dialog box specifies the configuration scheme and configuration device for the target device. Use the **Configuration** page settings to verify the configuration scheme with the MSEL pin settings used on your PCB schematic and the I/O voltage of the configuration scheme.

Your specific configuration settings may impact the availability of some dual-purpose I/O pins in user mode.

### Related Information

[Dual-Purpose Pins Settings](#) on page 45

### 2.1.1.2. Unused Pin Settings

The **Unused Pin** page specifies the behavior of all unused pins in your design. Use the **Unused Pin** page to ensure that unused pin settings are compatible with your PCB.

For example, if you reserve all unused pins as outputs driving ground, you must ensure that you do not connect unused I/O pins to VCC pins on your PCB. Connecting unused I/O pins to VCC pins may result in contention that could lead to higher than expected current draw and possible device overstress.

The **Reserve all unused pins** list shows available unused pin state options for the target device. The default state for each pin is the recommended setting for each device family.

When you reserve a pin as output driving ground, the Fitter connects a ground signal to the output pin internally. You should connect the output pin to the ground plane on your PCB, although you are not required to do so. Connecting the output driving ground to the ground plane is known as creating a virtual ground pin, which helps to minimize simultaneous switching noise (SSN) and ground bounce effects.

### 2.1.1.3. Dual-Purpose Pins Settings

The **Dual-Purpose Pins** page specifies how configuration pins should be used after device configuration completes. You can set the function of the dual-purpose pins by selecting a value for a specific pin in the **Dual-purpose pins** list. Pin functions should match your PCB schematic. The available options on the **Dual-Purpose Pins** page may differ depending on the selected configuration mode.

#### 2.1.1.4. Voltage Settings

The **Voltage** page specifies the default VCCIO I/O bank voltage and the default I/O bank voltage for the pins on the target device. VCCIO I/O bank voltage settings made in the **Voltage** page are overridden by I/O standard assignments made on I/O pins in their respective banks.

Ensure that the settings in the **Voltage** page match the settings in your PCB schematic, especially if the target device includes transceivers.

The **Voltage** page settings requirements differ depending on the settings of the transceiver instances in the design. Refer to the Fitter report for the required settings, and verify that the voltage settings are correctly set up for your PCB schematic.

After verifying your settings in the **Device** and **Settings** dialog boxes, you can verify your device pin-out with the Fitter report.

##### Related Information

[Reviewing Device Pin-Out Information in the Fitter Report](#) on page 46

#### 2.1.1.5. Error Detection CRC Settings

The **Error Detection CRC** page specifies error detection cyclic redundancy check (CRC) use for the target device. When **Enable error detection CRC** is turned on, the device checks the validity of the programming data in the devices. Any changes made in the data while the device is in operation generates an error.

Turning on the **Enable open drain on CRC error pin** option allows the CRC ERROR pin to be set as an open-drain pin in some devices, which decouples the voltage level of the CRC ERROR pin from VCCIO voltage. You must connect a pull-up resistor to the CRC ERROR pin on your PCB if you turn on this option.

In addition to settings in the **Device** dialog box, you should verify settings in the **Voltage** page of the **Settings** dialog box.

##### Related Information

[Device and Pin Options Dialog Box](#)  
In Quartus Prime Help

## 2.2. Reviewing Device Pin-Out Information in the Fitter Report

After you compile your design, you can use the reports in the Resource section of the Fitter report to check your device pin-out in detail.

The Input Pins, Output Pins, and Bidirectional Pins reports identify all the user I/O pins in your design and the features enabled for each I/O pin. For example, you can find use of weak internal pull-ups, PCI clamp diodes, and on-chip termination (OCT) pin assignments in these sections of the Fitter report. You can check the pin assignments reported in the Input Pins, Output Pins, and Bidirectional Pins reports against your PCB schematic to determine whether your PCB requires external components.

These reports also identify whether you made pin assignments or if the Fitter automatically placed the pins. If the Fitter changed your pin assignments, you should make these changes user assignments because the location of pin assignments made by the Fitter may change with subsequent compilations.

**Figure 18. Resource Section Report**

Open the **Compilation Report** tab with **Ctrl+R**. In the **Plan Stage** folder under **Fitter** open the Input Pins report. The following figure shows the pins the Fitter chose for the OCT external calibration resistor connections (RUP/RDN) and the name of the associated termination block in the Input Pins report. You should make these types of assignments user assignments.

	Name	Pin #	I/O Bank	X coordin...	Y coordin
1	clock_source	AB39	2C	0	59
2	global_reset_n	AB41	2C	0	60
3	termination_blk0~_rdn_pad	C40	1A	0	113
4	termination_blk0~_rup_pad	D40	1A	0	113

The I/O Bank Usage report provides a high-level overview of the VCCIO and VREF requirements for your design, based on your I/O assignments. Verify that the requirements in this report match the settings in your PCB schematic. All unused I/O banks, and all banks with I/O pins with undefined I/O standards, default the VCCIO voltage to the voltage defined in the **Voltage** page of the **Device and Pin Options** dialog box.

The All Package Pins report lists all the pins on your device, including unused pins, dedicated pins and power/ground pins. You can use this report to verify pin characteristics, such as the location, name, usage, direction, I/O standard and voltage for each pin with the pin information in your PCB schematic. In particular, you should verify the recommended voltage levels at which you connect unused dedicated inputs and I/O and power pins, especially if you selected a migration device. Use the All Package Pins report to verify that you connected all the device voltage rails to the voltages reported.

Errors commonly reported include connecting the incorrect voltage to the predriver supply (VCCPD) pin in a specific bank, or leaving dedicated clock input pins floating. Unused input pins that should be connected to ground are designated as **GND+** in the **Pin Name/Usage** column in the All Package Pins report.

You can also use the All Package Pins report to check transceiver-specific pin connections and verify that they match the PCB schematic. Unused transceiver pins have the following requirements, based on the pin designation in the Fitter report:

- **GXB\_GND**—Unused GXB receiver or dedicated reference clock pin. This pin must be connected to GXB\_GND through a 10k Ohm resistor.
- **GXB\_NC**—Unused GXB transmitter or dedicated clock output pin. This pin must be disconnected.

Some transceiver power supply rails have dual voltage capabilities, such as VCCA\_L/R and VCCH\_L/R, that depend on the settings you created for the ALTGX parameter editor. Because these user-defined settings overwrite the default settings, you should use the All Package Pins report to verify that these power pins on the device symbol in the PCB schematics are connected to the voltage required by the transceiver. An incorrect connection may cause the transceiver to function not as expected.

If your design includes a memory interface, the DQS Summary report provides an overview of each DQ pin group. You can use this report to quickly confirm that the correct DQ/DQS pins are grouped together.

Finally, the Fitter Device Options report summarizes some of the settings made in the **Device and Pin Options** dialog box. Verify that these settings match your PCB schematics.

## 2.3. Reviewing Compilation Error and Warning Messages

If your project does not compile without error or warning messages, you should resolve the issues identified by the Compiler before signing off on your pin-out or PCB schematic. Error messages often indicate illegal or unsupported use of the device resources and IP.

Additionally, you should cross-reference fitting and timing analysis warnings with the design implementation. Timing may be constrained due to nonideal pin placement. You should investigate if you can reassign pins to different locations to prevent fitting and timing analysis warnings. Ensure that you review each warning and consider its potential impact on the design.

## 2.4. Using Additional Quartus Prime Software Features

You can generate IBIS files, which contain models specific to your design and selected I/O standards and options, with the Quartus Prime software.

Because board-level simulation is important to verify, you should check for potential signal integrity issues. You can turn on the **Board-Level Signal Integrity** feature in the **EDA Tool Settings** page of the **Settings** dialog box.

Additionally, using advanced I/O timing allows you to enter physical PCB information to accurately model the load seen by an output pin. This feature facilitates accurate I/O timing analysis.

### Related Information

- [Signal Integrity Analysis with Third-Party Tools](#) on page 4
- [Managing Device I/O Pins](#)

## 2.5. Using Additional Quartus Prime Software Tools

Use the Pin Planner to assist you with reviewing your PCB schematics.

### 2.5.1. Pin Planner

The Quartus Prime Pin Planner helps you visualize, plan, and assign device I/O pins in a graphical view of the target device package. You can quickly locate various I/O pins and assign them design elements or other properties to ensure compatibility with your PCB layout.

You can use the Pin Planner to verify the location of clock inputs, and whether they have been placed on dedicated clock input pins, which is recommended when your design uses PLLs.

You can also use the Pin Planner to verify the placement of dedicated SERDES pins. SERDES receiver inputs can be placed only on DIFFIO\_RX pins, while SERDES transmitter outputs can be placed only on DIFFIO\_TX pins.

The Pin Planner gives a visual indication of signal-to-signal proximity in the **Pad View** window, and also provides information about differential pin pair placement, such as the placement of pseudo-differential signals.

2015.11.02	15.1	Changed instances of <i>Quartus II</i> to <i>Quartus Prime</i> .
June 2014	14.0	Template update.
November 2012	12.1	Minor update of Pin Planner description for task and report windows.
June 2012	12.0	Removed survey link.
November 2011	10.0	Template update.
December 2010	10.0	Changed to new document template. No change to content.
July 2010	10.0	Initial release.

## 3. Siemens EDA PCB Design Tools Support

---

You can integrate the Siemens EDA DxDesigner\* PCB design tool into the Quartus Prime design flow.

With today's large, high-pin-count and high-speed FPGA devices, good and correct PCB design practices are essential to ensure correct system operation. The PCB design takes place concurrently with the design and programming of the FPGA. The FPGA or ASIC designer initially creates signal and pin assignments, and the board designer must correctly transfer these assignments to the symbols in their system circuit schematics and board layout. As the board design progresses, Intel recommends reassigning pins to optimize the PCB layout. Ensure that you inform the FPGA designer of the pin reassignments so that the new assignments are included in an updated placement and routing of the design.

This chapter covers the following topics:

- Siemens EDA and Quartus Prime software integration flow
- Generating supporting files
- Creating DxDesigner symbols from the Quartus Prime output files

This chapter is intended for board design and layout engineers who want to start the FPGA board integration while the FPGA is still in the design phase. Alternatively, the board designer can plan the FPGA pin-out and routing requirements in the Siemens EDA tools and pass the information back to the Quartus Prime software for placement and routing. Part librarians can also benefit from this chapter by learning how to use output from the Quartus Prime software to create new library parts and symbols.

The procedures in this chapter require the following software:

- The Quartus Prime software version 5.1 or later
- DxDesigner software version 2004 or later

**Note:** To obtain and license the Siemens EDA tools and for product information, support, and training, refer to the Siemens EDA website.

### 3.1. Integrating with DxDesigner

You can integrate the Siemens EDA DxDesigner schematic capture tool into the Quartus Prime design flow. Use DxDesigner to create flat circuit schematics or to create hierarchical schematics that facilitate design reuse and a team-based design for all PCB types.

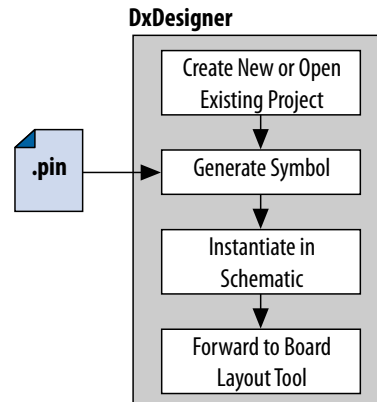

If you use DxDesigner without the I/O Designer software, the design flow is one-way, using only the **.pin** generated by the Quartus Prime software. You can only make signal and pin assignment changes in the Quartus Prime software. You cannot back-annotate changes made in a board layout tool or in a DxDesigner symbol to the Quartus Prime software.

\*Other names and brands may be claimed as the property of others.

**Figure 19. DxDesigner-only Flow**

### 3.1.1. DxDesigner Project Settings

DxDesigner new projects automatically create FPGA symbols by default. To enable the DxBoardLink flow design configuration when creating a new DxDesigner project, follow these steps:

1. Start the DxDesigner software.
2. Click **File ► New**, and then click the **Project** tab.
3. Click **More**. Turn on **DxBoardLink**. To enable the DxBoardLink Flow design configuration for an existing project, click **Design Configurations** in the Design Configuration toolbar and turn on **DxBoardLink**.

### 3.1.2. Creating Schematic Symbols in DxDesigner

You can create schematic symbols in the DxDesigner software manually or with the Symbol wizard. The DxDesigner Symbol wizard is similar to the I/O Designer Symbol wizard, but with fewer fracturing options. The DxDesigner Symbol wizard creates, fractures, and edits FPGA symbols based on the specified Intel FPGA device. To create a symbol with the Symbol wizard, follow these steps;

1. Start the DxDesigner software.
2. Click **Symbol Wizard** in the toolbar.
3. Type the new symbol name in the name field and click **OK**.
4. Specify creation of a new symbol or modification of an existing symbol. To modify an existing symbol, specify the library path or alias, and select the existing symbol. To create a new symbol, select DxBoardLink for the symbol source. The DxDesigner block type defaults to Module because the FPGA design does not have an underlying DxDesigner schematic. Choose whether or not to fracture the symbol. Click **Next**.
5. Type a name for the symbol, an overall part name for all the symbol fractures, and a library name for the new library created for this symbol. By default, the part and library names are the same as the symbol name. Click **Next**.
6. Specify the appearance of the generated symbol in your DxDesigner project schematic. After making your selections. Click **Next**.

7. In the **FPGA vendor** list, select **Intel Quartus**. In the **Pin-Out file to import** field, select the **.pin** from your Quartus Prime project directory. You can also specify Fracturing Scheme, Bus pin, and Power pin options. Click **Next**.
8. Select to create or modify symbol attributes for use in the DxDesigner software. Click **Next**.
9. On the **Pin Settings** page, make any final adjustments to pin and label location and information. Each tabbed spreadsheet represents a fracture of your symbol. Click **Save Symbol**.  
After creating the symbol, you can examine and place any fracture of the symbol in your schematic. You can locate separate files of all the fractures you created in the library you specified or created in the **/sym** directory in your DxDesigner project. You can add the symbols to your schematics or you can manually edit the symbols or with the Symbol wizard.

## 3.2. Siemens EDA PCB Design Tools Support Revision History

**Table 6. Document Revision History**

Date	Quartus Prime Version	Changes
2020.11.04	18.1	Removed references to unsupported .fx files and related tools.
2016.10.31	16.1	<ul style="list-style-type: none"> <li>Implemented Intel rebranding.</li> </ul>
2015.11.02	15.1	<ul style="list-style-type: none"> <li>Changed instances of <i>Quartus II</i> to <i>Quartus Prime</i>.</li> </ul>

December 2010	10.1	<ul style="list-style-type: none"> <li>Changed to new document template.</li> </ul>

## 4. Cadence Board Design Tools Support

---

### 4.1. Cadence PCB Design Tools Support

The Quartus Prime software interacts with the following software to provide a complete FPGA-to-board integration design workflow: the Cadence Allegro Design Entry HDL software and the Cadence Allegro Design Entry CIS (Component Information System) software (also known as OrCAD Capture CIS). The information is useful for board design and layout engineers who want to begin the FPGA board integration process while the FPGA is still in the design phase. Part librarians can also benefit by learning the method to use output from the Quartus Prime software to create new library parts and symbols.

With today's large, high-pin-count and high-speed FPGA devices, good PCB design practices are important to ensure the correct operation of your system. The PCB design takes place concurrently with the design and programming of the FPGA. An FPGA or ASIC designer initially creates the signal and pin assignments and the board designer must transfer these assignments to the symbols used in their system circuit schematics and board layout correctly. As the board design progresses, you must perform pin reassignments to optimize the layout. You must communicate pin reassignments to the FPGA designer to ensure the new assignments are processed through the FPGA with updated placement and routing.

You require the following software:

- The Quartus Prime software version 5.1 or later
- The Cadence Allegro Design Entry HDL software or the Cadence Allegro Design Entry CIS software version 15.2 or later
- The OrCAD Capture software with the optional CIS option version 10.3 or later (optional)

*Note:*

These programs are very similar because the Cadence Allegro Design Entry CIS software is based on the OrCAD Capture software. Any procedural information can also apply to the OrCAD Capture software unless otherwise noted.

#### Related Information

For more information about obtaining and licensing the Cadence tools and for product information, support, and training
- [www.orcad.com](http://www.orcad.com)  
For more information about the OrCAD Capture software and the CIS option
- [www.ema-eda.com](http://www.ema-eda.com)  
For more information about Cadence and OrCAD support and training.

## 4.2. Product Comparison

**Table 7. Cadence and OrCAD Product Comparison**

Description	Cadence Allegro Design Entry HDL	Cadence Allegro Design Entry CIS	OrCAD Capture CIS
Former Name	Concept HDL Expert	Capture CIS Studio	—
History	More commonly known by its former name, Cadence renamed all board design tools in 2004 under the Allegro name.	Based directly on OrCAD Capture CIS, the Cadence Allegro Design Entry CIS software is still developed by OrCAD but sold and marketed by Cadence. EMA provides support and training.	The basis for Design Entry CIS is still developed by OrCAD for continued use by existing OrCAD customers. EMA provides support and training for all OrCAD products.
Vendor Design Flow	Cadence Allegro 600 series, formerly known as the Expert Series, for high-end, high-speed design.	Cadence Allegro 200 series, formerly known as the Studio Series, for small- to medium-level design.	—

## 4.3. FPGA-to-PCB Design Flow

You can create a design flow integrating an Intel FPGA design from the Quartus Prime software through a circuit schematic in the Cadence Allegro Design Entry HDL software or the Cadence Allegro Design Entry CIS software.

**Figure 20. Design Flow with the Cadence Allegro Design Entry HDL Software**

**Figure 21. Design Flow with the Cadence Allegro Design Entry CIS Software**

To create FPGA symbols using the Cadence Allegro PCB Librarian Part Developer tool, you must obtain the Cadence PCB Librarian Expert license. You can update symbols with changes made to the FPGA design using any of these tools.

### 4.3.1. Integrating Intel FPGA Designs

To integrate an Intel FPGA design starting in the Quartus Prime software through to a circuit schematic in the Cadence Allegro Design Entry HDL software or the Cadence Allegro Design Entry CIS software, follow these steps:

1. In the Quartus Prime software, compile your design to generate a Pin-Out File (.pin) to transfer the assignments to the Cadence software.
2. If you are using the Cadence Allegro Design Entry HDL software for your schematic design, follow these steps:
  - a. Open an existing project or create a new project in the Cadence Allegro Project Manager tool.
  - b. Construct a new symbol or update an existing symbol using the Cadence Allegro PCB Librarian Part Developer tool.
  - c. With the Cadence Allegro PCB Librarian Part Developer tool, edit your symbol or fracture it into smaller parts (optional).
  - d. Instantiate the symbol in your Cadence Allegro Design Entry HDL software schematic and transfer the design to your board layout tool.
3. If you are using the Cadence Allegro Design Entry CIS software for your schematic design, follow these steps:

- a. Generate a new part in a new or existing Cadence Allegro Design Entry CIS project, referencing the **.pin** output file from the Quartus Prime software. You can also update an existing symbol with a new **.pin**.
- b. Split the symbol into smaller parts as necessary.
- c. Instantiate the symbol in your Cadence Allegro Design Entry CIS schematic and transfer the design to your board layout tool.

## 4.4. Setting Up the Quartus Prime Software

You can transfer pin and signal assignments from the Quartus Prime software to the Cadence design tools by generating the Quartus Prime project **.pin**. The **.pin** is an output file generated by the Quartus Prime Fitter containing pin assignment information. You can use the Quartus Prime Pin Planner to set and change the assignments in the **.pin** and then transfer the assignments to the Cadence design tools. You cannot, however, import pin assignment changes from the Cadence design tools into the Quartus Prime software with the **.pin**.

The **.pin** lists all used and unused pins on your selected Intel device. The **.pin** also provides the following basic information fields for each assigned pin on the device:

- Pin signal name and usage
- Pin number
- Signal direction
- I/O standard
- Voltage
- I/O bank
- User or Fitter-assigned

### 4.4.1. Generating a .pin File

To generate a **.pin**, follow these steps:

1. Compile your design.
2. Locate the **.pin** in your Quartus Prime project directory with the name <project name>.**.pin**.

## 4.5. FPGA-to-Board Integration with the Cadence Allegro Design Entry HDL Software

The Cadence Allegro Design Entry HDL software is a schematic capture tool and is part of the Cadence 600 series design flow. Use the Cadence Allegro Design Entry HDL software to create flat circuit schematics for all types of PCB design. The Cadence Allegro Design Entry HDL software can also create hierarchical schematics to facilitate design reuse and team-based design. With the Cadence Allegro Design Entry HDL software, the design flow from FPGA-to-board is one-way, using only the **.pin** generated by the Quartus Prime software. You can only make signal and pin assignment changes in the Quartus Prime software and these changes reflect as updated symbols in a Cadence Allegro Design Entry HDL project.

For more information about the design flow with the Cadence Allegro Design Entry HDL software, refer to [FPGA-to-PCB Design Flow](#).

**Note:** Routing or pin assignment changes made in a board layout tool or a Cadence Allegro Design Entry HDL software symbol cannot be back-annotated to the Quartus Prime software.

#### Related Information

[www.cadence.com](http://www.cadence.com)

Provides information about the Cadence Allegro Design Entry HDL software and the Cadence Allegro PCB Librarian Part Developer tool, including licensing, support, usage, training, and product updates.

### 4.5.1. Creating Symbols

In addition to circuit simulation, circuit board schematic creation is one of the first tasks required when designing a new PCB. Schematics must understand how the PCB works, and to generate a netlist for a board layout tool for board design and routing. The Cadence Allegro PCB Librarian Part Developer tool allows you to create schematic symbols based on FPGA designs exported from the Quartus Prime software.

You can create symbols for the Cadence Allegro Design Entry HDL project with the Cadence Allegro PCB Librarian Part Developer tool, which is available in the Cadence Allegro Project Manager tool. Intel recommends using the Cadence Allegro PCB Librarian Part Developer tool to import FPGA designs into the Cadence Allegro Design Entry HDL software.

You must obtain a PCB Librarian Expert license from Cadence to run the Cadence Allegro PCB Librarian Part Developer tool. The Cadence Allegro PCB Librarian Part Developer tool provides a GUI with many options for creating, editing, fracturing, and updating symbols. If you do not use the Cadence Allegro PCB Librarian Part Developer tool, you must create and edit symbols manually in the Symbol Schematic View in the Cadence Allegro Design Entry HDL software.

**Note:** If you do not have a PCB Librarian Expert license, you can automatically create FPGA symbols using the programmable IC (PIC) design flow found in the Cadence Allegro Project Manager tool.

Before creating a symbol from an FPGA design, you must open a Cadence Allegro Design Entry HDL project with the Cadence Allegro Project Manager tool. If you do not have an existing Cadence Allegro Design Entry HDL project, you can create one with the Cadence Allegro Design Entry HDL software. The Cadence Allegro Design Entry HDL project directory with the name <project name>.**cpm** contains your Cadence Allegro Design Entry HDL projects.

While the Cadence Allegro PCB Librarian Part Developer tool refers to symbol fractures as slots, the other tools use different names to refer to symbol fractures.

**Table 8. Symbol Fracture Naming Conventions**

	Cadence Allegro PCB Librarian Part Developer Tool	Cadence Allegro Design Entry HDL Software	Cadence Allegro Design Entry CIS Software
During symbol generation	Slots	—	Sections
During symbol schematic instantiation	—	Versions	Parts

### Related Information

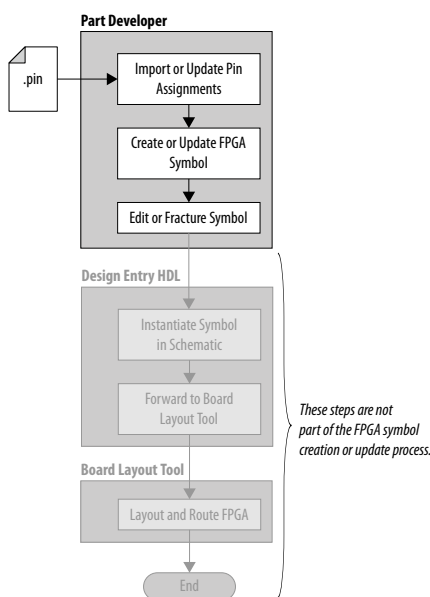

[www.cadence.com](http://www.cadence.com)

Provides information about using the PIC design flow.

#### 4.5.1.1. Cadence Allegro PCB Librarian Part Developer Tool

You can create, fracture, and edit schematic symbols for your designs using the Cadence Allegro PCB Librarian Part Developer tool. Symbols designed in the Cadence Allegro PCB Librarian Part Developer tool can be split or fractured into several functional blocks called slots, allowing multiple smaller part fractures to exist on the same schematic page or across multiple pages.

##### 4.5.1.1.1. Cadence Allegro PCB Librarian Part Developer Tool in the Design Flow

To run the Cadence Allegro PCB Librarian Part Developer tool, you must open a Cadence Allegro Design Entry HDL project in the Cadence Allegro Project Manager tool. To open the Cadence Allegro PCB Librarian Part Developer tool, on the Flows menu, click **Library Management**, and then click **Part Developer**.

### Related Information

[FPGA-to-PCB Design Flow](#) on page 54

#### 4.5.1.1.2. Import and Export Wizard

After starting the Cadence Allegro PCB Librarian Part Developer tool, use the **Import and Export** wizard to import your pin assignments from the Quartus Prime software.

**Note:** Intel recommends using your PCB Librarian Expert license file. To point to your PCB Librarian Expert license file, on the File menu, click **Change Product** and then select the correct product license.

To access the Import and Export wizard, follow these steps:

1. On the File menu, click **Import and Export**.
2. Select **Import ECO-FPGA**, and then click **Next**.
3. In the **Select Source** page of the **Import and Export** wizard, specify the following settings:
  - a. In the **Vendor** list, select **Altera**.
  - b. In the **PnR Tool** list, select **quartusII**.
  - c. In the **PR File** box, browse to select the **.pin** in your Quartus Prime project directory.
  - d. Click **Simulation Options** to select simulation input files.
  - e. Click **Next**.
4. In the **Select Destination** dialog box, specify the following settings:
  - a. Under **Select Component**, click **Generate Custom Component** to create a new component in a library,  
or  
Click **Use standard component** to base your symbol on an existing component.  
*Note:* Intel recommends creating a new component if you previously created a generic component for an FPGA device. Generic components can cause some problems with your design. When you create a new component, you can place your pin and signal assignments from the Quartus Prime software on this component and reuse the component as a base when you have a new FPGA design.
  - b. In the **Library** list, select an existing library. You can select from the cells in the selected library. Each cell represents all the symbol versions and part fractures for a particular part. In the **Cell** list, select the existing cell to use as a base for your part.
  - c. In the **Destination Library** list, select a destination library for the component. Click **Next**.
  - d. Review and edit the assignments you import into the Cadence Allegro PCB Librarian Part Developer tool based on the data in the **.pin** and then click **Finish**. The location of each pin is not included in the **Preview of Import Data** page of the **Import and Export** wizard, but input pins are on the left side of the created symbol, output pins on the right, power pins on the top, and ground pins on the bottom.

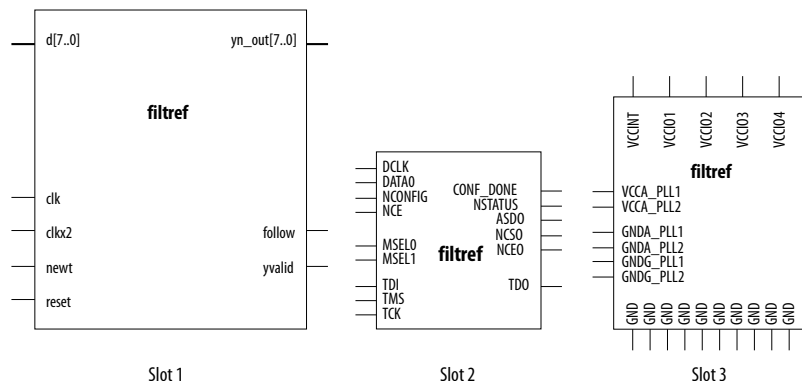

#### 4.5.1.1.3. Editing and Fracturing Symbol

After creating your new symbol in the Cadence Allegro PCB Librarian Part Developer tool, you can edit the symbol graphics, fracture the symbol into multiple slots, and add or change package or symbol properties.

The Part Developer Symbol Editor contains many graphical tools to edit the graphics of a particular symbol. To edit the symbol graphics, select the symbol in the cell hierarchy. The **Symbol Pins** tab appears. You can edit the preview graphic of the symbol in the **Symbol Pins** tab.

Fracturing a Cadence Allegro PCB Librarian Part Developer package into separate symbol slots is useful for FPGA designs. A single symbol for most FPGA packages might be too large for a single schematic page. Splitting the part into separate slots allows you to organize parts of the symbol by function, creating cleaner circuit schematics. For example, you can create one slot for an I/O symbol, a second slot for a JTAG symbol, and a third slot for a power/ground symbol.

**Figure 22. Splitting a Symbol into Multiple Slots**

- This diagram represents a Cyclone device with JTAG or passive serial (PS) mode configuration option settings. Symbols created for other devices or other configuration modes may have different sets of configuration pins, but can be fractured in a similar manner.  
- The power/ground slot shows only a representation of power and ground pins because the device contains a large number of power and ground pins.

To fracture a part into separate slots, or to modify the slot locations of pins on parts fractured in the Cadence Allegro PCB Librarian Part Developer tool, follow these steps:

1. Start the Cadence Allegro Design Project Manager.
2. On the Flows menu, click **Library Management**.
3. Click **Part Developer**.
4. Click the name of the package you want to change in the cell hierarchy.
5. Click **Functions/Slots**. If you are not creating new slots but want to change the slot location of some pins, proceed to Step 6. If you are creating new slots, click **Add**. A dialog box appears, allowing you to add extra symbol slots. Set the number of extra slots you want to add to the existing symbol, not the total number of desired slots for the part. Click **OK**.
6. Click **Distribute Pins**. Specify the slot location for each pin. Use the checkboxes in each column to move pins from one slot to another. Click **OK**.
7. After distributing the pins, click the **Package Pin** tab and click **Generate Symbol(s)**.
8. Select whether to create a new symbol or modify an existing symbol in each slot. Click **OK**.

The newly generated or modified slot symbols appear as separate symbols in the cell hierarchy. Each of these symbols can be edited individually.

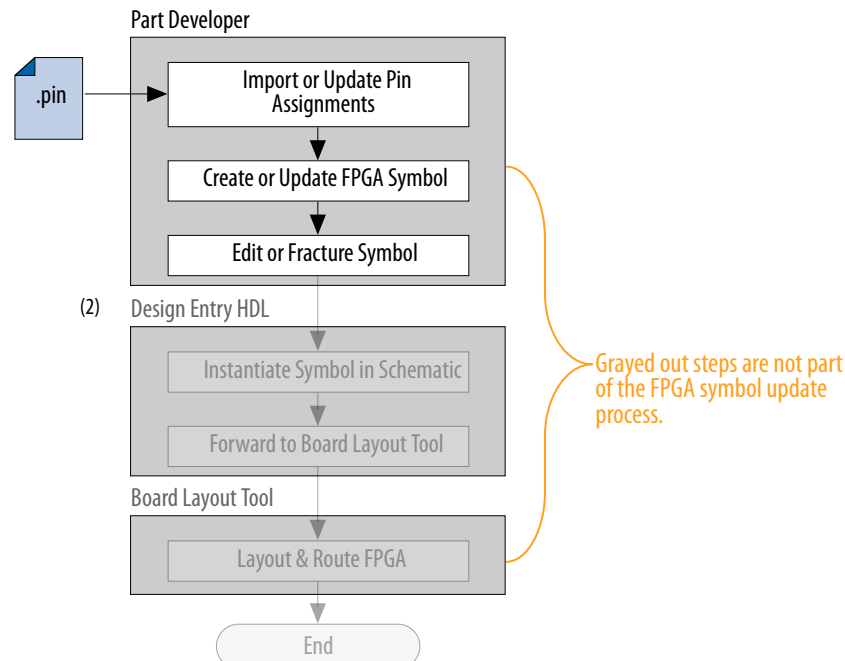

**Caution:** The Cadence Allegro PCB Librarian Part Developer tool allows you to remap pin assignments in the **Package Pin** tab of the main Cadence Allegro PCB Librarian Part Developer window. If signals remap to different pins in the Cadence Allegro PCB Librarian Part Developer tool, the changes reflect only in regenerated symbols for use in your schematics. You cannot transfer pin assignment changes to the Quartus Prime software from the Cadence Allegro PCB Librarian Part Developer tool, which creates a potential mismatch of the schematic symbols and assignments in the FPGA design. If pin assignment changes are necessary, make the changes in the Quartus Prime Pin Planner instead of the Cadence Allegro PCB Librarian Part Developer tool, and update the symbol as described in the following sections.

For more information about creating, editing, and organizing component symbols with the Cadence Allegro PCB Librarian Part Developer tool, refer to the Part Developer Help.

#### 4.5.1.1.4. Updating FPGA Symbols

As the design process continues, you must make logic changes in the Quartus Prime software, placing signals on different pins after recompiling the design, or use the Quartus Prime Pin Planner to make changes manually. The board designer can request such changes to improve the board routing and layout. To ensure signals connect to the correct pins on the FPGA, you must carry forward these types of changes to the circuit schematic and board layout tools. Updating the `.pin` in the Quartus Prime software facilitates this flow.

**Figure 23. Updating the FPGA Symbol in the Design Flow**

To update the symbol using the Cadence Allegro PCB Librarian Part Developer tool after updating the `.pin`, follow these steps:

1. On the File menu, click **Import and Export**. The Import and Export wizard appears.
2. In the list of actions to perform, select **Import ECO - FPGA**. Click **Next**. The **Select Source** dialog box appears.
3. Select the updated source of the FPGA assignment information. In the **Vendor** list, select **Altera**. In the **PnR Tool** list, select **quartusII**. In the **PR File** field, click **browse** to specify the updated `.pin` in your Quartus Prime project directory. Click **Next**. The Select Destination window appears.
4. Select the source component and a destination cell for the updated symbol. To create a new component based on the updated pin assignment data, select **Generate Custom Component**. Selecting **Generate Custom Component** replaces the cell listed under the **Specify Library and Cell** name header with a new, nonfractured cell. You can preserve these edits by selecting **Use standard component and select the existing library and cell**. Select the destination library for the component and click **Next**. The **Preview of Import Data** dialog box appears.
5. Make any additional changes to your symbol. Click **Next**. A list of ECO messages appears summarizing the changes made to the cell. To accept the changes and update the cell, click **Finish**.
6. The main Cadence Allegro PCB Librarian Part Developer window appears. You can edit, fracture, and generate the updated symbols as usual from the main Cadence Allegro PCB Librarian Part Developer window.

*Note:*

If the Cadence Allegro PCB Librarian Part Developer tool is not set up to point to your PCB Librarian Expert license file, an error message appears in red at the bottom of the message text window of the Part Developer when you select the **Import and Export** command. To point to your PCB Librarian Expert license, on the File menu, click **Change Product**, and select the correct product license.

#### Related Information

[FPGA-to-PCB Design Flow](#) on page 54

### 4.5.2. Instantiating the Symbol in the Cadence Allegro Design Entry HDL Software

To instantiate the symbol in your Cadence Allegro Design Entry HDL schematic after saving the new symbol in the Cadence Allegro PCB Librarian Part Developer tool, follow these steps:

1. In the Cadence Allegro Project Manager tool, switch to the board design flow.
2. On the Flows menu, click **Board Design**.
3. To start the Cadence Allegro Design Entry HDL software, click **Design Entry**.
4. To add the newly created symbol to your schematic, on the Component menu, click **Add**. The **Add Component** dialog box appears.
5. Select the new symbol library location, and select the name of the cell you created from the list of cells.

The symbol attaches to your cursor for placement in the schematic. To fracture the symbol into slots, right-click the symbol and choose **Version** to select one of the slots for placement in the schematic.

#### Related Information

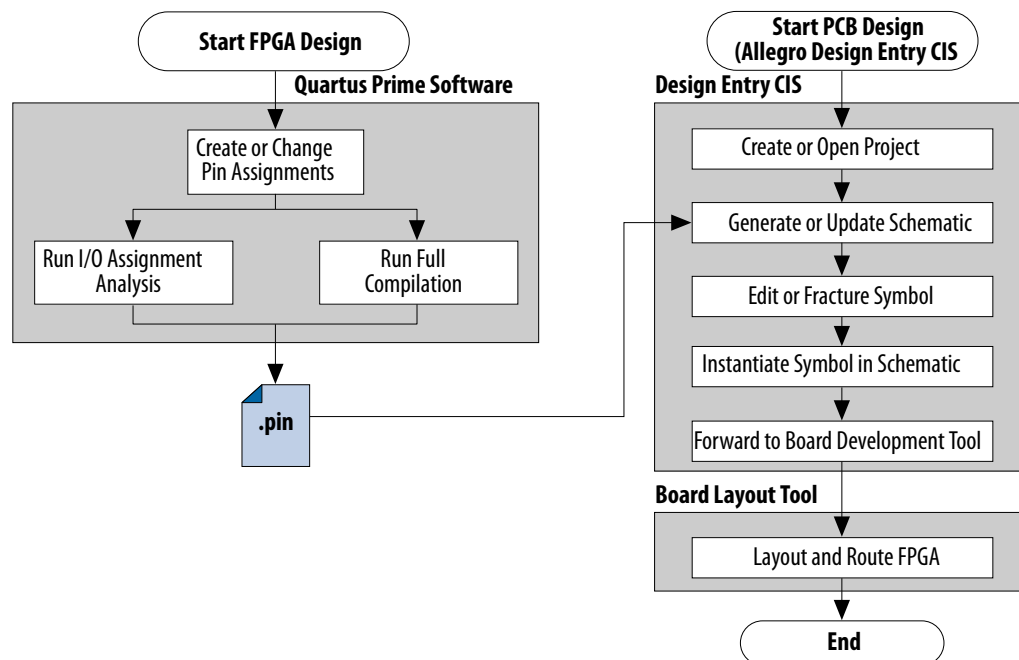

[www.cadence.com](http://www.cadence.com)

Provides more information about the Cadence Allegro Design Entry HDL software, including licensing, support, usage, training, and product updates.

## 4.6. FPGA-to-Board Integration with Cadence Allegro Design Entry CIS Software

The Cadence Allegro Design Entry CIS software is a schematic capture tool (part of the Cadence 200 series design flow based on OrCAD Capture CIS). Use the Cadence Allegro Design Entry CIS software to create flat circuit schematics for all types of PCB design. You can also create hierarchical schematics to facilitate design reuse and team-based design using the Cadence Allegro Design Entry CIS software. With the Cadence Allegro Design Entry CIS software, the design flow from FPGA-to-board is unidirectional using only the **.pin** generated by the Quartus Prime software. You can only make signal and pin assignment changes in the Quartus Prime software. These changes reflect as updated symbols in a Cadence Allegro Design Entry CIS schematic project.

**Figure 24. Design Flow with the Cadence Allegro Design Entry CIS Software**

**Note:** Routing or pin assignment changes made in a board layout tool or a Cadence Allegro Design Entry CIS symbol cannot be back-annotated to the Quartus Prime software.

### Related Information

- [www.cadence.com](http://www.cadence.com)  
For more information about the Cadence Allegro Design Entry CIS software, including licensing, support, usage, training, and product updates.
- [www.ema-eda.com](http://www.ema-eda.com)  
For more information about the Cadence Allegro Design Entry CIS software, including licensing, support, usage, training, and product updates.

#### 4.6.1. Creating a Cadence Allegro Design Entry CIS Project

The Cadence Allegro Design Entry CIS software has built-in support for creating schematic symbols using pin assignment information imported from the Quartus Prime software.

To create a new project in the Cadence Allegro Design Entry CIS software, follow these steps:

1. On the File menu, point to **New** and click **Project**. The New Project wizard starts.  
When you create a new project, you can select the PC Board wizard, the Programmable Logic wizard, or a blank schematic.
2. Select the PC Board wizard to create a project where you can select which part libraries to use, or select a blank schematic.

The Programmable Logic wizard only builds an FPGA logic design in the Cadence Allegro Design Entry CIS software.

Your new project is in the specified location and consists of the following files:

- OrCAD Capture Project File (.opj)
- Schematic Design File (.dsn)

#### 4.6.2. Generating a Part

After you create a new project or open an existing project in the Cadence Allegro Design Entry CIS software, you can generate a new schematic symbol based on your Quartus Prime FPGA design. You can also update an existing symbol. The Cadence Allegro Design Entry CIS software stores component symbols in OrCAD Library File (.olb). When you place a symbol in a library attached to a project, it is immediately available for instantiation in the project schematic.

You can add symbols to an existing library or you can create a new library specifically for the symbols generated from your FPGA designs. To create a new library, follow these steps:

1. On the File menu, point to **New** and click **Library** in the Cadence Allegro Design Entry CIS software to create a default library named **library1.olb**. This library appears in the **Library** folder in the Project Manager window of the Cadence Allegro Design Entry CIS software.
2. To specify a desired name and location for the library, right-click the new library and select **Save As**. Saving the new library creates the library file.

### 4.6.3. Generating Schematic Symbol

You can now create a new symbol to represent your FPGA design in your schematic.

To generate a schematic symbol, follow these steps:

1. Start the Cadence Allegro Design Entry CIS software.
2. On the Tools menu, click **Generate Part**. The **Generate Part** dialog box appears.
3. To specify the **.pin** from your Quartus Prime design, in the **Netlist/source file type** field, click **Browse**.
4. In the **Netlist/source file type** list, select **Altera Pin File**
5. Type the new part name.
6. Specify the **Destination part library** for the symbol. Failing to select an existing library for the part creates a new library with a default name that matches the name of your Cadence Allegro Design Entry CIS project.
7. To create a new symbol for this design, select **Create new part**. If you updated your **.pin** in the Quartus Prime software and want to transfer any assignment changes to an existing symbol, select **Update pins on existing part in library**.
8. Select any other desired options and set **Implementation type** to **<none>**. The symbol is for a primitive library part based only on the **.pin** and does not require special implementation. Click **OK**.
9. Review the Undo warning and click **Yes** to complete the symbol generation.

You can locate the generated symbol in the selected library or in a new library found in the **Outputs** folder of the design in the Project Manager window. Double-click the name of the new symbol to see its graphical representation and edit it manually using the tools available in the Cadence Allegro Design Entry CIS software.

*Note:* For more information about creating and editing symbols in the Cadence Allegro Design Entry CIS software, refer to the Help in the software.

### 4.6.4. Splitting a Part

After saving a new symbol in a project library, you can fracture the symbol into multiple parts called sections. Fracturing a part into separate sections is useful for FPGA designs. A single symbol for most FPGA packages might be too large for a single schematic page. Splitting the part into separate sections allows you to organize parts of the symbol by function, creating cleaner circuit schematics. For example, you can create one slot for an I/O symbol, a second slot for a JTAG symbol, and a third slot for a power/ground symbol.

**Figure 25. Splitting a Symbol into Multiple Sections**

- This diagram represents a Cyclone device with JTAG or passive serial (PS) mode configuration option settings. Symbols created for other devices or other configuration modes might have different sets of configuration pins, but can be fractured in a similar manner.  
- The power/ground section shows only a representation of power and ground pins because the device contains a high number of power and ground pins.

**Note:** Although symbol generation in the Design Entry CIS software refers to symbol fractures as sections, other tools use different names to refer to symbol fractures.

To split a part into sections, select the part in its library in the Project Manager window of the Cadence Allegro Design Entry CIS software. On the Tools menu, click **Split Part** or right-click the part and choose **Split Part**. The **Split Part Section Input Spreadsheet** appears.

**Figure 26. Split Part Section Input Spreadsheet**

Section Column

	Number	Name	Type	Order	Length	User Assig	I/O Bank	Voltage	I/O Standard	Location	Section
1	H1	clk	Input	0	Line		1			Left	1

1

Split... Cancel Help

Each row in the spreadsheet represents a pin in the symbol. The **Section** column indicates the section of the symbol to which each pin is assigned. You can locate all pins in a new symbol in section 1. You can change the values in the **Section** column to assign pins to various sections of the symbol. You can also specify the side of a section on the location of the pin by changing the values in the **Location** column. When you are ready, click **Split**. A new symbol appears in the same library as the original with the name <original part name>\_Split1.

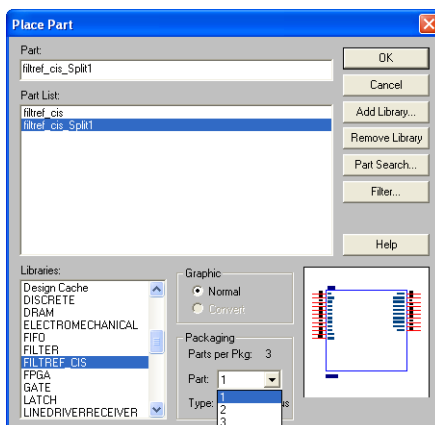

View and edit each section individually. To view the new sections of the part, double-click the part. The Part Symbol Editor window appears and the first section of the part displays for editing. On the View menu, click **Package** to view thumbnails of all the part sections. To edit the section of the symbol, double-click the thumbnail.

For more information about splitting parts into sections and editing symbol sections in the Cadence Allegro Design Entry CIS software, refer to the Help in the software.

#### 4.6.5. Instantiating a Symbol in a Design Entry CIS Schematic

After saving a new symbol in a library in your Cadence Allegro Design Entry CIS project, you can instantiate the new symbol on a page in your schematic. Open a schematic page in the Project Manager window of the Cadence Allegro Design Entry CIS software. To add the new symbol to your schematic on the schematic page, on the Place menu, click **Part**. The **Place Part** dialog box appears.

**Figure 27. Place Part Dialog Box**

Select the new symbol library location and the newly created part name. If you select a part that is split into sections, you can select the section to place from the **Part** menu. Click **OK**. The symbol attaches to your cursor for placement in the schematic. To place the symbol, click the schematic page.

For more information about using the Cadence Allegro Design Entry CIS software, refer to the Help in the software.

#### 4.6.6. Intel Libraries for the Cadence Allegro Design Entry CIS Software

Intel provides downloadable **.olb** for many of its device packages. You can add these libraries to your Cadence Allegro Design Entry CIS project and update the symbols with the pin assignments contained in the **.pin** generated by the Quartus Prime software. You can use the downloaded library symbols as a base for creating custom

schematic symbols with your pin assignments that you can edit or fracture. This method increases productivity by reducing the amount of time it takes to create and edit a new symbol.

#### 4.6.6.1. Using the Intel-provided Libraries with your Cadence Allegro Design Entry CIS Project

To use the Intel-provided libraries with your Cadence Allegro Design Entry CIS project, follow these steps:

1. Download the library of your target device from the Download Center page found through the Support page on the Intel website.
2. Create a copy of the appropriate **.olb** to maintain the original symbols. Place the copy in a convenient location, such as your Cadence Allegro Design Entry CIS project directory.
3. In the Project Manager window of the Cadence Allegro Design Entry CIS software, click once on the **Library** folder to select it. On the Edit menu, click **Project** or right-click the **Library** folder and choose **Add File** to select the copy of the downloaded **.olb** and add it to your project. You can locate the new library in the list of part libraries for your project.
4. On the Tools menu, click **Generate Part**. The **Generate Part** dialog box appears.
5. In the **Netlist/source file** field, click **Browse** to specify the **.pin** in your Quartus Prime design.
6. From the **Netlist/source file type** list, select **Altera Pin File**.
7. For **Part name**, type the name of the target device the same as it appears in the downloaded library file. For example, if you are using a device from the **CYCLONE06.OLB** library, type the part name to match one of the devices in this library such as **ep1c6f256**. You can rename the symbol in the Project Manager window after updating the part.
8. Set the **Destination part library** to the copy of the downloaded library you added to the project.
9. Select **Update pins on existing part in library**. Click **OK**.
10. Click **Yes**.

The symbol is updated with your pin assignments. Double-click the symbol in the Project Manager window to view and edit the symbol. On the View menu, click **Package** if you want to view and edit other sections of the symbol. If the symbol in the downloaded library is fractured into sections, you can edit each section but you cannot further fracture the part. You can generate a new part without using the downloaded part library if you require additional sections.

For more information about creating, editing, and fracturing symbols in the Cadence Allegro Design Entry CIS software, refer to the Help in the software.

## 4.7. Cadence Board Design Tools Support Revision History

**Table 9. Document Revision History**

Date	Quartus Prime Version	Changes
2023.08.01	18.1	<ul style="list-style-type: none"> <li>Corrected junk characters in <i>Cadence and OrCAD Product Comparison</i> table.</li> <li>Corrected junk characters in <i>Symbol Fracture Naming Conventions</i> table.</li> <li>Corrected image scaling problem in <i>Updating the FPGA Symbol in the Design Flow</i> figure.</li> </ul>
2020.11.04	18.1	<ul style="list-style-type: none"> <li>Added "Intel" to "Quartus Prime" software reference in a figure.</li> </ul>

May 2008	8.0	Updated references.

## 5. Quartus Prime Pro Edition User Guide: PCB Design Tools Document Archives

---

For the latest and previous versions of this user guide, refer to [Quartus Prime Pro Edition User Guide: PCB Design Tools](#). If an IP or software version is not listed, the user guide for the previous IP or software version applies.

## A. Quartus Prime Pro Edition User Guides

---

Refer to the following user guides for comprehensive information on all phases of the Quartus Prime Pro Edition FPGA design flow.

### Related Information

- [Quartus Prime Pro Edition User Guide: Getting Started](#)  
Introduces the basic features, files, and design flow of the Quartus Prime Pro Edition software, including managing Quartus Prime Pro Edition projects and IP, initial design planning considerations, and project migration from previous software versions.
- [Quartus Prime Pro Edition User Guide: Platform Designer](#)  
Describes creating and optimizing systems using Platform Designer, a system integration tool that simplifies integrating customized IP cores in your project. Platform Designer automatically generates interconnect logic to connect intellectual property (IP) functions and subsystems.
- [Quartus Prime Pro Edition User Guide: Design Recommendations](#)  
Describes best design practices for designing FPGAs with the Quartus Prime Pro Edition software. HDL coding styles and synchronous design practices can significantly impact design performance. Following recommended HDL coding styles ensures that Quartus Prime Pro Edition synthesis optimally implements your design in hardware.
- [Quartus Prime Pro Edition User Guide: Design Compilation](#)  
Describes set up, running, and optimization for all stages of the Quartus Prime Pro Edition Compiler. The Compiler synthesizes, places, and routes your design before generating a device programming file.
- [Quartus Prime Pro Edition User Guide: Design Optimization](#)  
Describes Quartus Prime Pro Edition settings, tools, and techniques that you can use to achieve the highest design performance in Intel FPGAs. Techniques include optimizing the design netlist, addressing critical chains that limit retiming and timing closure, optimizing device resource usage, device floorplanning, and implementing engineering change orders (ECOs).
- [Quartus Prime Pro Edition User Guide: Programmer](#)  
Describes operation of the Quartus Prime Pro Edition Programmer, which allows you to configure Intel FPGA devices, and program CPLD and configuration devices, via connection with an Intel FPGA download cable.
- [Quartus Prime Pro Edition User Guide: Block-Based Design](#)  
Describes block-based design flows, also known as modular or hierarchical design flows. These advanced flows enable preservation of design blocks (or logic that comprises a hierarchical design instance) within a project, and reuse of design blocks in other projects.

- [Quartus Prime Pro Edition User Guide: Partial Reconfiguration](#)  
Describes Partial Reconfiguration, an advanced design flow that allows you to reconfigure a portion of the FPGA dynamically, while the remaining FPGA design continues to function. Define multiple personas for a particular design region, without impacting operation in other areas.
- [Quartus Prime Pro Edition User Guide: Third-party Simulation](#)  
Describes RTL- and gate-level design simulation support for third-party simulation tools by Aldec\*, Cadence\*, Siemens EDA, and Synopsys that allow you to verify design behavior before device programming. Includes simulator support, simulation flows, and simulating Intel FPGA IP.
- [Quartus Prime Pro Edition User Guide: Third-party Synthesis](#)  
Describes support for optional synthesis of your design in third-party synthesis tools by Siemens EDA, and Synopsys. Includes design flow steps, generated file descriptions, and synthesis guidelines.
- [Quartus Prime Pro Edition User Guide: Third-party Logic Equivalence Checking Tools](#)  
Describes support for optional logic equivalence checking (LEC) of your design in third-party LEC tools by OneSpin\*.
- [Quartus Prime Pro Edition User Guide: Debug Tools](#)  
Describes a portfolio of Quartus Prime Pro Edition in-system design debugging tools for real-time verification of your design. These tools provide visibility by routing (or “tapping”) signals in your design to debugging logic. These tools include System Console, Signal Tap logic analyzer, system debugging toolkits, In-System Memory Content Editor, and In-System Sources and Probes Editor.
- [Quartus Prime Pro Edition User Guide: Timing Analyzer](#)  
Explains basic static timing analysis principals and use of the Quartus Prime Pro Edition Timing Analyzer, a powerful ASIC-style timing analysis tool that validates the timing performance of all logic in your design using an industry-standard constraint, analysis, and reporting methodology.
- [Quartus Prime Pro Edition User Guide: Power Analysis and Optimization](#)  
Describes the Quartus Prime Pro Edition Power Analysis tools that allow accurate estimation of device power consumption. Estimate the power consumption of a device to develop power budgets and design power supplies, voltage regulators, heat sink, and cooling systems.
- [Quartus Prime Pro Edition User Guide: Design Constraints](#)  
Describes timing and logic constraints that influence how the Compiler implements your design, such as pin assignments, device options, logic options, and timing constraints. Use the Interface Planner to prototype interface implementations, plan clocks, and quickly define a legal device floorplan. Use the Pin Planner to visualize, modify, and validate all I/O assignments in a graphical representation of the target device.
- [Quartus Prime Pro Edition User Guide: PCB Design Tools](#)  
Describes support for optional third-party PCB design tools by Siemens EDA and Cadence\*. Also includes information about signal integrity analysis and simulations with HSPICE and IBIS Models.
- [Quartus Prime Pro Edition User Guide: Scripting](#)  
Describes use of Tcl and command line scripts to control the Quartus Prime Pro Edition software and to perform a wide range of functions, such as managing projects, specifying constraints, running compilation or timing analysis, or generating reports.

## 1. Command Line Scripting

---

FPGA design software that easily integrates into your design flow saves time and improves productivity. The Quartus® Prime software provides you with a command-line executable for each step of the FPGA design flow to make the design process customizable and flexible.

The command-line executables are completely interchangeable with the Quartus Prime GUI, allowing you to use the exact combination of tools that best suits your needs.

### Related Information

- [Tcl Design Examples](#)
- [TCL Commands and Packages](#) on page 52

### 1.1. Benefits of Command-Line Executables

Quartus Prime command-line executables give you precise control over each step of the design flow, reduce memory requirements, and improve performance.

You can group Quartus Prime executable files into a script, batch file, or a makefile to automate design flows. These scripting capabilities facilitate the integration of Quartus Prime software and other EDA synthesis, simulation, and verification software. Automatic design flows can perform on multiple computers simultaneously and easily archive and restore projects.

Command-line executables add flexibility without sacrificing the ease-of-use of the Quartus Prime GUI. You can use the Quartus Prime GUI and command-line executables at different stages in the design flow. For example, you might use the Quartus Prime GUI to edit the floorplan for the design, use the command-line executables to perform place-and-route, and return to the Quartus Prime GUI to perform debugging.

Command-line executables reduce the amount of memory required during each step in the design flow. Since each executable targets only one step in the design flow, the executables themselves are relatively compact, both in file size and the amount of memory used during processing. This memory usage reduction improves performance, and is particularly beneficial in design environments where heavy usage of computing resources results in reduced memory availability.

### Related Information

[About Command-Line Executables](#)  
in Quartus Prime Help

## 1.2. Command-Line Scripting Help

Help for command-line executables is available through different methods. You can access help built into the executables with command-line options. You can use the Quartus Prime Command-Line and Tcl API Help browser for an easy graphical view of the help information.

To use the Quartus Prime Command-Line and Tcl API Help browser, type the following command:

```
quartus_sh --qhelp
```

This command starts the Quartus Prime Command-Line and Tcl API Help browser, a viewer for information about the Quartus Prime Command-Line executables and Tcl API.

Use the `-h` option with any of the Quartus Prime Command-Line executables to get a description and list of supported options. Use the `--help=<option name>` option for detailed information about each option.

**Figure 1. Quartus Prime Command-Line and Tcl API Help Browser**

## 1.3. Project Settings with Command-Line Options

The Quartus Prime software command-line executables accept arguments to set project variables and access common settings.

To make assignments to an individual entity you can use the Quartus Prime Tcl scripting API. On existing projects, you can also open the project in the Quartus Prime GUI, change the assignment, and close the project. The changed assignment is updated in the `.qsf`. Any command-line executables that are run after this update use the updated assignment.

### Related Information

- [Compilation with quartus\\_sh --flow](#) on page 8
- [Quartus Prime Settings File \(.qsf\) Definition](#) in Quartus Prime Help

- [Quartus Prime Pro Edition Settings File Reference Manual](#)

### 1.3.1. Option Precedence

Project assignments follow a set of precedence rules. Assignments for a project can exist in three places:

- Quartus Prime Settings File (.qsf)
- The compiler database
- Command-line options

The .qsf file contains all the project-wide and entity-level assignments and settings for the current revision for the project. The compiler database contains the result of the last compilation in the /db directory, and reflects the assignments at the moment when the project was compiled. Updated assignments first appear in the compiler database and later in the .qsf file.

Command-line options override any conflicting assignments in the .qsf file or the compiler database files. To specify whether the .qsf or compiler database files take precedence for any assignments not specified in the command-line, use the option `--read_settings_files`.

**Table 1. Precedence for Reading Assignments**

Option Specified	Precedence for Reading Assignments
<code>--read_settings_files = on</code> (Default)	<ol style="list-style-type: none"> <li>1. Command-line options</li> <li>2. The .qsf for the project</li> <li>3. Project database (db directory, if it exists)</li> <li>4. Quartus Prime software defaults</li> </ol>
<code>--read_settings_files = off</code>	<ol style="list-style-type: none"> <li>1. Command-line options</li> <li>2. Project database (db directory, if it exists)</li> <li>3. Quartus Prime software defaults</li> </ol>

The `--write_settings_files` command-line option lists the locations to which assignments are written..

**Table 2. Location for Writing Assignments**

Option Specified	Location for Writing Assignments
<code>--write_settings_files = on</code> (Default)	.qsf file and compiler database
<code>--write_settings_files = off</code>	Compiler database

Any assignment not specified as a command-line option or found in the .qsf file or compiler database file is set to its default value.

Use the options `--read_settings_files=off` and `--write_settings_files=off` (where appropriate) to optimize the way that the Quartus Prime software reads and updates settings files.

## 1.4. Compilation with `quartus_sh --flow`

The figure shows a typical Quartus Prime FPGA design flow using command-line executables.

**Figure 2. Typical Design Flow**

Use the `quartus_sh` executable with the `--flow` option to perform a complete compilation flow with a single command. The `--flow` option supports the smart recompile feature and efficiently sets command-line arguments for each executable in the flow.

You can resume an interrupted compilation with the `-resume` argument of the `--flow` option.

After you start a compilation flow with the `quartus_sh` executable, you can monitor the progress of the compilation flow in the Quartus Prime Pro Edition GUI.

The following example runs analysis & synthesis, fitter, timing analysis, and programming file generation with a single command:

```
quartus_sh --flow compile filtref
```

**Tip:**

For information about specialized flows, type `quartus_sh --help=flow` at a command prompt.

**Related Information**

- [Resuming a Compilation with `quartus\_sh --flow` on page 9](#)
- [Compilation Monitoring in \*Intel Quartus Prime Pro Edition User Guide: Design Compilation\*](#)

### 1.4.1. Resuming a Compilation with `quartus_sh --flow`

You can resume a compilation flow for a project from the last valid step completed in the flow with the `-resume` option of the `quartus_sh --flow` command. If you want to resume a compilation flow, ensure that no settings that affect the subsequent compilation stages have changed from initial start of the compilation.

You can also use the `-start` and `-stop` options of `quartus_sh --flow` command to start and stop a compilation flow at specific compilation tasks.

Resuming a compilation flow also updates the Compilation Dashboard to show how the flow is progressing.

For command syntax and example of how to use the flow resume feature, run `quartus_sh --help=flow` at a command prompt.

**Related Information**

[Using the Compilation Dashboard](#)

### 1.4.2. Temporarily Overriding the Compiler Optimization Mode

You can run a full compilation flow that temporarily overrides the compiler optimization mode set in the Quartus settings file (`.qsf`) for your design. The optimization mode set for your project in your settings file does not change and remains the default compilation strategy for your project.

Overriding the compiler optimization mode set in your project can be helpful when your project has long compile times and you want to quickly produce a bitstream for on-chip testing.

The following temporary optimization mode compilation flow options are available for the `quartus_sh --flow`, `quartus_fit`, and `quartus_syn` commands:

- `-aggressive_compile_time`

In the Aggressive Compile Time optimization mode, the Compiler reduces its performance optimization efforts and performs minimal reporting to provide a shorter compilation time.

- `-fast_functional_test`

In Fast Functional Test optimization mode, the Compiler minimizes its setup-timing optimization efforts to provide an even shorter compilation time.

For example, to compile revision `rev1` of project `top` with a temporary Fast Functional Test optimization mode that overrides the compiler optimization mode set in the project `.qsf` file, issue the following command:

```
quartus_sh --flow compile top -c rev1 -fast_functional_test
```

The selected optimization mode is enabled only for the duration of the compilation. After the compilation completes, Quartus Prime returns to the compilation optimization strategy that is set in the project settings.

**Important:** With these optimization modes, the clocks in the resulting compilation might not meet setup. You might need to slow down the clocks on your design, such as by using PLL ECOs post-compile, before generating the bitstream.

#### Related Information

- [Full Compilation Flow with Temporary Optimization in \*Intel Quartus Prime Pro Edition User Guide: Design Compilation\*](#)
- [Compiler Optimization Modes in \*Intel Quartus Prime Pro Edition User Guide: Design Compilation\*](#)

## 1.5. Text-Based Report Files

Each command-line executable creates a text report file when it is run. These files report success or failure, and contain information about the processing performed by the executable.

Report file names contain the revision name and the short-form name of the executable that generated the report file, in the format `<revision>.<executable>.rpt`. For example, using the `quartus_fit` executable to place and route a project with the revision name **design\_top** generates a report file named `design_top.fit.rpt`. Similarly, using the `quartus_sta` executable to perform timing analysis on a project with the revision name **fir\_filter** generates a report file named `fir_filter.sta.rpt`.

As an alternative to parsing text-based report files, you can use the `::quartus::report` Tcl package.

#### Related Information

- [Text-Format Report File \(.rpt\) Definition](#)  
in Quartus Prime Help
- [::quartus::report](#)  
in Quartus Prime Help

## 1.6. Using Command-Line Executables in Scripts

You can use command-line executables in scripts that control other software, in addition to Quartus Prime software. For example, if your design flow uses third-party synthesis or simulation software, and you can run this other software at the command prompt, you can group those commands with Quartus Prime executables in a single script.

To set up a new project and apply individual constraints, such as pin location assignments and timing requirements, you must use a Tcl script or the Quartus Prime GUI.

Command-line executables are very useful for working with existing projects, for making common global settings, and for performing common operations. For more flexibility in a flow, use a Tcl script. Additionally, Tcl scripts simplify passing data between different stages of the design flow.

For example, you can create a UNIX shell script to run a third-party synthesis software, place-and-route the design in the Quartus Prime software, and generate output netlists for other simulation software.

## 1.7. Common Scripting Examples

You can create scripts including command line executable to control common Quartus Prime processes.

### 1.7.1. Create a Project and Apply Constraints

The command-line executables include options for common global project settings and commands. You can use a Tcl script to apply constraints such as pin locations and timing assignments. You can write a Tcl constraint file, or generate one for an existing project by clicking **Project > Generate Tcl File for Project**.

The example creates a project with a Tcl script and applies project constraints using the tutorial design files in the <Quartus Prime *installation directory*>/qdesigns/fir\_filter/ directory.

```
project_new filtref -overwrite
# Assign family, device, and top-level file
set_global_assignment -name FAMILY "Arria 10"
set_global_assignment -name DEVICE <Device>
set_global_assignment -name VERILOG_FILE filtref.v
# Assign pins
set_location_assignment -to clk Pin_28
set_location_assignment -to clkx2 Pin_29
set_location_assignment -to d[0] Pin_139
set_location_assignment -to d[1] Pin_140
#
project_close
```

Save the script in a file called `setup_proj.tcl` and type the commands illustrated in the example at a command prompt to create the design, apply constraints, compile the design, and perform fast-corner and slow-corner timing analysis. Timing analysis results are saved in two files, `filtref_sta_1.rpt` and `filtref_sta_2.rpt`.

```
quartus_sh -t setup_proj.tcl
quartus_syn filtref
quartus_fit filtref
quartus_asm filtref
quartus_sta filtref --model=fast --export_settings=off
mv filtref_sta.rpt filtref_sta_1.rpt
quartus_sta filtref --export_settings=off
mv filtref_sta.rpt filtref_sta_2.rpt
```

Type the following commands to create the design, apply constraints, and compile the design, without performing timing analysis:

```
quartus_sh -t setup_proj.tcl
quartus_sh --flow compile filtref
```

The `quartus_sh --flow compile` command performs a full compilation, and is equivalent to clicking the **Start Compilation** button in the toolbar.

### 1.7.2. Check Design File Syntax

The .tcl script example below assumes the Quartus Prime software **fir\_filter** tutorial project exists in the current directory. You can find the **fir\_filter** project in the *<Quartus Prime directory>/qdesigns/fir\_filter* directory unless the Quartus Prime software tutorial files are not installed.

When options are not specified, the executable uses the project database values. If not specified in the project database, the executable uses the Quartus Prime software default values.

To run this script, save this script to a file such as `check_syntax.tcl` and then run the following command from a command prompt: `quartus_syn -t check_syntax.tcl`.

```
set dir [pwd]; # set dir to current working directory

# assign quartus_files variable to all files within current working directory
# asterisk (*) may be changed to specific file extensions (i.e. *.v, *.vhd1, *.etc)
set quartus_files [glob -directory $dir *]

# open project fir_filter with revision name filtref
project_open fir_filter -revision filtref

foreach file $quartus_files {
    post_message $file;          # echo which file was analyzed
    analyze_files -files $file -library work; # analyze file for syntax
}

project_close; # close project
```

### 1.7.3. Create a Project and Synthesize a Netlist Using Netlist Optimizations

This example creates a new Quartus Prime project with a file `top.edf` as the top-level entity. The `--enable_register_retiming=on` and `--enable_wysiwyg_resynthesis=on` options cause `quartus_map` to optimize the design using gate-level register retiming and technology remapping.

The `--part` option causes `quartus_syn` to target a device. To create the project and synthesize it using the netlist optimizations described above, type the command shown in this example at a command prompt.

```
quartus_syn top --source=top.edf --enable_register_retiming=on
--enable_wysiwyg_resynthesis=on --part=<part>
```

### 1.7.4. Archive and Restore Projects

You can archive or restore an Quartus Prime Archive File (.qar) with a single command. This makes it easy to take snapshots of projects when you use batch files or shell scripts for compilation and project management.

Use the `--archive` or `--restore` options for `quartus_sh` as appropriate. Type the command shown in the example at a command prompt to archive your project.

```
quartus_sh --archive <project name>
```

The archive file is automatically named `<project name>.qar`. If you want to use a different name, type the command with the `-output` option as shown in example the example.

```
quartus_sh --archive <project name> -output <filename>
```

To restore a project archive, type the command shown in the example at a command prompt.

```
quartus_sh --restore <archive name>
```

The command restores the project archive to the current directory and overwrites existing files.

#### Related Information

[Managing Quartus Prime Projects](#)

### 1.7.5. Update Memory Contents Without Recompiling

You can use two commands to update the contents of memory blocks in your design without recompiling. Use the `quartus_cdb` executable with the `--update_mif` option to update memory contents from .mif or .hexout files. Then, rerun the assembler with the `quartus_asm` executable to regenerate the .sof, .pof, and any other programming files.

```
quartus_cdb --update_mif <project name> [--rev=<revision name>]  
quartus_asm <project name> [--rev=<revision name>]
```

The example shows the commands for a DOS batch file for this example. With a DOS batch file, you can specify the project name and the revision name once for both commands. To create the DOS batch file, paste the following lines into a file called `update_memory.bat`.

```
quartus_cdb --update_mif %1 --rev=%2  
quartus_asm %1 --rev=%2
```

To run the batch file, type the following command at a command prompt:

```
update_memory.bat <project name> <revision name>
```

### 1.7.6. Create Device Configuration Files

You can use the `quartus_cpf` or `quartus_pfg` command line executables to generate different types of device configuration files at the command line, depending on your target device.

- `quartus_pfg`—controls the same programming file generation functions as the **Programming File Generator** dialog box in the Quartus Prime software GUI, and supports programming file generation for Stratix® 10 and Agilex™ FPGA portfolio devices.

**Table 3.** `quartus_pfg` Command Examples

Command Function	Command Syntax
Specify the ASX4 operation mode, convert .sof to .jic	<code>quartus_pfg -c -o device=MT25QU512 -o mode=ASX4 -o flash_loader=1SG280HN3S3 \ project.sof project.jic</code>
Access full command-line syntax help	<code>quartus_pfg --help</code>

- `quartus_cpf`—controls the same functions as the **Convert Programming Files** dialog box in the Quartus Prime software GUI, and supports programming file generation for all device families prior to the Stratix 10 device family.

**Table 4.** `quartus_cpf` Command Examples

Command Function	Command Syntax
Create an option file that turns on compression, type the following command at a command prompt	<code>quartus_cpf -w &lt;filename&gt;.opt</code>
Create a compressed .pof that targets an EPCS64 device	<code>quartus_cpf --convert --option=&lt;filename&gt;.opt --device=EPCS64 \ &lt;file&gt;.sof &lt;file&gt;.pof</code>
Save configuration options in a conversion setup file (.cof)	<code>quartus_cpf --convert &lt;file&gt;.cof</code>
Convert a .sof programming file to CvP periphery image (*.jam) file	<code>quartus_cpf -c &lt;filename&gt;.sof &lt;filename&gt;.jam --cvp</code>
Access full command-line syntax help	<code>quartus_cpf --help</code>

**Note:** For complete Quartus Prime command line executable syntax and examples, refer to [Command-Line Scripting Help](#) on page 6.

### 1.7.7. Fit a Design Using Multiple Seeds

This shell script example assumes that the Quartus Prime software tutorial project called **fir\_filter** exists in the current directory (defined in the file `fir_filter.qpf`). If the tutorial files are installed on your system, this project exists in the `<Quartus Prime directory>/qdesigns<quartus_version_number>/fir_filter` directory.

Because the top-level entity in the project does not have the same name as the project, you must specify the revision name for the top-level entity with the `--rev` option. The `--seed` option specifies the seeds to use for fitting.

A seed is a parameter that affects the random initial placement of the Quartus Prime Fitter. Varying the seed can result in better performance for some designs.

After each fitting attempt, the script creates new directories for the results of each fitting attempt and copies the complete project to the new directory so that the results are available for viewing and debugging after the script has completed.

```
#!/bin/sh
ERROR_SEEDS=""
quartus_syn fir_filter --rev=filtref
# Iterate over a number of seeds
for seed in 1 2 3 4 5
do
echo "Starting fit with seed=$seed"
# Perform a fitting attempt with the specified seed
quartus_fit fir_filter --seed=$seed --rev=filtref
# If the exit-code is non-zero, the fitting attempt was
# successful, so copy the project to a new directory
if [ $? -eq 0 ]
then
        mkdir ../fir_filter-seed_$seed
        mkdir ../fir_filter-seed_$seed/db
        cp * ../fir_filter-seed_$seed
        cp db/* ../fir_filter-seed_$seed/db
else
        ERROR_SEEDS="$ERROR_SEEDS $seed"
fi
done
if [ -z "$ERROR_SEEDS" ]
then
echo "Seed sweeping was successful"
exit 0
else
echo "There were errors with the following seed(s)"
echo $ERROR_SEEDS
exit 1
fi
```

*Tip:* Use Design Space Explorer II (DSE) included with the Quartus Prime software script (by typing `quartus_dse` at a command prompt) to improve design performance by performing automated seed sweeping.

## 1.8. The QFlow Script

A Tcl/Tk-based graphical interface called QFlow is included with the command-line executables. You can use the QFlow interface to open projects, launch some of the command-line executables, view report files, and make some global project assignments.

The QFlow interface can run the following command-line executables:

- `quartus_syn` (Analysis and Synthesis)
- `quartus_fit` (Fitter)
- `quartus_sta` (Timing Analyzer)
- `quartus_asm` (Assembler)
- `quartus_eda` (EDA Netlist Writer)

To view floorplans or perform other GUI-intensive tasks, launch the Quartus Prime software.

Start QFlow by typing the following command at a command prompt:

```
quartus_sh -g
```

*Tip:* The QFlow script is located in the `<Quartus Prime directory>/common/tcl/apps/qflow/` directory.

### 1.8.1. --partition Option

The `--partition` option is for the `--simulation` top-level argument for `quartus_eda`. This option selects an individual partition as the netlist output.

#### `--exclude_sub_partitions`

The `--exclude_sub_partitions` flag limits the output to the netlist of this partition only. This flag is only valid when you use the `--partition` option, this flag outputs the netlist belonging to the partition specified. The software instantiates sub-partitions as separate modules.

For no partition argument, the software writes the entire design out to a single file. The partition argument takes a name of a partition in the design. The sub-option is a flag only and takes no arguments.

When you specify the `--exclude_sub_partitions` flag, the software only writes out the contents of the selected partition. Sub-partitions are instantiated as separate modules. Each call of `quartus_eda` writes one netlist. If you write out the design one partition at a time, excluding sub partitions, they need to call `quartus_eda` for each partition in the design including the root.

#### `root_partition`

You can specify the `root_partition` flag to get the full design. You can provide the partition option to write to a netlist file (`.vo` or `.vho` file). The file contains all the logic and atoms corresponding the contents of the specified partition along with its sub-partition.

#### `--rename`

Additionally, you have the option to rename a module name in the generated netlist file using the `--rename` option. By default, the software uses the partition name as the module name in the netlist file. This option is only valid when you use the partition option. You can elect to rename any module using `--module_name=abc=xyz --module_name=def=prq`. The generated file names format is: `<revision>.<module`

*or partition name>.<vo or who>* By default, the software writes the netlist file to the simulation/*<3rd party simulation tool>* directory (for example, simulation/modelsim), unless you specify an output\_directory (using a command line option or .qsf assignment).

## 1.9. Command-Line Scripting Revision History

The following revision history applies to this chapter:

**Table 5. Document Revision History**

Document Version	Quartus Prime Version	Changes
2024.07.08	24.2	<ul style="list-style-type: none"> <li>Updated throughout to reflect support for the Agilex 5 device family.</li> </ul>
2024.04.01	24.1	<ul style="list-style-type: none"> <li>Applied phase I Altera rebranding throughout.</li> </ul>
2022.04.03	23.1	<ul style="list-style-type: none"> <li>Updated name of the Agilex 7 device family.</li> </ul>
2022.09.26	22.3	<ul style="list-style-type: none"> <li>Added Top FAQs navigation to document cover.</li> </ul>
2022.03.28	22.1	<ul style="list-style-type: none"> <li>Added "Temporarily Overriding the Compiler Optimization Mode"</li> <li>Added information about monitoring a compilation to "Compilation with quartus_sh --flow"</li> </ul>
2021.03.29	21.1	<ul style="list-style-type: none"> <li>Added "Resuming a Compilation with quartus_sh --flow"</li> <li>Revised "Check Design File Syntax".</li> </ul>
2020.12.14	20.4	<ul style="list-style-type: none"> <li>Updated "Create Device Configuration Files" to include references to the cvp command option and the quartus_pfg command.</li> </ul>
2020.04.13	20.1	Added --partition option.
2017.05.08	17.0.0	<ul style="list-style-type: none"> <li>Reorganized content on topics: Benefits of Command-Line Executables and Project Settings with Command-Line Options.</li> <li>Removed mentions to unsupported executables and options.</li> <li>Removed topics: Introductory Example and Common Scripting Examples</li> </ul>
2016.10.31	16.1.0	<ul style="list-style-type: none"> <li>Implemented Intel rebranding.</li> </ul>
2015.11.02	15.1.0	Changed instances of <i>Quartus II</i> to <i>Quartus Prime</i> .
2015.05.04	15.0.0	Remove descriptions of makefile support that was removed from software in 14.0.
December 2014	14.1.0	Updated DSE II commands.
June 2014	14.0.0	Updated formatting.
November 2013	13.1.0	Removed information about -silnet qmegawiz command
June 2012	12.0.0	Removed survey link.
November 2011	11.0.1	Template update.
May 2011	11.0.0	Corrected quartus_qpf example usage. Updated examples.
December 2010	10.1.0	Template update. Added section on using a script to regenerate megafunction variations. Removed references to the Classic Timing Analyzer (quartus_tan). Removed Qflow illustration.

*continued...*

Document Version	Quartus Prime Version	Changes
July 2010	10.0.0	Updated script examples to use quartus_sta instead of quartus_tan, and other minor updates throughout document.
November 2009	9.1.0	Updated Table 2-1 to add quartus_jli and quartus_jbcc executables and descriptions, and other minor updates throughout document.
March 2009	9.0.0	No change to content.
November 2008	8.1.0	<p>Added the following sections:</p> <ul style="list-style-type: none"> <li>• "The MegaWizard Plug-In Manager" on page 2-11</li> <li>• "Command-Line Support" on page 2-12</li> <li>• "Module and Wizard Names" on page 2-13</li> <li>• "Ports and Parameters" on page 2-14</li> <li>• "Invalid Configurations" on page 2-15</li> <li>• "Strategies to Determine Port and Parameter Values" on page 2-15</li> <li>• "Optional Files" on page 2-15</li> <li>• "Parameter File" on page 2-16</li> <li>• "Working Directory" on page 2-17</li> <li>• "Variation File Name" on page 2-17</li> <li>• "Create a Compressed Configuration File" on page 2-21</li> <li>• Updated "Option Precedence" on page 2-5 to clarify how to control precedence</li> <li>• Corrected Example 2-5 on page 2-8</li> <li>• Changed Example 2-1, Example 2-2, Example 2-4, and Example 2-7 to use the EP1C12F256C6 device</li> <li>• Minor editorial updates</li> <li>• Updated entire chapter using 8½" × 11" chapter template</li> </ul>
May 2008	8.0.0	<ul style="list-style-type: none"> <li>• Updated "Referenced Documents" on page 2-20.</li> <li>• Updated references in document.</li> </ul>

## 2. Tcl Scripting

---

You can use Tcl scripts, as an alternative to the GUI, to control the function and operation of Quartus Prime software.

For example, you can use Tcl scripts to perform the following tasks:

- Manage Quartus Prime projects
- Specify assignments and constraints
- Compile your design
- Perform timing analysis
- Generate and view reports about your project

You can also use Tcl scripts to migrate a project or project settings. For example, when working with different projects targeting the same prototype or development board, you can define a Tcl script to automate pin assignments for each project, rather than entering the assignments individually in the GUI. You can automatically generate a Tcl script based on current project assignments, which simplifies transferring the assignments to another project.

The Quartus Prime software Tcl commands follow familiar EDA industry Tcl application programming interface (API) standards for command-line options. If you encounter an error with a command argument, the Tcl interpreter includes help information showing correct usage.

This chapter includes sample Tcl scripts for automating tasks in the Quartus Prime software, along with a complete reference of all supported Tcl commands and arguments. You can modify the example scripts for use with your own designs. Refer to Design Examples section of the Support area on the Intel website.

### Related Information

- [Tcl Design Examples](#)
- [TCL Commands and Packages](#) on page 52

### 2.1. Tool Command Language

Tcl (pronounced “tickle”) stands for Tool Command Language, and is the industry-standard scripting language. Tcl supports control structures, variables, network socket access, and APIs.

With Tcl, you can work seamlessly across most development platforms. Synopsys\*, Mentor Graphics\*, and Intel software products support the Tcl language.

By combining Tcl commands and Quartus Prime API functions, you can create your own procedures and automate your design flow. Run Quartus Prime software in batch mode, or execute individual Tcl commands interactively in the Quartus Prime Tcl shell.

\*Other names and brands may be claimed as the property of others.

Quartus Prime software supports Tcl/Tk version 8.5, supplied by the Tcl DeveloperXchange.

## 2.2. The Quartus Prime Tcl Console Window

A Tcl Console Window is available in the Quartus Prime software GUI by clicking **View** ► **Tcl Console**. You can run Quartus Prime Tcl commands directly in the **Tcl Console** window. The Quartus Prime Tcl shell interprets all Tcl commands that you type in the **Tcl Console**.

In addition, when you run commands in the Quartus Prime GUI, the Tcl Console displays the equivalent Tcl command. You can right-click in the Tcl Console and click **Save to File** to save a log file of the Tcl commands in the Tcl Console.

**Note:** Some shell commands such as `cd`, `ls`, and others can be run in the Tcl Console window, with the Tcl `exec` command. However, for best results, run shell commands and Quartus Prime executables from a system command prompt outside of the Quartus Prime software GUI.

Tcl messages appear in the **System** tab (**Messages** window). Errors and messages written to `stdout` and `stderr` also are shown in the Quartus Prime **Tcl Console** window.

## 2.3. Quartus Prime Tcl Packages

The Quartus Prime software groups Tcl commands into packages by function.

**Note:** Refer to [TCL Commands and Packages](#) on page 52 for a comprehensive reference of all Quartus Prime Tcl packages and commands.

**Table 6. Quartus Prime Tcl Packages**

Package Name	Package Description
backannotate	Back-annotate the Compiler's assignments.
bpps	Floorplan IP interfaces and other device resources in Interface Planner.
chip_planner	Identify and modify resource usage and routing with the Chip Planner.
design	Manipulate project databases, including the assignments database, to enable the creation of instance assignments without modifying the <code>.qsf</code> file.
device	Get device and family information from the device database.
dni_sdc	Set false path, input delay, or output delay SDC constraints.
drc	Interact with Design Assistant design rule checks.
eco	Specify engineering change orders after design compilation.
external_memif_toolkit	Interact with external memory interfaces and debug components.
fif	Contains the set of Tcl functions for using the Fault Injection File (FIF) Driver
flng	Query properties of generic objects.
flow	Compile a project, run command-line executables, and other compilation flows.
help	Tcl command help.
continued...	

Package Name	Package Description
insystem_memory_edit	Read and edit memory contents in Intel FPGA devices.
insystem_source_probe	Interact with the In-System Sources and Probes tool in an Intel device.
interactive_synthesis	Interactive synthesis controls.
ipgen	IP generation controls.
iptclgen	Memory IP generation controls.
jtag	Control the JTAG chain.
logic_analyzer_interface	Query and modify the Logic Analyzer Interface output pin state.
misc	Perform miscellaneous tasks such as enabling natural bus naming, package loading, and message posting.
names	Gets or sets assignment names.
periph	Interact with the interface pins.
pfg	Controls the Programming File Generator.
project	Create and manage projects and revisions, make any project assignments including timing assignments.
project_ui	Query the GUI.
qshm	Client and server controls.
report	Get information from report tables, create custom reports.
rtl	Traverse and query the RTL netlist of your design.
sdc	Specify constraints and exceptions to the Timing Analyzer.
sdc_ext	Intel FPGA-specific SDC commands.
sta	Contains the set of Tcl functions for obtaining advanced information from the Timing Analyzer.
stp	Run the Signal Tap Logic Analyzer.
tdc	Obtain information from the Timing Analyzer.

To keep memory requirements as low as possible, only the minimum number of packages load automatically with each Quartus Prime executable. To run commands from other packages, load those packages beforehand.

Run your scripts with executables that include the packages you use in the scripts. For example, to use commands in the `sdc_ext` package, you must use the `quartus_sta` executable because `quartus_sta` is the only executable with support for the `sdc_ext` package.

The following command prints lists of the packages loaded or available to load for an executable, to the console:

```
<executable name> --tcl_eval help
```

For example, type the following command to list the packages loaded or available to load by the `quartus_fit` executable:

```
quartus_fit --tcl_eval help
```

### Related Information

- [Tcl Design Examples](#)
- [TCL Commands and Packages](#) on page 52

## 2.3.1. Loading Tcl Packages

To load an Quartus Prime Tcl package, use the `load_package` command as follows:

```
load_package [-version <version number>] <package name>
```

This command is similar to `package require`, but it allows to alternate between different versions of an Quartus Prime Tcl package.

## 2.3.2. Quartus Prime Tcl API Help

Quartus Prime Tcl help allows easy access to information about the Quartus Prime Tcl commands.

- This command opens the Quartus Prime Command-Line and Tcl API help browser, which documents all commands and options in the Quartus Prime Tcl API. At a system command prompt, access the Quartus Prime Tcl API Help by typing:

```
quartus_sh --qhelp
```

- The Tcl API Help can be accessed from the Tcl console as well. At a Tcl prompt, type

```
help
```

to access the help information. The output is:

The Tcl console provides help options that display specific information:

**Table 7. Help Options Available in the Quartus Prime Tcl Environment**

Help Command	Description
<code>help</code>	Displays complete list of available Quartus Prime Tcl packages.
<code>help -tcl</code>	Explains how to load Tcl packages and access command-line help.
<code>help -pkg &lt;package_name&gt; [-version &lt;version number&gt;]</code>	<p>Displays help commands of the Quartus Prime package that you specify, including the list of available Tcl commands.</p> <ul style="list-style-type: none"> <li>• If you do not specify <code>-version</code>, the Quartus Prime software loads the latest version of the package.</li> <li>• If the package is not loaded, the Quartus Prime software displays the help for the latest version of the package.</li> </ul> <p>Examples:</p> <pre>help -pkg ::quartus::project</pre> <pre>help -pkg project</pre> <pre>help -pkg project -version 1.0</pre>

*continued...*

Help Command	Description
<code>&lt;command_name&gt; -h</code> or <code>&lt;command_name&gt; -help</code>	<p>Displays the short help of a Quartus Prime Tcl command in a loaded package. Examples:</p> <pre>project_open -h</pre> <pre>project_open -help</pre>
<code>package require ::quartus::&lt;package name&gt;[&lt;version&gt;]</code>	<p>Loads a specific version of an Quartus Prime Tcl package. If you do not specify <code>-version</code>, the Quartus Prime software loads the latest version of the package.</p> <p>Example:</p> <pre>package require ::quartus::project 1.0</pre> <p>This command is similar to the <code>load_package</code> command</p>
<code>load_package &lt;package name&gt; [-version &lt;version number&gt;]</code>	<p>Allows you to alternate between different versions of the same package.</p> <p>Example:</p> <pre>load_package ::quartus::project -version 1.0</pre>
<code>help -cmd &lt;command_name&gt; [-version &lt;version&gt;]</code> or <code>&lt;command_name&gt; -long_help</code>	<p>Displays the complete help text for an Quartus Prime Tcl command. If you do not specify <code>-version</code>, the Quartus Prime software loads the latest version of the package.</p> <p>Examples:</p> <pre>project_open -long_help</pre> <pre>help -cmd project_open</pre> <pre>help -cmd project_open -version 1.0</pre>
<code>help -examples</code>	<p>Displays examples of Quartus Prime Tcl usage.</p>
<code>help -quartus</code>	<p>To view help on the predefined global Tcl array that contains project information and information about the Quartus Prime executable that is currently running.</p>
<code>quartus_sh --qhelp</code>	<p>Launches the Tk viewer for Quartus Prime command-line help and display help for the command-line executables and Tcl API packages.</p>
<code>help -timequestinfo</code>	<p>To view help on the predefined global</p> <pre>"TimeQuestInfo"</pre> <p>Tcl array that contains delay model information and speed grade information of a Timing Analyzer design that is currently running.</p>

The Tcl API help is also available in Quartus Prime online help. Search for the command or package name to find details about that command or package.

### 2.3.2.1. Command-Line Options

You can use any of the following command line options with executables that support Tcl:

**Table 8. Command-Line Options Supporting Tcl Scripting**

Command-Line Option	Description
<code>--script=&lt;script file&gt; [&lt;script args&gt;]</code>	Run the specified Tcl script with optional arguments.
<code>-t &lt;script file&gt; [&lt;script args&gt;]</code>	Run the specified Tcl script with optional arguments. The <code>-t</code> option is the short form of the <code>--script</code> option.
<code>--shell</code>	Open the executable in the interactive Tcl shell mode.
<code>-s</code>	Open the executable in the interactive Tcl shell mode. The <code>-s</code> option is the short form of the <code>--shell</code> option.
<code>--tcl_eval &lt;tcl command&gt;</code>	Evaluate the remaining command-line arguments as Tcl commands. For example, the following command displays help for the project package: <code>quartus_sh --tcl_eval help -pkg project</code>

### 2.3.2.1.1. Run a Tcl Script

Running an executable with the `-t` option runs the specified Tcl script. You can also specify arguments to the script. Access the arguments through the `argv` variable, or use a package such as `cmdline`, which supports arguments of the following form:

```
-<argument name> <argument value>
```

The `cmdline` package is included in the `<Quartus Prime directory>/common/tcl/packages` directory.

For example, to run a script called `myscript.tcl` with one argument, `Stratix`, type the following command at a system command prompt:

```
quartus_sh -t myscript.tcl Stratix
```

### 2.3.2.1.2. Interactive Shell Mode

Running an executable with the `-s` option starts an interactive Tcl shell. For example, to open the Quartus Prime Timing Analyzer executable in interactive shell mode, type:

```
quartus_sta -s
```

Commands you type in the Tcl shell are interpreted when you press Enter. To run a Tcl script in the interactive shell type:

```
source <script name>
```

If a command is not recognized by the shell, it is assumed to be external and executed with the `exec` command.

### 2.3.2.1.3. Evaluate as Tcl

Running an executable with the `--tcl_eval` option causes the executable to immediately evaluate the remaining command-line arguments as Tcl commands. This can be useful if you want to run simple Tcl commands from other scripting languages.

For example, the following command runs the Tcl command that prints out the commands available in the project package.

```
quartus_sh --tcl_eval help -pkg project
```

## 2.4. Tcl Design Flow Controls

You can use Tcl scripts to control all aspects of the design flow, including controlling other software, when the other software also includes a scripting interface.

Typically, EDA tools include their own script interpreters that extend core language functionality with tool-specific commands. For example, the Quartus Prime Tcl interpreter supports all core Tcl commands, and adds numerous commands specific to the Quartus Prime software. You can include commands in one Tcl script to run another script, which allows you to combine or chain together scripts to control different tools. Because scripts for different tools must be executed with different Tcl interpreters, it is difficult to pass information between the scripts unless one script writes information into a file and another script reads it.

Within the Quartus Prime software, you can perform many different operations in a design flow (such as synthesis, fitting, and timing analysis) from a single script, making it easy to maintain global state information and pass data between the operations. However, there are some limitations on the operations you can perform in a single script due to the various packages supported by each executable.

There are no limitations on running flows from any executable. Flows include operations found in

**Processing > Start** in the Quartus Prime GUI, and are also documented as options for the `execute_flow` Tcl command. If you can make settings in the Quartus Prime software and run a flow to get your desired result, you can make the same settings and run the same flow in a Tcl script.

### 2.4.1. Creating Projects and Making Assignments

You can create a script that makes all the assignments for an existing project, and then use the script at any time to restore your project settings to a known state.

Click **Project > Generate Tcl File for Project** to automatically generate a `.tcl` file containing your assignments. You can source this file to recreate your project, and you can add other commands to this file, such as commands for compiling the design. This file is a good starting point to learn about project management and assignment commands.

To commit the assignments you create or modify to the `.qsf` file, you use the `export_assignments` or `project_close` commands. However, when you run the `execute_flow` command, Quartus Prime software automatically commits the assignment changes to the `.qsf` file. To prevent this behavior, specify the `-dont_export_assignments` logic option.

#### Related Information

- [Quartus Prime Pro Edition Settings File Reference Manual](#)
- [Interactive Shell Mode](#) on page 24
- [Constraining Designs](#)

## 2.4.2. Compiling Designs

You can run the Quartus Prime command-line executables from Tcl scripts. Use the included `flow` package to run various Quartus Prime compilation flows, or run each executable directly.

### 2.4.2.1. The flow Package

The `flow` package includes two commands for running Quartus Prime command-line executables, either individually or together in standard compilation sequence.

- The `execute_module` command allows you to run an individual Quartus Prime command-line executable.
- The `execute_flow` command allows you to run some or all the executables in commonly-used combinations.

Use the `flow` package instead of system calls to run Quartus Prime executables from scripts or from the Quartus Prime Tcl Console.

### 2.4.2.2. Compile All Revisions

You can use a simple Tcl script to compile all revisions in your project. Save the following script in a file called `compile_revisions.tcl` and type the following to run it:

```
quartus_sh -t compile_revisions.tcl <project name>
```

#### Compile All Revisions

```
load_package flow project_open [lindex $quartus(args) 0] set original_revision [get_current_revision]
foreach revision [get_project_revisions] { set_current_revision $revision execute_flow -compile }
set_current_revision $original_revision project_close
```

## 2.4.3. Reporting

You can extract information from the Compilation Report to evaluate results. The Quartus Prime Tcl API provides easy access to report data so you do not have to write scripts to parse the text report files.

If you know the exact report cell or cells you want to access, use the `get_report_panel_data` command and specify the row and column names (or *x* and *y* coordinates) and the name of the appropriate report panel. You can often search for data in a report panel. To do this, use a loop that reads the report one row at a time with the `get_report_panel_row` command.

Column headings in report panels are in row 0. If you use a loop that reads the report one row at a time, start with row 1 to skip column headings. The `get_number_of_rows` command returns the number of rows in the report panel, including the column heading row. Since the number of rows includes the column heading row, continue your loop if the loop index is less than the number of rows.

Report panels are hierarchically arranged and each level of hierarchy is denoted by the string "|" in the panel name. For example, the name of the Fitter Settings report panel is Fitter|Fitter Settings because it is in the Fitter folder. Panels at the highest hierarchy level do not use the "|" string. For example, the Flow Settings report panel is named Flow Settings.

The following Tcl code prints a list of all report panel names in your project. You can run this code with any executable that includes support for the report package.

#### Print All Report Panel Names

```
load_package report
project_open myproject
load_report
set panel_names [get_report_panel_names]
foreach panel_name $panel_names {
    post_message "$panel_name"
}
```

#### 2.4.3.1. Saving Report Data in csv Format

You can create a Comma Separated Value (.csv) file from any Quartus Prime report to open with a spreadsheet editor.

The following Tcl code shows a simple way to create a .csv file with data from the Fitter panel in a report.

#### Create .csv Files from Reports

```
load_package report
project_open my-project
load_report
# This is the name of the report panel to save as a CSV file
set panel_name "Fitter|Fitter Settings"
set csv_file "output.csv"
set fh [open $csv_file w]
set num_rows [get_number_of_rows -name $panel_name]
# Go through all the rows in the report file, including the
# row with headings, and write out the comma-separated data
for { set i 0 } { $i < $num_rows } { incr i } {
    set row_data [get_report_panel_row -name $panel_name \
        -row $i]
    puts $fh [join $row_data ","]
}
close $fh
unload_report
```

You can modify the script to use command-line arguments to pass in the name of the project, report panel, and output file to use. You can run this script example with any executable that supports the report package.

#### 2.4.4. Timing Analysis

The Quartus Prime Timing Analyzer includes support for industry-standard SDC commands in the sdc package.

The Quartus Prime software includes comprehensive Tcl APIs and SDC extensions for the Timing Analyzer in the sta, and sdc\_ext packages. The Quartus Prime software also includes a tdc package that obtains information from the Timing Analyzer.

## Related Information

Quartus Prime Pro Edition Settings File Reference Manual

## 2.5. Automating Script Execution

You can configure scripts to run automatically at various points during compilation. Use this capability to automatically run scripts that perform custom reporting, make specific assignments, and perform many other tasks.

The following three global assignments control when a script is run automatically:

- `PRE_FLOW_SCRIPT_FILE` —before a flow starts
- `POST_MODULE_SCRIPT_FILE` —after a module finishes
- `POST_FLOW_SCRIPT_FILE` —after a flow finishes

A module is another term for an Quartus Prime executable that performs one step in a flow. For example, two modules are Analysis and Synthesis (`quartus_syn`), and timing analysis (`quartus_sta`).

A flow is a series of modules that the Quartus Prime software runs with predefined options. For example, compiling a design is a flow that typically consists of the following steps (performed by the indicated module):

1. Analysis and Synthesis (`quartus_syn`)
2. Fitter (`quartus_fit`)
3. Assembler (`quartus_asm`)
4. Timing Analyzer (`quartus_sta`)

Other flows are described in the help for the `execute_flow` Tcl command. In addition, many commands in the **Processing** menu of the Quartus Prime GUI correspond to this design flow.

To make an assignment automatically run a script, add an assignment with the following form to the `.qsf` for your project:

```
set_global_assignment -name <assignment name> <executable>:<script name>
```

The Quartus Prime software runs the scripts.

```
<executable> -t <script name> <flow or module name> <project name> <revision name>
```

The first argument passed in the `argv` variable (or `quartus(args)` variable) is the name of the flow or module being executed, depending on the assignment you use. The second argument is the name of the project and the third argument is the name of the revision.

The last process, current project, and current revision are passed to the script by the Quartus Prime software and can be accessed by the following commands:

```
set process [lindex $quartus(args) 0]
set project [lindex $quartus(args) 1]
set revision [lindex $quartus(args) 2]

project_open $project -revision $revision
```

When you use the `POST_MODULE_SCRIPT_FILE` assignment, the specified script is automatically run after every executable in a flow. You can use a string comparison with the module name (the first argument passed in to the script) to isolate script processing to certain modules.

### 2.5.1. Execution Example

To illustrate how automatic script execution works in a complete flow, assume you have a project called **top** with a current revision called **rev\_1**, and you have the following assignments in the `.qsf` for your project.

```
set_global_assignment -name PRE_FLOW_SCRIPT_FILE quartus_sh:first.tcl
set_global_assignment -name POST_MODULE_SCRIPT_FILE quartus_sh:next.tcl
set_global_assignment -name POST_FLOW_SCRIPT_FILE quartus_sh:last.tcl
```

When you compile your project, the `PRE_FLOW_SCRIPT_FILE` assignment causes the following command to be run before compilation begins:

```
quartus_sh -t first.tcl compile top rev_1
```

Next, the Quartus Prime software starts compilation with analysis and synthesis, performed by the `quartus_syn` executable. After the Analysis and Synthesis finishes, the `POST_MODULE_SCRIPT_FILE` assignment causes the following command to run:

```
quartus_sh -t next.tcl quartus_syn top rev_1
```

Then, the Quartus Prime software continues compilation with the Fitter, performed by the `quartus_fit` executable. After the Fitter finishes, the `POST_MODULE_SCRIPT_FILE` assignment runs the following command:

```
quartus_sh -t next.tcl quartus_fit top rev_1
```

Corresponding commands are run after the other stages of the compilation. When the compilation is over, the `POST_FLOW_SCRIPT_FILE` assignment runs the following command:

```
quartus_sh -t last.tcl compile top rev_1
```

### 2.5.2. Controlling Processing

The `POST_MODULE_SCRIPT_FILE` assignment causes a script to run after every module. Because the same script is run after every module, you might have to include some conditional statements that restrict processing in your script to certain modules.

For example, if you want a script to run only after timing analysis, use a conditional test like the following example. It checks the flow or module name passed as the first argument to the script and executes code when the module is `quartus_sta`.

#### Restrict Processing to a Single Module

```
set module [lindex $quartus(args) 0]
if [string match "quartus_sta" $module] {
    # Include commands here that are run
    # after timing analysis
    # Use the post-message command to display
```

```
# messages
post_message "Running after timing analysis"
}
```

### 2.5.3. Displaying Messages

Because of the way the Quartus Prime software runs the scripts automatically, you must use the `post_message` command to display messages, instead of the `puts` command. This requirement applies only to scripts that are run by the three assignments listed in "Automating Script Execution".

#### Related Information

- [The `post\_message` Command](#) on page 41
- [Automating Script Execution](#) on page 28

## 2.6. Other Scripting Features

The Quartus Prime Tcl API includes other general-purpose commands and features described in this section.

### 2.6.1. Natural Bus Naming

The Quartus Prime software supports natural bus naming. Natural bus naming allows you to use square brackets to specify bus indexes in HDL, without including escape characters to prevent Tcl from interpreting the square brackets as containing commands. For example, one signal in a bus named `address` can be identified as `address[0]` instead of `address\[0\]`. You can take advantage of natural bus naming when making assignments.

```
set_location_assignment -to address[10] Pin_M20
```

The Quartus Prime software defaults to natural bus naming. You can turn off natural bus naming with the `disable_natural_bus_naming` command. For more information about natural bus naming, type the following at an Quartus Prime Tcl prompt:

```
enable_natural_bus_naming -h
```

### 2.6.2. Short Option Names

You can use short versions of command options, if they are unambiguous. For example, the `project_open` command supports two options: `-current_revision` and `-revision`.

You can use any of the following abbreviations of the `-revision` option:

- `-r`
- `-re`
- `-rev`

- -revi
- -revis
- -revisio

You can use an extremely short option such as `-r` because in the case of the `project_open` command no other option starts with the letter `r`. However, the `report_timing` command includes the options `-recovery` and `-removal`. You cannot use `-r` or `-re` to shorten either of those options, because the abbreviation is not unique.

### 2.6.3. Collection Commands

Some Quartus Prime Tcl functions return very large sets of data that are inefficient as Tcl lists. These data structures are referred to as collections. The Quartus Prime Tcl API uses a collection ID to access the collection.

There are two Quartus Prime Tcl commands for working with collections, `foreach_in_collection` and `get_collection_size`. Use the `set` command to assign a collection ID to a variable.

#### 2.6.3.1. The `foreach_in_collection` Command

The `foreach_in_collection` command is similar to the `foreach` Tcl command. Use it to iterate through all elements in a collection. The following example prints all instance assignments in an open project.

##### `foreach_in_collection` Example

```
set all_instance_assignments [get_all_instance_assignments -name *]
foreach_in_collection asgn $all_instance_assignments {
    # Information about each assignment is
    # returned in a list. For information
    # about the list elements, refer to Help
    # for the get-all-instance-assignments command.
    set to [lindex $asgn 2]
    set name [lindex $asgn 3]
    set value [lindex $asgn 4]
    puts "Assignment to $to: $name = $value"
}
```

##### Related Information

[foreach\\_in\\_collection \(::quartus::misc\)](#)  
In Quartus Prime Help

#### 2.6.3.2. The `get_collection_size` Command

Use the `get_collection_size` command to get the number of elements in a collection. The following example prints the number of global assignments in an open project.

##### `get_collection_size` Example

```
set all_global_assignments [get_all_global_assignments -name *]
set num_global_assignments [get_collection_size $all_global_assignments]
puts "There are $num_global_assignments global assignments in your project"
```

## 2.6.4. Node Finder Commands

The Node Finder allows you to find any node name in your project's compilation database. You can then perform various actions on found nodes, such as specifying constraints or assignments to those nodes. You can filter the search on various criteria, and also use wildcard characters in the search string.

A complete set of Node Finder Tcl commands that support the equivalent Node Finder filtering options is available for use in the scripted design flow environment.

The filtering options include the following default filters that appear in the filter combo box in the Node Finder:

[Design Entry \(all names\) Filter](#) on page 32

[Pins: assigned Filter](#) on page 33

[Pins: unassigned Filter](#) on page 33

[Pins: input Filter](#) on page 33

[Pins: output Filter](#) on page 34

[Pins: bidirectional Filter](#) on page 34

[Pins: virtual Filter](#) on page 34

[Pins: all Filter](#) on page 35

[Pins: all & Registers: post-fitting Filter](#) on page 35

[Ports: partition](#) on page 35

[Entity instance: pre-synthesis Filter](#) on page 36

[Registers: pre-synthesis Filter](#) on page 36

[Registers: post-fitting Filter](#) on page 36

[Post-synthesis Filter](#) on page 37

[Post-Compilation Filter](#) on page 37

[Signal Tap: pre-synthesis Filter](#) on page 37

[Signal Tap: post-fitting Filter](#) on page 38

### 2.6.4.1. Design Entry (all names) Filter

This Node Finder filter finds all user-entered names in your design.

The following Tcl command demonstrates the use of the `Design Entry (all names)` filtering option:

```
set name_ids_col [get_names -filter * -node_type all \
-observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \
$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to [The get\\_names Command](#) on page 38.

#### 2.6.4.2. Pins: assigned Filter

This Node Finder filter finds all pin names assigned locations or other pin-related assignments.

The following Tcl command demonstrates the use of the Pins: assigned filtering option:

```
set name_ids_col [get_names -filter * -node_type assigned \
-observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \
$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.3. Pins: unassigned Filter

This Node Finder filter finds all pin names unassigned locations or other pin related assignments.

The following Tcl command demonstrates the use of the Pins: unassigned filtering option:

```
set name_ids_col [get_names -filter * -node_type unassigned \
-observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \
$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.4. Pins: input Filter

This Node Finder filter finds all input pin names in your design files.

The following Tcl command demonstrates the use of the Pins: input filtering option:

```
set name_ids_col [get_names -filter * -node_type input \
-observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \
$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.5. Pins: output Filter

This Node Finder filter finds all output pin names in your design files.

The following Tcl command demonstrates the use of the Pins: output filtering option:

```
set name_ids_col [get_names -filter * -node_type output \
-observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \
$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the get\_names command, refer to [The get\\_names Command](#) on page 38.

#### 2.6.4.6. Pins: bidirectional Filter

This Node Finder filter finds all bidirectional pin names in your design files.

The following Tcl command demonstrates the use of the Pins: bidirectional filtering option:

```
set name_ids_col [get_names -filter * -node_type bidir \
-observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \
$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the get\_names command, refer to [The get\\_names Command](#) on page 38.

#### 2.6.4.7. Pins: virtual Filter

This Node Finder filter finds names of all I/O elements mapped to logic elements with a Virtual Pin logic option assignment.

The following Tcl command demonstrates the use of the Pins: virtual filtering option:

```
set name_ids_col [get_names -filter * -node_type virtual \
-observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \
$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the get\_names command, refer to [The get\\_names Command](#) on page 38.

#### 2.6.4.8. Pins: all Filter

This Node Finder filter finds all pin names in your design files.

The following Tcl command demonstrates the use of the Pins: all filtering option:

```
set name_ids_col [get_names -filter * -node_type \  
pin -observable_type pre_synthesis]  
foreach_in_collection name_id $name_ids_col {  
    set name [get_name_info -info full_path -observable_type pre_synthesis \  
$name_id]  
    append name ", "  
    append name [get_name_info -info node_type $name_id]  
    puts $name  
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.9. Pins: all & Registers: post-fitting Filter

This Node Finder filter finds all pin names in your design along with all register names from your design files that persist after physical synthesis and fitting. The Pins: all & Registers: post-fitting filter is a combination of the Pins: all and Registers: post-fitting filters.

The following Tcl command demonstrates the use of the Pins: all & Registers: post-fitting filtering option:

```
set name_ids_col [get_names -filter * -node_type \  
all_reg -observable_type post_fitter]  
foreach_in_collection name_id $name_ids_col {  
    set name [get_name_info -info full_path -observable_type post_fitter \  
$name_id]  
    append name ", "  
    append name [get_name_info -info node_type $name_id]  
    puts $name  
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.10. Ports: partition

This Node Finder filter must be used after running the Fitter, to find nodes for post-fit partition.

**Note:** When you run this filter before running the Fitter, a "No nodes available. Run Fitter." message displays.

The following Tcl command demonstrates the use of the Ports: partition filtering option:

```
set name_ids_col [get_names -filter * -node_type partition \  
-observable_type post_fitter]  
foreach_in_collection name_id $name_ids_col {  
    set name [get_name_info -info full_path -observable_type post_fitter \  
$name_id]  
    append name ", "  
}
```

```
append name [get_name_info -info node_type $name_id]
puts $name
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.11. Entity instance: pre-synthesis Filter

This Node Finder filter finds a list of instances in the logical hierarchy for pre-synthesis netlist.

The following Tcl command demonstrates the use of the `Entity instance: pre-synthesis` filtering option:

```
set name_ids_col [get_names -filter * -node_type hierarchy \
-observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \
$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.12. Registers: pre-synthesis Filter

This Node Finder filter finds all register names you entered in the design after Analysis and Elaboration, but before physical synthesis performs any synthesis optimizations.

The following Tcl command demonstrates the use of the `Registers: pre-synthesis` filtering option:

```
set name_ids_col [get_names -filter * -node_type reg \
-observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type pre_synthesis \
$name_id]
    append name ","
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.13. Registers: post-fitting Filter

This Node Finder filter finds all user-entered register names in your design files that remain after physical synthesis and fitting.

The following Tcl command demonstrates the use of the `Registers: post-fitting` filtering option:

```
set name_ids_col [get_names -filter * -node_type reg \
-observable_type post_fitter]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type post_fitter \
```

```
$name_id]
    append name ", "
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.14. Post-synthesis Filter

This Node Finder filter finds all user-entered and synthesis-generated names that remain in the design after design elaboration and physical synthesis.

The following Tcl command demonstrates the use of the Post-Synthesis filtering option:

```
set name_ids_col [get_names -filter * -node_type all \
-observable_type post_synthesis]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type post_synthesis \
$name_id]
    append name ", "
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.15. Post-Compilation Filter

This Node Finder filter finds all user-centered and Compiler-generated names that remain after fitting and do not have location assignments.

The following Tcl command demonstrates the use of the Post-Compilation filtering option:

```
set name_ids_col [get_names -filter * -node_type all \
-observable_type post_fitter]
foreach_in_collection name_id $name_ids_col {
    set name [get_name_info -info full_path -observable_type post_fitter \
$name_id]
    append name ", "
    append name [get_name_info -info node_type $name_id]
    puts $name
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.16. Signal Tap: pre-synthesis Filter

This Node Finder filter finds all internal device nodes in the pre-synthesis netlist that can be analyzed by the Signal Tap Logic Analyzer.

The following Tcl command demonstrates the use of the Signal Tap: pre-synthesis filtering option:

```
set name_ids_col [get_names -filter * -node_type all \
-observable_type pre_synthesis]
foreach_in_collection name_id $name_ids_col {
    set is_signaltap [get_name_info -info signaltapii -observable_type \
pre_synthesis $name_id]
    if {$is_signaltap == 1} {
        set name [get_name_info -use_cached_database -info full_path \
-observable_type pre_synthesis $name_id]
        append name ","
        append name [get_name_info -info node_type -observable_type \
pre_synthesis $name_id]
        puts $name
    }
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.4.17. Signal Tap: post-fitting Filter

This Node Finder filter finds all internal device nodes in the post fit netlist that can be analyzed by the Signal Tap Logic Analyzer.

The following Tcl command demonstrates the use of the Signal Tap: post-fitting filtering option:

```
set name_ids_col [get_names -filter * -node_type all \
-observable_type post_fitter]
foreach_in_collection name_id $name_ids_col {
    set is_signaltap [get_name_info -info signaltapii -observable_type \
post_fitter $name_id]
    if {$is_signaltap == 1} {
        set name [get_name_info -use_cached_database -info full_path \
-observable_type post_fitter $name_id]
        append name ","
        append name [get_name_info -info node_type -observable_type \
pre_synthesis $name_id]
        puts $name
    }
}
```

For more information about the `get_names` command, refer to [The `get\_names` Command](#) on page 38.

#### 2.6.5. The `get_names` Command

To query a filtered output collection of all matching node name IDs found in a compiled Quartus Prime project, use the `get_names` command.

To access each element of the output collection, use the Tcl command [foreach\\_in\\_collection](#). For `get_names` or `foreach_in_collection` command example, type `get_names -long_help` or `foreach_in_collection -long_help`.

- If the `-node_type` option is not specified, the default value is `all`.
- If the `-observable_type` option is not specified, the default value is `all`.
- The node type `pin` includes `input`, `output`, `bidir`, `assigned`, `unassigned`, `virtual`, and `pin`.
- The node type `qsf` include names from the `.qsf` settings file.
- The node type `all` includes all node types.
- The node type `all_reg` includes all node types and registers post-fitting.

The value for `-observable_type` option can be one of the following:

**Table 9. Values for observable\_type Option**

Observable Type	Description
<code>all</code>	Use post-Fitter information. If it is not available, post-synthesis information is used. Else, pre-synthesis information is used if it exists.
<code>pre_synthesis</code>	Use pre-synthesis information.
<code>post_synthesis</code>	Use post-synthesis information.
<code>post_fitter</code>	Use post-Fitter information.
<code>post_asm</code>	Use post-Assembler information. The post-Assembler information is supported only for designs using the HardCopy II device family.
<code>stp_pre_synthesis</code>	Use Signal Tap pre-synthesis information.

### Arguments

Following table lists the `get_names` command arguments:

**Table 10. The get\_names Command Arguments**

Argument	Description
<code>-h   -help</code>	Displays a short help.
<code>-long help</code>	Displays a long help with examples and possible return values.
<code>-entity&lt;wildcard&gt;</code>	Specifies the entity to get names from hierarchies instantiated by the entity.
<code>-filter&lt;wildcard&gt;</code>	Specifies the node's full path name and wildcard characters.
<code>-node_type &lt;all comb reg pin input output bidir hierarchy mem bus qsf state_machine assigned unassigned all_reg partition virtual&gt;</code>	Filters based on the specified node type.
<code>-observable_type &lt;all pre_synthesis post_synthesis post_fitter stp_pre_synthesis&gt;]</code>	Filters based on the specified observable type.

## Return Values

Following table lists values returned by the `get_names` command:

**Table 11. The `get_names` Command Return Values**

Code Name	Code	String Returned
TCL_OK	0	INFO: operation successful
TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
TCL_ERROR	1	ERROR: Get names cannot return <string> because the name was found in a partition that's not the root partition. Refine your <code>get_names</code> search pattern to exclude child partitions.
TCL_ERROR	1	ERROR: Compiler database does not exist for revision name: <string>. At the minimum, run Analysis & Synthesis with the specified revision name before using this Tcl command.
TCL_ERROR	1	ERROR: Illegal node type: <string>. Specify "all", "comb", "reg", "pin", "hierarchy", or "bus".
TCL_ERROR	1	ERROR: Illegal observable type: <string>. Specify "all", "pre_synthesis", "post_synthesis", or "post_fitter".
TCL_ERROR	1	ERROR: You must open a project before you can use this command.

## Example Use

```
# Search for a single post-Fitter pin with the name accel and make assignments
set accel_name_id [get_names -filter accel -node_type pin -observable_type
post_fitter]

foreach_in_collection name_id $accel_name_id {
    # Get the full path name of the node
    set target [get_name_info -info full_path $name_id]
    # Set multicycle assignment
    set_multicycle_assignment -to $target 2
    # Set location assignment
    set_location_assignment -to $target Pin_E22
}
# Search for nodes of any post-Fitter node type with name length <= 5. The
default node type is "all"
set name_ids [get_names -filter ????? -observable_type post_fitter]
foreach_in_collection name_id $name_ids {
    # Print the name id
    puts $name_id
    # Print the node type
    puts [get_name_info -info node_type $name_id]
    # Print the full path (which excludes the current focus entity from the path)
    puts [get_name_info -info full_path $name_id]
}
# Search for nodes of any post-Fitter node type that end in "eed".
# The default node type is "all"
set name_ids [get_names -filter *eed -observable_type post_fitter]
foreach_in_collection name_id $name_ids {
    # Print the name id
    puts $name_id
    # Print the node type
    puts [get_name_info -info node_type $name_id]
    # Print the full path (which excludes the current
    # focus entity from the path)
    puts [get_name_info -info full_path $name_id]
}
```

### 2.6.6. The `post_message` Command

To print messages that are formatted like Quartus Prime software messages, use the `post_message` command. Messages printed by the `post_message` command appear in the **System** tab of the **Messages** window in the Quartus Prime GUI, and are written to standard output when scripts are run. Arguments for the `post_message` command include an optional message type and a required message string.

The message type can be one of the following:

- `info` (default)
- `extra_info`
- `warning`
- `critical_warning`
- `error`

If you do not specify a type, Quartus Prime software defaults to `info`.

With the Quartus Prime software in Windows, you can color code messages displayed at the system command prompt with the `post_message` command. Add the following line to your `quartus2.ini` file:

```
DISPLAY_COMMAND_LINE_MESSAGES_IN_COLOR = on
```

The following example shows how to use the `post_message` command.

```
post_message -type warning "Design has gated clocks"
```

### 2.6.7. Accessing Command-Line Arguments

The global variable `quartus(args)` is a list of the arguments typed on the command-line following the name of the Tcl script.

#### Example 1. Simple Command-Line Argument Access

The following Tcl example prints all the arguments in the `quartus(args)` variable:

```
set i 0
foreach arg $quartus(args) {
    puts "The value at index $i is $arg"
    incr i
}
```

#### Example 2. Passing Command-Line Arguments to Scripts

If you copy the script in the previous example to a file named `print_args.tcl`, it displays the following output when you type the following at a command prompt.

```
quartus_sh -t print_args.tcl my_project 100MHz
The value at index 0 is my_project
The value at index 1 is 100MHz
```

### 2.6.7.1. The cmdline Package

You can use the `cmdline` package included with the Quartus Prime software for more robust and self-documenting command-line argument passing. The `cmdline` package supports command-line arguments with the form `-<option><value>`.

#### cmdline Package

```
package require cmdline
variable ::argv0 $::quartus(args)
set options {
    { "project.arg" "" "Project name" }
    { "frequency.arg" "" "Frequency" }
}
set usage "You need to specify options and values"
array set optshash [::cmdline::getoptions ::argv $options $usage]
puts "The project name is $optshash(project)"
puts "The frequency is $optshash(frequency)"
```

If you save those commands in a Tcl script called `print_cmd_args.tcl` you see the following output when you type the following command at a command prompt.

#### Passing Command-Line Arguments for Scripts

```
quartus_sh -t print_cmd_args.tcl -project my_project -frequency 100MHz
The project name is my_project
The frequency is 100MHz
```

Virtually all Quartus Prime Tcl scripts must open a project. You can open a project, and you can optionally specify a revision name with code like the following example. The example checks whether the specified project exists. If it does, the example opens the current revision, or the revision you specify.

#### Full-Featured Method to Open Projects

```
package require cmdline
variable ::argv0 $::quartus(args)
set options { \
    { "project.arg" "" "Project Name" } \
    { "revision.arg" "" "Revision Name" } \
}
array set optshash [::cmdline::getoptions ::argv0 $options]
# Ensure the project exists before trying to open it
if {[project_exists $optshash(project)]} {
    if {[string equal "" $optshash(revision)]} {
        # There is no revision name specified, so default
        # to the current revision
        project_open $optshash(project) -current_revision
    } else {
        # There is a revision name specified, so open the
        # project with that revision
        project_open $optshash(project) -revision \
            $optshash(revision)
    }
} else {
    puts "Project $optshash(project) does not exist"
    exit 1
}
# The rest of your script goes here
```

If you do not require this flexibility or error checking, you can use just the `project_open` command.

### Simple Method to Open Projects

```
set proj_name [lindex $argv 0]  
project_open $proj_name
```

### 2.6.8. The quartus() Array

The global `quartus()` Tcl array includes other information about your project and the current Quartus Prime executable that might be useful to your scripts. The scripts in the preceding examples parsed command line arguments found in `quartus(args)`. For information on the other elements of the `quartus()` array, type the following command at a Tcl prompt:

```
help -quartus
```

## 2.7. The Quartus Prime Tcl Shell in Interactive Mode Example

This section presents how to make project assignments and then compile the finite impulse response (FIR) filter tutorial project with the `quartus_sh` interactive shell.

This example assumes you already have the `fir_filter` tutorial design files in a project directory.

1. To run the interactive Tcl shell, type the following at the system command prompt:

```
quartus_sh -s
```

2. Create a new project called `fir_filter`, with a revision called `filtref` by typing:

```
project_new -revision filtref fir_filter
```

**Note:**

- If the project file and project name are the same, the Quartus Prime software gives the revision the same name as the project.
- If a `.qpf` file for this project already exists, the Quartus Prime software displays an error stating that the project already exists.

Because the revision named `filtref` matches the top-level file, all design files are automatically picked up from the hierarchy tree.

3. Set a global assignment for the device:

```
set_global_assignment -name family <device family name>
```

To learn more about assignment names that you can use with the `-name` option, refer to Quartus Prime Help.

**Note:** For assignment values that contain spaces, enclose the value in quotation marks.

4. To compile a design, use the `::quartus::flow` package, which properly exports the new project assignments and compiles the design with the proper sequence of the command-line executables. First, load the package:

```
load_package flow
```

It returns:

```
1.1
```

5. To perform a full compilation of the FIR filter design, use the `execute_flow` command with the `-compile` option:

```
execute_flow -compile
```

This command compiles the FIR filter tutorial project, exporting the project assignments and running `quartus_syn`, `quartus_fit`, `quartus_asm`, and `quartus_sta`. This sequence of events is the same as selecting **Processing ► Start Compilation** in the Quartus Prime GUI.

6. When you are finished with a project, close it with the `project_close` command.
7. To exit the interactive Tcl shell, type `exit` at a Tcl prompt.

## 2.8. The tclsh Shell

On the UNIX and Linux operating systems, the `tclsh` shell included with the Quartus Prime software is initialized with a minimal `PATH` environment variable. As a result, system commands might not be available within the `tclsh` shell because certain directories are not in the `PATH` environment variable.

To include other directories in the path searched by the `tclsh` shell, set the `QUARTUS_INIT_PATH` environment variable before running the `tclsh` shell. Directories in the `QUARTUS_INIT_PATH` environment variable are searched by the `tclsh` shell when you execute a system command.

## 2.9. Tcl Scripting Basic Examples

The core Tcl commands support variables, control structures, and procedures. Additionally, there are commands for accessing the file system and network sockets, and running other programs. You can create platform-independent graphical interfaces with the Tk widget set.

Tcl commands are executed immediately as they are typed in an interactive Tcl shell. You can also create scripts (including the examples in this chapter) in files and run them with the Quartus Prime executables or with the `tclsh` shell.

### 2.9.1. Hello World Example

The following shows the basic "Hello world" example in Tcl:

```
puts "Hello world"
```

Use double quotation marks to group the words `hello` and `world` as one argument. Double quotation marks allow substitutions to occur in the group. Substitutions can be simple variable substitutions, or the result of running a nested command. Use curly braces `{ }` for grouping when you want to prevent substitutions.

## 2.9.2. Variables

Assign a value to a variable with the `set` command. You do not have to declare a variable before using it. Tcl variable names are case-sensitive.

```
set a 1
```

To access the contents of a variable, use a dollar sign (“\$”) before the variable name. The following example prints “Hello world” in a different way.

```
set a Hello  
set b world  
puts "$a $b"
```

## 2.9.3. Substitutions

Tcl performs three types of substitution:

- Variable value substitution
- Nested command substitution
- Backslash substitution

### 2.9.3.1. Variable Value Substitution

Variable value substitution, refers to accessing the value stored in a variable with a dollar sign (“\$”) before the variable name.

### 2.9.3.2. Nested Command Substitution

Nested command substitution refers to how the Tcl interpreter evaluates Tcl code in square brackets. The Tcl interpreter evaluates nested commands, starting with the innermost nested command, and commands nested at the same level from left to right. Each nested command result is substituted in the outer command.

```
set a [string length foo]
```

### 2.9.3.3. Backslash Substitution

Backslash substitution allows you to quote reserved characters in Tcl, such as dollar signs (“\$”) and braces (“[ ]”). You can also specify other special ASCII characters like tabs and new lines with backslash substitutions. A backslash before a character tells the TCL interpreter to treat the next character as a literal if the character is not the last character on the line.

```
puts "This is a \$ special character"  
  
puts "This is a\  
$ special character and line continuation"  
  
puts "This is backslash \is ignored"  
  
puts "This is backslash\  
continued on next line"
```

### 2.9.4. Arithmetic

Use the `expr` command to perform arithmetic calculations. Use curly braces ("`{ }`") to group the arguments of this command for greater efficiency and numeric precision.

```
set a 5
set b [expr { $a + sqrt(2) }]
```

The Quartus Prime software supports all standard Tcl boolean and arithmetic operators, such as `&&` (AND), `||` (OR), `!` (NOT), and comparison operators such as `<` (less than), `>` (greater than), and `==` (equal to).

### 2.9.5. Lists

A Tcl list is a series of values. Supported list operations include creating lists, appending lists, extracting list elements, computing the length of a list, sorting a list, and more.

```
set a { 1 2 3 }
```

You can use the `lindex` command to extract information at a specific index in a list. Indexes are zero-based. You can use the index `end` to specify the last element in the list, or the index `end-<n>` to count from the end of the list. For example, to print the second element (at index 1) in the list stored in `a` use the following code.

```
puts [lindex $a 1]
```

The `llength` command returns the length of a list.

```
puts [llength $a]
```

The `lappend` command appends elements to a list. If a list does not already exist, the list you specify is created. The list variable name is not specified with a dollar sign ("`$`").

```
lappend a 4 5 6
```

### 2.9.6. Arrays

Arrays are similar to lists except that they use a string-based index. Tcl arrays are implemented as hash tables. You can create arrays by setting each element individually or with the `array set` command.

To set an element with an index of `Mon` to a value of `Monday` in an array called `days`, use the following command:

```
set days(Mon) Monday
```

The `array set` command requires a list of index/value pairs. This example sets the array called `days`:

```
array set days { Sun Sunday Mon Monday Tue Tuesday\
                Wed Wednesday Thu Thursday Fri Friday Sat Saturday }

set day_abbreviation Mon
puts $days($day_abbreviation)
```

Use the `array names` command to get a list of all the indexes in a particular array. The index values are not returned in any specified order. The following example is one way to iterate over all the values in an array.

```
foreach day [array names days] {
    puts "The abbreviation $day corresponds to the day name $days($day)"
}
```

Arrays are a very flexible way of storing information in a Tcl script and are a good way to build complex data structures.

## 2.9.7. Control Structures

Tcl supports common control structures, including if-then-else conditions and `for`, `foreach`, and `while` loops. The position of the curly braces as shown in the following examples ensures the control structure commands are executed efficiently and correctly. The following example prints whether the value of variable `a` is positive, negative, or zero.

### If-Then-Else Structure

```
if { $a > 0 } { puts "The value is positive"
} elseif { $a < 0 } {
    puts "The value is negative"
} else {
    puts "The value is zero"
}
```

The following example uses a `for` loop to print each element in a list.

### For Loop

```
set a { 1 2 3 }
for { set i 0 } { $i < [llength $a] } { incr i } {
    puts "The list element at index $i is [lindex $a $i]"
}
```

The following example uses a `foreach` loop to print each element in a list.

### foreach Loop

```
set a { 1 2 3 }
foreach element $a {
    puts "The list element is $element"
}
```

The following example uses a `while` loop to print each element in a list.

### while Loop

```
set a { 1 2 3 }
set i 0
while { $i < [llength $a] } { puts "The list element at index $i is [lindex $a $i]"
    incr i
}
```

You do not have to use the `expr` command in boolean expressions in control structure commands because they invoke the `expr` command automatically.

## 2.9.8. Procedures

Use the `proc` command to define a Tcl procedure (known as a subroutine or function in other scripting and programming languages). The scope of variables in a procedure is local to the procedure. If the procedure returns a value, use the `return` command to return the value from the procedure. The following example defines a procedure that multiplies two numbers and returns the result.

### Simple Procedure

```
proc multiply { x y } {
    set product [expr { $x * $y }]
    return $product
}
```

The following example shows how to use the `multiply` procedure in your code. You must define a procedure before your script calls it.

### Using a Procedure

```
proc multiply { x y } {
    set product [expr { $x * $y }]
    return $product
}
set a 1
set b 2
puts [multiply $a $b]
```

Define procedures near the beginning of a script. If you want to access global variables in a procedure, use the `global` command in each procedure that uses a global variable.

### Accessing Global Variables

```
proc print_global_list_element { i } {
    global my_data
    puts "The list element at index $i is [lindex $my_data $i]"
}
set my_data { 1 2 3}
print_global_list_element 0
```

## 2.9.9. File I/O

Tcl includes commands to read from and write to files. You must open a file before you can read from or write to it, and close it when the read and write operations are done.

To open a file, use the `open` command; to close a file, use the `close` command. When you open a file, specify its name and the mode in which to open it. If you do not specify a mode, Tcl defaults to read mode. To write to a file, specify `w` for write mode.

### Open a File for Writing

```
set output [open myfile.txt w]
```

Tcl supports other modes, including appending to existing files and reading from and writing to the same file.

The `open` command returns a file handle to use for read or write access. You can use the `puts` command to write to a file by specifying a file handle.

### Write to a File

```
set output [open myfile.txt w]
puts $output "This text is written to the file."
close $output
```

You can read a file one line at a time with the `gets` command. The following example uses the `gets` command to read each line of the file and then prints it out with its line number.

### Read from a File

```
set input [open myfile.txt]
set line_num 1
while { [gets $input line] >= 0 } {
    # Process the line of text here
    puts "$line_num: $line"
    incr line_num
}
close $input
```

## 2.9.10. Syntax and Comments

Arguments to Tcl commands are separated by white space, and Tcl commands are terminated by a newline character or a semicolon. You must use backslashes when a Tcl command extends more than one line. The backslash (`\`) must be the last character in the line to designate line extension. If the backslash is followed by any other character including a space, that character is treated as a literal.

Tcl uses the hash or pound character (`#`) to begin comments. The `#` character must begin a comment. If you prefer to include comments on the same line as a command, be sure to terminate the command with a semicolon before the `#` character. The following example is a valid line of code that includes a `set` command and a comment.

```
set a 1;# Initializes a
```

Without the semicolon, the command is invalid because the `set` command does not terminate until the new line after the comment.

The Tcl interpreter counts curly braces inside comments, which can lead to errors that are difficult to track down. The following example causes an error because of unbalanced curly braces.

```
# if { $x > 0 } {
if { $y > 0 } {
    # code here
}
```

### 2.9.11. External References

### 3.1.1.1. ::quartus::backannotate

The following table displays information for the **::quartus::backannotate** Tcl package:

<b>Tcl Package and Version</b>	::quartus::backannotate 1.1
<b>Description</b>	This package contains the set of Tcl functions for back-annotating assignments for a project.
<b>Availability</b>	This package is available for loading in the following executables:  qpro quartus quartus_cdb
<b>Tcl Commands</b>	<a href="#">get_back_annotation_assignments (::quartus::backannotate)</a> on page 73 <a href="#">logiclock_back_annotate (::quartus::backannotate)</a> on page 73

### 3.1.1.1. get\_back\_annotation\_assignments (::quartus::backannotate)

The following table displays information for the `get_back_annotation_assignments` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::backannotate</a> on page 72		
Syntax	get_back_annotation_assignments [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	<p>Returns an output collection of back-annotation assignments.</p> <p>Each element of the collection is a list with the following format:</p> <pre>{ {&lt;Source&gt;} {&lt;Destination&gt;} {&lt;Assignment name&gt;} {&lt;Assignment value&gt;} {&lt;Entity name&gt;} }</pre>		
Example Usage	<pre>## Print out all the back-annotation assignments set asgn_col [get_back_annotation_assignments] foreach_in_collection asgn \$asgn_col {      ## Each element in the collection has the following     ## format:     ## { {&lt;Source&gt;} {&lt;Destination&gt;} {&lt;Assignment name&gt;} {&lt;Assignment value&gt;} {&lt;Entity name&gt;} }     set from [lindex \$asgn 0]     set to [lindex \$asgn 1]     set name [lindex \$asgn 2]     set value [lindex \$asgn 3]     set entity [lindex \$asgn 4]     puts "\$entity : \$name (\$from -&gt; \$to) = \$value" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Back annotation failed -- design did not compile properly. Run a successful compilation before performing back-annotation.
	TCL_ERROR	1	ERROR: Project has no active revision. Make sure there is an open, active revision.
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: Device or device family does not support node location back annotation.
	TCL_ERROR	1	ERROR: Device or device family does not support LogicLock back annotation.
	TCL_ERROR	1	ERROR: Wrong number of arguments. For correct syntax, refer to help for the logiclock_back_annotate command.

### 3.1.1.2. logiclock\_back\_annotate (::quartus::backannotate)

The following table displays information for the `logiclock_back_annotate` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::backannotate</a> on page 72
<b>Syntax</b>	<code>logiclock_back_annotate [-h   -help] [-long_help] [-exclude_from] [-exclude_to] [-from &lt;source name&gt;] [-lock] [-no_contents] [-no_delay_chain] [-no_demote_lab] [-no_demote_mac] [-no_demote_pin] [-no_demote_ram] [-</code>
	<i>continued...</i>

	no_dont_touch] [-path_exclude <path_exclude name> ] [-region <region name> ] [-remove_assignments] [-resource_filter <resource_filter value> ] [-routing] [-to <destination name> ]															
Arguments	-h   -help	Short help														
	-long_help	Long help with examples and possible return values														
	-exclude_from	Option to exclude the source node														
	-exclude_to	Option to exclude the destination node														
	-from <source name>	Name (or wildcard expression) of the source node to be back-annotated														
	-lock	Option to lock back-annotated regions														
	-no_contents	Option not to back-annotate contents														
	-no_delay_chain	Option not to back-annotate delay chain settings														
	-no_demote_lab	Option not to demote LAB or LE assignments														
	-no_demote_mac	Option not to demote DSP block assignments														
	-no_demote_pin	Option not to demote pin assignments														
	-no_demote_ram	Option not to demote RAM assignments														
	-no_dont_touch	Option not to set the don't_touch flag for each back-annotated node														
	-path_exclude <path_exclude name>	Option to exclude the specified node from the path filter														
	-region <region name>	Name (or wildcard expression) of region to be back-annotated														
	-remove_assignments	Option to remove matching assignments instead of creating them														
	-resource_filter <resource_filter value>	Option to use the resource filter														
	-routing	Option to back-annotate the LogicLock region's routing														
	-to <destination name>	Name (or wildcard expression) of the destination node to be back-annotated														
Description	<p>Back-annotates a LogicLock region and its contents.</p> <p>When you use the "-routing" option, you must use the "-lock" and "-no_demote_lab" options, without the "-no_contents" option, or use the "-remove_assignments" option.</p> <p>The "-remove_assignments" option removes all matching region contents. When you use the "-remove_assignments" option, the demotion options, "-no_contents" and "-lock", are not applicable.</p> <p>The "-resource_filter" option allows you to back-annotate only specific resource types on the device. For example:</p> <pre>logiclock_back_annotate -resource_filter "COMBINATORIAL"</pre> <p>This command back-annotates all combinatorial nodes in the design. The complete set of options is:</p> <table><tr><td>COMBINATORIAL</td><td>combinatorial nodes</td></tr><tr><td>REGISTER</td><td>registered nodes</td></tr><tr><td>MEGA</td><td>M-RAMs</td></tr><tr><td>MEDIUM</td><td>M4K memory blocks</td></tr><tr><td>SMALL</td><td>M512 memory blocks</td></tr><tr><td>IO</td><td>I/O elements</td></tr><tr><td>MAC</td><td>DSP blocks</td></tr></table>		COMBINATORIAL	combinatorial nodes	REGISTER	registered nodes	MEGA	M-RAMs	MEDIUM	M4K memory blocks	SMALL	M512 memory blocks	IO	I/O elements	MAC	DSP blocks
COMBINATORIAL	combinatorial nodes															
REGISTER	registered nodes															
MEGA	M-RAMs															
MEDIUM	M4K memory blocks															
SMALL	M512 memory blocks															
IO	I/O elements															
MAC	DSP blocks															
continued...																

continued...

	<p>Intel recommends that you use a Verilog Quartus(R) Mapping File (.vqm) as the source. When any of the advanced netlist optimizations are enabled, it is possible for the Fitter to create and rename nodes in the design during a place and route operation. Back annotation requires that on subsequent compilations the node names in the netlist match those in the constraint file. Write out a VQM netlist and create a new project using that netlist as its source. Copy all of the existing constraint files into the new project directory and remove all the design files except the new .vqm by using the Add/Remove Files in a Project command (Project menu) in the Quartus Prime GUI.</p> <p>The Quartus Prime software will create a root region if you back-annotate nodes that are not members of a LogicLock region. The root region is device-size and locked. You can make assignments to the root region but you cannot delete it or modify its size or location.</p>		
Example Usage	<pre># Open the project "example_project" project_open example_project  # Compile the design package require ::quartus::flow execute_flow -compile  package require ::quartus::backannotate  # Back annotate all nodes and routing in the region "one_region" logiclock_back_annotate -routing -lock -no_demote_lab -region one_region  # Back annotate the location of the nodes on all paths that # start with a node that matches the "Data_in*" wildcard # expression, and end with a node that matches the "Data_out*" # wildcard expression logiclock_back_annotate -from Data_in* -to Data_out*  # Back annotate the placement of all the registers in the design logiclock_back_annotate -resource_filter "REGISTER"  # Close the project project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Back annotation failed -- design did not compile properly. Run a successful compilation before performing back-annotation.
	TCL_ERROR	1	ERROR: Project has no active revision. Make sure there is an open, active revision.
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: Device or device family does not support node location back annotation.
	TCL_ERROR	1	ERROR: The -routing option is used with incompatible options. To use the -routing option, you must use the -lock and -no_demote_lab options without the -no_contents option, or use the -remove_assignments option.
	TCL_ERROR	1	ERROR: Device or device family does not support LogicLock back annotation.
	TCL_ERROR	1	ERROR: Wrong number of arguments. For correct syntax, refer to help for the logiclock_back_annotate command.

### 3.1.2. ::quartus::board

The following table displays information for the **::quartus::board** Tcl package:

<b>Tcl Package and Version</b>	::quartus::board 1.0
<b>Description</b>	This package contains no general description.
<b>Availability</b>	This package is loaded by default in the following executables:  quartus quartus_sh
<b>Tcl Commands</b>	activate_link (::quartus::board) on page 76 check_online_design_validity (::quartus::board) on page 77 create_metadata (::quartus::board) on page 77 deploy_par_file (::quartus::board) on page 77 download_par_file (::quartus::board) on page 78 get_board_design_path (::quartus::board) on page 78 get_board_devkits (::quartus::board) on page 79 get_board_families (::quartus::board) on page 79 get_board_info (::quartus::board) on page 79 get_board_vendors (::quartus::board) on page 80 get_design_description (::quartus::board) on page 80 get_design_development_kits (::quartus::board) on page 81 get_design_documents_info (::quartus::board) on page 81 get_design_download_link (::quartus::board) on page 82 get_design_families (::quartus::board) on page 82 get_design_info (::quartus::board) on page 83 get_design_quartus_versions (::quartus::board) on page 83 get_design_rich_description (::quartus::board) on page 84 get_ui_file (::quartus::board) on page 84 launch_gsys (::quartus::board) on page 85 load_design_info (::quartus::board) on page 85 reset_board_info (::quartus::board) on page 86

#### 3.1.2.1. activate\_link (::quartus::board)

The following table displays information for the activate\_link Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::board</a> on page 76		
<b>Syntax</b>	activate_link [-h   -help] [-long_help] -link <i>&lt;link&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-link <i>&lt;link&gt;</i>	The URL	
<b>Description</b>	<div>This command will open the URL link from the default Browser.</div>		
<b>Example Usage</b>	<pre>::board::activate_link -link https://my_link.com</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.2. check\_online\_design\_validity (::quartus::board)

The following table displays information for the `check_online_design_validity` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	<code>check_online_design_validity [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	The command will return '1' if the Board Package is allowed to load the online design examples.		
<b>Example Usage</b>	<code>set valid [::board::check_online_design_validity]</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.3. create\_metadata (::quartus::board)

The following table displays information for the `create_metadata` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	<code>create_metadata [-h   -help] [-long_help] -path <i>&lt;path&gt;</i></code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-path <i>&lt;path&gt;</i></code>	The path that contains the PAR or ZIP files	
<b>Description</b>	The command creates the designs info metadata for designs in the specified path.		
<b>Example Usage</b>	<code>::board::create_metadata -path ../project_dir</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.4. deploy\_par\_file (::quartus::board)

The following table displays information for the `deploy_par_file` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76	
<b>Syntax</b>	<code>deploy_par_file [-h   -help] [-long_help] -design_path &lt;design_path&gt; -destination_dir &lt;destination_dir&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-design_path &lt;design_path&gt;</code>	The full path to the PAR file
<i>continued...</i>		

	-destination_dir <destination_dir>		The directory to extract the PAR file to
<b>Description</b>	This command will deploy the PAR file from the given design_path argument, and extract it to the given destination_dir.		
<b>Example Usage</b>	::board::deploy_par_file -design_path ./test_dir/top.par -destination_dir ./test_dir		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.5. download\_par\_file (::quartus::board)

The following table displays information for the download\_par\_file Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	download_par_file [-h   -help] [-long_help] -destination_dir <i>&lt;destination_dir&gt;</i> -link <i>&lt;link&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-destination_dir <i>&lt;destination_dir&gt;</i>	The directory to save the PAR file	
	-link <i>&lt;link&gt;</i>	The URL to download the PAR file	
<b>Description</b>	This commands will download the PAR file from the given link argument and save the downloaded PAR file to the given destination_dir argument.		
<b>Example Usage</b>	<code>::board::download_par_file -link https://design_link.com -destination_dir ./test_dir</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.6. get\_board\_design\_path (::quartus::board)

The following table displays information for the get\_board\_design\_path Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	<code>get_board_design_path [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div>This command returns the path that contains the pre-installed designs.</div>		
<b>Example Usage</b>	<code>set path [::board::get_board_design_path]</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.7. get\_board\_devkits (::quartus::board)

The following table displays information for the `get_board_devkits` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	<code>get_board_devkits [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<code>This command returns the unique development kits of all the boards.</code>		
<b>Example Usage</b>	<code>set devkits [::board::get_board_devkits]</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.8. get\_board\_families (::quartus::board)

The following table displays information for the `get_board_families` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	<code>get_board_families [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	This command returns the unique device families of all the loaded boards.		
<b>Example Usage</b>	<code>set families [::board::get_board_families]</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.9. get\_board\_info (::quartus::board)

The following table displays information for the `get_board_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	<code>get_board_info [-h   -help] [-long_help] [-family &lt;family&gt; ] [-name &lt;name&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-family &lt;family&gt;</code>	The device family that the board targeted to	
	<code>-name &lt;name&gt;</code>	The name of the board	
<i>continued...</i>			

<b>Description</b>	This command returns the information of boards that contain the given board name and device family (case insensitive). If no argument is given, the command will return the information of all the available boards.		
<b>Example Usage</b>	<code>::board::get_board_info</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.10. get\_board\_vendors (::quartus::board)

The following table displays information for the get\_board\_vendors Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::board</a> on page 76		
Syntax	get_board_vendors [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	This command returns the unique vendors of all the boards.		
Example Usage	set vendors [::board::get_board_vendors]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.2.11. get\_design\_description (::quartus::board)

The following table displays information for the get\_design\_description Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::board</a> on page 76	
<b>Syntax</b>	get_design_description [-h   -help] [-long_help] [-name <name> ] [-source <online quartus my_download all> ] [-version <version> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-name <name>	The name of the design
	-source <online quartus my_download all>	The Load From sources of the designs (Online, Pre-installed, Downloaded or All)
	-version <version>	The version of the design
<b>Description</b>	This commands returns the text description information of designs that contain the given design name. If no argument is supplied, the command will return the design description of all the available designs.	
continued...		

<b>Example Usage</b>	<pre>set description [::board::get_design_description -name pll]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.12. get\_design\_development\_kits (::quartus::board)

The following table displays information for the `get_design_development_kits` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::board</a> on page 76		
<b>Syntax</b>	<code>get_design_development_kits [-h   -help] [-long_help] [-source &lt;online quartus my_download all&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-source &lt;online quartus my_download all&gt;</code>	The Load From sources of the designs (Online, Pre-installed, Downloaded or All)	
<b>Description</b>	This command returns the unique development kits of the designs that are loaded from the source argument. If source argument isn't specified, the command will return unique development kits of all the loaded designs.		
<b>Example Usage</b>	<code>set devkits [::board::get_design_development_kits]</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.13. get\_design\_documents\_info (::quartus::board)

The following table displays information for the `get_design_documents_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::board</a> on page 76	
<b>Syntax</b>	get_design_documents_info [-h   -help] [-long_help] [-name <name> ] [-source <online quartus my_download all> ] [-version <version> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-name <name>	The name of the design
	-source <online quartus my_download all>	The Load From sources of the designs (Online, Pre-installed, Downloaded or All)
	-version <version>	The version of the design
<b>Description</b>	This commands returns the document title(s) and URL(s) of documentation(s) of designs that contain the given design name. If no argument is supplied, the command will return the design documentation of all the available designs.	
continued...		

<b>Example Usage</b>	<pre>set docs [::board::get_design_documents_info -name memory]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.14. get\_design\_download\_link (::quartus::board)

The following table displays information for the get\_design\_download\_link Tcl command:

Tcl Package and Version	Belongs to ::quartus::board on page 76		
Syntax	get_design_download_link [-h   -help] [-long_help] [-link_only] [-name <name> ] [-source <online quartus my_download all> ] [-version <version> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-link_only	If this option is specified, only a list of download link will be returned (instead of list of <design_name, download_link> pair)	
	-name <name>	The name of the design	
	-source <online quartus my_download all>	The Load From sources of the designs (Online, Pre-installed, Downloaded or All)	
	-version <version>	The version of the design	
Description	This command returns the URL to download the designs that contain the given design name. If no argument is supplied, the command will return the design download link of all the available designs.		
Example Usage	set link [::board::get_design_download_link -link_only]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.2.15. get\_design\_families (::quartus::board)

The following table displays information for the get\_design\_families Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76	
<b>Syntax</b>	<code>get_design_families [-h   -help] [-long_help] [-source &lt;online quartus my_download all&gt; ]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-source &lt;online quartus my_download all&gt;</code>	The Load From sources of the designs (Online, Pre-installed, Downloaded or All)
<i>continued...</i>		

<b>Description</b>	This command returns the unique device families of the designs that are loaded from the source argument. If source argument isn't specified, the command will return unique device families of all the loaded designs.		
<b>Example Usage</b>	set families [::board::get_design_families]		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.16. get\_design\_info (::quartus::board)

The following table displays information for the get\_design\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	<code>get_design_info [-h   -help] [-long_help] [-family &lt;family&gt; ] [-name &lt;name&gt; ] [-source &lt;online quartus my_download all&gt; ] [-version &lt;version&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-family &lt;family&gt;</code>	The targeted device family of the design	
	<code>-name &lt;name&gt;</code>	The name of the design	
	<code>-source &lt;online quartus my_download all&gt;</code>	The Load From sources of the designs (Online, Pre-installed, Downloaded or All)	
	<code>-version &lt;version&gt;</code>	The version of the design	
<b>Description</b>	This command returns the information of designs that contain the given design name and device family (case insensitive). If no argument is given, the command will return the information of all the available designs.		
<b>Example Usage</b>	set designs [::board::get_design_info -name pll -family agilex -source online]		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.17. get\_design\_quartus\_versions (::quartus::board)

The following table displays information for the get\_design\_quartus\_versions Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	<code>get_design_quartus_versions [-h   -help] [-long_help] [-max_count &lt;max_count&gt; ] [-source &lt;online quartus my_download all&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-max_count &lt;max_count&gt;</code>	The maximum number of Quartus versions returned (the last max_count from the latest Quartus version)	
<i>continued...</i>			

	<code>-source &lt;online quartus my_download all&gt;</code>		The Load From sources of the designs (Online, Pre-installed, Downloaded or All)
<b>Description</b>	This command returns the unique Quartus versions of the designs that are loaded from the source argument. If source argument isn't specified, the command will return unique Quartus versions of all the loaded designs.		
<b>Example Usage</b>	<code>set quartus_versions [::board::get_design_quartus_versions -max_count 5]</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.2.18. get\_design\_rich\_description (::quartus::board)

The following table displays information for the `get_design_rich_description` Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::board</code> on page 76		
Syntax	<code>get_design_rich_description [-h   -help] [-long_help] [-name &lt;name&gt; ] [-source &lt;online quartus my_download all&gt; ] [-version &lt;version&gt; ]</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name &lt;name&gt;</code>	The name of the design	
	<code>-source &lt;online quartus my_download all&gt;</code>	The Load From sources of the designs (Online, Pre-installed, Downloaded or All)	
	<code>-version &lt;version&gt;</code>	The version of the design	
Description	This commands returns the rich-text description information of designs that contain the given design name. If no argument is supplied, the command will return the rich-text description of all the available designs.		
Example Usage	<code>set rich_description [::board::get_design_rich_description]</code>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.2.19. get\_ui\_file (::quartus::board)

The following table displays information for the `get_ui_file` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	<code>get_ui_file [-h   -help] [-long_help] [-destination_dir &lt;destination_dir&gt; ] [-download_url &lt;download_url&gt; ] [-name &lt;name&gt; ] [-source &lt;online quartus my_download all&gt; ] [-version &lt;version&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-destination_dir &lt;destination_dir&gt;</code>	The directory to save the UI file	
<b>continued...</b>			

	-download_url <download_url>		The download URL of the design
	-name <name>		The UI filename of the design
	-source <online quartus my_download all>		The Load From sources of the designs (Online, Pre-installed, Downloaded or All)
	-version <version>		The version of the design
Description	This commands returns the UI filename of designs that contain the given design name. If no argument is supplied, the command will return the UI filename of all the available designs.		
Example Usage	set ui_file [::board::get_ui_file -name pll]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.2.20. launch\_qsys (::quartus::board)

The following table displays information for the launch\_qsys Tcl command:

Tcl Package and Version	Belongs to ::quartus::board on page 76		
Syntax	launch_qsys [-h   -help] [-long_help] [-board <board> ] [-qpf_file <qpf_file> ] [-qsf_file <qsf_file> ] [-qsys_file <qsys_file> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-board <board>	The name of the board (e.g. Intel Agilex F-Series Transceiver-SoC Development Kit DK-SI-AGF014EA)	
	-qpf_file <qpf_file>	The full path to the Quartus Project file (QPF, *.qpf file)	
	-qsf_file <qsf_file>	The full path to the Quartus Setting file (QSF, *.qsf file)	
	-qsys_file <qsys_file>	The full path to the Platform Designer System (QSYS, *.qsys file)	
Description	This command will launch Platform Designer application in GUI mode. With qsys_file, qpf_file and board argument supplied, the Platform Designer will open the project and skip the Open System dialog.		
Example Usage	::board::launch_qsys		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.2.21. load\_design\_info (::quartus::board)

The following table displays information for the load\_design\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::board</a> on page 76		
<b>Syntax</b>	load_design_info [-h   -help] [-long_help] [-append] [-download_path <download_path> ] [-source <online quartus my_download> ]		
<b>Arguments</b>	-h   -help	Short help	
continued...			

	-long_help	Long help with examples and possible return values	
	-append	If this option is specified, the designs information will be appended to the existing loaded designs	
	-download_path <download_path>	A list of paths that contains the PAR files. This argument will be ignored for source = online   quartus option	
	-source <online quartus my_download>	Load From sources of the designs (Online, Pre-installed or Downloaded)	
Description	The command loads the designs based on the source argument specified.		
Example Usage	::board::load_design_info -source quartus ::board::load_design_info -source my_download -download_path ../project_dir -append		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.2.22. reset\_board\_info (::quartus::board)

The following table displays information for the reset\_board\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::board</code> on page 76		
<b>Syntax</b>	<code>reset_board_info [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Clear the loaded board information.		
<b>Example Usage</b>	<code>::board::reset_board_info</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3. ::quartus::bpps

The following table displays information for the ::quartus::bpps Tcl package:

Tcl Package and Version	::quartus::bpps 1.0
Description	This package provides non-backend support for pin-planner mode in Interface Planner.
Availability	<div>This package is loaded by default in the following executables:</div> <div><div>qacv</div><div>qppl</div><div>qpro</div><div>quartus</div><div>quartus_bpps</div><div>quartus_drc</div><div>quartus_pdp</div><div>quartus_pow</div><div>quartus_sta</div><div>quartus_staw</div></div>
continued...	

<b>Tcl Commands</b>	<pre> bpps::apply_assignments (::quartus::bpps) on page 87 bpps::check_plan (::quartus::bpps) on page 88 bpps::export_constraints_to_qsf (::quartus::bpps) on page 88 bpps::get_cell_info (::quartus::bpps) on page 89 bpps::get_device (::quartus::bpps) on page 90 bpps::get_hdbpath_from_id (::quartus::bpps) on page 90 bpps::get_id_from_hdbpath (::quartus::bpps) on page 91 bpps::get_location_info (::quartus::bpps) on page 91 bpps::get_placement (::quartus::bpps) on page 92 bpps::get_placement_info (::quartus::bpps) on page 92 bpps::get_placements (::quartus::bpps) on page 93 bpps::get_placements_of_group (::quartus::bpps) on page 93 bpps::harden_cell (::quartus::bpps) on page 94 bpps::harden_cells (::quartus::bpps) on page 95 bpps::initialize (::quartus::bpps) on page 95 bpps::load_floorplan (::quartus::bpps) on page 96 bpps::place_cells (::quartus::bpps) on page 96 bpps::read_tpl_placement (::quartus::bpps) on page 97 bpps::remove_invalid_reports (::quartus::bpps) on page 98 bpps::report_all (::quartus::bpps) on page 98 bpps::report_cell_connectivity (::quartus::bpps) on page 98 bpps::report_cell_placement_reasons (::quartus::bpps) on page 99 bpps::report_cells (::quartus::bpps) on page 99 bpps::report_clocks (::quartus::bpps) on page 100 bpps::report_legal_cell_locations (::quartus::bpps) on page 101 bpps::report_location_types (::quartus::bpps) on page 101 bpps::report_locations (::quartus::bpps) on page 102 bpps::report_regions (::quartus::bpps) on page 102 bpps::report_summary (::quartus::bpps) on page 103 bpps::reset_plan (::quartus::bpps) on page 103 bpps::save_floorplan (::quartus::bpps) on page 104 bpps::save_pin_assignments (::quartus::bpps) on page 104 bpps::select_dr_ips (::quartus::bpps) on page 105 bpps::set_mode (::quartus::bpps) on page 105 bpps::shutdown (::quartus::bpps) on page 105 bpps::soften_cell (::quartus::bpps) on page 106 bpps::soften_cells (::quartus::bpps) on page 106 bpps::undo_last_placement (::quartus::bpps) on page 107 bpps::unplace_cells (::quartus::bpps) on page 107 bpps::update_pdpw (::quartus::bpps) on page 108 bpps::validate_placement (::quartus::bpps) on page 108 bpps::write_plan (::quartus::bpps) on page 109 bpps::write_tpl_placement (::quartus::bpps) on page 109 </pre>
---------------------	--

### 3.1.3.1. bpps::apply\_assignments (::quartus::bpps)

The following table displays information for the `bpps::apply_assignments` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::apply_assignments [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div>&lt;/</div></div></div></div>		

### 3.1.3.2. `bpps::check_plan (::quartus::bpps)`

The following table displays information for the `bpps::check_plan` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::check_plan [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div>In classic mode, checks the legality of the current plan</div> <div>In pin planner mode, this will be a stub. Assignments are checked real time, no backend engine to check legality of anything.</div>		
<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize  bpps::update_plan  bpps::check_plan  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.3. `bpps::export_constraints_to_qsf (::quartus::bpps)`

The following table displays information for the `bpps::export_constraints_to_qsf` Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::bpps on page 86	
<b>Syntax</b>	bpps::export_constraints_to_qsf [-h   -help] [-long_help] [-bb_locations] [-close_pdp] [-disabled] [-pin_locations] [-tile_locations]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-bb_locations	Write out building block location assignments
	-close_pdp	Send call back to PDPW to close after exporting is done
	-disabled	Write out disabled assignments
	-pin_locations	Write out pin location assignments
	-tile_locations	Write out tile location assignments
<b>Description</b>	In Tile Planner mode, export constraints to qsf file	
<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize  bpps::update_plan  set io_cells [bpps::get_cells -unplaced -type IO_CLUSTER] bpps::place_cells -cells \$io_cells</pre>	

continued...

	<pre>       bpps::validate_placement       bpps::export_constraints -disabled -tile_locations -bb_locations       project_close     </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.4. bpps::get\_cell\_info (::quartus::bpps)

The following table displays information for the `bpps::get_cell_info` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::bpps</a> on page 86		
Syntax	bpps::get_cell_info [-h   -help] [-long_help] [-children] [-guide_cell_id] [-ip_type] [-links] [-location] [-name] [-parent] [-type] <cell_id>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-children	Return the the cell id of the children cells	
	-guide_cell_id	Returns the guide cell's elem_id	
	-ip_type	Returns the IP type if the cell is an IP cell or an empty string otherwise	
	-links	Return the given design element's connections to other cells	
	-location	Returns the location ID if the cell is placed or an empty string otherwise	
	-name	Return the cell name of the cell id	
	-parent	Return the the cell id of the parent cells	
	-type	Return the the type of the cell	
<cell_id>	Single cell id		
Description	Gets information about the specified cell (referenced by cell ID). You can obtain cell using the periph::get_cells Tcl command.		
Example Usage	<pre>project_open onewire_nf  blueprint::initialize periph::update_plan  foreach cell [periph::get_cells -type IO_CLUSTER] {     puts "Found cell ID \$cell named [periph::get_cell_info -name \$cell]" }  blueprint::shutdown project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.5. bpps::get\_device (::quartus::bpps)

The following table displays information for the `bpps::get_device` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::get_device [-h   -help] [-long_help] [-compress]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-compress</code>	Compress requested data	
<b>Description</b>	Internal function to get the device tree in json, this gets the complete device model.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.6. bpps::get\_hdbpath\_from\_id (::quartus::bpps)

The following table displays information for the `bpps::get_hdbpath_from_id` Tcl command:

Tcl Package and Version	Belongs to ::quartus::bpps on page 86		
Syntax	bpps::get_hdbpath_from_id [-h   -help] [-long_help] [-design_cell_id <design_cell_id> ] [-device_loc_id <device_loc_id> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-design_cell_id <design_cell_id>	design cell ID	
	-device_loc_id <device_loc_id>	device location ID	
Description	<div>In classic mode, load the floorplan from a Interface Planner floorplan file</div> <div>In pin planner mode, this is a stub.</div>		
Example Usage	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan  bpps::place_cells -unplaced_cells bpps::save_floorplan -filename onewire_blueprint_floorplan.plan  bpps::load_floorplan -filename onewire_blueprint_floorplan.plan  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.7. bpps::get\_id\_from\_hdbpath (::quartus::bpps)

The following table displays information for the `bpps::get_id_from_hdbpath` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::get_id_from_hdbpath [-h   -help] [-long_help] [-design_cell &lt;design_cell&gt; ] [-device_loc &lt;device_loc&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-design_cell &lt;design_cell&gt;</code>	HDB Path of design cell	
	<code>-device_loc &lt;device_loc&gt;</code>	HDB Path of device location	
<b>Description</b>	<div>In classic mode, load the floorplan from a Interface Planner floorplan file</div> <div>In pin planner mode, this is a stub.</div>		
<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize  bpps::update_plan  bpps::place_cells -unplaced_cells bpps::save_floorplan -filename onewire_blueprint_floorplan.plan  bpps::load_floorplan -filename onewire_blueprint_floorplan.plan  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.8. bpps::get\_location\_info (::quartus::bpps)

The following table displays information for the `bpps::get_location_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::bpps</a> on page 86	
<b>Syntax</b>	bpps::get_location_info [-h   -help] [-long_help] [-children] [-gid] [-name] [-parents] [-placed_cells] [-properties] [-type] <location_id>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-children	Query the children location IDs
	-gid	Query the gid of the location IDs
	-name	Return the location name of the location id
	-parents	Query the parent location IDs
	-placed_cells	Return the placed cells at the location id
	-properties	Return the device location properties in json
	-type	Return the location type of the location id
continued...		

	<location_id>			location id
<b>Description</b>	Gets information about the specified location (referenced by location ID). You can obtain location using the <code>periph::get_locations</code> Tcl command or using the <code>bpps::get_location_info -properties &lt;loc_id&gt;</code> Tcl command			
<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize periph::update_plan  foreach cell [periph::get_cells -placed] {     puts "Found cell ID \$cell named [periph::get_cell_info -name \$cell] placed in location [periph::get_cell_info -location \$cell] named [periph::get_location_info -name [periph::get_cell_info -location \$cell]]"</pre>			
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>	
	TCL_OK	0	INFO: Operation successful	

### 3.1.3.9. bpps::get\_placement (::quartus::bpps)

The following table displays information for the `bpps::get_placement` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::bpps</a> on page 86		
<b>Syntax</b>	bpps::get_placement [-h   -help] [-long_help] [-compress]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-compress	Compress requested data	
<b>Description</b>	Return information about design placement		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.10. bpps::get\_placement\_info (::quartus::bpps)

The following table displays information for the `bpps::get_placement_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::bpps</a> on page 86		
<b>Syntax</b>	<code>bpps::get_placement_info [-h   -help] [-long_help] [-placement] &lt;placement_id&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-placement</code>	Return the placement as a list of cell/id pairs	
	<code>&lt;placement_id&gt;</code>	Single placement id	
<i>continued...</i>			

<b>Description</b>	<p>In classic mode, return information about a given placement</p> <p>In pin planner mode, looking up placement objects is not supported, no such thing.</p>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.11. bpps::get\_placements (::quartus::bpps)

The following table displays information for the `bpps::get_placements` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::get_placements [-h   -help] [-long_help] [-ips] &lt;cell_id&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-ips</code>	Get placements for IPs only	
	<code>&lt;cell_id&gt;</code>	Single cell id	
<b>Description</b>	<div>In classic mode, returns a vector of placements for the supplied cell</div> <div>In pin planner mode, returns a vector of compatible locations for the supplied pin</div>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied design pin ID <i>&lt;string&gt;</i> is invalid.
	TCL_ERROR	1	ERROR: At least one pin ID must be supplied, but no IDs were supplied
	TCL_ERROR	1	ERROR: The supplied pin id <i>&lt;string&gt;</i> is not a placeable pin.
	TCL_ERROR	1	ERROR: <i>&lt;string&gt;</i> IDs expected, but <i>&lt;string&gt;</i> were supplied

### 3.1.3.12. bpps::get\_placements\_of\_group (::quartus::bpps)

The following table displays information for the `bpps::get_placements_of_group` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::get_placements_of_group [-h   -help] [-long_help] -cells &lt;cells&gt; [-ips]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<i>continued...</i>			

	-cells <cells>	One or more cell ids	
	-ips	Get placements for IPs only	
Description	Given a list of design cell IDs, returns a vector of possible placement IDs for all the cells.		
Example Usage	<pre>project_open onewire_nf\n\nblueprint::initialize\n\nbpps::update_plan\n\nbpps::place_cells -unplaced_cells\n\nbpps::check_plan\n\nproject_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied ID <string> is invalid.
	TCL_ERROR	1	ERROR: At least one ID must be supplied, but no IDs were supplied
	TCL_ERROR	1	ERROR: <string> IDs expected, but <string> were supplied

### 3.1.3.13. bpps::harden\_cell (::quartus::bpps)

The following table displays information for the bpps::harden\_cell Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::bpps</a> on page 86		
<b>Syntax</b>	bpps::harden_cell [-h   -help] [-long_help] -cell <cell>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-cell <cell>	Harden the existing placement of the specified cell	
<b>Description</b>	<div><p>In modes that support soft / hard placements (ie. Tile Planner mode), hardens the existing placement of the specified cell.</p><p>If the cell is subsequently unplaced and placed again, the placement soft / hard attribute will be based on the new placement action.</p><p>For modes that do not support soft / hard placements, nothing is performed.</p></div>		
<b>Example Usage</b>	bpps::harden_cell -cell <design_cell_id>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.14. bpps::harden\_cells (::quartus::bpps)

The following table displays information for the `bpps::harden_cells` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::bpps</a> on page 86		
<b>Syntax</b>	bpps::harden_cells [-h   -help] [-long_help] -cells <cells>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-cells <cells>	Harden the existing placement of the specified cells	
<b>Description</b>	<div><p>In modes that support soft / hard placements (ie. Tile Planner mode), hardens the existing placement of the specified cell.</p><p>If the cell is subsequently unplaced and placed again, the placement soft / hard attribute will be based on the new placement action.</p><p>For modes that do not support soft / hard placements, nothing is performed.</p></div>		
<b>Example Usage</b>	bpps::harden_cells -cells [<design_cell_id>]		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.15. bpps::initialize (::quartus::bpps)

The following table displays information for the `bpps::initialize` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::initialize [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div>Replaces <code>blueprint::initialize</code> command. It will create the design and device models without a backend <code>separate-exe</code> engine.</div>		
<b>Example Usage</b>	<pre>project_open onewire_nf  bpps::initialize bpps::update_plan bpps::shutdown  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.16. bpps::load\_floorplan (::quartus::bpps)

The following table displays information for the `bpps::load_floorplan` Tcl command:

Tcl Package and Version	Belongs to ::quartus::bpps on page 86		
Syntax	bpps::load_floorplan [-h   -help] [-long_help] -filename <filename>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-filename <filename>	Filename to load	
Description	<div>In classic mode, load the floorplan from a Interface Planner floorplan file</div> <div>In pin planner mode, this is a stub.</div>		
Example Usage	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan  bpps::place_cells -unplaced_cells bpps::save_floorplan -filename onewire_blueprint_floorplan.plan  bpps::load_floorplan -filename onewire_blueprint_floorplan.plan project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.17. bpps::place\_cells (::quartus::bpps)

The following table displays information for the `bpps::place_cells` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86	
<b>Syntax</b>	<code>bpps::place_cells [-h   -help] [-long_help] [-cell_location &lt;cell_location&gt; ] [-cells &lt;cells&gt; ] [-dont_revert_on_fail] [-fixed_cells] [-placement &lt;placement&gt; ] [-unplaced_cells]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-cell_location &lt;cell_location&gt;</code>	Cell location id pair to place cells into
	<code>-cells &lt;cells&gt;</code>	One or more cell ids
	<code>-dont_revert_on_fail</code>	Option to specify that the best partial placement should be saved on the undo stack upon a placement failure
	<code>-fixed_cells</code>	Place all unplaced cells
	<code>-placement &lt;placement&gt;</code>	Place cells according to a placement. A placement is a special object that comes from the <code>bpps::get_placements</code> Tcl command
	<code>-unplaced_cells</code>	Place all unplaced cells
<b>continued...</b>		

<b>Description</b>	<p>In classic mode, performs a placement on the supplied cells</p> <p>In pin planner mode, auto assigns all the pins in the design if possible. Only -cell_ids &lt;cell_id_list&gt; and -cell_location &lt;(cell_id, loc_id)&gt; are actually used. If, exclusively, one of these are not specified, the command does NOTHING.</p>		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan bpps::place_cells -unplaced_cells bpps::check_plan project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied ID <string> is invalid.
	TCL_ERROR	1	ERROR: At least one ID must be supplied, but no IDs were supplied
	TCL_ERROR	1	ERROR: <string> IDs expected, but <string> were supplied

### 3.1.3.18. bpps::read\_tpl\_placement (::quartus::bpps)

The following table displays information for the `bpps::read_tpl_placement` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::read_tpl_placement [-h   -help] [-long_help] -filename <i>&lt;filename&gt;</i></code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-filename <i>&lt;filename&gt;</i></code>	Filename to write to	
<b>Description</b>	<div>In TilePlanner mode, read placement from a JSON file. Nothing happens (should not be available in GUI) in other modes.</div>		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan bpps::place_cells -unplaced_cells bpps::check_plan bpps::write_tpl_placement -filename onewire_blueprint_assignments.tcl project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Filename provided incorrectly

### 3.1.3.19. bpps::remove\_invalid\_reports (::quartus::bpps)

The following table displays information for the `bpps::remove_invalid_reports` Tcl command:

Tcl Package and Version	Belongs to ::quartus::bpps on page 86		
Syntax	bpps::remove_invalid_reports [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	<div>In classic mode, remove all invalid report</div> <div>In pin planner mode, this is a stub call.</div>		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.20. bpps::report\_all (::quartus::bpps)

The following table displays information for the `bpps::report_all` Tcl command:

Tcl Package and Version	Belongs to ::quartus::bpps on page 86		
Syntax	bpps::report_all [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	<div>In classic mode, create all default summary reports.</div> <div>In pin planner mode, this is a stub call.</div>		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.21. bpps::report\_cell\_connectivity (::quartus::bpps)

The following table displays information for the `bpps::report_cell_connectivity` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::report_cell_connectivity [-h   -help] [-long_help] [-fanins] [-fanouts] [-panel_name &lt;name&gt; ] &lt;cell_id&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	

*continued...*

	-fanins		Report only the fanins of the cell
	-fanouts		Report only the fanouts of the cell
	-panel_name <name>		Sends the results to the panel and specifies the name of the new panel
	<cell_id>		Single cell id
Description	In classic mode, creates a report of the connectivity for a cell.  In pin planner mode, this is a stub call.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.22. bpps::report\_cell\_placement\_reasons (::quartus::bpps)

The following table displays information for the `bpps::report_cell_placement_reasons` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::report_cell_placement_reasons [-h   -help] [-long_help] [-panel_name &lt;name&gt; ] &lt;cell_id&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-panel_name &lt;name&gt;</code>	Sends the results to the panel and specifies the name of the new panel	
	<code>&lt;cell_id&gt;</code>	Single cell id	
<b>Description</b>	<div>In classic mode, creates a report of all the locations a particular cell can be placed and the reasons it cannot be placed there</div> <div>In pin planner mode, this is a stub call.</div>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.23. bpps::report\_cells (::quartus::bpps)

The following table displays information for the `bpps::report_cells` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86	
<b>Syntax</b>	<code>bpps::report_cells [-h   -help] [-long_help] [-name &lt;name&gt; ] [-panel_name &lt;name&gt; ] [-placed] [-type &lt;type&gt; ] [-unplaced]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
continued...		

	-long_help	Long help with examples and possible return values	
	-name <name>	Filter the list of placed cells specifying a name. Wildcards are supported.	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-placed	Report the list of placed cells	
	-type <type>	Filter the list of placed cells specifying a list of types	
	-unplaced	Report the list of unplaced cells	
Description	In classic mode, returns a list of periphery cells based on the specified criteria.  In pin planner mode, this is a stub call.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.24. bpps::report\_clocks (::quartus::bpps)

The following table displays information for the `bpps::report_clocks` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::bpps</a> on page 86		
<b>Syntax</b>	bpps::report_clocks [-h   -help] [-long_help] [-panel_name <name> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
<b>Description</b>	<div>In classic mode, show the signals that are using low-skew routing networks (clock networks) in the device. If applicable, also show any signals that were considered for automatic clock network promotion, but were not promoted.</div> <div>In pin planner mode, this is a stub call.</div>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.25. bpps::report\_legal\_cell\_locations (::quartus::bpps)

The following table displays information for the `bpps::report_legal_cell_locations` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::report_legal_cell_locations [-h   -help] [-long_help] [-panel_name &lt;name&gt; ] &lt;cell_id&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-panel_name &lt;name&gt;</code>	Sends the results to the panel and specifies the name of the new panel	
	<code>&lt;cell_id&gt;</code>	Single cell id	
<b>Description</b>	In classic mode, creates a report of the legal periphery cell locations of a cell  In pin planner mode, this is a stub call.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.26. bpps::report\_location\_types (::quartus::bpps)

The following table displays information for the `bpps::report_location_types` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::report_location_types [-h   -help] [-long_help] [-panel_name &lt;name&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-panel_name &lt;name&gt;</code>	Sends the results to the panel and specifies the name of the new panel	
<b>Description</b>	<div>In classic mode, creates a report of the location types in the periphery</div> <div>In pin planner mode, this is a stub call.</div>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.27. bpps::report\_locations (::quartus::bpps)

The following table displays information for the `bpps::report_locations` Tcl command:

Tcl Package and Version	Belongs to ::quartus::bpps on page 86		
Syntax	bpps::report_locations [-h   -help] [-long_help] [-panel_name <name> ] <type>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	<type>	location type to query	
Description	In classic mode, Creates a report of the locations for the requested type in the periphery In pin planner mode, this is a stub call.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.28. bpps::report\_regions (::quartus::bpps)

The following table displays information for the `bpps::report_regions` Tcl command:

Tcl Package and Version	Belongs to ::quartus::bpps on page 86		
Syntax	bpps::report_regions [-h   -help] [-long_help] [-panel_name <name> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
Description	In pin planner mode, this is a stub call.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.29. bpps::report\_summary (::quartus::bpps)

The following table displays information for the `bpps::report_summary` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::report_summary [-h   -help] [-long_help] [-panel_name &lt;name&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-panel_name &lt;name&gt;</code>	Sends the results to the panel and specifies the name of the new panel	
<b>Description</b>	In pin planner mode, this is a stub call.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.30. bpps::reset\_plan (::quartus::bpps)

The following table displays information for the `bpps::reset_plan` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::reset_plan [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div>In classic mode, reverts the current design to be unplaced and without assignments applied</div> <div>In pin planner mode, removes all the user created pin assignments. Keeps the original assignments. (currently just a stub still)</div>		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan bpps::reset_plan blueprint::shutdown project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.31. bpps::save\_floorplan (::quartus::bpps)

The following table displays information for the `bpps::save_floorplan` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::save_floorplan [-h   -help] [-long_help] -filename &lt;filename&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-filename &lt;filename&gt;</code>	Filename to write to	
<b>Description</b>	<div><div>In classic mode, write the Interface Planner floorplan that can be reloaded in Interface Planner</div><div>In pin planner mode, write the user pin assignments as constraints to QSF file. It is preferred to use the new <code>save_pin_assignments</code> call instead in pin planner mode.</div></div>		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan  set io_cells [bpps::get_cells -unplaced -type IO_CLUSTER] bpps::place_cells -cells \$io_cells  bpps::save_floorplan -filename onewire_blueprint_floorplan.plan project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.32. bpps::save\_pin\_assignments (::quartus::bpps)

The following table displays information for the `bpps::save_pin_assignments` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::save_pin_assignments [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Write the Interface Planner floorplan that can be reloaded in Interface Planner		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan bpps::save_pin_assignments project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.33. bpps::select\_dr\_ips (::quartus::bpps)

The following table displays information for the `bpps::select_dr_ips` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::select_dr_ips [-h   -help] [-long_help] [-deselect] [-ips &lt;ips&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-deselect</code>	Deselects any selections previously made	
	<code>-ips &lt;ips&gt;</code>	One or more ip ids that exist in DR groups	
<b>Description</b>	Selects the DR ips. Any placement sync requests afterwards will only return placements for those selected DR IPs. All other non-DR placements are still returned. Any IP IDs passed over that are inside DR groups will be ignored.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.34. bpps::set\_mode (::quartus::bpps)

The following table displays information for the `bpps::set_mode` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::set_mode [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Internal use only for PDPW to set the mode of the middleware. Also defines what plugins will be loaded		
<b>Example Usage</b>	DO NOT call this explicitly		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.35. bpps::shutdown (::quartus::bpps)

The following table displays information for the `bpps::shutdown` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86	
<b>Syntax</b>	<code>bpps::shutdown [-h   -help] [-long_help]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
<i>continued...</i>		

<b>Description</b>	Shutdown Interface Planner.		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan blueprint::shutdown project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.36. bpps::soften\_cell (::quartus::bpps)

The following table displays information for the `bpps::soften_cell` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::bpps</a> on page 86		
<b>Syntax</b>	bpps::soften_cell [-h   -help] [-long_help] -cell <cell>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-cell <cell>	Soften the existing placement of the specified cell	
<b>Description</b>	<div><p>In modes that support soft / hard placements (ie. Tile Planner mode), softens the existing placement of the specified cell.</p><p>If the cell is subsequently unplaced and placed again, the placement soft / hard attribute will be based on the new placement action.</p><p>For modes that do not support soft / hard placements, nothing is performed.</p></div>		
<b>Example Usage</b>	bpps::soften_cell -cell <design_cell_id>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.37. bpps::soften\_cells (::quartus::bpps)

The following table displays information for the `bpps::soften_cells` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::bpps</a> on page 86		
<b>Syntax</b>	bpps::soften_cells [-h   -help] [-long_help] [-cells <cells> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-cells <cells>	One or more cell ids to soften	
<b>Description</b>	<div>In modes that support soft / hard placements (ie. Tile Planner mode), softens the existing placement of the specified cell. If the cell is subsequently unplaced and placed again, the placement soft / hard attribute will be based</div>		
continued...			

	on the new placement action. For modes that do not support soft / hard placements, nothing is performed.		
<b>Example Usage</b>	<pre>bpps::soften_cells -cells [&lt;design_cell_ids&gt;]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.38. bpps::undo\_last\_placement (::quartus::bpps)

The following table displays information for the `bpps::undo_last_placement` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::undo_last_placement [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div>In classic mode, undo the last placement or unplacement operation.</div> <div>In classic mode, undo the last pin assignment or assignment removal operation.</div>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.39. bpps::unplace\_cells (::quartus::bpps)

The following table displays information for the `bpps::unplace_cells` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::unplace_cells [-h   -help] [-long_help] [-cells &lt;cells&gt; ] [-placed_cells]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-cells &lt;cells&gt;</code>	One or more cell ids	
	<code>-placed_cells</code>	Unplace all placed cells	
<b>Description</b>	<div>In classic mode, removes the placement from the specified cells. Any constraints for the cells remain, but the cell no longer has a placement.</div> <div>In pin planner mode, similar to classic mode, unassigns pin locations made within this session.</div>		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan</pre>		
continued...			

*continued...*

	<pre>bpps::unplace_cells -placed_cells bpps::check_plan project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.40. bpps::update\_pdpw (::quartus::bpps)

The following table displays information for the `bpps::update_pdpw` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::update_pdpw [-h   -help] [-long_help] [-assignments] [-placement]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-assignments</code>	Indicates assignment model needs updating	
	<code>-placement</code>	Indicates placement needs updating	
<b>Description</b>	<div>In classic mode, this command update everything that needs updating in pdpw. This essentially sends a single TCL command to pdpw to update everything as needed. Used in the TCL proc source wrapper only.</div> <div>In pin planner mode, this command is just a stub.</div>		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize     bpps::update_pdpw -pdp_state [blueprint_internal::get_pdp_state]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.41. bpps::validate\_placement (::quartus::bpps)

The following table displays information for the `bpps::validate_placement` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::validate_placement [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Removes the exception to ignore the given project assignments. The result is the project assignments will take affect on the active design.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.3.42. bpps::write\_plan (::quartus::bpps)

The following table displays information for the `bpps::write_plan` Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::bpps</code> on page 86		
Syntax	<code>bpps::write_plan [-h   -help] [-long_help] [-clocks] [-disabled] -filename &lt;filename&gt; [-force] [-other_locations] [-pin_locations]</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-clocks</code>	Write out clock assignments	
	<code>-disabled</code>	Write out disabled assignments	
	<code>-filename &lt;filename&gt;</code>	Filename to write to	
	<code>-force</code>	Force the creation of the plan	
	<code>-other_locations</code>	Write out other location assignments	
	<code>-pin_locations</code>	Write out pin location assignments	
Description	<div>In classic mode, export the floorplan constraints Tcl script</div> <div>In pin planner mode, does nothing (we're not exporting to any TCL file, instead we write to QSF directly in <code>save_floorplan</code>, or <code>save_pin_assignments</code> (recommended), calls.</div>		
Example Usage	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan bpps::place_cells -unplaced_cells bpps::check_plan bpps::write_plan -filename onewire_blueprint_assignments.tcl project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.3.43. bpps::write\_tpl\_placement (::quartus::bpps)

The following table displays information for the `bpps::write_tpl_placement` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::bpps</code> on page 86		
<b>Syntax</b>	<code>bpps::write_tpl_placement [-h   -help] [-long_help] -filename &lt;filename&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-filename &lt;filename&gt;</code>	Filename to write to	
<b>Description</b>	In TilePlanner mode, write out the placement JSON file. Nothing happens (should not be available in GUI) in other modes.		
continued...			

<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize bpps::update_plan bpps::place_cells -unplaced_cells bpps::check_plan bpps::write_tpl_placement -filename onewire_blueprint_assignments.tcl project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Filename provided incorrectly

### 3.1.4. ::quartus::dcmnd\_dni

The following table displays information for the **::quartus::dcmnd\_dni** Tcl package:

<b>Tcl Package and Version</b>	::quartus::dcmnd_dni 1.0
<b>Description</b>	This package contains no general description.
<b>Availability</b>	<p>This package is available for loading in the following executables:</p> <pre>quartus quartus_sh quartus_sta quartus_syn</pre>
<b>Tcl Commands</b>	<pre>dni::add_to_collection (::quartus::dcmnd_dni) on page 111 dni::all_clocks (::quartus::dcmnd_dni) on page 111 dni::all_fanin (::quartus::dcmnd_dni) on page 111 dni::all_fanout (::quartus::dcmnd_dni) on page 112 dni::all_inputs (::quartus::dcmnd_dni) on page 112 dni::all_outputs (::quartus::dcmnd_dni) on page 113 dni::all_registers (::quartus::dcmnd_dni) on page 113 dni::append_to_collection (::quartus::dcmnd_dni) on page 114 dni::color (::quartus::dcmnd_dni) on page 114 dni::copy_collection (::quartus::dcmnd_dni) on page 115 dni::create_clock (::quartus::dcmnd_dni) on page 115 dni::current_design (::quartus::dcmnd_dni) on page 116 dni::current_instance (::quartus::dcmnd_dni) on page 116 dni::delete_stale_sandboxes (::quartus::dcmnd_dni) on page 117 dni::filter_collection (::quartus::dcmnd_dni) on page 117 dni::get_cells (::quartus::dcmnd_dni) on page 118 dni::get_clocks (::quartus::dcmnd_dni) on page 119 dni::get_designs (::quartus::dcmnd_dni) on page 119 dni::get_generated_clocks (::quartus::dcmnd_dni) on page 120 dni::get_nets (::quartus::dcmnd_dni) on page 121 dni::get_pins (::quartus::dcmnd_dni) on page 121 dni::get_ports (::quartus::dcmnd_dni) on page 122 dni::get_property (::quartus::dcmnd_dni) on page 123 dni::highlight (::quartus::dcmnd_dni) on page 123 dni::index_collection (::quartus::dcmnd_dni) on page 124 dni::is_dni_mode (::quartus::dcmnd_dni) on page 124 dni::is_dni_mode_for_developer_testing (::quartus::dcmnd_dni) on page 125 dni::list_properties (::quartus::dcmnd_dni) on page 125 dni::load_design (::quartus::dcmnd_dni) on page 125 dni::read_sdc (::quartus::dcmnd_dni) on page 126 dni::remove_from_collection (::quartus::dcmnd_dni) on page 126 dni::selection (::quartus::dcmnd_dni) on page 127 dni::set_property (::quartus::dcmnd_dni) on page 127 dni::set_time_format (::quartus::dcmnd_dni) on page 128 dni::set_time_unit (::quartus::dcmnd_dni) on page 128 dni::sizeof_collection (::quartus::dcmnd_dni) on page 129 dni::sort_collection (::quartus::dcmnd_dni) on page 129 dni::unload_design (::quartus::dcmnd_dni) on page 130 dni::write_sdc (::quartus::dcmnd_dni) on page 130</pre>

### 3.1.4.1. dni::add\_to\_collection (::quartus::dcmnd\_dni)

The following table displays information for the dni::add\_to\_collection Tcl command:

Tcl Package and Version	Belongs to ::quartus::dcmnd_dni on page 110		
Syntax	dni::add_to_collection [-h   -help] [-long_help] [-unique] <collection> <object_spec>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-unique	Only add non duplicated objects to the collection	
	<collection>	The base collection	
	<object_spec>	A list of objects to be added to collection	
Description	Add objects to a collection, resulting in a new collection. The base collection remains unchanged.		
Example Usage	::dni::add_to_collection \$collection [list \$o1 \$o2]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.2. dni::all\_clocks (::quartus::dcmnd\_dni)

The following table displays information for the dni::all\_clocks Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmnd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::all_clocks [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	This command creates a collection of all clocks in the design.		
<b>Example Usage</b>	<code>dni::all_clocks</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.3. dni::all\_fanin (::quartus::dcmnd\_dni)

The following table displays information for the dni::all\_fanin Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::dcmnd_dni</a> on page 110	
<b>Syntax</b>	dni::all_fanin [-h   -help] [-long_help] [-flat] [-insts_only] [-startpoints_only] -to <to>	
<b>Arguments</b>	-h   -help	Short help
continued...		

	-long_help	Long help with examples and possible return values	
	-flat	trace across the hierarchies	
	-insts_only	returns a set of all instances in the timing fanin of the sink	
	-startpoints_only	returns only the timing startpoints	
	-to <to>	sink port or inst_port in the design	
Description	This command reports the timing fanin of specified sink ports or inst_ports in the design		
Example Usage	dni::all_fanin -to [ dni::get_ports {a[0]} ]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.4. dni::all\_fanout (::quartus::dcmd\_dni)

The following table displays information for the dni::all\_fanout Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::dcmd_dni</a> on page 110		
<b>Syntax</b>	dni:: <a href="#">all_fanout</a> [-h   -help] [-long_help] [-endpoints_only] [-flat] -from <from> [-insts_only]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-endpoints_only	returns only the timing endpoints	
	-flat	trace across the hierarchies	
	-from <from>	source port or inst_port in the design	
	-insts_only	returns a set of all instances in the timing fanout of the source	
<b>Description</b>	This command reports the timing fanout of specified source ports or inst_ports in the design		
<b>Example Usage</b>	dni:: <a href="#">all_fanout</a> -from [dni:: <a href="#">get_ports</a> {a[0]}]		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.5. dni::all\_inputs (::quartus::dcmd\_dni)

The following table displays information for the dni::all\_inputs Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dcmd_dni on page 110	
<b>Syntax</b>	dni::all_inputs [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
continued...		

<b>Description</b>	This command creates a collection of all input ports in the current design.		
<b>Example Usage</b>	<pre># List all input ports from top module in current design. dni::all_inputs</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.6. dni::all\_outputs (::quartus::dcmd\_dni)

The following table displays information for the dni::all\_outputs Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::all_outputs [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	This command creates a collection of all output ports in the current design.		
<b>Example Usage</b>	# List all output ports from top module in current design. <code>dni::all_outputs</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.7. dni::all\_registers (::quartus::dcmd\_dni)

The following table displays information for the dni::all\_registers Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::all_registers [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	This command creates a collection of all register cells		
<b>Example Usage</b>	<code>dni::all_registers</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.8. dni::append\_to\_collection (::quartus::dcmd\_dni)

The following table displays information for the dni::append\_to\_collection Tcl command:

Tcl Package and Version	Belongs to ::quartus::dcmd_dni on page 110		
Syntax	dni::append_to_collection [-h   -help] [-long_help] [-unique] <collection> <object_spec>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-unique	Only append non duplicated objects to the collection	
	<collection>	TCL variable name pointing to a collection	
	<object_spec>	A list of objects to be appended to collection	
Description	Append objects to a collection and modifies a variable.		
Example Usage	::dni::append_to_collection collection [list \$o1 \$o2]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.9. dni::color (::quartus::dcmd\_dni)

The following table displays information for the dni::color Tcl command:

Tcl Package and Version	Belongs to ::quartus::dcmd_dni on page 110		
Syntax	dni::color [-h   -help] [-long_help] -action <action> [-append] [-checkpoint <checkpoint name> ] [-file <file> ] [-name <name> ] [-object <object> ] [-set <set> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-action <action>	color action	
	-append	to append to existing file or overwrite	
	-checkpoint <checkpoint name>	checkpoint name	
	-file <file>	file name to save or restore color sets	
	-name <name>	name for the colored set	
	-object <object>	object to be colored	
	-set <set>	a set containing colored objects	
Description	Work with object color set.		
Example Usage	dni::color -action \$action		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.10. dni::copy\_collection (::quartus::dcmcmd\_dni)

The following table displays information for the dni::copy\_collection Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dcmcmd_dni on page 110		
<b>Syntax</b>	dni::copy_collection [-h   -help] [-long_help] <collection>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<collection>	The collection to be copied	
<b>Description</b>	Duplicates the contents of a collection, resulting in a new collection. The base collection remains unchanged.		
<b>Example Usage</b>	set copied_collection [::dni::copy_collection \$collection]		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.11. dni::create\_clock (::quartus::dcmcmd\_dni)

The following table displays information for the dni::create\_clock Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dcmcmd_dni on page 110	
<b>Syntax</b>	dni::create_clock [-h   -help] [-long_help] [-add] [-comment <i>&lt;comment&gt;</i> ] [-name <i>&lt;name&gt;</i> ] -period <i>&lt;period&gt;</i> [-waveform <i>&lt;waveform&gt;</i> ] [ <i>&lt;targets&gt;</i> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-add	whether to add
	-comment <i>&lt;comment&gt;</i>	comment for creating a clock
	-name <i>&lt;name&gt;</i>	name for creating a clock
	-period <i>&lt;period&gt;</i>	period for creating a clock
	-waveform <i>&lt;waveform&gt;</i>	waveform for creating a clock
	<i>&lt;targets&gt;</i>	target objects for creating a clock
<b>Description</b>	<p>Defines a clock. If the -name option is not used, the clock name is the same as the first target in the list or collection. The clock name is used to refer to the clock in other commands.</p> <p>The -period option specifies the clock period. It is also possible to use this option to specify a frequency to define the clock period. This can be done by using -period option followed by either <i>&lt;frequency&gt;</i>MHz or "<i>&lt;frequency&gt;</i> MHz". Please note this is a convenience extension and using it is non-standard SDC syntax.</p> <p>The -waveform option specifies the rising and falling edges (duty cycle) of the clock, and is specified as a list of two time values: the first rising edge and the next falling edge. The rising edge must be within the range [0, period]. The falling edge must be within one clock period of the rising edge. The waveform defaults to (0, period/2).</p>	
continued...		

	<p>If a clock with the same name is already assigned to a given target, the create_clock command will return an error. If a clock with a different name exists on the given target, the create_clock command will be ignored unless the -add option is used. The -add option can be used to assign multiple clocks to a pin or port.</p> <p>If the target of the clock is internal (i.e. not an input port), the source latency is zero by default.</p> <p>If a clock is on a path after another clock, then it blocks or overwrites the previous clock from that point forward.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl substitution rules.</p>		
<b>Example Usage</b>	dni::create_clock \$period		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.12. dni::current\_design (::quartus::dcmd\_dni)

The following table displays information for the dni::current\_design Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::current_design [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div>This command returns the current top module of the design. In Quartus, top module cannot be changed.</div>		
<b>Example Usage</b>	<code>dni::current_design</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.13. dni::current\_instance (::quartus::dcmd\_dni)

The following table displays information for the dni::current\_instance Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::current_instance [-h   -help] [-long_help] [ &lt;instance&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>&lt;instance&gt;</code>	An instance name relative to the current instance	
<b>Description</b>	<p>This command sets the instance as current point of reference for object names (e.g. relative path names) used in object query commands. This command returns the new current instance hierarchy or empty if current is design top.</p>		
continued...			

	<p>If no instance name specified, the current instance is set to the current design top. If instance name specified as ".", the current instance is not changed. If instance name specified as "..", move current instance one level up in the hierarchy.</p> <p>The instance name can include any number of "." (separated by hierarchy separators ' ') as well as hierarchy instance names.</p> <p>The new current instance cannot be a leaf cell.</p>		
<b>Example Usage</b>	<pre> move current instance up two levels dni::current_instance .. ..  # move current instance to foo under parent of current instance dni::current_instance .. foo  # Save the current instance set saved_ci [dni::current_instance .]  # make the design top the new current instance dni::current_instance  # query top-level objects set top_level_foo [dni::get_cells foo]  # restore saved current instance current_instance \$saved_ci </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

#### 3.1.4.14. dni::delete\_stale\_sandboxes (::quartus::dcmd\_dni)

The following table displays information for the dni::delete\_stale\_sandboxes Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dcmd_dni on page 110		
<b>Syntax</b>	dni::delete_stale_sandboxes [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Removes stale sandbox directories on disk.		
<b>Example Usage</b>	project_open <revision name> dni::delete_stale_sandboxes project_close		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

#### 3.1.4.15. dni::filter\_collection (::quartus::dcmd\_dni)

The following table displays information for the dni::filter\_collection Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::dcmd_dni</a> on page 110
<b>Syntax</b>	dni::filter_collection [-h   -help] [-long_help] [-nocase] [-regexp] <collection> <filter>
continued...	

Arguments	-h   -help		Short help
	-long_help		Long help with examples and possible return values
	-nocase		Whether to perform case insensitive filter
	-regexp		Whether to apply regular expression when to filter
	<collection>		The base collection
	<filter>		Filter expression
Description	Filters an existing collection, resulting in a new collection. The base collection remains unchanged.		
Example Usage	set filtered_collection [::dni::filter_collection \$collection "name=\"speed\""]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.16. dni::get\_cells (::quartus::dcmd\_dni)

The following table displays information for the dni::get\_cells Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dcmd_dni on page 110	
<b>Syntax</b>	dni::get_cells [-h   -help] [-long_help] [-exact] [-filter <expression> ] [-hierarchical] [-nocase] [-of_objects <objects> ] [-quiet] [ <patterns> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-exact	exact patterns to search for object. Exact patterns cannot include wildcard characters "*" or "?" and escaped characters "\\".
	-filter <expression>	filter search by expression
	-hierarchical	search level-by-level down from current instance
	-nocase	perform case insensitive search
	-of_objects <objects>	search based on relationship to objects
	-quiet	Suppress error, warning, or information messages
	<patterns>	patterns to search for object. Patterns can include wildcard characters "*" or "?". Wildcard characters do not match with hierarchy separator
<b>Description</b>	This command creates a collection of instances from the current design, relative to the current instance.	
<b>Example Usage</b>	<pre># Suppose a design from top contains two hierchical instances. # instance name (module name) #   (top) #   -h1_i1 (mod_A) #   -h2_i1 (mod_B) #   #   -h1_i2 (mod_A) #   -h2_i1 (mod_B) # # Get instances from top module: {h1_1 h1_2} dni::get_cells</pre>	
continued...		

	<pre># Get hierarchical instances with prefix h from top module: { h1_i1 h1_i1 h2_i1 h1_i2 h1_i2  h2_i1 } dni::get_cells h* -hierarchical  # Get hierarchical instances with prefix h from  h1_i2 instance: { h1_i2 h2_i1 } dni::current_instance h1_i2 dni::get_cells h* -hierarchical  # Get instance of instance port dni::get_cells -of_objects [dni::get_pins h1_i2 in1]</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.17. dni::get\_clocks (::quartus::dcmd\_dni)

The following table displays information for the dni::get\_clocks Tcl command:

Tcl Package and Version	Belongs to ::quartus::dcmd_dni on page 110		
Syntax	dni::get_clocks [-h   -help] [-long_help] [-filter <filter> ] [-nocase] [-quiet] [-regexp] [ <patterns> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-filter <filter>	filter for getting clocks	
	-nocase	whether to apply case insensitive on filter for getting clocks	
	-quiet	quiet mode for getting clocks	
	-regexp	whether to use regexp on filter for getting clocks	
	<patterns>	patterns for getting clocks	
Description	This command creates a collection of clocks from clocks that are currently defined.		
Example Usage	dni::get_clocks		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.18. dni::get\_designs (::quartus::dcmd\_dni)

The following table displays information for the dni::get\_designs Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::dcmd_dni</a> on page 110		
<b>Syntax</b>	dni::get_designs [-h   -help] [-long_help] [-exact <i>&lt;exact&gt;</i> ] [-filter <i>&lt;expression&gt;</i> ] [-nocase] [-quiet] [ <i>&lt;patterns&gt;</i> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-exact <i>&lt;exact&gt;</i>	exact patterns to search for object. Exact patterns cannot include wildcard characters "*" or "?" and escaped characters "\".	
continued...			

	-filter <expression>	filter search by expression	
	-nocase	perform case insensitive search	
	-quiet	Suppress error, warning, or information messages	
	<patterns>	patterns to search for object. Patterns can include wildcard characters "*" or "?". Wildcard characters do not match with hierarchy separator	
Description	Creates a collection of one or more modules in the design.		
Example Usage	# Create a collection of all modules dni::get_designs  # Lookup by prefix name dni::get_designs auto*		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.19. dni::get\_generated\_clocks (::quartus::dcmd\_dni)

The following table displays information for the dni::get\_generated\_clocks Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::dcmd_dni</a> on page 110		
<b>Syntax</b>	dni::get_generated_clocks [-h   -help] [-long_help] [-exact] [-filter <i>&lt;filter&gt;</i> ] [-nocase] [-quiet] [-regex] [ <i>&lt;patterns&gt;</i> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-exact	whether to match filter exactly for getting generated clocks	
	-filter <i>&lt;filter&gt;</i>	filter for getting generated clocks	
	-nocase	whether to apply case insensitive on filter for getting generated clocks	
	-quiet	quiet mode for getting generated clocks	
	-regex	whether to use regexp on filter for getting generated clocks	
	<i>&lt;patterns&gt;</i>	patterns for getting generated clocks	
<b>Description</b>	This command creates a collection of all generated clocks in the design.		
<b>Example Usage</b>	dni::get_generated_clocks		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.20. dni::get\_nets (::quartus::dcmd\_dni)

The following table displays information for the dni::get\_nets Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::dcmd_dni</a> on page 110		
<b>Syntax</b>	dni::get_nets [-h   -help] [-long_help] [-exact] [-filter <i>&lt;expression&gt;</i> ] [-hierarchical] [-nocase] [-of_objects <i>&lt;objects&gt;</i> ] [-quiet] [ <i>&lt;patterns&gt;</i> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-exact	exact patterns to search for object. Exact patterns cannot include wildcard characters "*" or "?" and escaped characters "\\".	
	-filter <i>&lt;expression&gt;</i>	filter search by expression	
	-hierarchical	search level-by-level down from current instance	
	-nocase	perform case insensitive search	
	-of_objects <i>&lt;objects&gt;</i>	search based on relationship to objects	
	-quiet	Suppress error, warning, or information messages	
	<i>&lt;patterns&gt;</i>	patterns to search for object. Patterns can include wildcard characters "*" or "?". Wildcard characters do not match with hierarchy separator	
<b>Description</b>	This command creates a collection of nets from the current design, relative to the current instance.		
<b>Example Usage</b>	# Creates a collection of nets at hierarchy h1* from top module. dni::get_nets h1* *  # Creates a collection of nets connected to instance port h1_il in?. dni::get_nets -of_objects [dni::get_pins h1_il in?]		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.21. dni::get\_pins (::quartus::dcmd\_dni)

The following table displays information for the dni::get\_pins Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dcmd_dni on page 110	
<b>Syntax</b>	dni::get_pins [-h   -help] [-long_help] [-exact] [-filter <expression> ] [-hierarchical] [-nocase] [-of_objects <objects> ] [-quiet] [ <patterns> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-exact	exact patterns to search for object. Exact patterns cannot include wildcard characters "*" or "?" and escaped characters "\".
	-filter <expression>	filter search by expression
	-hierarchical	search level-by-level down from current instance
continued...		

	-nocase	perform case insensitive search
	-of_objects <objects>	search based on relationship to objects
	-quiet	Suppress error, warning, or information messages
	<patterns>	patterns to search for object. Patterns can include wildcard characters "*" or "?". Wildcard characters do not match with hierarchy separator
<b>Description</b>	This command creates a collection of instance ports from given search specifications.	
<b>Example Usage</b>	<pre># Creates a collection of instance ports with prefix out from top module. dni::get_pins out*  # Creates a collection of instance ports connected to net hl_il nl. dni::get_pins -of_objects {dni::get_nets hl_il nl}  # Creates a collection of instance ports from hierarchy hl* with direction as input and name prefix. dni::get_pins hl* * -filter {direction==input &amp;&amp; name=~in*}]</pre>	
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>
	TCL_OK	0
		<b>String Return</b>
		INFO: Operation successful

### 3.1.4.22. dni::get\_ports (::quartus::dcmd\_dni)

The following table displays information for the dni::get\_ports Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dcmd_dni on page 110	
<b>Syntax</b>	dni::get_ports [-h   -help] [-long_help] [-exact] [-filter <expression> ] [-hierarchical] [-nocase] [-of_objects <objects> ] [-quiet] [ <patterns> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-exact	exact patterns to search for object. Exact patterns cannot include wildcard characters "*" or "?" and escaped characters "\\".
	-filter <expression>	filter search by expression
	-hierarchical	search level-by-level down from current instance
	-nocase	perform case insensitive search
	-of_objects <objects>	search based on relationship to objects
	-quiet	Suppress error, warning, or information messages
	<patterns>	patterns to search for object. Patterns can include wildcard characters "*" or "?". Wildcard characters do not match with hierarchy separator
<b>Description</b>	This command creates a collection of ports from the current design, relative to the current instance.	
<b>Example Usage</b>	<pre># Creates a collection of ports from top module. dni::get_ports  # Creates a collection of ports filter by output direction. dni::get_ports -filter {direction==output}</pre>	

continued...

	# Creates a collection of ports connected to net n1. dni::get_ports -of_objects [dni::get_nets n1]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.23. dni::get\_property (::quartus::dcmnd\_dni)

The following table displays information for the dni::get\_property Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmnd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::get_property [-h   -help] [-long_help] -name <i>&lt;name&gt;</i> -object <i>&lt;object&gt;</i></code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name <i>&lt;name&gt;</i></code>	property name	
	<code>-object <i>&lt;object&gt;</i></code>	object from which to get property	
<b>Description</b>	Command to get property.		
<b>Example Usage</b>	<code>set mod_port_name [dni::get_property -object \$mod_port -name name]</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.24. dni::highlight (::quartus::dcmnd\_dni)

The following table displays information for the dni::highlight Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmnd_dni</code> on page 110	
<b>Syntax</b>	<code>dni::highlight [-h   -help] [-long_help] -action &lt;action&gt; [-append] [-file &lt;file&gt; ] [-name &lt;name&gt; ] [-object &lt;object&gt; ] [-set &lt;set&gt; ]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-action &lt;action&gt;</code>	highlight action
	<code>-append</code>	to append to existing file or overwrite
	<code>-file &lt;file&gt;</code>	file name to save or restore highlight sets
	<code>-name &lt;name&gt;</code>	name for the highlight set
	<code>-object &lt;object&gt;</code>	object to be highlighted
	<code>-set &lt;set&gt;</code>	a set containing highlight objects
<b>Description</b>	Command for object highlight.	
continued...		

<b>Example Usage</b>	dni::highlight -action find		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.25. dni::index\_collection (::quartus::dcmd\_dni)

The following table displays information for the dni::index\_collection Tcl command:

Tcl Package and Version	Belongs to ::quartus::dcmd_dni on page 110		
Syntax	dni::index_collection [-h   -help] [-long_help] <collection> <index> <index2>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<collection>	The base collection	
	<index>	The index to locate an object in the collection	
	<index2>	The second index to locate an item in the collection. If present, a list of objects between index and index2 in the base collection will be used to create a new collection	
Description	Given a collection and an index, if the index is in range, create a new collection containing only the single object. Optionally a second index can be passed to create a new collection with the objects between the two indices in the base collection.		
Example Usage	set new_collection [::dni::index_collection \$collection 0 10]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.26. dni::is\_dni\_mode (::quartus::dcmd\_dni)

The following table displays information for the dni::is\_dni\_mode Tcl command:

Tcl Package and Version	Belongs to ::quartus::dcmd_dni on page 110		
Syntax	dni::is_dni_mode [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Command to check if it is in DNI mode.		
Example Usage	dni::is_dni_mode		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.27. dni::is\_dni\_mode\_for\_developer\_testing (::quartus::dcmd\_dni)

The following table displays information for the `dni::is_dni_mode_for_developer_testing` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::is_dni_mode_for_developer_testing [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Command to check if it is in DNI mode for developer testing.		
<b>Example Usage</b>	<code>dni::is_dni_mode_for_developer_testing</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.28. dni::list\_properties (::quartus::dcmd\_dni)

The following table displays information for the `dni::list_properties` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::list_properties [-h   -help] [-long_help] -object <i>&lt;object&gt;</i> -type <i>&lt;type&gt;</i></code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-object <i>&lt;object&gt;</i></code>	object from which to list properties	
	<code>-type <i>&lt;type&gt;</i></code>	type from which to list properties	
<b>Description</b>	<div>This command gets the list of property names of an object or a specific object type.</div>		
<b>Example Usage</b>	<pre>set prop_list [dni::list_properties -type \$type -object \$object]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.29. dni::load\_design (::quartus::dcmd\_dni)

The following table displays information for the `dni::load_design` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::load_design [-h   -help] [-long_help] -checkpoint <i>&lt;checkpoint name&gt;</i> [-mode <i>&lt;mode&gt;</i> ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<i>continued...</i>			

	-checkpoint < <i>checkpoint name</i> >		checkpoint name
	-mode < <i>mode</i> >		Mode for open design
Description	Open the specified checkpoint into a sandbox and load the design from the sandbox. The opened design becomes the default design used for Tcl commands query.		
Example Usage	dni::load_design -checkpoint "elaborated"		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.30. dni::read\_sdc (::quartus::dcmd\_dni)

The following table displays information for the dni::read\_sdc Tcl command:

Tcl Package and Version	Belongs to ::quartus::dcmd_dni on page 110		
Syntax	dni::read_sdc [-h   -help] [-long_help] [-replace] <sd<_file>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-replace	Option to override existing constraints	
	<sd<_file>	Sdc filename	
Description	Command to source constraints from sdc file.		
Example Usage	dni::read_sdc top.sdc		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.31. dni::remove\_from\_collection (::quartus::dcmd\_dni)

The following table displays information for the dni::remove\_from\_collection Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::dcmd_dni</a> on page 110	
<b>Syntax</b>	dni::remove_from_collection [-h   -help] [-long_help] [-intersect] <collection> <object_spec>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-intersect	Removes objects from collection1 not found in object_spec. Without this option, removes objects from collection1 that are found in object_spec.
	<collection>	The base collection
	<object_spec>	A list of objects to be removed from the base collection
continued...		

<b>Description</b>	Remove objects from a collection, resulting in a new collection. The base collection remains unchanged.		
<b>Example Usage</b>	<code>set new_collection [::dni::remove_from_collection \$collection [list \$o1 \$o2]]</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.32. dni::selection (::quartus::dcmd\_dni)

The following table displays information for the dni::selection Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::selection [-h   -help] [-long_help] -action &lt;action&gt; [-object &lt;object&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-action &lt;action&gt;</code>	selection action	
	<code>-object &lt;object&gt;</code>	object to be selected	
<b>Description</b>	Command for object selection.		
<b>Example Usage</b>	<code>dni::selection -action clear</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.33. dni::set\_property (::quartus::dcmd\_dni)

The following table displays information for the dni::set\_property Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::dcmd_dni</a> on page 110		
<b>Syntax</b>	dni::set_property [-h   -help] [-long_help] -name <i>&lt;name&gt;</i> -object <i>&lt;object&gt;</i> -value <i>&lt;value&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name&gt;</i>	property name to set property	
	-object <i>&lt;object&gt;</i>	object from which to set property	
	-value <i>&lt;value&gt;</i>	property value to set property	
<b>Description</b>	Command to set property.		
<b>Example Usage</b>	dni::set_property -object \$mod_port -name name -value {new_name}		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.4.34. dni::set\_time\_format (::quartus::dcmd\_dni)

The following table displays information for the dni::set\_time\_format Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dcmd_dni on page 110		
<b>Syntax</b>	dni::set_time_format [-h   -help] [-long_help] [-decimal_places <decimal_places> ] [-unit <unit> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-decimal_places <decimal_places>	Number of decimal places to use	
	-unit <unit>	Default time unit to use	
<b>Description</b>	<p>Sets time format, including time unit and decimal places.</p> <p>Time units are assumed to be nanoseconds (ns) by default. The "-unit" option overrides the default time units. Legal time unit values are: ps, ns, us, ms.</p> <p>Time units are displayed with three decimal places by default. The "-decimal_places" option overrides the default number of decimal places to show.</p> <p>The smallest resolution of all times units is one picosecond (ps). Any additional specified precision will be truncated.</p>		
<b>Example Usage</b>	<pre># Create two clocks with a clock period of 8 nanoseconds. create_clock -period 8.000 clk1  set_time_format -unit ps -decimal_places 0 create_clock -period 8000 clk2</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified number of decimal places is invalid. Please specify an integral value >= 0.
	TCL_ERROR	1	ERROR: The default time unit can be set to ms, us, ns, or ps. Please specify one of these units instead.

### 3.1.4.35. dni::set\_time\_unit (::quartus::dcmd\_dni)

The following table displays information for the dni::set\_time\_unit Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dcmd_dni on page 110		
<b>Syntax</b>	dni::set_time_unit [-h   -help] [-long_help] <unit>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<unit>	Default time unit to use	
<b>Description</b>	<p>Time units are assumed to be nanoseconds (ns) by default unless otherwise specified. Time or delay values are also displayed in nanoseconds by default without time units. The dni::set_time_unit COMMAND overrides the default time units assumed by the Timing Analyzer.</p>		
continued...			

	Legal values are: ps, ns, us, ms  The smallest resolution of all times units is one picosecond (ps). Any additional specified precision will be truncated.		
<b>Example Usage</b>	<pre># Create two clocks with a clock period of 8 nanoseconds. create_clock -period 8.000 clk1  dni::set_time_unit ps create_clock -period 8000 clk2</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The default time unit can be set to ms, us, ns, or ps. Please specify one of these units instead.

### 3.1.4.36. dni::sizeof\_collection (::quartus::dcmd\_dni)

The following table displays information for the dni::sizeof\_collection Tcl command:

Tcl Package and Version	Belongs to ::quartus::dcmd_dni on page 110		
Syntax	dni::sizeof_collection [-h   -help] [-long_help] [-categorize] <collection>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-categorize	Return 0, 1, 2 indicating if the collection has 1, or or more than 1 item	
	<collection>	The base collection	
Description	Returns the number of objects in a collection.		
Example Usage	set size [::dni::sizeof_collection \$collection]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.37. dni::sort\_collection (::quartus::dcmd\_dni)

The following table displays information for the dni::sort\_collection Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::sort_collection [-h   -help] [-long_help] [-descending] [-dictionary] [-limit &lt;limit&gt; ] &lt;collection&gt; &lt;criteria&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-descending</code>	Indicates that the collection is to be sorted in reverse order. By default, the sort proceeds in ascending order	
<i>continued...</i>			

	-dictionary		Sort strings dictionary order. For example "a30" would come after "a4"
	-limit <limit>		Only return the first unique values from the primary sort key
	<collection>		The base collection
	<criteria>		Specifies a list of one or more application or user-defined attributes to use as sort keys
Description	Sorts a collection based on one or more attributes, resulting in a new, sorted collection. The sort is ascending by default.		
Example Usage	set size [::dni::sort_collection \$collection {is_hierarchy}]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.38. dni::unload\_design (::quartus::dcmnd\_dni)

The following table displays information for the dni::unload\_design Tcl command:

Tcl Package and Version	Belongs to ::quartus::dcmnd_dni on page 110		
Syntax	dni::unload_design [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Closes the design of the current opened sandbox and closes the sandbox.		
Example Usage	dni::load_design -checkpoint "elaborated" ... dni::unload_design		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.4.39. dni::write\_sdc (::quartus::dcmnd\_dni)

The following table displays information for the dni::write\_sdc Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dcmnd_dni</code> on page 110		
<b>Syntax</b>	<code>dni::write_sdc [-h   -help] [-long_help] [-command &lt;command&gt; ] [-design &lt;design&gt; ] [-file &lt;file&gt; ] [-include_file_info] [-line &lt;line&gt; ] [-output_file &lt;output_file&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-command &lt;command&gt;</code>	Only output constraint statements defined with this command	
	<code>-design &lt;design&gt;</code>	Design for CDMS design related commands	
continued...			

	-file <file>	Only output constraint statements defined in this file	
	-include_file_info	Include the file name and line number where the constraint is defined	
	-line <line>	Only output constraint statements defined on this line number	
	-output_file <output_file>	Path to output file where constraint statements are written	
Description			
	Write the SDC constraint statements currently loaded for this design.		
Example Usage			
	# Write the SDC constraints to the console dni::write_sdc  # Write the SDC constraints to a file dni::write_sdc -output_file write_sdc_output.txt		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.5. ::quartus::design

The following table displays information for the **::quartus::design** Tcl package:

<b>Tcl Package and Version</b>	::quartus::design 1.0
<b>Description</b>	<p>This package contains the set of Tcl functions for manipulating databases including the assignments database. Using this package makes it possible to create instance assignments without modifying the Quartus Prime Settings File (.qsf).</p>
<b>Availability</b>	<p>This package is loaded by default in the following executable:</p> <pre>quartus_cdb</pre> <p>This package is available for loading in the following executables:</p> <pre>qacv qpro qpro_sh quartus quartus_fit quartus_map quartus_pow quartus_sh quartus_sta quartus_syn</pre>
<b>Tcl Commands</b>	<pre>design::commit_design (::quartus::design) on page 132 design::convert_partition (::quartus::design) on page 132 design::create_assignment (::quartus::design) on page 133 design::delete_assignments (::quartus::design) on page 133 design::disable_assignments (::quartus::design) on page 134 design::enable_assignments (::quartus::design) on page 135 design::export_design (::quartus::design) on page 135 design::export_partition (::quartus::design) on page 136 design::extract_metadata (::quartus::design) on page 137 design::get_assignment_info (::quartus::design) on page 137 design::get_assignment_names (::quartus::design) on page 138 design::get_assignments (::quartus::design) on page 138 design::get_entity_names (::quartus::design) on page 139 design::get_instances (::quartus::design) on page 140 design::import_design (::quartus::design) on page 140 design::import_partition (::quartus::design) on page 141 design::list_valid_snapshot_names (::quartus::design) on page 142 design::load_design (::quartus::design) on page 142 design::report_assignments (::quartus::design) on page 143 design::set_assignment_info (::quartus::design) on page 143</pre>

### 3.1.5.1. design::commit\_design (::quartus::design)

The following table displays information for the design::commit\_design Tcl command:

Tcl Package and Version	Belongs to ::quartus::design on page 131		
Syntax	design::commit_design [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	<p>Commit any changes to the databases to disk.</p> <p>Assignments created or modified on a design loaded as writeable are not saved to the databases unless you explicitly call this command.</p>		
Example Usage	<pre>project_open onewire_nf  design::load_design -latest_snapshot -writeable design::delete_assignments [design::get_assignments -name location] design::commit_design</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.5.2. design::convert\_partition (::quartus::design)

The following table displays information for the design::convert\_partition Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131	
<b>Syntax</b>	design::convert_partition [-h   -help] [-long_help] -infile <i>&lt;QDB file name&gt;</i> -outfile <i>&lt;QDB file name&gt;</i>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-infile <i>&lt;QDB file name&gt;</i>	Input file name of the QDB archive (version-compatible format).
	-outfile <i>&lt;QDB file name&gt;</i>	Output file name of the QDB archive (current-version-only format).
<b>Description</b>	Convert a partition's QDB file in version-compatible ASCII format into a QDB file in BINARY format for current version of Quartus.	
<b>Example Usage</b>	<pre># The input QDB file is created by running design::export_partition # from compiled source design with Quartus of older or current version  project_open onewire_nf design::export_partition core_ptn -snapshot synthesized -file src_ip.qdb -compatible project_close  # Make sure you are using the same version of Quartus that will use to compile your design.  project_open onewire_nf design::convert_partition -infile src_ip.qdb -outfile ip.qdb project_close</pre>	
continued...		

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified archive <string> does not exist.

### 3.1.5.3. design::create\_assignment (::quartus::design)

The following table displays information for the `design::create_assignment` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::design</code> on page 131		
<b>Syntax</b>	<code>design::create_assignment [-h   -help] [-long_help] [-from &lt;from&gt; ] -name &lt;name&gt; -to &lt;to&gt; -value &lt;value&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-from &lt;from&gt;</code>	The source name of the assignment	
	<code>-name &lt;name&gt;</code>	The type name of the assignment	
	<code>-to &lt;to&gt;</code>	The destination name of the assignment	
	<code>-value &lt;value&gt;</code>	The value of the assignment	
<b>Description</b>	Create a new assignment in the assignment database		
<b>Example Usage</b>	<pre>project_open onewire_nf  design::load_design -latest_snapshot -writeable design::create_assignment -name location -to in1 -value PIN_A5 design::commit_design</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Both the -to or -from argument is required.
	TCL_ERROR	1	ERROR: Either the -to or -from argument is required.
	TCL_ERROR	1	ERROR: The -to argument is required.
	TCL_ERROR	1	ERROR: The value of an assignment cannot be empty.

### 3.1.5.4. design::delete\_assignments (::quartus::design)

The following table displays information for the `design::delete_assignments` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::design</code> on page 131		
<b>Syntax</b>	<code>design::delete_assignments [-h   -help] [-long_help] &lt;assignment&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>&lt;assignment&gt;</code>	one or more assignment ids	
<i>continued...</i>			

<b>Description</b>	Delete one or more assignments from the assignment database		
<b>Example Usage</b>	<pre>project_open onewire_nf  design::load_design -latest_snapshot -writeable design::delete_assignments [design::get_assignments -name location] design::commit_design</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied assignment id <i>&lt;string&gt;</i> is invalid.
	TCL_ERROR	1	ERROR: At least one peripheral assignment ID must be supplied, but no assignments IDs were supplied.
	TCL_ERROR	1	ERROR: <i>&lt;string&gt;</i> assignment IDs were expected but <i>&lt;string&gt;</i> were supplied.

### 3.1.5.5. design::disable\_assignments (::quartus::design)

The following table displays information for the design::disable\_assignments Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131		
<b>Syntax</b>	design:: <b>disable_assignments</b> [-h   -help] [-long_help] <i>&lt;assignment&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<i>&lt;assignment&gt;</i>	one or more assignment ids	
<b>Description</b>	Disables one or more assignments from the assignment database		
<b>Example Usage</b>	<pre>project_open onewire_nf  design::load_design -latest_snapshot -writeable design::disable_assignments [design::get_assignments -name location] design::commit_design</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied assignment id <i>&lt;string&gt;</i> is invalid.
	TCL_ERROR	1	ERROR: At least one periphery assignment ID must be supplied, but no assignments IDs were supplied.
	TCL_ERROR	1	ERROR: <i>&lt;string&gt;</i> assignment IDs were expected but <i>&lt;string&gt;</i> were supplied.

### 3.1.5.6. design::enable\_assignments (::quartus::design)

The following table displays information for the `design::enable_assignments` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::design</a> on page 131		
Syntax	design::enable_assignments [-h   -help] [-long_help] <assignment>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<assignment>	one or more assignment ids	
Description	Enables one or more assignments from the assignment database that were previously disabled		
Example Usage	<pre>project_open onewire_nf  design::load_design -latest_snapshot -writeable design::enable_assignments [design::get_assignments -name location] design::commit_design</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied assignment id <string> is invalid.
	TCL_ERROR	1	ERROR: At least one periphery assignment ID must be supplied, but no assignments IDs were supplied.
	TCL_ERROR	1	ERROR: <string> assignment IDs were expected but <string> were supplied.

### 3.1.5.7. design::export\_design (::quartus::design)

The following table displays information for the `design::export_design` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131	
<b>Syntax</b>	design::export_design [-h   -help] [-long_help] -file <file> [-quartus_metadata <quartus_metadata> ] -snapshot <snapshot> [-user_metadata <user_metadata> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-file <file>	The file.qdb to export to
	-quartus_metadata <quartus_metadata>	A space-separated list of Quartus Metadata to export. Valid Quartus Metadata options include <none project_information resource_utilization all>.
	-snapshot <snapshot>	The snapshot you want to export. Valid snapshot <synthesized final>.
	-user_metadata <user_metadata>	The absolute or relative path to the User Metadata configuration file.
continued...		

<b>Description</b>	Export the specified metadata and loaded databases for the open project and revision and snapshot to <file>.qdb in a version-compatible format.  This command is available only in the quartus_cdb executable.		
<b>Example Usage</b>	<pre>project_open onewire_nf design::export_design -file onewire.qdb -snapshot synthesized project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.5.8. design::export\_partition (::quartus::design)

The following table displays information for the design::export\_partition Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131		
<b>Syntax</b>	design::export_partition [-h   -help] [-long_help] [-exclude_pr_subblocks] -file <QDB file name> [-include_sdc_entity_in_partition] [-preserve_sdc] [-quartus_metadata <quartus_metadata> ] -snapshot <Snapshot(s) to be exported> [-user_metadata <user_metadata> ] <Partition to be exported>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-exclude_pr_subblocks	Exclude PR subpartitions	
	-file <QDB file name>	File name of the QDB archive.	
	-include_sdc_entity_in_partition	Preserve SDC/TCL Entity files	
	-preserve_sdc	Deprecated option to Preserve SDC/TCL Entity files	
	-quartus_metadata <quartus_metadata>	A space-separated list of Quartus Metadata to export. Valid Quartus Metadata options include <none project_information resource_utilization all>.	
	-snapshot <Snapshot(s) to be exported>	Snapshot(s) to be exported. Valid snapshot options include <synthesized final>.	
	-user_metadata <user_metadata>	The absolute or relative path to the User Metadata configuration file.	
	<Partition to be exported>	Name of the partition to be exported.	
<b>Description</b>	Export the metadata and IP of the specified partition and snapshot.		
<b>Example Usage</b>	project_open onewire_nf design::export_partition core_ptn -snapshot synthesized -file ip.qdb project_close		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.5.9. design::extract\_metadata (::quartus::design)

The following table displays information for the `design::extract_metadata` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131		
<b>Syntax</b>	design::extract_metadata [-h   -help] [-long_help] -dir <dir> -file <file> [-overwrite] -type <type>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-dir <dir>	The extraction directory. This directory must exist prior to invoking this command.	
	-file <file>	The Partition Database File (.qdb) holding the metadata to be extracted.	
	-overwrite	Attempt to overwrite any existing files in the extraction directory.	
	-type <type>	The type of QDB metadata to be extracted. Legal QDB metadata types include <quartus user all>.	
<b>Description</b>	Extracts the specified metadata from the given Partition Database File (.qdb) file to the provided extraction directory.		
<b>Example Usage</b>	<pre># Create a Partition Database File (.qdb) with Quartus Metadata using the "synthesized" snapshot. project_open onewire_nf design::export_design -file onewire.qdb -snapshot synthesized -quartus_metadata all project_close  # Create the extraction directory. file mkdir "extract/dir"  # Extract all the Quartus Metadata from "onewire.qdb" to the extraction directory located at "extract/dir". design::extract_metadata -file onewire.qdb -type quartus -dir "extract/dir"</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.5.10. design::get\_assignment\_info (::quartus::design)

The following table displays information for the `design::get_assignment_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131	
<b>Syntax</b>	design::get_assignment_info [-h   -help] [-long_help] [-from] [-name] [-to] [-value] <assignment>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-from	Return the source name of the assignment id
	-name	Return the type name of the assignment id
	-to	Return the destination name of the assignment id
continued...		

	-value		Return the value of the assignment id
	<assignment>		assignment id
Description	Get information about a given assignent ID		
Example Usage	<pre>project_open onewire_nf  design::load_design -latest_snapshot foreach asgn_id [design::get_assignments] {     puts "Found assignment [design::get_assignment_info -name \$asgn_id] [design::get_assignment_info -to \$asgn_id] = [design::get_assignment_info -value \$asgn_id]" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied assignment id <string> is invalid.
	TCL_ERROR	1	ERROR: At least one periphery assignment ID must be supplied, but no assignments IDs were supplied.
	TCL_ERROR	1	ERROR: <string> assignment IDs were expected but <string> were supplied.

### 3.1.5.11. design::get\_assignment\_names (::quartus::design)

The following table displays information for the design::get\_assignment\_names Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131		
<b>Syntax</b>	design::get_assignment_names [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Get a list of valid assignment type names		
<b>Example Usage</b>	<pre>project_open onewire_nf  design::load_design -latest_snapshot puts "Valid assignment type names:" foreach asgn_type [lsort [design::get_assignment_names]] {     puts \$asgn_type }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.5.12. design::get\_assignments (::quartus::design)

The following table displays information for the design::get\_assignments Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131
<b>Syntax</b>	<code>design::get_assignments [-h   -help] [-long_help] [-deleted] [-disabled] [-enabled] [-ignored] [-name &lt;name&gt; ]</code>
<i>continued...</i>	

Arguments	-h   -help		Short help
	-long_help		Long help with examples and possible return values
	-deleted		Return only deleted assignments
	-disabled		Return only disabled assignments
	-enabled		Return only enabled assignments
	-ignored		Return only ignored assignments
	-name <i>&lt;name&gt;</i>		Return only assignments of the provided type name
Description	Get a list of assignment IDs for the currently loaded design.		
Example Usage	<pre>project_open onewire_nf  design::load_design -latest_snapshot foreach asgn_id [design::get_assignments] {     puts "Found assignment [design::get_assignment_info -name \$asgn_id] [design::get_assignment_info -to \$asgn_id] = [design::get_assignment_info -value \$asgn_id]" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The assignment with id <i>&lt;string&gt;</i> is not enabled.
	TCL_ERROR	1	ERROR: The supplied assignment type name <i>&lt;string&gt;</i> is invalid.
	TCL_ERROR	1	ERROR: At least one assignment type name must be supplied, but no type namess were supplied.
	TCL_ERROR	1	ERROR: <i>&lt;string&gt;</i> assignment type names were expected but <i>&lt;string&gt;</i> were supplied.

### 3.1.5.13. design::get\_entity\_names (::quartus::design)

The following table displays information for the design::get\_entity\_names Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131		
<b>Syntax</b>	design::get_entity_names [-h   -help] [-long_help] [ <filter> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<filter>	Object filter	
<b>Description</b>	Get a list of entity names in the loaded design		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.5.14. design::get\_instances (::quartus::design)

The following table displays information for the design::get\_instances Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131		
<b>Syntax</b>	design::get_instances [-h   -help] [-long_help] [-entity <i>&lt;entity&gt;</i> ] [ <i>&lt;filter&gt;</i> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-entity <i>&lt;entity&gt;</i>	Return only instance names that have the supplied entity name	
	<i>&lt;filter&gt;</i>	Object filter	
<b>Description</b>	<div>Get a list of instances in the loaded design</div>		
<b>Example Usage</b>	<div>This command currently contains no example usage.</div>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.5.15. design::import\_design (::quartus::design)

The following table displays information for the design::import\_design Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131	
<b>Syntax</b>	design::import_design [-h   -help] [-long_help] -file <file> [-overwrite] [-timing_analysis_mode]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-file <file>	The file.qdb to import from
	-overwrite	overwrites the databases in the active qdb directory
	-timing_analysis_mode	Import the design for Timing Analysis. User will not be able to generate programming file after importing design with this option. See -timing_analysis_mode option description below.
<b>Description</b>	<p>Import all the databases from the specified &lt;file&gt;.qdb.</p> <p>If overwrite is specified then databases will be overwritten in the active qdb directory.</p> <p>The database revision in the &lt;file&gt;.qdb must match the active revision.</p> <p>This command is available only in the quartus_cdb executable.</p> <p>----- OPTIONS DESCRIPTION -----</p> <p>-timing_analysis_mode</p> <p>Import the design for Timing Analysis. This option disables legality checks for certain configuration rules which may have changed from prior versions</p>	
continued...		

*continued...*

	of Quartus Prime Pro. Use this option only if you were unable to successfully import your design without this option. After a design has been imported in timing analysis mode, the imported database will not be able to be used to generate programming files.		
<b>Example Usage</b>	<pre># For the pro/quartus/sys/dsgn tests we need to export # a design first so there's a design to import project_open onewire_nf design::export_design -file onewire.qdb -snapshot synthesized project_close  project_open onewire_nf design::import_design -file onewire.qdb -overwrite project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified archive <string> does not exist.
	TCL_ERROR	1	ERROR: Databases already exist for the specified revision <string>. Use -overwrite to overwrite them.

### 3.1.5.16. design::import\_partition (::quartus::design)

The following table displays information for the design::import\_partition Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131		
<b>Syntax</b>	design::import_partition [-h   -help] [-long_help] -file <i>&lt;QDB file name&gt;</i> [-no_overwrite] <i>&lt;Partition to be imported&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-file <i>&lt;QDB file name&gt;</i>	File name of the QDB archive.	
	-no_overwrite	Don't delete existing snapshots when importing partition	
	<i>&lt;Partition to be imported&gt;</i>	Partition name at which the imported IP will be rooted.	
<b>Description</b>	Import a partition into the current design.		
<b>Example Usage</b>	<pre># You need to run design::export_partition from a source design # so that there's a partition to import from  project_open onewire_nf design::export_partition root_partition -snapshot synthesized -file ip.qdb project_close  # The imported DB file can be used as root_partition  project_open onewire_nf design::import_partition root_partition -file ip.qdb project_close  # Or non-root_partition  project_open onewire_nf design::import_partition ip_sub -file ip.qdb project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified archive <i>&lt;string&gt;</i> does not exist.

### 3.1.5.17. design::list\_valid\_snapshot\_names (::quartus::design)

The following table displays information for the design::list\_valid\_snapshot\_names Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::design</code> on page 131		
Syntax	<code>design::list_valid_snapshot_names [-h   -help] [-long_help]</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
Description	Returns the list of the valid design snapshot names.		
Example Usage	<code>puts "Valid design snapshot names: [design::list_valid_snapshot_names]"</code>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.5.18. design::load\_design (::quartus::design)

The following table displays information for the design::load\_design Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131		
<b>Syntax</b>	design::load_design [-h   -help] [-long_help] [-latest_snapshot] [-snapshot <snapshot> ] [-writeable]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-latest_snapshot	Load the latest snapshot for the design	
	-snapshot <snapshot>	Snapshot name to load database(s) from	
	-writeable	Loads databases in a writeable mode.	
<b>Description</b>	Load the databases for the currently opened project. The databases are by default loaded in read-only mode and must be loaded with the -writeable option if manipulation to the databases is desired.		
<b>Example Usage</b>	<pre>project_open onewire_nf  design::load_design -latest_snapshot foreach asgn_id [design::get_assignments] {     puts "Found assignment [design::get_assignment_info -name \$asgn_id] [design::get_assignment_info -to \$asgn_id] = [design::get_assignment_info -value \$asgn_id]" }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified snapshot name, <string>, is invalid.
	TCL_ERROR	1	ERROR: At least one snapshot must be supplied, but no snapshots were supplied.
	TCL_ERROR	1	ERROR: <string> snapshots were expected but <string> were supplied.

### 3.1.5.19. design::report\_assignments (::quartus::design)

The following table displays information for the `design::report_assignments` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::design</a> on page 131		
Syntax	design::report_assignments [-h   -help] [-long_help] [-deleted] [-disabled] [-enabled] [-ignored] [-name <name> ] [-panel_name <name> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-deleted	Report only deleted assignments	
	-disabled	Report only disabled assignments	
	-enabled	Return only enabled assignments	
	-ignored	Report only ignored assignments	
	-name <name>	The type name of the assignments to report	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
Description	Create a report of all instance assignments in the loaded design		
Example Usage	project_open onewire_nf design::load_design -latest_snapshot design::report_assignments -name location		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.5.20. design::set\_assignment\_info (::quartus::design)

The following table displays information for the `design::set_assignment_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::design</a> on page 131	
<b>Syntax</b>	design::set_assignment_info [-h   -help] [-long_help] [-disable] [-enable] [-value <value> ] <assignment>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-disable	Disable the assignment
	-enable	Enable the assignment
	-value <value>	Set the assignment value
	<assignment>	assignment id
<b>Description</b>	Set information for a given assignment ID	
continued...		

<b>Example Usage</b>	<pre>project_open onewire_nf  design::load_design -latest_snapshot set asgn_id [lindex [design::get_assignments -name location] 0] puts "Setting location of [design::get_assignment_info -to \$asgn_id] to PIN_A5" design::set_assignment_info -value PIN_A5 \$asgn_id puts "New location of [design::get_assignment_info -to \$asgn_id] is [design::get_assignment_info -value \$asgn_id]"</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied assignment id <string> is invalid.
	TCL_ERROR	1	ERROR: The supplied assignment value <string> is invalid.
	TCL_ERROR	1	ERROR: At least one periphery assignment ID must be supplied, but no assignments IDs were supplied.
	TCL_ERROR	1	ERROR: Either the -to or -from argument is required.
	TCL_ERROR	1	ERROR: The value of an assignment cannot be empty.
	TCL_ERROR	1	ERROR: <string> assignment IDs were expected but <string> were supplied.

### 3.1.6. ::quartus::device

The following table displays information for the **::quartus::device** Tcl package:

<b>Tcl Package and Version</b>	::quartus::device 1.0
<b>Description</b>	<p>This package contains the set of Tcl functions for accessing information from the Quartus Prime device database.</p>
<b>Availability</b>	<p>This package is loaded by default in the following executables:</p> <pre>qpro_sh quartus_cdb quartus_eda quartus_fit quartus_ipgenerate quartus_sh quartus_sim quartus_sta quartus_syn</pre> <p>This package is available for loading in the following executables:</p> <pre>qpro quartus quartus_si</pre>
<b>Tcl Commands</b>	<pre>get_family_list (::quartus::device) on page 144 get_part_info (::quartus::device) on page 145 get_part_list (::quartus::device) on page 146 report_device_info (::quartus::device) on page 147 report_family_info (::quartus::device) on page 147 report_part_info (::quartus::device) on page 148</pre>

#### 3.1.6.1. get\_family\_list (::quartus::device)

The following table displays information for the **get\_family\_list** Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::device</a> on page 144
<b>Syntax</b>	get_family_list [-h   -help] [-long_help]
<b>continued...</b>	

<b>Arguments</b>	-h   -help		Short help
	-long_help		Long help with examples and possible return values
<b>Description</b>	Returns a list of available families.		
<b>Example Usage</b>	get_family_list		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal or missing <string> value, '<string>'. Specify a legal value.

### 3.1.6.2. get\_part\_info (::quartus::device)

The following table displays information for the get\_part\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::device on page 144	
<b>Syntax</b>	get_part_info [-h   -help] [-long_help] [-default_voltage] [-device] [-device_group] [-family] [-family_variant] [-fast_grade_revision] [-grade_revision] [-hssi_speed_grade] [-iobank_revision] [-package] [-pdn_model_status] [-pin_count] [-pof_id] [-power_model] [-power_model_status] [-rohs_grade] [-sip_tile] [-speed_grade] [-subdevice_id_code] [-subdevice_id_mask] [-temperature_grade] <part>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-default_voltage	Option to get the default core voltage (such as 0.9V or 1.1V)
	-device	Option to get device name (such as EP1S25 or EP1S80)
	-device_group	Option to get the device_group
	-family	Option to get family name (such as Stratix or Cyclone)
	-family_variant	Option to get family variant (such as Base, E or GX)
	-fast_grade_revision	Option to get the fast_grade_revision
	-grade_revision	Option to get the grade_revision
	-hssi_speed_grade	Option to get the hssi speed grade
	-iobank_revision	Option to get the iobank_revision
	-package	Option to get package name (such as FBGA or BGA)
	-pdn_model_status	Option to get the power distribution network (PDN) model status (such as ADVANCE, PRELIMINARY, or FINAL)
	-pin_count	Option to get total number of pins in the package
	-pof_id	Option to get the pof_id
	-power_model	Option to get the power model (such as STANDARD or LOW)
	-power_model_status	Option to get the power model status (such as PRELIMINARY or FINAL)
continued...		

	-rohs_grade	Option to get the ROHS grade (ROHS5, ROHS6, Leaded)	
	-sip_tile	Option to get SiP tile (such as L-tile, H-tile, E-tile)	
	-speed_grade	Option to get speed grade (such as 5, 6, or 7)	
	-subdevice_id_code	Option to get the subdevice_id_code	
	-subdevice_id_mask	Option to get the subdevice_id_mask	
	-temperature_grade	Option to get temperature grade of the package (such as COMMERCIAL or INDUSTRIAL)	
	<part>	Part name	
Description	Returns part characteristics for the specified part.  If you use multiple options, the command returns a list in the following order: <family> <device> <package> <pin_count> <speed grade> <temperature_grade> <family_variant> <power_model_status> <hssi_speed_grade> <power_model> <rohs_grade>		
Example Usage	tcl> get_part_info -family EP1S25F780C5 tcl> Stratix  tcl> get_part_info -family -device EP1S25F780C5 tcl> Stratix EP1S25  tcl> get_part_info -device -package -pin_count -speed_grade EP1S25F780C5 tcl> EP1S25 FBGA 780 5		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal die location name: <string>. Specify a legal die location name.
	TCL_ERROR	1	ERROR: Illegal resource name: <string>. Specify a legal resource name.

### 3.1.6.3. get\_part\_list (::quartus::device)

The following table displays information for the get\_part\_list Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::device</a> on page 144	
<b>Syntax</b>	get_part_list [-h   -help] [-long_help] [-device <value> ] [-family <value> ] [-package <value> ] [-pin_count <value> ] [-speed_grade <value> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-device <value>	Option to match device name
	-family <value>	Option to match family name
	-package <value>	Option to match package name
	-pin_count <value>	Option to match pin count
	-speed_grade <value>	Option to match speed grade
<b>Description</b>	Returns a list of available parts based on the options that are specified. Examples are as follows: Return a list of all supported parts	
continued...		

	<pre>get_part_list Return a list of all supported parts for Cyclone get_part_list -family Cyclone Return a list of all supported parts with the FBGA package and 780 pins get_part_list -package fbga -pin_count 780</pre>		
<b>Example Usage</b>	<pre>get_part_list -family "Stratix IV"</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal or missing <i>&lt;string&gt;</i> value, ' <i>&lt;string&gt;</i> '. Specify a legal value.

#### 3.1.6.4. report\_device\_info (::quartus::device)

The following table displays information for the `report_device_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::device</code> on page 144		
<b>Syntax</b>	<code>report_device_info [-h   -help] [-long_help] &lt;device&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>&lt;device&gt;</code>	Device name	
<b>Description</b>	<div>Returns a string value containing the report with information about the specified device, such as the following:<div>Available parts</div>Some additional information specific to the device</div>		
<b>Example Usage</b>	<pre>set report [report_device_info APEX20K1000E] puts \$report</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal device name: <i>&lt;string&gt;</i> . Specify a legal device name.

#### 3.1.6.5. report\_family\_info (::quartus::device)

The following table displays information for the `report_family_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::device</code> on page 144		
<b>Syntax</b>	<code>report_family_info [-h   -help] [-long_help] &lt;family&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>&lt;family&gt;</code>	Family name	
<b>Description</b>	<div>Returns a string value containing the report with information about the specified family, such as the following:<div>Available devices</div><div>Available packages</div></div>		
continued...			

	Available speed grades Available pin counts Some additional information specific to the family		
<b>Example Usage</b>	<pre>set report [report_family_info Stratix] puts \$report</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal family name: <string>. Specify a legal family name.

### 3.1.6.6. report\_part\_info (::quartus::device)

The following table displays information for the `report_part_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::device</a> on page 144		
<b>Syntax</b>	report_part_info [-h   -help] [-long_help] <part>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<part>	Part name	
<b>Description</b>	Returns a string value containing the report with information about the specified part, such as the following: Family name Device name Package name Pin count Speed grade Any additional information		
<b>Example Usage</b>	set report [report_part_info EPM1270F256I5] puts \$report		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal part name: <string>. Specify a legal part name. Use report_family_info, report_device_info, or get_part_list to find available parts.

### 3.1.7. ::quartus::dni\_sdc

The following table displays information for the `::quartus::dni_sdc` Tcl package:

<b>Tcl Package and Version</b>	<code>::quartus::dni_sdc 1.5</code>
<b>Description</b>	This package contains no general description.
<b>Availability</b>	This package is available for loading in the following executables:  <pre>qpro quartus quartus_cdb quartus_sh quartus_syn</pre>
continued...	

<b>Tcl Commands</b>	<code>dni::create_generated_clock (::quartus::dni_sdc)</code> on page 149 <code>dni::set_clock_groups (::quartus::dni_sdc)</code> on page 151 <code>dni::set_clock_latency (::quartus::dni_sdc)</code> on page 152 <code>dni::set_clock_uncertainty (::quartus::dni_sdc)</code> on page 153 <code>dni::set_data_delay (::quartus::dni_sdc)</code> on page 155 <code>dni::set_disable_timing (::quartus::dni_sdc)</code> on page 157 <code>dni::set_false_path (::quartus::dni_sdc)</code> on page 158 <code>dni::set_input_delay (::quartus::dni_sdc)</code> on page 159 <code>dni::set_input_transition (::quartus::dni_sdc)</code> on page 161 <code>dni::set_max_delay (::quartus::dni_sdc)</code> on page 162 <code>dni::set_max_skew (::quartus::dni_sdc)</code> on page 164 <code>dni::set_max_time_borrow (::quartus::dni_sdc)</code> on page 165 <code>dni::set_min_delay (::quartus::dni_sdc)</code> on page 166 <code>dni::set_multicycle_path (::quartus::dni_sdc)</code> on page 168 <code>dni::set_net_delay (::quartus::dni_sdc)</code> on page 170 <code>dni::set_operating_conditions (::quartus::dni_sdc)</code> on page 171 <code>dni::set_output_delay (::quartus::dni_sdc)</code> on page 173 <code>dni::set_sense (::quartus::dni_sdc)</code> on page 174 <code>dni::set_timing_derate (::quartus::dni_sdc)</code> on page 175
---------------------	---

### 3.1.7.1. dni::create\_generated\_clock (::quartus::dni\_sdc)

The following table displays information for the `dni::create_generated_clock` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dni_sdc</code> on page 148	
<b>Syntax</b>	<code>dni::create_generated_clock [-h   -help] [-long_help] [-add] [-combinational] [-comment &lt;string&gt;] [-divide_by &lt;factor&gt;] [-duty_cycle &lt;percent&gt;] [-edge_shift &lt;shift_list&gt;] [-edges &lt;edge_list&gt;] [-invert] [-master_clock &lt;clock&gt;] [-multiply_by &lt;factor&gt;] [-name &lt;clock_name&gt;] [-offset &lt;time&gt;] [-phase &lt;degrees&gt;] [-preinvert] [-source &lt;clock_source&gt;] [&lt;targets&gt;]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-add</code>	Add clock to existing clock node
	<code>-combinational</code>	Specifies that the source latency paths for this type of generated clock only includes the logic where the master clock propagates along combinational paths
	<code>-comment &lt;string&gt;</code>	Comment string
	<code>-divide_by &lt;factor&gt;</code>	Division factor
	<code>-duty_cycle &lt;percent&gt;</code>	Specifies the duty cycle as a percentage of the clock period--accepts floating point values
	<code>-edge_shift &lt;shift_list&gt;</code>	List of edge shifts
	<code>-edges &lt;edge_list&gt;</code>	List of edge values
	<code>-invert</code>	Invert the clock waveform
	<code>-master_clock &lt;clock&gt;</code>	Specifies clock of the source node
	<code>-multiply_by &lt;factor&gt;</code>	Multiplication factor
	<code>-name &lt;clock_name&gt;</code>	Name of generated clock
	<code>-offset &lt;time&gt;</code>	Specifies the offset as an absolute time shift
	<code>-phase &lt;degrees&gt;</code>	Specifies the phase shift in degrees
	<code>-preinvert</code>	Preinvert the clock waveform
	<code>-source &lt;clock_source&gt;</code>	Source pin for the generated clock
<b>continued...</b>		

	<targets>	List or collection of targets
<b>Description</b>	<p>Defines an internally generated clock. If -name is not specified, the clock name is the same as the first target in the list or collection. The clock name is used to refer to the clock in other commands.</p> <p>If a clock with the same name is already assigned to a given target, the create_generated_clock command overwrites the existing clock. If a clock with a different name exists on the given target, the create_generated_clock command is ignored unless the -add option is used. The -add option can be used to assign multiple clocks to a pin or port, and is recommended be used with -master_clock option.</p> <p>The master clock must be defined on (or must propagate to) the port or pin specified in -source. The waveform of the generated clock is computed based on the master clock's waveform as observed at that port or pin, including inversions that may occur between the master clock source and that pin.</p> <p>The source latency of the generated clock is based on the clock network of the generated clock, and not the clock network of the node specified using -source. This latency is added to any source latency of the master clock.</p> <p>If no target is specified, the clock is treated as a virtual clock. In that case, the source latency of the generated clock will be equal to the source latency of the master clock, plus any added latency specified with set_clock_latency.</p> <p>The -divide_by, -multiply_by, -invert, -duty_cycle, -edges, and -edge_shift options modify the waveform relative to the waveform at the source node.</p> <p>Clock division and multiplication, using -divide_by and -multiply_by, is performed relative to the first rising edge. Clock division is based on edges in the master clock waveform, and scaled if the division is an odd number. Use the -duty_cycle option to specify the new duty cycle for clock multiplication. Use the -invert option to invert the generated waveform. The -duty_cycle option may be specified as a decimal value (e.g. 22.5) or as a ratio of two numbers (e.g. 45/2). The latter form may improve Timing Analyzer accuracy when detecting relationships between related clocks.</p> <p>Clock generation can also be specified with the -edges and -edge_shift options. The -edges option accepts a list of three numbers specifying the master clock edges to use for the first rising edge, the next falling edge, and next rising edge. Edges of the master clock are labeled according to the first rising edge (1), next falling edge (2), next rising edge (3), etc. For example, a basic clock divider can be specified equivalently with -divide_by 2 or -edges {1 3 5}. The -edge_shift option accepts a list of three time values, the amount to shift each of the three edges.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type.</p> <p>Note -preinvert and -combinational options are not supported.</p>	
<b>Example Usage</b>	<pre># Create a clock and a divide-by-2 generated clock create_clock -period 10 [get_ports clk] create_generated_clock -divide_by 2 -source [get_ports clk] -name clkdiv [get_cells clkdiv]  # An equivalent generated clock create_generated_clock -edges {1 3 5} -source [get_ports clk] -name clkdiv [get_cells clkdiv]  # Specify a clock multiplier with a 60% duty cycle create_generated_clock -multiply_by 2 -source [get_ports clk] -duty_cycle 60 [get_pins clkmult  combout]  # Specify an inverted divide-by-2 clock relative to the output of the source clock create_generated_clock -divide_by 2 -invert -source [get_ports clk] -name nclkdiv [get_cells clkdiv]  # Specify a divide-by-2 clock create_generated_clock -divide_by 2 -source [get_ports clk] -name clkdiv [get_cells clkdiv]  # Create a divide-by-2 generated clock generated off the falling edge of the source clock create_generated_clock -edges {2 4 6} -source [get_ports clk] -name clkfall_div [get_cells clkfall_div]  # Assign two clocks to an input port that are switched externally, # along with an internal clock divider. create_clock -period 10 -name clk100Mhz [get_ports clk] create_clock -period 6.667 -name clk150Mhz -add [get_ports clk] create_generated_clock -divide_by 2 -name clk50Mhz -source [get_ports clk] -master_clock</pre>	
continued...		

	<pre>clk100Mhz -add [get_cells clkdiv] create_generated_clock -divide_by 2 -name clk75Mhz -source [get_ports clk] -master_clock clk150Mhz -add [get_cells clkdiv]</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.7.2. dni::set\_clock\_groups (::quartus::dni\_sdc)

The following table displays information for the `dni::set_clock_groups` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dni_sdc</code> on page 148	
<b>Syntax</b>	<code>dni::set_clock_groups [-h   -help] [-long_help] [-allow_paths] [-asynchronous] [-comment &lt;string&gt; ] [-exclusive] -group &lt;names&gt; [-logically_exclusive] [-name &lt;name&gt; ] [-physically_exclusive]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-allow_paths</code>	Enables timing analysis between the specified clock groups
	<code>-asynchronous</code>	Specify mutually exclusive clocks (such as groups of primary clocks)
	<code>-comment &lt;string&gt;</code>	Comment string
	<code>-exclusive</code>	Specify mutually exclusive clocks (an alias for the <code>-logically_exclusive</code> option). Exists for backwards compatibility.
	<code>-group &lt;names&gt;</code>	Valid destinations (string patterns are matched using Tcl string matching)
	<code>-logically_exclusive</code>	Specify logically exclusive clocks (meaning they are not actively used at the same time)
	<code>-name &lt;name&gt;</code>	Clock group name
	<code>-physically_exclusive</code>	Specify physically exclusive clocks (meaning they are not physically present at the same time)
<b>Description</b>	<p>Clock groups provide a quick and convenient way to specify which clocks are not related. Asynchronous clocks are those that are completely unrelated (e.g., have different ideal clock sources). Logically exclusive clocks are not actively used in the design at the same time (e.g., multiplexed clocks), but the clock signals may physically exist on-chip at the same time and therefore may still influence each other through crosstalk effects. Physically exclusive clocks, in contrast, cannot be physically present in the device at the same time (e.g., multiple clocks defined on the same clock pin).</p> <p>The Timing Analyzer does not currently analyze crosstalk explicitly. Instead, the timing models use extra guard bands to account for any potential crosstalk-induced delays. As a result, the Timing Analyzer currently treats asynchronous, logically_exclusive, and physically_exclusive clock groups the same. However, different parts of the Timing Analyzer may treat asynchronous and exclusive groups differently. Any commands that are affected by clock groups will say so in their help text. But, no distinction is made between logically and physically exclusive clock groups, since the only difference between them is how they affect crosstalk.</p> <p>The result of <code>set_clock_groups</code> is that all clocks in any group are cut from all clocks in every other group. The use of a single <code>-group</code> option tells the Timing Analyzer to cut this group of clocks from all other clocks in the design, including clocks that are created in the future. This command is similar to calling <code>set_false_path</code> from each clock in every group to each clock in every other group and vice</p>	

continued...

	<p>versa, making set_clock_groups easier to specify for cutting clock domains. However, cutting clocks with set_clock_groups also affects the results of some other commands. Any commands that are affected by clock groups will say so in their help text.</p> <p>Note -allow_paths is not supported yet.</p>		
<b>Example Usage</b>	<pre>project_open top create_timing_netlist create_clock -period 10.000 -name clkA [get_ports sysclk[0]] create_clock -period 10.000 -name clkB [get_ports sysclk[1]]  # Set clkA and clkB to be mutually exclusive clocks. dni::set_clock_groups -logically_exclusive -group {clkA} -group {clkB}  # The previous line is equivalent to the following two commands. set_false_path -from [get_clocks clkA] -to [get_clocks clkB] set_false_path -from [get_clocks clkB] -to [get_clocks clkA]</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.7.3. dni::set\_clock\_latency (::quartus::dni\_sdc)

The following table displays information for the dni::set\_clock\_latency Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dni_sdc on page 148	
<b>Syntax</b>	dni::set_clock_latency [-h   -help] [-long_help] [-clock <clock_list> ] [-dynamic <jitter> ] [-early] [-fall] [-late] [-max] [-min] [-rise] -source <delay> <targets>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-clock <clock_list>	Valid clock destinations (string patterns are matched using Tcl string matching)
	-dynamic <jitter>	Specifies the dynamic component of the clock latency, which represents the amount of jitter in the original clock source
	-early	Specifies the early clock latency
	-fall	Specifies the falling transition clock latency
	-late	Specifies the late clock latency
	-max	Specifies the clock latency at the worst-case operation condition
	-min	Specifies the clock latency at the best-case operation condition
	-rise	Specifies the rising transition clock latency
	-source	Specifies the source clock latency
	<delay>	Latency delay value
<targets>	Valid destinations (string patterns are matched using Tcl string matching)	
<b>Description</b>	<p>Specifies clock latency for a given clock or clock target.</p> <p>There are two types of latency: network and source. Network latency is the clock network delay between the clock and register clock pins. Source latency is the clock network delay between the clock and its</p>	
continued...		

	<p>source (e.g., the system clock or base clock of a generated clock).</p> <p>The Timing Analyzer automatically computes network latencies for all register and generated clocks. Overriding clock network latencies is not supported by the Timing Analyzer. Therefore, the -source option must always be specified.</p> <p>You can apply clock latency to a clock, which affects all targets of the clock, or to a specific clock target. If you specify a specific clock target that is driven by more than one clock, use the -clock option to specify which clock to use. Latencies assigned to a clock target override any latencies assigned to a clock.</p> <p>Different clock latencies can be specified for early (-early) and late (-late) latencies, as well as for rising edges (-rise) and falling edges (-fall). If only some combinations are specified, the other combinations are used by default. For example, if only a -rise -early latency and a -fall -early latency are specified, then the -rise -late latency is assumed to be the same as the -rise -early latency and the -fall -late latency is assumed to be the same as the -fall -early latency. If neither -rise nor -fall are used or neither -early nor -late are used, then the latency applies to both conditions.</p> <p>Source latency can also be assigned to generated clocks. This may be useful for specifying board level delays from a clock output port to a clock input port when the clock input port is acting as a feedback clock.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type.</p> <p>Note -dynamic is not supported yet.</p>		
<b>Example Usage</b>	<pre>create_clock -name SYSCLK -period 10.000 [get_ports inclk] create_generated_clock -name OUTCLK -divide_by 1 -source [get_ports inclk] [get_ports outclk] create_generated_clock -name FDBKCLK -divide_by 1 -source [get_ports outclk] [get_ports fdbkclk]  # Apply a simple 2.000 ns source latency to the system clock. set_clock_latency -source 2.000 [get_clocks SYSCLK]  # Specify feedback clock latencies between output port outclk # and the input port fdbkclk. set_clock_latency -source -late -rise 0.800 [get_clocks FDBKCLK] set_clock_latency -source -late -fall 0.750 [get_clocks FDBKCLK] set_clock_latency -source -early -rise 0.500 [get_clocks FDBKCLK] set_clock_latency -source -early -fall 0.460 [get_clocks FDBKCLK]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.7.4. dni::set\_clock\_uncertainty (::quartus::dni\_sdc)

The following table displays information for the dni::set\_clock\_uncertainty Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dni_sdc on page 148	
<b>Syntax</b>	<pre>dni::set_clock_uncertainty [-h   -help] [-long_help] [-add] [-enable_same_physical_edge] [-fall] [-fall_from &lt;fall_from_clock&gt; ] [-fall_to &lt;fall_to_clock&gt; ] [-from &lt;from_clock&gt; ] [-hold] [-rise] [-rise_from &lt;rise_from_clock&gt; ] [-rise_to &lt;rise_to_clock&gt; ] [-setup] [-to &lt;to_clock&gt; ] &lt;uncertainty&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-add	Specifies that this assignment is an addition to the clock uncertainty derived by derive_clock_uncertainty call
	-enable_same_physical_edge	Enable setting uncertainty value for same physical clock edge
continued...		

	-fall	Indicates that the uncertainty applies to only the falling edge of the destination clock	
	-fall_from <fall_from_clock>	Valid destinations (string patterns are matched using Tcl string matching)	
	-fall_to <fall_to_clock>	Valid destinations (string patterns are matched using Tcl string matching)	
	-from <from_clock>	Valid destinations (string patterns are matched using Tcl string matching)	
	-hold	Only apply the uncertainty value to hold and removal checks	
	-rise	Indicates that the uncertainty applies to only the rising edge of the destination clock	
	-rise_from <rise_from_clock>	Valid destinations (string patterns are matched using Tcl string matching)	
	-rise_to <rise_to_clock>	Valid destinations (string patterns are matched using Tcl string matching)	
	-setup	Only apply the uncertainty value to setup and recovery checks	
	-to <to_clock>	Valid destinations (string patterns are matched using Tcl string matching)	
	<uncertainty>	Uncertainty	
Description	<p>Specifies clock uncertainty or skew for clocks for clock-to-clock transfers. You can specify uncertainty separately for setup and hold, and you can specify separate rising and falling clock transitions. If you omit to specify -setup or -hold, the uncertainty value will be applied to both analysis types. Similarly, if you omit to specify rising or falling clock transitions, the uncertainty value will be applied to both transitions. The setup uncertainty is subtracted from the data required time for each applicable path, and the hold uncertainty is added to the data required time for each applicable path.</p> <p>Intel Quartus Prime software computes clock uncertainty for every clock transfer. For particular transfers, you can use the set_clock_uncertainty assignment to override the automatically derived value. If multiple set_clock_uncertainty assignments apply to the same clock transfer, the later value overrides the earlier ones.</p> <p>Note: The Timing Analyzer does not apply clock uncertainty to transfers involving the same physical launch and latch edge (that is, the latch and launch edges are the same edge of a clock source and occur at the same time) by default. Such transfers typically occur in hold analysis, but may also occur in setup analysis with a multicycle value of 0.You can use the -enable_same_physical_edge option to override this behavior.</p> <p>The values for -from, -to, and similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types.</p> <p>Note -rise and -fall options are not supported yet.</p>		
Example Usage	set_clock_uncertainty -setup -rise_from clk1 -fall_to clk2 200ps		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.7.5. dni::set\_data\_delay (::quartus::dni\_sdc)

The following table displays information for the dni::set\_data\_delay Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dni_sdc on page 148	
<b>Syntax</b>	dni::set_data_delay [-h   -help] [-long_help] [-add_latch_clock] [-add_launch_clock] [-allow_destination_borrowing] [-fall_from <names> ] [-fall_to <names> ] [-from <names> ] [-get_value_from_clock_period <src_clock_period dst_clock_period min_clock_period max_clock_period> ] [-no_synchronizer] [-override] [-rise_from <names> ] [-rise_to <names> ] [-through <names> ] [-to <names> ] [-value_multiplier <multiplier> ] [ <value> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-add_latch_clock	Include the latch clock path in timing analysis
	-add_launch_clock	Include the launch clock path in timing analysis
	-allow_destination_borrowing	Allow time borrowing at the destination
	-fall_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-get_value_from_clock_period <src_clock_period dst_clock_period min_clock_period max_clock_period>	Compute constraint as a multiple of the clock period
	-no_synchronizer	Prevent this data delay from triggering a synchronizer
	-override	Make this constraint override non-datapath-only setup constraints, instead of applying it in addition to them (equivalent to set_data_delay & set_false_path -setup -no_synchronizer, unless -add_launch_clock is used as well)
	-rise_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-rise_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	-to <names>	Valid destinations (string patterns are matched using Tcl string matching)
	-value_multiplier <multiplier>	Value by which the clock period should be multiplied to compute requirement
	<value>	Time Value
<b>Description</b>	<p>Specifies a maximum datapath delay exception for a given path.</p> <p>The maximum delay analysis includes Tco of the launching register, and Tsu of the latching register. By default, it does not include clock arrival times at the launching or latching register. To include launch clock arrival times, use the -allow_launch_clock option. To include latch clock arrival times, use the -allow_latch_clock option. If the path starts or ends at a port, the analysis does not</p>	

*continued...*

include delays due to `set_input_delay` or `set_output_delay`.

Use `-get_value_from_clock_period` to set the delay requirement for each path to be equal to the launching or latching clock period, or whichever of the two has a smaller or larger period. If `-value_multiplier` is used, the requirement will be multiplied by that value. If there are no clocks clocking the endpoints of the path (such as if the path begins or ends at an unconstrained I/O), the constraint will be ignored.

The datapath delay constraint is applied in addition to other constraints on the given path, including the default constraint. Furthermore, the datapath delay constraint is analyzed independently from other SDC constraints, including `set_false_path` and `set_clock_groups`, and cannot be overridden by other SDC constraints. For example, you can use `set_data_delay` to specify an upper limit on logic and routing delay for paths cut by `set_false_path`.

To both cut a path for (clock-aware) timing and constrain its datapath delay, the path must be constrained with both `set_false_path` and `set_data_delay`.

The `-from` and `-to` values are collections of clocks, ports, pins, or cells in the design.

Applying exceptions between clocks applies the exception from all register or ports driven by the `-from` clock to all registers or ports driven by the `-to` clock.

If pin names or collections are used, the `-from` value must be a clock pin and the `-to` value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells apply to all registers in the cell or driven by the clock pin.

The `-through` values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node. The Timing Analyzer allows you to specify the `-through` argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The `-rise_from` and `-fall_from` options can be used in place of the `-from` destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The `--from` option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The `-rise_to` and `-fall_to` options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.

The values of the `-from`, `-to`, `-through`, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the `use_timing_analyzer_style_escaping` command for details.

If the source of a path with a `set_data_delay` constraint has any time borrowed, the delay budget will be reduced by the time borrowed.

By default, the delay budget will not be increased by time borrowed at the destination of a path constrained by a `set_data_delay` constraint, and negative slack on a `set_data_delay` constraint will not cause time borrowing to happen. To change this behavior, use the `-allow_destination_borrowing` option.

*continued...*

<b>Example Usage</b>	<pre># Apply a 10ns max data delay on paths between two unrelated clocks set_data_delay -from [get_clocks clkA] -to [get_clocks clkB] 10.000  # Apply a 2ns max data delay from an input port to any valid destination set_data_delay -from [get_ports in[*]] -to * 2.000  # Require net delay to be at most 90% of the period of the clock driving the inst9 register set_data_delay -get_value_from_clock_period dst_clock_period -value_multiplier 0.9 -from [get_clocks clk] -to [get_cells inst9]  # Apply a 2ns max data delay for an input port only to nodes driven by # the rising edge of clock CLK set_data_delay -from [get_ports in[*]] -rise_to [get_clocks CLK] 2.000</pre>		
	<b>Return Value</b>	<b>Code Name</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.7.6. dni::set\_disable\_timing (::quartus::dni\_sdc)

The following table displays information for the `dni::set_disable_timing` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::dni_sdc</a> on page 148		
<b>Syntax</b>	dni::set_disable_timing [-h   -help] [-long_help] [-from <name> ] [-restore] [-to <name> ] <cells>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-from <name>	Valid source pin suffix	
	-restore	Restores the specified arcs so that they are no longer disabled	
	-to <name>	Valid destination pin suffix	
	<cells>	List of cells	
<b>Description</b>	<p>This command is not supported by SDC on RTL yet.</p> <p>Disables a timing edge (arc) from inside a given cell or cells. Disabling a timing edge prevents timing analysis through that edge. If either -from or -to (or both) are unspecified, the missing value or values are replaced by a "*" character.</p> <p>The values of the -from and -to are valid pin suffixes.</p> <p>Note -restore option is not supported yet.</p>		
<b>Example Usage</b>	<pre>set_disable_timing -from datain -to combout A B set_disable_timing -from carryin *</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.7.7. dni::set\_false\_path (::quartus::dni\_sdc)

The following table displays information for the `dni::set_false_path` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dni_sdc</code> on page 148	
<b>Syntax</b>	<code>dni::set_false_path [-h   -help] [-long_help] [-comment &lt;string&gt;] [-fall] [-fall_from &lt;names&gt;] [-fall_through &lt;names&gt;] [-fall_to &lt;names&gt;] [-from &lt;names&gt;] [-hold] [-latency_insensitive] [-reset_path] [-rise] [-rise_from &lt;names&gt;] [-rise_through &lt;names&gt;] [-rise_to &lt;names&gt;] [-setup] [-through &lt;names&gt;] [-to &lt;names&gt;]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-comment &lt;string&gt;</code>	Comment string
	<code>-fall</code>	Marks falling delays false, as measured on the path endpoint
	<code>-fall_from &lt;names&gt;</code>	Valid source clocks (string patterns are matched using Tcl string matching)
	<code>-fall_through &lt;names&gt;</code>	Valid through nodes (string patterns are matched using Tcl string matching)
	<code>-fall_to &lt;names&gt;</code>	Valid destination clocks (string patterns are matched using Tcl string matching)
	<code>-from &lt;names&gt;</code>	Valid sources (string patterns are matched using Tcl string matching)
	<code>-hold</code>	Specifies the false_path value (applies only to clock hold or removal checks)
	<code>-latency_insensitive</code>	Mark this false path as one that should still be optimized
	<code>-reset_path</code>	Removes existing point-to-point exception information on the specified paths
	<code>-rise</code>	Marks rising delays false, as measured on the path endpoint
	<code>-rise_from &lt;names&gt;</code>	Valid source clocks (string patterns are matched using Tcl string matching)
	<code>-rise_through &lt;names&gt;</code>	Valid through nodes (string patterns are matched using Tcl string matching)
	<code>-rise_to &lt;names&gt;</code>	Valid destination clocks (string patterns are matched using Tcl string matching)
	<code>-setup</code>	Specifies the false_path value (applies only to clock setup or recovery checks)
	<code>-through &lt;names&gt;</code>	Valid through nodes (string patterns are matched using Tcl string matching)
	<code>-to &lt;names&gt;</code>	Valid destinations (string patterns are matched using Tcl string matching)
<b>Description</b>	<p>Specifies a false-path exception, removing (or cutting) paths from timing analysis.</p> <p>The <code>-from</code> and <code>-to</code> values are collections of clocks, registers, ports, pins, or cells in the design. If the <code>-from</code> or <code>-to</code> values are not specified, the collection is converted automatically into <code>[get_keepers *]</code>. It is worth noting that if the counterpart of the unspecified</p>	

*continued...*

	<p>collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection only if the clock collection also generates the desired assignment.</p> <p>Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.</p> <p>If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.</p> <p>The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node. The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.</p> <p>The -rise_from and -fall_from options can be used in place of the -from destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node, taking into consideration any logical inversions along the clock path. The -from option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.</p> <p>The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value, taking into consideration any logical inversions that are along the clock path.</p> <p>The -setup and -hold options allow the false path to only be applied to the corresponding setup/recovery or hold/removal checks. The default if neither value is specified is to apply the false path to both -setup and -hold.</p> <p>The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types.</p> <p>Note -rise, -fall, -rise_through, -fall_through and -reset_path options are not supported yet.</p>		
<b>Example Usage</b>	<pre># Set a false-path between two unrelated clocks set_false_path -from [get_clocks clkA] -to [get_clocks clkB]  # Set a false-path for a specific path set_false_path -from [get_pins regA clk] -to [get_pins regB aclr]  # Set a false-path from a node to a falling clock set_false_path -from [get_pins regA clk] -fall_to [get_clocks clkB]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.7.8. dni::set\_input\_delay (::quartus::dni\_sdc)

The following table displays information for the dni::set\_input\_delay Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dni_sdc</code> on page 148		
<b>Syntax</b>	<code>dni::set_input_delay [-h   -help] [-long_help] [-add_delay] -clock &lt;name&gt; [-clock_fall] [-fall] [-level_sensitive] [-max] [-min] [-network_latency_included] [-reference_pin &lt;name&gt; ] [-rise] [-source_latency_included] &lt;delay&gt; &lt;targets&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<i>continued...</i>

-add_delay	Create additional delay constraint instead of overriding previous constraints																										
-clock <name>	Clock name																										
-clock_fall	Specifies that input delay is relative to the falling edge of the clock																										
-fall	Specifies the falling input delay at the port																										
-level_sensitive	Specifies that input delay is relative to a level-sensitive latch																										
-max	Applies value as maximum data arrival time																										
-min	Applies value as minimum data arrival time																										
-network_latency_included	Specifies that input delay includes added network latency																										
-reference_pin <name>	Specifies a pin or port in the design to which the input delay is relative																										
-rise	Specifies the rising input delay at the port																										
-source_latency_included	Specifies that input delay includes added source latency																										
<delay>	Time value																										
<targets>	List of input port type objects																										
<b>Description</b>	<p>Specifies the data arrival times at the specified input ports relative the clock specified by the -clock option. The clock must refer to a clock name in the design.</p> <p>Input delays can be specified relative to the rising edge (default) or falling edge (-clock_fall) of the clock.</p> <p>Input delays can be specified relative to a pin or a port (-reference_pin) in the clock network. Clock arrival times to the reference pin or port are added to data arrival times.</p> <p>Input delays can already include clock source latency. By default the clock source latency of the related clock is added to the input delay value, but when the -source_latency_included option is specified, the clock source latency is not added because it was factored into the input delay value.</p> <p>The maximum input delay (-max) is used for clock setup checks or recovery checks and the minimum input delay (-min) is used for clock hold checks or removal checks. If only -min or -max (or neither) is specified for a given port, the same value is used for both.</p> <p>Separate rising (-rise) and falling (-fall) arrival times at the port can be specified. If only one of -rise and -fall are specified for a given port, the same value is used for both.</p> <p>By default, set_input_delay removes any other input delays to the port except for those with the same -clock, -clock_fall, and -reference_pin combination. Multiple input delays relative to different clocks, clock edges, or reference pins can be specified using the -add_delay option. Future input delays relative to different clocks, clock edges, or reference pins that do not specify the -add_delay option will still remove previous input delays that specified the -add_delay option.</p> <p>Note that -level_sensitive and -network_latency_included are not supported yet.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type.</p>																										
<b>Example Usage</b>	<pre># Simple input delay with the same value for min/max and rise/fall: # 1) set on ports with names of the form myin* set_input_delay -clock clk 1.5 [get_ports myin*] # 2) set on all input ports set_input_delay -clock clk 1.5 [all_inputs]  # Input delay with respect to the falling edge of clock set_input_delay -clock clk -clock_fall 1.5 [get_ports myin*]</pre>

Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-comment <string>	Comment string
	-fall	Marks falling delays false, as measured on the path endpoint
	-fall_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	-fall_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-ignore_clock_latency	Indicates that the launch and capture clock latencies are to be ignored when computing slack on the specified paths
	-reset_path	Removes existing point-to-point exception information on the specified paths
	-rise	Marks rising delays false, as measured on the path endpoint
	-rise_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-rise_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	-rise_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	-to <names>	Valid destinations (string patterns are matched using Tcl string matching)
<value>	Time Value	
Description	Specifies a maximum delay exception for a given path.  The maximum delay is similar to changing the setup relationship	
continued...		

(latching clock edge - launching clock edge), except that it can be applied to input or output ports without input or output delays assigned to them. Maximum delays are always relative to any clock network delays (if the source or destination is a register) or any input or output delays (if the source or destination is a port). Therefore, input delays and clock latencies are added to the data arrival times. Clock latencies also added to data required times and output delays are subtracted from data required times.

The -from and -to values are collections of clocks, registers, ports, pins, or cells in the design. If the -from or -to values are not specified, the collection is converted automatically into [get\_cells \*]. It is worth noting that if the counterpart to the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection but only if the clock collection also generates the desired assignment.

Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.

If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.

The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node. The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.

The -rise\_from and -fall\_from options can be used in place of the -from destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The "-from" option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.

The -rise\_to and -fall\_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.

The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types.

Note -rise, -fall, -rise\_through, -fall\_through, -ignore\_clock\_latency and -reset\_path options are not supported yet.

**Example Usage**

```
# Apply a 10ns max delay between two unrelated clocks
set_max_delay -from [get_clocks clkA] -to [get_clocks clkB] 10.000

# Apply a 2ns max delay for an input port (TSU)
set_max_delay -from [get_ports in[*]] -to [get_cells *] 2.000

# Apply a 2ns max delay for an output port (TCO)
set_max_delay -from [get_cells *] -to [get_ports out[*]] 2.000

# Apply a 2ns max delay for an input port to an output port (TPD)
set_max_delay -from [get_ports in[*]] -to [get_ports out[*]] 2.000

# Apply a 2ns max delay for an input port only to nodes driven by
# the rising edge of clock CLK
set_max_delay -from [get_ports in[*]] -rise_to [get_clocks CLK] 2.000
```

**Return Value**

### 3.1.7.11. dni::set\_max\_skew (::quartus::dni\_sdc)

The following table displays information for the dni::set\_max\_skew Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dni_sdc on page 148	
<b>Syntax</b>	<pre>dni::set_max_skew [-h   -help] [-long_help] [-fall_from_clock &lt;names&gt; ] [-fall_to_clock &lt;names&gt; ] [-from &lt;names&gt; ] [-from_clock &lt;names&gt; ] [-get_skew_value_from_clock_period &lt;src_clock_period&gt; &lt;dst_clock_period&gt; &lt;min_clock_period&gt; ] [-rise_from_clock &lt;names&gt; ] [-rise_to_clock &lt;names&gt; ] [-skew_value_multiplier &lt;multiplier&gt; ] [-to &lt;names&gt; ] [-to_clock &lt;names&gt; ] [ &lt;skew&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-fall_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-get_skew_value_from_clock_period <src_clock_period> <dst_clock_period> <min_clock_period>	Compute skew constraint as a multiple of the clock period
	-rise_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-rise_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-skew_value_multiplier <multiplier>	Value by which the clock period should be multiplied to compute skew requirement
	-to <names>	Valid destinations (string patterns are matched using Tcl string matching)
	-to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	<skew>	Required skew
<b>Description</b>	<p>Use the set_max_skew constraint to perform maximum allowable skew analysis between sets of registers or ports. In order to constrain skew across multiple paths, all such paths must be defined within a single set_max_skew constraint. The set_max_skew timing constraint is not affected by the set_max_delay, set_min_delay, and set_multicycle_path constraints, but is affected by the set_clock_groups -exclusive constraint. Paths between exclusive clocks are not analyzed for skew, and no two paths are compared for skew if their clocks are exclusive to each other. However, paths whose clocks are asynchronous are still analyzed for skew.</p> <p>Legal values for the -from and -to options are collections of clocks, ports, pins, or cells in a design.</p> <p>Applying maximum skew constraints between clocks applies the constraint from all register or ports driven by the clock specified with the -from option to all registers or ports driven by the clock specified with the -to option.</p>	

continued...

	<p>If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells apply to all registers contained in the cell or driven by the clock pin. Similarly, -to and -from partition specifications apply to all registers in the specified partition.</p> <p>Max skew analysis includes data arrival times, clock arrival times, register micro parameters, clock uncertainty, on-die variation and ccpp removal.</p> <p>Use -get_skew_value_from_clock_period to set the skew requirement to be equal to the launching or latching clock period, or whichever of the two has a smaller period. If -skew_value_multiplier is used, the requirement is multiplied by that value. If this option is used, then the positional skew option may not be set. If the set of skew paths is clocked by more than one clock, the Timing Analyzer will use the one with the smallest period to compute the skew constraint.</p> <p>When this constraint is used, results of max skew analysis are displayed in the Report Max Skew (report_max_skew) report from the Timing Analyzer. Since skew is defined between two or more paths, no results are displayed if the -from/-from_clock and -to/-to_clock filters satisfy fewer than two paths.</p>		
<b>Example Usage</b>	<pre># Constrain the skew on an input port to all registers it feeds set_max_skew -from [get_ports din] 0.200  # Constrain the skew on output bus dout[*] set_max_skew -to [get_ports dout\[*\]] 0.200  # Constrain skew to be less than 90% of the period of any clock in the source # register set set_max_skew -to [get_cells inst1[*]] -get_skew_value_from_clock_period src_clock_period - skew_value_multiplier 0.900  # Report the results of max skew assignments report_max_skew -panel_name "Report Max Skew" -npaths 10 -detail path_only</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.7.12. dni::set\_max\_time\_borrow (::quartus::dni\_sdc)

The following table displays information for the dni::set\_max\_time\_borrow Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::dni_sdc</a> on page 148		
<b>Syntax</b>	dni::set_max_time_borrow [-h   -help] [-long_help] <value> <targets>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<value>	Time Value	
	<targets>	Collection or list of latches	
<b>Description</b>	<p>This command is not supported by SDC on RTL yet.</p> <p>Specifies the maximum borrowed time for level-sensitive latches. The actual borrowed time will be determined automatically, but will never exceed the amount you specify. For any latches without a set_max_time_borrow constraint, no limit will apply (except for the physical limit of what is possible on the device, as described below).</p> <p>Time borrowing is specified with respect to the earliest possible time a signal can be clocked into the latch node. For example, for a positive latch, if the earliest possible arrival time of the rising</p>		
continued...			

	<p>clock edge is 1.025ns, then a signal that has an arrival time of 1.035ns (where this arrival time already includes the micro-setup time of the latch) will require at least 0.010ns of time borrowing.</p> <p>Regardless of how the borrowed time is determined (automatically without a limit or automatically with a <code>set_max_time_borrow</code> constraint), the borrowed time can never exceed what is physically possible to borrow on the device. The maximum amount that can be borrowed is the period of time when the latch is open (e.g. half the clock period if the clock has a 50% duty cycle), but this time is reduced by clock propagation time spread and clock uncertainty between the latch-opening and latch-closing clock edges, and is further reduced by the closing-edge setup time of the latch. Some of these factors vary from corner to corner, as well as from clock to clock (if multiple clocks drive the latch).</p> <p>Time borrowing analysis will only occur in the Timing Analysis (Signoff) stage, or when manually running the Timing Analyzer. The Fitter will not utilize time borrowing information and will assume zero time borrowed. Thus, the use of level-sensitive latches with high-speed clocks is not recommended, unless other constraints (such as <code>set_max_delay</code>) are manually set to ensure optimal Fitter behavior.</p> <p>The targets of this command must be level-sensitive latches (all other targets will be ignored).</p> <p>The targets can be specified as either a collections or a Tcl list of wildcards used to create collections of appropriate types.</p>		
<b>Example Usage</b>	<pre># Borrow at most 3ns at all "lat*" latches: set_max_time_borrow 3 [get_cells lat*]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

	-max	Specifies maximum delay
	-min	Specifies minimum delay
	-to <names>	Valid destination pins, ports, or nets (string patterns are matched using Tcl string matching)
	-value_multiplier <multiplier>	Value by which the clock period should be multiplied to compute net delay requirement
	<delay>	Net delay
<b>Description</b>	Use the set_net_delay command to query the net delays and perform minimum or maximum timing analysis across nets. The -from and -to options can be string patterns or pin, port, or net collections. When a pin or net collection is used, the collection should include output pins or nets.	
continued...		

	<p>If the -to option is unused or if the -to filter is an "*" character, all the output pins and registers on timing netlist become valid destination points.</p> <p>When you use the -min option, slack is calculated by looking at the minimum delay on the edge. If you use the -max option, slack is calculated with the maximum edge delay.</p> <p>Use -get_value_from_clock_period to set the net delay requirement to be equal to the launching or latching clock period, or whichever of the two has a smaller or larger period. If -value_multiplier is used, the requirement will be multiplied by that value. If the set of nets is clocked by more than one clock, the Timing Analyzer will use the one with the smallest period to compute the constraint for a -max constraint, and the largest period for a -min constraint. If there are no clocks clocking the endpoints of the net (e.g. if the endpoints of the nets are not registers or constrained ports), then the net delay constraint will be ignored.</p>		
<b>Example Usage</b>	<pre>project_open my_project create_timing_netlist read_sdc update_timing_netlist  # add min delay constraint set_net_delay -min 0.160 -from [get_pins inst9 combout] -to [get_pins * dataf]  # add max delay constraint set_net_delay -max 0.500 -from [get_pins inst8 combout]  # this is same as the previous call set_net_delay -max 0.500 -from inst8 combout -to *  # Require net delay to be at most 90% of the period of the clock driving the inst9 register set_net_delay -max -get_value_from_clock_period dst_clock_period -value_multiplier 0.9 -from [get_pins inst8 combout] -to [get_pins inst9 q]  update_timing_netlist  report_net_delay -panel "Net Delay"</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.7.16. dni::set\_operating\_conditions (::quartus::dni\_sdc)

The following table displays information for the dni::set\_operating\_conditions Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dni_sdc on page 148	
<b>Syntax</b>	<pre>dni::set_operating_conditions [-h   -help] [-long_help] [-analysis_type &lt;bc_wc on_chip_variation single&gt;] [-condition &lt;condition&gt;] [-force_dat] [-grade &lt;c l  m e a&gt;] [-library &lt;lib&gt;] [-max &lt;max_condition&gt;] [-max_library &lt;max_lib&gt;] [- max_phys &lt;max_proc&gt;] [-min &lt;min_condition&gt;] [-min_library &lt;min_lib&gt;] [-min_phys &lt;min_proc&gt;] [-model &lt;fast slow&gt;] [-object_list &lt;object_list&gt;] [-speed &lt;speed&gt;] [- temperature &lt;value_in_C&gt;] [-voltage &lt;value_in_mV&gt;] [ &lt;list_of_operating_conditions&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-analysis_type <bc_wc on_chip_variation single>	Specifies how to use the operating conditions
	-condition <condition>	Specifies conditions that define environmental characteristics to use during maximum and minimum delay analysis
	-force_dat	Option to force delay annotation (only done when selecting an unanalyzed corner)
continued...		

	<table> <tr> <td>-grade &lt; c i m e a&gt;</td><td>Option to specify temperature grade</td></tr> <tr> <td>-library &lt;lib&gt;</td><td>Specifies the library containing definitions of the operating conditions for both maximum and minimum delay analysis</td></tr> <tr> <td>-max &lt;max_condition&gt;</td><td>Specifies the operating condition to use for maximum delay analysis</td></tr> <tr> <td>-max_library &lt;max_lib&gt;</td><td>Specifies the library containing definitions of the operating conditions for maximum delay analysis</td></tr> <tr> <td>-max_phys &lt;max_proc&gt;</td><td>Specifies the name of the process resource to search for the resistance and capacitance values for maximum delay analysis</td></tr> <tr> <td>-min &lt;min_condition&gt;</td><td>Specifies the operating condition to use for minimum delay analysis</td></tr> <tr> <td>-min_library &lt;min_lib&gt;</td><td>Specifies the library containing definitions of the operating conditions for minimum delay analysis</td></tr> <tr> <td>-min_phys &lt;min_proc&gt;</td><td>Specifies the name of the process resource to search for the resistance and capacitance values for minimum delay analysis</td></tr> <tr> <td>-model &lt;fast slow&gt;</td><td>Option to specify timing model</td></tr> <tr> <td>-object_list &lt;object_list&gt;</td><td>Specifies the cells or ports on which to set operating conditions</td></tr> <tr> <td>-speed &lt;speed&gt;</td><td>Speed grade</td></tr> <tr> <td>-temperature &lt;value_in_C&gt;</td><td>Operating temperature</td></tr> <tr> <td>-voltage &lt;value_in_mV&gt;</td><td>Operating voltage</td></tr> <tr> <td>&lt;list_of_operating_conditions&gt;</td><td>list or collection of Operating conditions Tcl objects or names</td></tr> </table>	-grade < c i m e a>	Option to specify temperature grade	-library <lib>	Specifies the library containing definitions of the operating conditions for both maximum and minimum delay analysis	-max <max_condition>	Specifies the operating condition to use for maximum delay analysis	-max_library <max_lib>	Specifies the library containing definitions of the operating conditions for maximum delay analysis	-max_phys <max_proc>	Specifies the name of the process resource to search for the resistance and capacitance values for maximum delay analysis	-min <min_condition>	Specifies the operating condition to use for minimum delay analysis	-min_library <min_lib>	Specifies the library containing definitions of the operating conditions for minimum delay analysis	-min_phys <min_proc>	Specifies the name of the process resource to search for the resistance and capacitance values for minimum delay analysis	-model <fast slow>	Option to specify timing model	-object_list <object_list>	Specifies the cells or ports on which to set operating conditions	-speed <speed>	Speed grade	-temperature <value_in_C>	Operating temperature	-voltage <value_in_mV>	Operating voltage	<list_of_operating_conditions>	list or collection of Operating conditions Tcl objects or names
-grade < c i m e a>	Option to specify temperature grade																												
-library <lib>	Specifies the library containing definitions of the operating conditions for both maximum and minimum delay analysis																												
-max <max_condition>	Specifies the operating condition to use for maximum delay analysis																												
-max_library <max_lib>	Specifies the library containing definitions of the operating conditions for maximum delay analysis																												
-max_phys <max_proc>	Specifies the name of the process resource to search for the resistance and capacitance values for maximum delay analysis																												
-min <min_condition>	Specifies the operating condition to use for minimum delay analysis																												
-min_library <min_lib>	Specifies the library containing definitions of the operating conditions for minimum delay analysis																												
-min_phys <min_proc>	Specifies the name of the process resource to search for the resistance and capacitance values for minimum delay analysis																												
-model <fast slow>	Option to specify timing model																												
-object_list <object_list>	Specifies the cells or ports on which to set operating conditions																												
-speed <speed>	Speed grade																												
-temperature <value_in_C>	Operating temperature																												
-voltage <value_in_mV>	Operating voltage																												
<list_of_operating_conditions>	list or collection of Operating conditions Tcl objects or names																												
<b>Description</b>	<p>This command is not supported by SDC on RTL yet.</p> <p>Use this command to specify operating conditions different from the initial conditions used to create the timing netlist. When a timing model is not specified, the slow model is used.</p> <p>Voltage and temperature options must be used together. These two options are not available for all devices. The <code>get_available_operating_conditions</code> command returns the list of available operating conditions for your device.</p> <p>Use the <code>-speed</code> option to analyze the design at a different speed grade of the selected device.</p> <p>Use the <code>-grade</code> option to analyze the design at a different temperature grade. This option is provided to support what-if analysis and is not recommended for final sign-off analysis.</p> <p>By default, delay annotation is skipped if previously performed. Use <code>-force_dat</code> to rerun delay annotation.</p> <p>Note <code>-analysis_type</code>, <code>-min</code>, <code>-max</code>, <code>-min_library</code>, <code>-max_library</code>, <code>-min_phys</code>, <code>-max_phys</code>, <code>-library</code>, <code>-object_list</code> and condition options are not supported yet,</p>																												
<b>Example Usage</b>	<pre>#do report timing for different operating conditions one by one foreach_in_collection op [get_available_operating_conditions] {     set_operating_conditions \$op     update_timing_netlist     report_timing }  #set aggregated report timing for all operating conditions when corner aggregation is enabled set_operating_conditions [get_available_operating_conditions] report_timing  #manually set operating conditions</pre>																												

*continued...*

	<pre>set_operating_conditions -model fast -temperature 85 -voltage 1200 update_timing_netlist  #change device speed grade and set operating conditions set_operating_conditions -speed 3 -model slow -temperature 0 -voltage 1100 update_timing_netlist</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.7.17. dni::set\_output\_delay (::quartus::dni\_sdc)

The following table displays information for the `dni::set_output_delay` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::dni_sdc</code> on page 148	
<b>Syntax</b>	<code>dni::set_output_delay [-h   -help] [-long_help] [-add_delay] -clock &lt;name&gt; [-clock_fall] [-fall] [-max] [-min] [-network_latency_included] [-reference_pin &lt;name&gt;] [-rise] [-source_latency_included] &lt;delay&gt; &lt;targets&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-add_delay</code>	Create additional delay constraint instead of overriding previous constraints
	<code>-clock &lt;name&gt;</code>	Clock name
	<code>-clock_fall</code>	Specifies output delay relative to the falling edge of the clock
	<code>-fall</code>	Specifies the falling output delay at the port
	<code>-max</code>	Applies value as maximum data required time
	<code>-min</code>	Applies value as minimum data required time
	<code>-network_latency_included</code>	Specifies that input delay includes added network latency
	<code>-reference_pin &lt;name&gt;</code>	Specifies a pin or port in the design to which the output delay is relative
	<code>-rise</code>	Specifies the rising output delay at the port
	<code>-source_latency_included</code>	Specifies input delay already includes added source latency
	<code>&lt;delay&gt;</code>	Time value
	<code>&lt;targets&gt;</code>	Collection or list of output ports
<b>Description</b>	<p>Specifies the data required times at the specified output ports relative the clock specified by the <code>-clock</code> option. The clock must refer to a clock name in the design.</p> <p>Output delays can be specified relative to the rising edge (default) or falling edge (<code>-clock_fall</code>) of the clock.</p> <p>Output delays can be specified relative to a pin or a port (<code>-reference_pin</code>) in the clock network. Clock arrival times to the reference pin or port are added to the data required time.</p> <p>Output delays can include clock source latency. By default the clock source latency of the related clock is added to the output delay value, but when the <code>-source_latency_included</code> option is specified, the clock source latency is not added because it was factored into the output delay value.</p> <p>The maximum output delay (<code>-max</code>) is used for clock setup checks or</p>	

continued...

	<p>recovery checks and the minimum output delay (-min) is used for clock hold checks or removal checks. If only one of -min and -max (or neither) is specified for a given port, the same value is used for both.</p> <p>Separate rising (-rise) and falling (-fall) required times at the port can be specified. If only one of -rise and -fall are specified for a given port, the same value is used for both.</p> <p>By default, set_output_delay removes any other output delays to the port except for those with the same -clock, -clock_fall, and -reference_pin combination. Multiple output delays relative to different clocks, clock edges, or reference pins can be specified using the -add_delay option. Future output delays relative to different clocks, clock edges, or reference pins that do not specify the -add_delay option will still remove previous output delays that specified the -add_delay option.</p> <p>Note that -network_latency_included is not supported yet.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type.</p>		
<b>Example Usage</b>	<pre># Simple output delay with the same value for min/max and rise/fall: # 1) set on ports with names of the form myout* set_output_delay -clock clk 0.5 [get_ports myout*] # 2) set on all output ports set_output_delay -clock clk 0.5 [all_outputs]  # Output delay with respect to the falling edge of clock set_output_delay -clock clk -clock_fall 0.5 [get_ports myout*]  # Output delays for different min/max and rise/fall combinations set_output_delay -clock clk -max -rise 0.5 [get_ports myout*] set_output_delay -clock clk -max -fall 0.4 [get_ports myout*] set_output_delay -clock clk -min -rise 0.4 [get_ports myout*] set_output_delay -clock clk -min -fall 0.3 [get_ports myout*]  # Adding multiple output delays with respect to more than one clock set_output_delay -clock clkA -min 0.2 [get_ports myout*] set_output_delay -clock clkA -max 0.8 [get_ports myout*] set_output_delay -clock clkA -clock_fall 0.6 [get_ports myout*] -add_delay set_output_delay -clock clkB -min 1.1 [get_ports myout*] -add_delay set_output_delay -clock clkB -max 1.5 [get_ports myout*] -add_delay  # This is a common mistake where output delays are accidentally removed set_output_delay -clock clkA -min 0.2 [get_ports myout*] set_output_delay -clock clkB -min 1.1 [get_ports myout*] -add_delay # The following removes the clkB entry. You need to always use -add_delay # when more than one clock, clock_fall or reference_pin exists set_output_delay -clock clkA -max 0.8 [get_ports myout*] # The following removes the clkA entry. You need to always use -add_delay # when more than one clock, clock_fall or reference_pin exists set_output_delay -clock clkB -max 1.5 [get_ports myout*]  # Specifying an output delay relative to an external clock output port set_output_delay -clock clk -reference_pin [get_ports clkout] 0.8 [get_ports myout*]  # Specifying an output delay relative to the clock pin of a register set_output_delay -clock clk -reference_pin [get_pins regA clk] 0.8 [get_ports myout*]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.7.18. dni::set\_sense (::quartus::dni\_sdc)

The following table displays information for the dni::set\_sense Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dni_sdc on page 148	
<b>Syntax</b>	dni::set_sense [-h   -help] [-long_help] [-clocks <clock_list>] [-negative] [-positive] [-pulse <pulse_type>] [-stop_propagation] [-type <type>] <targets>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<i>continued...</i>		

	-clocks <clock_list>	Clock objects to which the assignment applies	
	-negative	Apply negative unate sense	
	-positive	Apply positive unate sense	
	-pulse <pulse_type>	Specifies the type of pulse clock applied to all pins in the target variable with respect to clock source	
	-stop_propagation	Stops the propagation of specified clocks from the specified pins or cell timing arcs	
	-type <type>	Specifies whether the type of sense being applied refers to clock networks or data networks	
	<targets>	List or collection of targets	
Description	<p>This command is not supported by SDC on RTL yet.</p> <p>Restrict unateness at a pin on a clock path, with respect to the clock source.</p> <p>If the -clocks option is used, the assignment will only apply to analysis of the specified clock domains. Otherwise, it applies to all clocks passing through the given pins.</p> <p>If the specified sense does not exist at the given pin, the assignment is ignored.</p> <p>Note -type, -pulse and -stop_propagation options are not supported.</p>		
Example Usage	<pre>set_sense -positive Mux combout set_sense -negative -clocks [get_clocks clk] XOR combout</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.7.19. dni::set\_timing\_derate (::quartus::dni\_sdc)

The following table displays information for the dni::set\_timing\_derate Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::dni_sdc on page 148	
<b>Syntax</b>	dni::set_timing_derate [-h   -help] [-long_help] [-cell_check] [-cell_delay] [-clock] [-data] [-early] [-fall] [-late] [-max] [-min] [-net_delay] [-operating_conditions <operating_conditions> ] [-pocvm_coefficient_scale_factor] [-pocvm_guardband] [-rise] <derate_value> [ <cells> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-cell_check	Applies the derating value to the setup and hold time requirements of cells
	-cell_delay	Specifies that derating factors are only to apply to cell delays
	-clock	Applies the derating value only to elements in the clock network
	-data	Applies the derating value only to elements in the data network
	-early	Specifies the minimum derating factor. This factor specifies how early the signal can arrive
continued...		

	-fall	Applies the derating value only to the delays of paths that have a falling transition at the specified objects	
	-late	Specifies the maximum derating factor. This factor specifies how late the signal can arrive	
	-max	Applies the derating value only to the maximum operating condition	
	-min	Applies the derating value only to the minimum operating condition	
	-net_delay	Specifies that derating factors are only to apply to net delays	
	-operating_conditions <operating_conditions>	Operating conditions Tcl object	
	-pocvm_coefficient_scale_factor	This option applies only to the parametric on-chip variation (POCV) context	
	-pocvm_guardband	This option applies only to the parametric on-chip variation (POCV) context	
	-rise	Applies the derating value only to the delays of paths that have a rising transition at the specified objects	
	<derate_value>	Timing derate value	
	<cells>	List of cell type objects	
Description	<p>This command is not supported by SDC on RTL yet.</p> <p>Sets the global derate factors for the current design. The maximum and minimum delays of all timing arcs in the design are multiplied by the factors specified with the -late and -early options respectively. Only positive derate factors are allowed. If neither the -cell_delay nor -net_delay option is used, the derating factors apply to both cell and net delays. For net delay derates, the derate factor is applied to nets driven by matching cells.</p> <p>Specifying a derate value of less than 1.0 for the -late option or a derate value of greater than 1.0 for the -early option reduces delay pessimism, which might lead to optimistic results from timing analysis.</p> <p>The effect of set_timing_derate command is deferred until the next time update_timing_netlist is called. To reset derate factors to original values, use the reset_timing_derate command.</p> <p>This assignment is for timing analysis only, and is not considered during timing-driven compilation.</p> <p>Note -min, -max, -data, -clock, -rise, -fall, -cell_check, -pocvm_guardband and -pocvm_coefficient_scale_factor options are not supported yet.</p>		
Example Usage	set_timing_derate -early 0.9 [get_cells *] set_timing_derate -late 1.1 [get_cells *]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.8. ::quartus::drc

The following table displays information for the **::quartus::drc** Tcl package:

<b>Tcl Package and Version</b>	::quartus::drc 1.0
<b>Description</b>	This package contains no general description.
<b>Availability</b>	<p>This package is available for loading in the following executables:</p> <pre> qacv qpro quartus quartus_cdb quartus_fit quartus_sta quartus_syn quartus_tlg           </pre>
<b>Tcl Commands</b>	<pre> drc::add_check_op (::quartus::drc) on page 177 drc::add_check_parameter (::quartus::drc) on page 178 drc::add_object (::quartus::drc) on page 179 drc::add_object_with_properties (::quartus::drc) on page 179 drc::add_property (::quartus::drc) on page 180 drc::add_rule (::quartus::drc) on page 181 drc::add_rule_violation (::quartus::drc) on page 182 drc::add_violation_record (::quartus::drc) on page 182 drc::add_waiver (::quartus::drc) on page 183 drc::check_design (::quartus::drc) on page 183 drc::delete_waivers (::quartus::drc) on page 184 drc::get_objects (::quartus::drc) on page 184 drc::get_option (::quartus::drc) on page 185 drc::get_property (::quartus::drc) on page 185 drc::get_stage_info (::quartus::drc) on page 186 drc::get_waivers (::quartus::drc) on page 187 drc::list_properties (::quartus::drc) on page 187 drc::report_waivers (::quartus::drc) on page 188 drc::set_option (::quartus::drc) on page 188 drc::set_property (::quartus::drc) on page 189 drc::should_run_drc (::quartus::drc) on page 189 drc::update_check_op (::quartus::drc) on page 190 drc::update_rule (::quartus::drc) on page 190           </pre>

#### 3.1.8.1. drc::add\_check\_op (::quartus::drc)

The following table displays information for the **drc::add\_check\_op** Tcl command:

<b>Tcl Package and Version</b>	Belongs to <b>::quartus::drc</b> on page 177	
<b>Syntax</b>	<pre> drc::add_check_op [-h   -help] [-long_help] -bind_to_tcl_execute &lt;per_rule  per_operation&gt; [-device_families &lt;device_families&gt; ] -exec_proc_name &lt;exec_proc_name&gt; [-executables &lt;executables&gt; ] [-finalize_proc_name &lt;finalize_proc_name&gt; ] -name &lt;name&gt; [-setup_proc_name &lt;setup_proc_name&gt; ] [-stages &lt;stages&gt; ] [-tcl_proc_source &lt;tcl_proc_source&gt; ]           </pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-bind_to_tcl_execute <per_rule  per_operation>	Check operation to rule binding mode
	-device_families <device_families>	Device family, check operation is valid for
	-exec_proc_name <exec_proc_name>	Check Operation execution proc name
	-executables <executables>	Allowed executables, check operation could be invoked from
<b>continued...</b>		

	-finalize_proc_name <finalize_proc_name>	Check Operation cleanup proc name
	-name <name>	Check Operation name
	-setup_proc_name <setup_proc_name>	Check Operation intialization proc name
	-stages <stages>	Allowed stages, check operation could be invoked from
	-tcl_proc_source <tcl_proc_source>	Check operation proc source file name
<b>Description</b>	Add Check Operation .	
<b>Example Usage</b>	<pre>add_check_op -name {TEST} -bind_to_tcl_execute {per_operation} -exec_proc_name {TEST_EXEC_PROC}</pre>	
<b>Return Value</b>	<b>Code Name</b>	<b>String Return</b>
	TCL_OK	INFO: Operation successful

### 3.1.8.2. drc::add\_check\_parameter (::quartus::drc)

The following table displays information for the drc::add\_check\_parameter Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::drc</a> on page 177		
<b>Syntax</b>	<code>drc::add_check_parameter [-h   -help] [-long_help] -check_op &lt;check_op&gt; [-is_user &lt;is_user&gt; ] [-param_description &lt;param_description&gt; ] -param_name &lt;param_name&gt; [-param_range &lt;param_range&gt; ] -param_value &lt;param_value&gt; -value_type &lt;integer double string string_list bool&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-check_op &lt;check_op&gt;</code>	Check Operation name	
	<code>-is_user &lt;is_user&gt;</code>	Is parameter user visible	
	<code>-param_description &lt;param_description&gt;</code>	Parameter description	
	<code>-param_name &lt;param_name&gt;</code>	Parameter name	
	<code>-param_range &lt;param_range&gt;</code>	Legal range for parameter	
	<code>-param_value &lt;param_value&gt;</code>	Default value for parameter	
	<code>-value_type &lt;integer double string string_list bool  string_list bool&gt;</code>	Parameter value type integer double string string_list bool	
<b>Description</b>	Add Check Operation .		
<b>Example Usage</b>	<code>add_check_parameter -check_op {TEST} -param_name {TEST_PARAM} -value_type {string} -param_value {TEST_VALUE}</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.8.3. drc::add\_object (::quartus::drc)

The following table displays information for the `drc::add_object` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::drc</a> on page 177		
<b>Syntax</b>	<code>drc::add_object [-h   -help] [-long_help] [-bind_to_tcl_execute &lt;bind_to_tcl_execute&gt; ] [-category &lt;category&gt; ] [-name &lt;name&gt; ] [-number &lt;number&gt; ] [-parent &lt;parent&gt; ] -type &lt;type&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-bind_to_tcl_execute &lt;bind_to_tcl_execute&gt;</code>	Specifies the Tcl execution mode of the new check_operation DRC object (none / per_rule / per_operation).	
	<code>-category &lt;category&gt;</code>	The category of the new DRC object.	
	<code>-name &lt;name&gt;</code>	The name of the new check_operation/rule_set DRC object.	
	<code>-number &lt;number&gt;</code>	The numeric part of the new DRC object's name.	
	<code>-parent &lt;parent&gt;</code>	The parent object of the new violation_record DRC object.	
	<code>-type &lt;type&gt;</code>	The type of the new DRC object.	
<b>Description</b>	Adds a new DRC object.		
<b>Example Usage</b>	<code>drc::add_object -type rule -category CLK -number 1</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to add DRC object.
	TCL_ERROR	1	ERROR: Invalid object type '<string>'.
	TCL_ERROR	1	ERROR: Category is needed for finding RULE or VIOLATION.
	TCL_ERROR	1	ERROR: Object name is needed.
	TCL_ERROR	1	ERROR: Object number is needed.
	TCL_ERROR	1	ERROR: Parent object is needed for violation record.

### 3.1.8.4. drc::add\_object\_with\_properties (::quartus::drc)

The following table displays information for the `drc::add_object_with_properties` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::drc</code> on page 177		
<b>Syntax</b>	<code>drc::add_object_with_properties [-h   -help] [-long_help] [-bind_to_tcl_execute &lt;bind_to_tcl_execute&gt; ] [-category &lt;category&gt; ] [-name &lt;name&gt; ] [-number &lt;number&gt; ] [-parent &lt;parent&gt; ] -properties &lt;properties&gt; -type &lt;type&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<i>continued...</i>			

	-bind_to_tcl_execute <bind_to_tcl_execute>	Specifies the Tcl execution mode of the new check_operation DRC object (none / per_rule / per_operation).	
	-category <category>	The category of the new DRC object.	
	-name <name>	The name of the new check_operation/rule_set DRC object.	
	-number <number>	The numeric part of the new DRC object's name.	
	-parent <parent>	The parent object of the new violation_record DRC object.	
	-properties <properties>	The property list of the new violation_record DRC object.	
	-type <type>	The type of the new DRC object.	
Description	Adds a new DRC object with properties.		
Example Usage	<pre>drc::add_object_with_properties -type violation_record -name &lt;violation&gt; -parent &lt;result_record_id&gt; -properties [list [list "fields" [list "HighFanout_DRV1", "1530"]], [list "fields:1:location_schema" "mod_A mod_A_1 out"]] drc::add_object_with_properties -type violation_record -name &lt;violation&gt; -parent &lt;result_record_id&gt; -properties [{"fields" {"HighFanout_DRV1", "1530"}} {"fields:1:location_schema" "mod_A mod_A_1 out"}]</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to add DRC object.
	TCL_ERROR	1	ERROR: Invalid object type '<string>'.
	TCL_ERROR	1	ERROR: Property list should consist of name-value pairs.
	TCL_ERROR	1	ERROR: Category is needed for finding RULE or VIOLATION.
	TCL_ERROR	1	ERROR: Object name is needed.
	TCL_ERROR	1	ERROR: Object number is needed.
	TCL_ERROR	1	ERROR: Parent object is needed for violation record.

### 3.1.8.5. drc::add\_property (::quartus::drc)

The following table displays information for the drc::add\_property Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::drc</a> on page 177	
<b>Syntax</b>	drc::add_property [-h   -help] [-long_help] -name <i>&lt;name&gt;</i> -object <i>&lt;object&gt;</i> -value <i>&lt;value&gt;</i> [-value_type <i>&lt;value_type&gt;</i> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-name <i>&lt;name&gt;</i>	property name.
	-object <i>&lt;object&gt;</i>	The DRC object to which the new property belongs.
	-value <i>&lt;value&gt;</i>	property value.
	-value_type <i>&lt;value_type&gt;</i>	property value type.
<b>Description</b>	Add a property (a name/value pair) to a generic DRC object	
continued...		

<b>Example Usage</b>	<code>drc::add_property -object &lt;DRC object&gt; -name &lt;property name&gt; -value &lt;property value&gt; -value_type &lt;value type&gt;</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to add object property.
	TCL_ERROR	1	ERROR: Invalid DRC object '%s'.
	TCL_ERROR	1	ERROR: Invalid property value.
	TCL_ERROR	1	ERROR: Invalid property value type.
	TCL_ERROR	1	ERROR: Property '<string>' already exists. Cannot be added.

### 3.1.8.6. drc::add\_rule (::quartus::drc)

The following table displays information for the `drc::add_rule` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::drc</a> on page 177		
<b>Syntax</b>	<code>drc::add_rule [-h   -help] [-long_help] -category &lt;category&gt; -check_operation &lt;check_operation&gt; [-description &lt;description&gt; ] -id &lt;id&gt; [-is_default &lt;is_default&gt; ] [-recommendation &lt;recommendation&gt; ] -severity &lt;severity&gt; [-short_description &lt;short_description&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-category &lt;category&gt;</code>	Rule category	
	<code>-check_operation &lt;check_operation&gt;</code>	Check operation associated	
	<code>-description &lt;description&gt;</code>	Detailed description	
	<code>-id &lt;id&gt;</code>	Rule ID	
	<code>-is_default &lt;is_default&gt;</code>	Is Default Rule	
	<code>-recommendation &lt;recommendation&gt;</code>	Detailed recommendation	
	<code>-severity &lt;severity&gt;</code>	Rule Severity	
	<code>-short_description &lt;short_description&gt;</code>	Rule title	
<b>Description</b>	Add Check Operation .		
<b>Example Usage</b>	<code>add_rule -category {TEST} -id {TEST_ID} -check_operation {TEST_CHECK_OP} -severity {TEST_SEVERITY}</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.8.7. drc::add\_rule\_violation (::quartus::drc)

The following table displays information for the `drc::add_rule_violation` Tcl command:

Tcl Package and Version	Belongs to ::quartus::drc on page 177		
Syntax	drc::add_rule_violation [-h   -help] [-long_help] [-argument_spec <argument_spec> ] [-category <category> ] [-format_msg <format_msg> ] [-id <id> ] [-num_args <num_args> ] [-object <rule_object> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-argument_spec <argument_spec>	Argument specifications {{type name description [sort_method] [order]}}...	
	-category <category>	Rule category for violation	
	-format_msg <format_msg>	Violation message format	
	-id <id>	Rule ID for violation	
	-num_args <num_args>	Number of arguments	
	-object <rule_object>	Rule object for violation	
Description	Add Rule Violation.		
Example Usage	add_rule_violation		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.8.8. drc::add\_violation\_record (::quartus::drc)

The following table displays information for the `drc::add_violation_record` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::drc</a> on page 177		
Syntax	drc::add_violation_record [-h   -help] [-long_help] -parent <i>&lt;parent&gt;</i>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-parent <i>&lt;parent&gt;</i>	Parent result record for violation	
Description	Add Violation Record.		
Example Usage	add_violation_record -parent {PARENT_RESULT_RECORD_ID}		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.8.9. drc::add\_waiver (::quartus::drc)

The following table displays information for the `drc::add_waiver` Tcl command:

Tcl Package and Version	Belongs to ::quartus::drc on page 177		
Syntax	drc::add_waiver [-h   -help] [-long_help] -description <description> [-no_warn] -owner <owner> -query_string <query_string> -rule_id <rule_id> [-stages <stages> ] [-tag <tag> ] [-timestamp <timestamp> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-description <description>	Waiver description, explaining the rationale of the waiver, as to why violations waived by this waiver are irrelevant or should be ignored.	
	-no_warn	Display no warning for adding waiver which will be applied to the next DA run.	
	-owner <owner>	User ID of creator. Meant for waiver audit trail.	
	-query_string <query_string>	Query string uses one ore more violation column arguments to define patterns of violations that should be ignored.	
	-rule_id <rule_id>	Alpha-numeric rule ID pattern to define the scope of this waiver.	
	-stages <stages>	one or more stage(s) where rules are defined, for which the waiver can be applied to.	
	-tag <tag>	User-specified tags for tracking different types of violations across the whole project.	
	-timestamp <timestamp>	The input timestamp when to add the waiver.	
Description	Creates a waiver for a given rule pattern with a specific query string.		
Example Usage	::drc::add_waiver -description {a waiver} -rule_id {TMC-20004} -query_string {Slack < -5.14 && "Start Point" =~ 'dir'} -stages [list analysis_planned_quartus_sta Plan] -tag {test} -owner {owner}		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.8.10. drc::check\_design (::quartus::drc)

The following table displays information for the `drc::check_design` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::drc</code> on page 177		
<b>Syntax</b>	<code>drc::check_design [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Run the specified rule set on a snapshot for the open project.		
continued...			

<b>Example Usage</b>	drc::check_design [-rule_set my_ruleset (if missing, the rule set is default)] [-executable quartus_sta (if missing, the default is the current process name)] [-rpt_file <DA DRC ASCII report file path>]		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to complete checks.

### 3.1.8.11. drc::delete\_waivers (::quartus::drc)

The following table displays information for the drc::delete\_waivers Tcl command:

Tcl Package and Version	Belongs to ::quartus::drc on page 177		
Syntax	drc::delete_waivers [-h   -help] [-long_help] [-all] [-owner <owner> ] [-query_string <query_string> ] [-rule_id <rule_id> ] [-stages <stages> ] [-tag <tag> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-all	The flag needed explicitly for deleting all the waivers without other arguments	
	-owner <owner>	User ID of creator. Meant for waiver audit trail.	
	-query_string <query_string>	Query string uses one ore more violation column arguments to define patterns of violations that should be ignored.	
	-rule_id <rule_id>	Alpha-numeric rule ID pattern to define the scope of this waiver.	
	-stages <stages>	one or more stage(s) where rules are defined, for which the waiver can be applied to.	
	-tag <tag>	User-specified tags for tracking different types of violations across the whole project.	
Description	Delete waivers based on the input arguments		
Example Usage	# This delete all the waivers. ::drc::delete_waivers		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.8.12. drc::get\_objects (::quartus::drc)

The following table displays information for the drc::get\_objects Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::drc</code> on page 177	
<b>Syntax</b>	<code>drc::get_objects [-h   -help] [-long_help] [-category &lt;category&gt; ] [-name &lt;name&gt; ] [-number &lt;number&gt; ] [-parent &lt;parent&gt; ] -type &lt;type&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
<i>continued...</i>		

	-category < <i>category</i> >	The category of the rule/violation DRC objects to be retrieved.	
	-name < <i>name</i> >	The literal name of the check_operation/rule_set DRC objects to be retrieved.	
	-number < <i>number</i> >	The numerical part of the name of the rule/violation DRC objects to be retrieved.	
	-parent < <i>parent</i> >	The parent object of the violation_record DRC object to be retrieved.	
	-type < <i>type</i> >	The type of DRC objects to be retrieved.	
Description	Get a list of specific existing DRC objects		
	Example Usage		
Return Value	drc::get_objects -type rule		
	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to get DRC objects.
	TCL_ERROR	1	ERROR: Parent object is needed for violation record.

### 3.1.8.13. drc::get\_option (::quartus::drc)

The following table displays information for the drc::get\_option Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::drc</a> on page 177		
<b>Syntax</b>	drc::get_option [-h   -help] [-long_help] -name <i>&lt;name&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name&gt;</i>	option name.	
<b>Description</b>	Get option for the DRC system		
<b>Example Usage</b>	drc::get_option -name <option name>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: DRC option ' <i>&lt;string&gt;</i> ' is invalid.

### 3.1.8.14. drc::get\_property (::quartus::drc)

The following table displays information for the drc::get\_property Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::drc</code> on page 177		
<b>Syntax</b>	<code>drc::get_property [-h   -help] [-long_help] -name &lt;name&gt; -object &lt;object&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<i>continued...</i>			

	-name < <i>name</i> >		property name.
	-object < <i>object</i> >		The DRC object to which the property belongs.
Description	Get the value of a generic DRC object's property.		
Example Usage	drc::get_property -object <DRC object> -name <property name>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid DRC object '%s'.
	TCL_ERROR	1	ERROR: Property '< <i>string</i> >' is invalid.

### 3.1.8.15. drc::get\_stage\_info (::quartus::drc)

The following table displays information for the drc::get\_stage\_info Tcl command:

Tcl Package and Version	Belongs to ::quartus::drc on page 177		
Syntax	drc::get_stage_info [-h   -help] [-long_help] [-executable <executable> ] [-rule_set <rule_set> ] [-snapshot <snapshot> ] [-stage <stage> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-executable <executable>	The executable name to find stages.	
	-rule_set <rule_set>	The rule set name to find stages.	
	-snapshot <snapshot>	The snapshot name to find stages.	
	-stage <stage>	The stage name to get executable, snapshot, and rule set.	
Description	The Utility to find stage info in terms of all available stages, and executables and snapshots associate with snapshots. No error info provided.		
Example Usage	# Get all the stage names ::drc::get_stage_info  # Get executable and snapshot for a stage ::drc::get_stage_info -stage \$stage_name  # Get stages with the input executable name ::drc::get_stage_info -executable \$executable_name  # Get stages with the input snapshot name ::drc::get_stage_info -snapshot \$snapshot_name  # Get stage with the input snapshot and executable name ::drc::get_stage_info -snapshot \$snapshot_name -executable \$executable_name		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.8.16. drc::get\_waivers (::quartus::drc)

The following table displays information for the `drc::get_waivers` Tcl command:

Tcl Package and Version	Belongs to ::quartus::drc on page 177		
Syntax	drc::get_waivers [-h   -help] [-long_help] [-owner <owner> ] [-query_string <query_string> ] [-rule_id <rule_id> ] [-stages <stages> ] [-tag <tag> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-owner <owner>	User ID of creator. Meant for waiver audit trail.	
	-query_string <query_string>	Query string uses one ore more violation column arguments to define patterns of violations that should be ignored.	
	-rule_id <rule_id>	Alpha-numeric rule ID pattern to define the scope of this waiver.	
	-stages <stages>	one or more stage(s) where rules are defined, for which the waiver can be applied to.	
	-tag <tag>	User-specified tags for tracking different types of violations across the whole project.	
Description	List all the waiver objects found in the memory filtered based on the input arguments.		
Example Usage	set waiver_objs [::drc::get_waivers]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.8.17. drc::list\_properties (::quartus::drc)

The following table displays information for the `drc::list_properties` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::drc</code> on page 177		
<b>Syntax</b>	<code>drc::list_properties [-h   -help] [-long_help] -object <i>&lt;object&gt;</i></code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-object <i>&lt;object&gt;</i></code>	The DRC object whose properties are returned as a list of property names.	
<b>Description</b>	Get the list of property names from a generic DRC object		
<b>Example Usage</b>	<code>drc::list_properties -object &lt;DRC object&gt;</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid DRC object '%s'.

### 3.1.8.18. drc::report\_waivers (::quartus::drc)

The following table displays information for the `drc::report_waivers` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::drc</a> on page 177		
<b>Syntax</b>	<code>drc::report_waivers [-h   -help] [-long_help] -file &lt;file&gt; [-force] [-owner &lt;owner&gt; ] [-query_string &lt;query_string&gt; ] [-rule_id &lt;rule_id&gt; ] [-stages &lt;stages&gt; ] [-tag &lt;tag&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-file &lt;file&gt;</code>	The file where to store all the waivers found in the memory	
	<code>-force</code>	the flag which can force to update DESIGN_ASSISTANT_WAIVER_FILE	
	<code>-owner &lt;owner&gt;</code>	User ID of creator. Meant for waiver audit trail.	
	<code>-query_string &lt;query_string&gt;</code>	Query string uses one ore more violation column arguments to define patterns of violations that should be ignored.	
	<code>-rule_id &lt;rule_id&gt;</code>	Alpha-numeric rule ID pattern to define the scope of this waiver.	
	<code>-stages &lt;stages&gt;</code>	one or more stage(s) where rules are defined, for which the waiver can be applied to.	
	<code>-tag &lt;tag&gt;</code>	User-specified tags for tracking different types of violations across the whole project.	
<b>Description</b>	Output the definition of all the waivers in the memory to a file filtered based on the input arguments.		
<b>Example Usage</b>	<code>::drc::report_waivers -file waivers.dawf</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.8.19. drc::set\_option (::quartus::drc)

The following table displays information for the `drc::set_option` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::drc</code> on page 177		
<b>Syntax</b>	<code>drc::set_option [-h   -help] [-long_help] -name <i>&lt;name&gt;</i> -value <i>&lt;value&gt;</i></code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name <i>&lt;name&gt;</i></code>	option name.	
	<code>-value <i>&lt;value&gt;</i></code>	option value.	
<b>Description</b>	Set options for the DRC system		
continued...			

<b>Example Usage</b>	<code>drc::set_option -name &lt;option name&gt; -value &lt;option value&gt;</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: DRC option '<string>' is invalid.

### 3.1.8.20. drc::set\_property (::quartus::drc)

The following table displays information for the `drc::set_property` Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::drc</code> on page 177		
Syntax	<code>drc::set_property [-h   -help] [-long_help] -name &lt;name&gt; -object &lt;object&gt; -value &lt;value&gt;</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name &lt;name&gt;</code>	property name.	
	<code>-object &lt;object&gt;</code>	The DRC object to which the property belongs.	
	<code>-value &lt;value&gt;</code>	property value.	
Description	Update property in term of name/value pair to a generic DRC object		
Example Usage	<code>drc::set_property -object &lt;DRC object&gt; -name &lt;property name&gt; -value &lt;property value&gt;</code>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid DRC object '%s'.
	TCL_ERROR	1	ERROR: Property '<string>' is invalid.

### 3.1.8.21. drc::should\_run\_drc (::quartus::drc)

The following table displays information for the `drc::should_run_drc` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::drc</code> on page 177		
<b>Syntax</b>	<code>drc::should_run_drc [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<code>Determine if DRC should run.</code>		
<b>Example Usage</b>	<code>should_run_drc</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	<code>TCL_OK</code>	<code>0</code>	INFO: Operation successful

### 3.1.8.22. drc::update\_check\_op (::quartus::drc)

The following table displays information for the `drc::update_check_op` Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::drc on page 177		
<b>Syntax</b>	drc::update_check_op [-h   -help] [-long_help] [-device_families <device_families> ] [-executables <executables> ] -name <name> [-stages <stages> ] [-tcl_proc_source <tcl_proc_source> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-device_families <device_families>	Device family, check operation is valid for	
	-executables <executables>	Allowed executables, check operation could be invoked from	
	-name <name>	Check operation name	
	-stages <stages>	Allowed stages, check operation could be invoked from	
	-tcl_proc_source <tcl_proc_source>	Check operation proc source file name	
<b>Description</b>	Add Check Operation .		
<b>Example Usage</b>	update_check_op -name {TEST}		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.8.23. drc::update\_rule (::quartus::drc)

The following table displays information for the `drc::update_rule` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::drc</a> on page 177	
<b>Syntax</b>	<code>drc::update_rule [-h   -help] [-long_help] -category &lt;category&gt; [-description &lt;description&gt; ] [-exec_proc &lt;exec_proc&gt; ] [-finalize_proc &lt;finalize_proc&gt; ] -id &lt;id&gt; [-is_user &lt;is_user&gt; ] [-param_description &lt;param_description&gt; ] [-param_value &lt;param_value&gt; ] [-parameter &lt;parameter&gt; ] [-recommendation &lt;recommendation&gt; ] [-setup_proc &lt;setup_proc&gt; ] [-short_description &lt;short_description&gt; ]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-category &lt;category&gt;</code>	Rule category
	<code>-description &lt;description&gt;</code>	Rule description
	<code>-exec_proc &lt;exec_proc&gt;</code>	Execution proc for the rule
	<code>-finalize_proc &lt;finalize_proc&gt;</code>	Cleanup proc for the rule
	<code>-id &lt;id&gt;</code>	Rule ID
	<code>-is_user &lt;is_user&gt;</code>	Is rule parameter user visible
<b>continued...</b>		

	-param_description <param_description>	Parameter description
	-param_value <param_value>	Parameter default value
	-parameter <parameter>	Parameter for the rule
	-recommendation <recommendation>	Rule recommendation
	-setup_proc <setup_proc>	Initialization proc for the rule
	-short_description <short_description>	Rule title
<b>Description</b>	Update Check Operation.	
<b>Example Usage</b>	update_rule -category {TEST} -id {TEST_ID}	
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>
	TCL_OK	0
		<b>String Return</b>
		INFO: Operation successful

### 3.1.9. ::quartus::eco

The following table displays information for the **::quartus::eco** Tcl package:

<b>Tcl Package and Version</b>	::quartus::eco 1.0
<b>Description</b>	<p>This package contains commands to perform Engineering Change Orders on a Post-Fit netlist.</p> <p>ECO compilations are supported on Intel Stratix 10 and Intel Agilex device families.</p>
<b>Availability</b>	<p>This package is available for loading in the following executable:</p> <p>quartus_fit</p>
<b>Tcl Commands</b>	<p>adjust_pll_refclk (::quartus::eco) on page 192</p> <p>create_new_node (::quartus::eco) on page 192</p> <p>create_wirelut (::quartus::eco) on page 193</p> <p>eco::report_partitions (::quartus::eco) on page 206</p> <p>eco_reroute (::quartus::eco) on page 194</p> <p>eco_unload_design (::quartus::eco) on page 194</p> <p>fitter_report_timing (::quartus::eco) on page 195</p> <p>fitter_timing_summary (::quartus::eco) on page 196</p> <p>get_available_snapshots (::quartus::eco) on page 196</p> <p>get_eco_checkpoint (::quartus::eco) on page 197</p> <p>get_loaded_snapshot (::quartus::eco) on page 197</p> <p>get_lutmask_equation (::quartus::eco) on page 197</p> <p>get_node_location (::quartus::eco) on page 198</p> <p>make_connection (::quartus::eco) on page 198</p> <p>modify_io_current_strength (::quartus::eco) on page 200</p> <p>modify_io_delay_chain (::quartus::eco) on page 200</p> <p>modify_io_slew_rate (::quartus::eco) on page 201</p> <p>modify_lutmask (::quartus::eco) on page 201</p> <p>place_node (::quartus::eco) on page 202</p> <p>remove_connection (::quartus::eco) on page 203</p> <p>remove_node (::quartus::eco) on page 204</p> <p>report_connections (::quartus::eco) on page 204</p> <p>report_legal_locations (::quartus::eco) on page 205</p> <p>report_nodes_at_location (::quartus::eco) on page 206</p> <p>report_ports (::quartus::eco) on page 207</p> <p>report_routing (::quartus::eco) on page 207</p> <p>report_unplaced_nodes (::quartus::eco) on page 208</p> <p>restore_eco_checkpoint (::quartus::eco) on page 208</p> <p>unplace_node (::quartus::eco) on page 209</p> <p>update_mif_files (::quartus::eco) on page 209</p>

### 3.1.9.1. adjust\_pll\_refclk (::quartus::eco)

The following table displays information for the adjust\_pll\_refclk Tcl command:

Tcl Package and Version	Belongs to ::quartus::eco on page 191		
Syntax	adjust_pll_refclk [-h   -help] [-long_help] -refclk <refclk_freq> -to <iopll_name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-refclk <refclk_freq>	New refclk frequency value in MHz	
	-to <iopll_name>	Instance name of upstream IOPLL to be adjusted	
Description	<p>The adjust_pll_refclk command can change IOPLL frequencies by modifying the input reference clock frequency.</p> <p>Assumptions and Limitations:</p> <ul style="list-style-type: none"><li>- The original refclk/outclk ratios will be maintained</li><li>- None of the IOPLLs being reconfigured can generate IP clocks (the frequencies of the LVDS, PhyLite and EMIF clocks cannot change)</li><li>- Cascaded IOPLLs must be connected directly (no clock gates in between them)</li><li>- IOPLLs cannot be in 'nondedicated' compensation modes</li><li>- For all IOPLL outclks duty cycle = 50 and phase shift = 0</li></ul>		
Example Usage	<pre>load_package eco adjust_pll_refclk -to "*pll_main*" -refclk 100</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.2. create\_new\_node (::quartus::eco)

The following table displays information for the create\_new\_node Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::eco on page 191		
<b>Syntax</b>	create_new_node [-h   -help] [-long_help] -name <node_name> -type <lut ff>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <node_name>	Name of the new node	
	-type <lut ff>	Node type	
<b>Description</b>	<p>The create_new_node command will create a new node with the specified type and return its id. The node name is hierarchical based, and the ECO Fitter will try to infer the name hierarchy. For example, if a node a b c d needs to be created, users should make sure that hierarchy a b c exists in the netlist. If a b c lies under a partition, the new node will be created under that partition.</p> <p>To connect to the created node, use make_connection command to connect to the LUT's DATAA/B/C/D/E/F input ports, and use modify_lutmask command to change its LUT-mask. The new node needs to be placed with place_node command and then new connections will be routed right after.</p>		
<b>Example Usage</b>	<pre>create_new_node -name eco_new_lut -type lut make_connection -from src_a -to eco_new_lut -port DATAA make_connection -from src_b -to eco_new_lut -port DATAB</pre>		
continued...			

*continued...*

	<pre>make_connection -from eco_new_lut -to dst_reg -port D modify_lutmask -to eco_new_lut -eqn A&amp;B place_node -name eco_new_lut</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.3. create\_wirelut (::quartus::eco)

The following table displays information for the `create_wirelut` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::eco</code> on page 191	
<b>Syntax</b>	<pre>create_wirelut [-h   -help] [-long_help] [-from &lt;source_output_net_name&gt; ] [-from_node &lt;from_node&gt; ] [-from_port &lt;from_port&gt; ] [-location &lt;location&gt; ] -name &lt;node_name&gt; [-port &lt;dest_node_port&gt; ] [-to &lt;dest_node_name&gt; ] [-to_node &lt;to_node&gt; ] [-to_port &lt;to_port&gt; ]</pre>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-from &lt;source_output_net_name&gt;</code>	Source of the connection
	<code>-from_node &lt;from_node&gt;</code>	ID of the source node
	<code>-from_port &lt;from_port&gt;</code>	ID of the source port
	<code>-location &lt;location&gt;</code>	PLACE_REGION assignment type location
	<code>-name &lt;node_name&gt;</code>	Name of the new node
	<code>-port &lt;dest_node_port&gt;</code>	Input port name of the destination node
	<code>-to &lt;dest_node_name&gt;</code>	Name of the destination node
	<code>-to_node &lt;to_node&gt;</code>	ID of the destination node
	<code>-to_port &lt;to_port&gt;</code>	ID of the destination port
<b>Description</b>	<p>The <code>create_wirelut</code> command will create and insert a wire LUT node in the specified connection. The ECO Fitter will place the newly created LUT and route the modified connections automatically, if <code>-location</code> argument is specified. Otherwise, the new wire LUT should be placed with <code>place_node</code> command.</p> <p>The name for the new node is hierarchy based, and the ECO Fitter will try to infer the name hierarchy. For example, if a node <code>a b c d</code> needs to be created, users should make sure that hierarchy <code>a b c</code> exists in the netlist. If the source or destination node lies under a partition, the new wire LUT will be inserted under that partition.</p>	
<b>Example Usage</b>	<pre>create_wirelut -name my_wirelut -from src_output -to dest_node -port D -location "X136 Y63 X149 Y82"  create_wirelut -name my_wirelut -from src_output -to dest_node -port D place_node -name my_wirelut  set to_node_id [get_netlist_node_id -name my_node] set iports [get_netlist_ports -node \$to_node_id -type iport] set iport 0 foreach_in_collection i \$iports {     set iport \$i     break }</pre>	

*continued...*

	<pre> } create_wirelut -name my_wirelut -from ~GND -to_node \$to_node_id -to_port \$iport place_node -name my_wirelut </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.4. eco\_reroute (::quartus::eco)

The following table displays information for the eco\_reroute Tcl command:

Tcl Package and Version	Belongs to ::quartus::eco on page 191		
Syntax	eco_reroute [-h   -help] [-long_help] [-hold_slack <hold_slack> ] [-keep_best] -node <node> -port <port> [-setup_slack <setup_slack> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-hold_slack <hold_slack>	targeted hold slack (ns)	
	-keep_best	keep best attempted slack if target slack not met	
	-node <node>	node name	
	-port <port>	port name	
	-setup_slack <setup_slack>	targeted setup slack (ns)	
Description	The eco_reroute command reroutes the item with user specified slacks.		
Example Usage	eco_reroute -node <node_name> -port <port_name> eco_reroute -node <node_name> -port <port_name> -setup_slack <setup_slack> -hold_slack <hold_slack> -max_iteration <max_iteration> -keep_best eco_reroute -node ff -port D -hold_slack 0.3 -setup_slack -2 -max_iteration 10		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.5. eco\_unload\_design (::quartus::eco)

The following table displays information for the eco\_unload\_design Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::eco</code> on page 191		
<b>Syntax</b>	<code>eco_unload_design [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div>The <code>eco_unload_design</code> command unloads the current design. It also discards all changes that were made but not committed.</div>		
<b>Example Usage</b>	<code>eco_unload_design</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.6. fitter\_report\_timing (::quartus::eco)

The following table displays information for the `fitter_report_timing` Tcl command:

Tcl Package and Version	Belongs to ::quartus::eco on page 191		
Syntax	fitter_report_timing [-h   -help] [-long_help] [-detail <summary path_only path_and_clock full_path> ] [-extra_info <basic all none> ] [-from <names> ] [-from_clock <names> ] [-hold] [-npaths <number> ] [-panel_name <name> ] [-recovery] [-removal] [-setup] [-through <names> ] [-to <names> ] [-to_clock <names> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-detail <summary path_only path_and_clock full_path>	Option to determine how much detail should be shown in the path report	
	-extra_info <basic all none>	Option to determine how much detail should be shown in the Extra Info report	
	-from <names>	Valid destinations (string patterns are matched using Tcl string matching)	
	-from_clock <names>	Valid destinations (string patterns are matched using Tcl string matching)	
	-hold	Option to report clock hold paths	
	-npaths <number>	Specifies the number of paths to report (default=1)	
	-panel_name <name>	Sends the results to the timing report	
	-recovery	Option to report recovery paths	
	-removal	Option to report removal paths	
	-setup	Option to report clock setup paths	
	-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)	
	-to <names>	Valid destinations (string patterns are matched using Tcl string matching)	
-to_clock <names>	Valid destinations (string patterns are matched using Tcl string matching)		
Description	Reports the worst-case paths and associated slack.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.7. fitter\_timing\_summary (::quartus::eco)

The following table displays information for the `fitter_timing_summary` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::eco</a> on page 191		
<b>Syntax</b>	fitter_timing_summary [-h   -help] [-long_help] [-hold] [-panel_name <name> ] [-recovery] [-removal] [-setup]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-hold	Option to report clock hold paths	
	-panel_name <name>	Sends the results to the timing summary	
	-recovery	Option to report recovery paths	
	-removal	Option to report removal paths	
	-setup	Option to report clock setup paths	
<b>Description</b>	<p>Reports the worst-case Clock Setup and Clock Hold slacks and endpoint TNS (total negative slack) per clock domain. Total negative slack is the sum of all slacks less than zero for either destination registers or ports in the clock domain.</p>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.8. get\_available\_snapshots (::quartus::eco)

The following table displays information for the `get_available_snapshots` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::eco</code> on page 191		
<b>Syntax</b>	<code>get_available_snapshots [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	The <code>get_available_snapshots</code> command reports all available snapshots.		
<b>Example Usage</b>	<code>get_available_snapshots</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.9. get\_eco\_checkpoint (::quartus::eco)

The following table displays information for the get\_eco\_checkpoint Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::eco</code> on page 191		
<b>Syntax</b>	<code>get_eco_checkpoint [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	The <code>get_eco_checkpoint</code> command prints the current checkpoint id in the console. It also returns the checkpoint id in a tcl object.		
<b>Example Usage</b>	<code>get_eco_checkpoint</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.10. get\_loaded\_snapshot (::quartus::eco)

The following table displays information for the get\_loaded\_snapshot Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::eco</a> on page 191		
<b>Syntax</b>	get_loaded_snapshot [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	The get_loaded_snapshot command gets the loaded snapshot.		
<b>Example Usage</b>	get_loaded_snapshot		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.11. get\_lutmask\_equation (::quartus::eco)

The following table displays information for the get\_lutmask\_equation Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::eco</code> on page 191		
<b>Syntax</b>	<code>get_lutmask_equation [-h   -help] [-long_help] [-name &lt;name&gt; ] [-node &lt;node_id&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name &lt;name&gt;</code>	name of the lut	
<i>continued...</i>			

	-node <node_id>		Node ID
<b>Description</b>	The get_lutmask_equation command reports the LUT equation of a given LUT.		
<b>Example Usage</b>	<pre>get_lutmask_equation -name &lt;name_string&gt;  # print lutmask equation of all nodes of type lcell_comb project_open top eco_load_design set nodes [get_netlist_nodes -type lcell_comb] foreach_in_collection i \$nodes {     get_lutmask_equation -node \$i } project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.12. get\_node\_location (::quartus::eco)

The following table displays information for the get\_node\_location Tcl command:

Tcl Package and Version	Belongs to ::quartus::eco on page 191		
Syntax	get_node_location [-h   -help] [-long_help] [-name <node_name> ] [-node <node_id> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <node_name>	Name of node to get location for	
	-node <node_id>	Node ID	
Description	The get_node_location command will print the location of the node in the console and return the location in a tcl object. If the node is not placed, then the string "Unplaced" will be printed and returned.		
Example Usage	<pre>get_node_location -name node  # print location of nodes of type FF project_open top eco_load_design set nodes [get_netlist_nodes -type FF] foreach_in_collection i \$nodes {     puts "Location = [get_node_location -node \$i]" } project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.13. make\_connection (::quartus::eco)

The following table displays information for the make\_connection Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::eco</code> on page 191
<b>Syntax</b>	<code>make_connection [-h   -help] [-long_help] [-from &lt;output_net_name&gt; ] [-from_node &lt;from_node&gt; ] [-from_port &lt;from_port&gt; ] [-port &lt;dest_node_port&gt; ] [-tieoff &lt;VCC GND&gt; ] [-to &lt;dest_node_name&gt; ] [-to_node &lt;to_node&gt; ] [-to_port &lt;to_port&gt; ]</code>
	<i>continued...</i>

<b>Arguments</b>	-h   -help			Short help
	-long_help			Long help with examples and possible return values
	-from <output_net_name>			Source of the connection
	-from_node <from_node>			ID of the source node
	-from_port <from_port>			ID of the source port
	-port <dest_node_port>			Input port name of the destination node
	-tieoff <VCC GND>			VCC or GND tieoff
	-to <dest_node_name>			Name of the destination node
	-to_node <to_node>			ID of the destination node
	-to_port <to_port>			ID of the destination port
<b>Description</b>	<p>The make_connection command will connect the source signal to the destination block port. If the port has an existing connection, the command will remove the previous connection and connect it to the specified signal.</p> <p>make_connection expects a source and destination through:          from - output net of the source block of the new connection, OR          from_node AND from_port - node ID and output port ID of source, OR          tieoff - tieoff value</p> <p>to AND port - name of the destination node and the input port name, OR          to_node AND to_port - node ID and input port ID of the destination</p> <p>Note that the changed path will be routed immediately. If the path contains a node that is created during ECO compilation, then the paths will be routed after the node is placed with place_node command.</p>			
<b>Example Usage</b>	<pre>make_connection -from top a_out -to top x -port D</pre> <p>This example will connect top a_out to the D input port of node top x.</p> <pre>make_connection -tieoff VCC -to top x -port D</pre> <p>This example will tie the D port of node top x to VCC, either internally or via lcell.</p> <pre>load_package netlist load_package eco project_open top set from_node [get_netlist_node_id -name my_node] set oports [get_netlist_ports -node \$from_node -type oport] set oport 0 foreach_in_collection i \$oports {     set oport \$i     break } set to_node [get_netlist_node_id -name my_ff] set iports [get_netlist_ports -node \$to_node -type iport] set iport 0 foreach_in_collection i \$iports {     set iport \$i     break } make_connection -ARG(from_node) \$from_node -ARG(from_port) \$oport -ARG(to_node) \$to_node - ARG(to_port) \$iport</pre> <p>This example iterates over the netlist and node ports, then makes a connection between the first oport of my_node and the first iport of my_ff</p>			
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>	
	TCL_OK	0	INFO: Operation successful	

### 3.1.9.14. modify\_io\_current\_strength (::quartus::eco)

The following table displays information for the `modify_io_current_strength` Tcl command:

Tcl Package and Version	Belongs to ::quartus::eco on page 191		
Syntax	modify_io_current_strength [-h   -help] [-long_help] -to <dest_pin_name> <current_strength>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-to <dest_pin_name>	Name of the destination pin node	
	<current_strength>	Current strength value	
Description	<p>The modify_io_current_strength command will modify the current strength of the targeted pin.</p> <p>modify_io_current_strength expects 1 positional argument and an option argument: to - the name of the destination pin</p>		
Example Usage	modify_io_current_strength 3mA -to top ipin		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.15. modify\_io\_delay\_chain (::quartus::eco)

The following table displays information for the `modify_io_delay_chain` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::eco</a> on page 191		
<b>Syntax</b>	modify_io_delay_chain [-h   -help] [-long_help] -to <dest_pin_name> -type <input output oe io_12_lane_input_data io_12_lane_input_strobe> <delay_chain>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-to <dest_pin_name>	Name of the destination pin node	
	-type <input output oe io_12_lane_input_data io_12_lane_input_strobe>	Type of the pin	
	<delay_chain>	Delay chain value	
<b>Description</b>	<p>The modify_io_delay_chain command will modify the delay chain setting of the targeted pin with the specified type.</p> <p>modify_io_delay_chain expects 1 positional argument and 2 option arguments:</p> <p>to - the name of the destination pin</p> <p>type - the type of the pin</p>		
<b>Example Usage</b>	modify_io_delay_chain 3 -to top ipin -type INPUT		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.16. modify\_io\_slew\_rate (::quartus::eco)

The following table displays information for the modify\_io\_slew\_rate Tcl command:

Tcl Package and Version	Belongs to ::quartus::eco on page 191		
Syntax	modify_io_slew_rate [-h   -help] [-long_help] -to <dest_pin_name> <slew_rate>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-to <dest_pin_name>	Name of the destination pin node	
	<slew_rate>	Slew rate value	
Description	<div>The modify_io_slew_rate command will modify the slew rate of the targeted pin.</div> <div>modify_io_slew_rate expects 1 positional argument and an option argument: to - the name of the destination pin</div>		
Example Usage	modify_io_slew_rate 1 -to top ipin		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.17. modify\_lutmask (::quartus::eco)

The following table displays information for the modify\_lutmask Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::eco</a> on page 191	
<b>Syntax</b>	modify_lutmask [-h   -help] [-long_help] [-eqn <equation> ] [-mask <mask> ] [-num <num_of_inputs> ] -to <dest_node_name>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-eqn <equation>	LUT equation
	-mask <mask>	New lutmask
	-num <num_of_inputs>	Number of inputs
	-to <dest_node_name>	Name of the destination node
<b>Description</b>	<p>The modify_lutmask command will modify the LUT-mask of the matching node, with LUT-mask value in binary or hexadecimal, or with equivalent LUT-mask value computed from specified logical equation.</p> <p>modify_lutmask expects 2 arguments (1 from mask or eqn):</p> <ul style="list-style-type: none"><li>to - name of the destination atom</li><li>mask - the LUT-mask value to be modified - in binary or hexadecimal</li><li>eqn - the logical equation of the inputs (A, B, C, D, E, F)<ul style="list-style-type: none"><li>- the supported lexical tokens include AND('&amp;'), OR(' '), XOR('^'), NOT('!'), OPEN_BRACE('('), CLOSE_BRACE(')')</li></ul></li></ul>	
continued...		

<b>Example Usage</b>	<pre> modify_lutmask -to top lut_a -mask 0xFF00FF00 modify_lutmask -to top lut_b -mask 0b11111111001010 modify_lutmask -to top lut_c -eqn {a&amp;b&amp;c} </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.18. place\_node (::quartus::eco)

The following table displays information for the place\_node Tcl command:

Tcl Package and Version	Belongs to ::quartus::eco on page 191		
Syntax	place_node [-h   -help] [-long_help] [-force] [-location <location> ] [-name <node_name> ] [-node <node_id> ] [-sample <sample> ] [-timing_driven]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-force	Force overwriting existing location constraint on the node	
	-location <location>	Exact location or region	
	-name <node_name>	Name of the new node	
	-node <node_id>	Node ID	
	-sample <sample>	Number of locations to try to place the node	
	-timing_driven	Try to place the node at a location meeting timing	
Description	<p>The place_node command will place the specified node either automatically, or within the region if -location is specified. If -sample is specified, then the command will randomly pick locations and place the node at the first valid location found. If -timing_driven is specified then the command will try to place the node at a location that meets timing. If none of the locations meet timing, then the node will be placed at the location with the highest slacks. The place_node command can be used on nodes that have been placed.</p> <p>-location argument takes in an exact location (-location "X20 Y20"), a region (-location "X20 Y20 X30 Y30"), or an ALM sublocation (-location "FF_X20_Y20_N10").</p> <p>-force argument will force overwrite existing location constraints on the node, if any. -force will not overwrite Partial Reconfiguration regions.</p>		
Example Usage	<pre>place_node -name eco_new_lut -location "X136 Y63 X149 Y82" place_node -name eco_new_lut -location "X5 Y10" place_node -name eco_new_lut -location "X5 Y10" -timing_driven place_node -name eco_new_ff -location "FF_X20_Y20_N10" place_node -name eco_new_ff -location "FF_X20_Y20_N10" -force place_node -name eco_new_lut -location "X5 Y10 X100 Y200" -sample 10 place_node -name eco_new_ff -location "X5 Y10 X100 Y200" -sample 100 -timing_driven  # place all FFs project_open top eco_load_design set nodes [get_netlist_nodes -type FF] foreach_in_collection i \$nodes {     place_node -node \$i }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.19. remove\_connection (::quartus::eco)

The following table displays information for the remove\_connection Tcl command:

Tcl Package and Version	Belongs to ::quartus::eco on page 191		
Syntax	remove_connection [-h   -help] [-long_help] [-from <output_net_name> ] [-from_node <from_node> ] [-from_port <from_port> ] [-port <dest_node_port> ] [-to <dest_node_name> ] [-to_node <to_node> ] [-to_port <to_port> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-from <output_net_name>	Source of the connection	
	-from_node <from_node>	ID of the source node	
	-from_port <from_port>	ID of the source port	
	-port <dest_node_port>	Input port name of the destination node	
	-to <dest_node_name>	Name of the destination node	
	-to_node <to_node>	ID of the destination node	
	-to_port <to_port>	ID of the destination port	
Description	<p>The remove_connection command will disconnect the source signal from the destination block port, and set the input port to a disconnected state.</p> <p>remove_connection expects a source and destination through: from - output net of the source block of the new connection, OR from_node AND from_port - node ID and output port ID of source</p> <p>to AND port - name of the destination node and the input port name, OR to_node AND to_port - node ID and input port ID of the destination</p> <p>Note: Connection path containing Hyper Registers is not allowed to be removed.</p>		
Example Usage	<pre>remove_connection -from top a_out -to top x -port D</pre> <p>This example will disconnect top a_out from the D input port of node top x, and set top x:D to a disconnected state.</p> <pre>load_package netlist load_package eco project_open top set from_node [get_netlist_node_id -name my_node] set oports [get_netlist_ports -node \$from_node -type oport] set oport 0 foreach_in_collection i \$oports {     set oport \$i     break } set to_node [get_netlist_node_id -name my_ff] set iports [get_netlist_ports -node \$to_node -type iport] set iport 0 foreach_in_collection i \$iports {     set iport \$i     break } remove_connection -ARG(from_node) \$from_node -ARG(from_port) \$oport -ARG(to_node) \$to_node -ARG(to_port) \$iport</pre> <p>This example iterates over the netlist and node ports, then removes the connection between the first oport of my_node and the first iport of my_ff</p>		
	Return Value	Code Name	Code
	TCL_OK	0	INFO: Operation successful

### 3.1.9.20. remove\_node (::quartus::eco)

The following table displays information for the remove\_node Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::eco</a> on page 191		
Syntax	remove_node [-h   -help] [-long_help] [-name <node_name> ] [-node <node_id> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <node_name>	Name of the node to remove	
	-node <node_id>	Node ID	
Description	The remove_node command will remove the specified node from final netlist. The node's source and destination signals will be disconnected.		
Example Usage	<pre>remove_node -name my_ff  # remove all nodes of type FF project_open top eco_load_design set nodes [get_netlist_nodes -type FF] foreach_in_collection i \$nodes {     remove_node -node \$i }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.21. report\_connections (::quartus::eco)

The following table displays information for the report\_connections Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::eco</a> on page 191	
<b>Syntax</b>	report_connections [-h   -help] [-long_help] [-from <i>&lt;from&gt;</i> ] [-from_port <i>&lt;from_port&gt;</i> ] [-limit <i>&lt;limit&gt;</i> ] [-return_result] [-timing] [-to <i>&lt;to&gt;</i> ] [-to_port <i>&lt;to_port&gt;</i> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-from <i>&lt;from&gt;</i>	Name of the source node
	-from_port <i>&lt;from_port&gt;</i>	Name of the source port
	-limit <i>&lt;limit&gt;</i>	Limit number of output connections reported
	-return_result	Return the result in a tcl object
	-timing	Report slacks
	-to <i>&lt;to&gt;</i>	Name of the destination node
	-to_port <i>&lt;to_port&gt;</i>	Name of the destination port
<b>Description</b>	The report_connections command will report connections between one of the following: <ul style="list-style-type: none"><li>- (-from) report all connections from a node</li><li>- (-from -from_port) report connections form a port of a node</li><li>- (-to) report all connections to a node</li></ul>	
continued...		

	- (-to -to_port)      report connection to a port of a node - (-from -to)          report connection between 2 nodes By default, 100 connections will be reported. In command-line mode, the result will be posted as info messages to the console. If -return_result is specified then the result will also be returned as a tcl object.		
<b>Example Usage</b>	<pre>report_connections -from my_ff report_connections -from my_ff -from_port Q report_connections -to my_ff report_connections -to my_ff -to_port D report_connections -from my_ff -to my_ff1  report_connections -from my_ff -from_port Q -limit 10 report_connections -from my_ff -from_port Q -return_result</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.22. report\_legal\_locations (::quartus::eco)

The following table displays information for the report\_legal\_locations Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::eco on page 191	
<b>Syntax</b>	report_legal_locations [-h   -help] [-long_help] [-check_routing] -location <location> [-name <node_name> ] [-node <node_id> ] [-patient] [-report_illegal] [-return_result]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-check_routing	Try to legalize the location by checking routing
	-location <location>	Region to search for legal locations
	-name <node_name>	Name of node to check legal locations for
	-node <node_id>	Node ID
	-patient	Override restriction on search region size
	-report_illegal	Report illegal locations and reasons within the search region
	-return_result	Return the result in a tcl object
<b>Description</b>	The report_legal_locations command will search for all legal locations within the region specified by -location for the specified node to be placed. The command can be used on nodes that have or have not been placed. Specify -patient to override the restriction on the search region size. Specify -report_illegal to report illegal location reasons. In command-line mode, the result will be posted as info messages to the console. If -return_result is specified then the result will also be returned as a tcl object. If -check_routing is specified then a location will be determined illegal if the legalization step fails and slacks will be reported for legal locations. Otherwise the legalization step will be skipped. Note that the -check_routing option is only supported when all nodes but the target have been placed. The report_legal_locations command does not work in "quartus_fit --eco" mode.	
<b>Example Usage</b>	<pre>report_legal_locations -name node -location "X136 Y63 X145 Y72" report_legal_locations -name node -location "X5 Y10 X5 Y10" report_legal_locations -name node -location "X5 Y10 X5 Y10" -report_illegal report_legal_locations -name node -location "X5 Y10 X5 Y10" -return_result report_legal_locations -name node -location "X5 Y10 X5 Y10" -check_routing report_legal_locations -name node -location "X136 Y63 X149 Y82" -patient report_legal_locations -name node -location "X136 Y63 X149 Y82" -patient -return_result</pre>	

continued...

	<pre># check legal locations of multiple FFs in a specified region project_open top eco_load_design set nodes [get_netlist_nodes -type FF] foreach_in_collection i \$nodes {     report_legal_locations -node \$i -location "X136 Y63 X145 Y72" } project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.23. report\_nodes\_at\_location (::quartus::eco)

The following table displays information for the report\_nodes\_at\_location Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::eco</code> on page 191		
<b>Syntax</b>	<code>report_nodes_at_location [-h   -help] [-long_help] -location &lt;location&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-location &lt;location&gt;</code>	location string to search	
<b>Description</b>	<div>The <code>report_nodes_at_location</code> command reports the nodes at a given location.</div>		
<b>Example Usage</b>	<code>report_nodes_at_location -location &lt;location_string&gt;</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.24. eco::report\_partitions (::quartus::eco)

The following table displays information for the eco::report\_partitions Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::eco</code> on page 191		
<b>Syntax</b>	<code>eco::report_partitions [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	<code>eco::report_partitions</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.25. report\_ports (::quartus::eco)

The following table displays information for the report\_ports Tcl command:

Tcl Package and Version	Belongs to ::quartus::eco on page 191		
Syntax	report_ports [-h   -help] [-long_help] [-name <node_name> ] [-node <node_id> ] [-return_result] [-timing]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <node_name>	Name of the node to query	
	-node <node_id>	Node ID	
	-return_result	Return the result in a tcl object	
	-timing	Report the slacks on each port	
Description	<div>The report_ports command will report all input ports of a node. In command-line mode, the result will be posted as info messages to the console. If -timing is specified then the slacks on each port will be reported. If -return_result is specified then the result will also be returned as a tcl object.</div>		
Example Usage	<div>report_ports -name my_ff report_ports -name my_ff -timing report_ports -name my_ff -return_result  # get input ports of a FF project_open top eco_load_design set node [get_netlist_node_id -name my_ff] report_ports -node \$node project_close</div>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.26. report\_routing (::quartus::eco)

The following table displays information for the report\_routing Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::eco</a> on page 191	
<b>Syntax</b>	report_routing [-h   -help] [-long_help] [-return_result] -to <to> -to_port <to_port>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-return_result	Return the result in a tcl object
	-to <to>	Name of the destination node
	-to_port <to_port>	Name of the destination port
<b>Description</b>	<p>The report_connections command will report routing between a connection. In command-line mode, the result will be posted as info messages to the console. If -return_result is specified then the result will also be returned as a tcl object.</p>	
continued...		

<b>Example Usage</b>	<code>report_routing -to my_ff1 -to_port D</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.27. report\_unplaced\_nodes (::quartus::eco)

The following table displays information for the `report_unplaced_nodes` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::eco</a> on page 191		
Syntax	report_unplaced_nodes [-h   -help] [-long_help] [-return_result]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-return_result	Return the result in a tcl object	
Description	<div>The report_unplaced_nodes command will report all unplaced nodes. In command-line mode, the result will be posted as info messages to the console. If -return_result is specified then the result will also be returned as a tcl object.</div>		
Example Usage	<div>report_unplaced_nodes report_unplaced_nodes -return_result</div>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.28. restore\_eco\_checkpoint (::quartus::eco)

The following table displays information for the `restore_eco_checkpoint` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::eco</a> on page 191		
<b>Syntax</b>	restore_eco_checkpoint [-h   -help] [-long_help] <cid>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<cid>	Checkpoint ID of a change	
<b>Description</b>	The restore_eco_checkpoint command reverts the design back to the targeted checkpoint.		
<b>Example Usage</b>	restore_eco_checkpoint 12345		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.9.29. unplace\_node (::quartus::eco)

The following table displays information for the unplace\_node Tcl command:

Tcl Package and Version	Belongs to ::quartus::eco on page 191		
Syntax	unplace_node [-h   -help] [-long_help] [-name <node_name> ] [-node <node_id> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <node_name>	Name of the node to unplace	
	-node <node_id>	Node ID	
Description	The unplace_node command will unplace a given node.		
Example Usage	<pre>unplace_node -name my_ff  # unplace all nodes of type FF project_open top eco_load_design set nodes [get_netlist_nodes -type FF] foreach_in_collection i \$nodes {     unplace_node -node \$i }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.9.30. update\_mif\_files (::quartus::eco)

The following table displays information for the update\_mif\_files Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::eco</a> on page 191		
<b>Syntax</b>	update_mif_files [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Update memory contents from the Memory Initialization File (.mif) or Hexadecimal (Intel-Format) File (.hex) for all RAM or CAM atoms.		
<b>Example Usage</b>	load_package eco update_mif_files		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.10. ::quartus::external\_memif\_toolkit

The following table displays information for the **::quartus::external\_memif\_toolkit** Tcl package:

<b>Tcl Package and Version</b>	::quartus::external_memif_toolkit 1.0
<b>Description</b>	This package contains the set of Tcl functions for interacting with external memory interfaces and debug components
<b>Availability</b>	This package is available for loading in the following executables:  qpro_sh quartus_sh
<b>Tcl Commands</b>	apply_setting (::quartus::external_memif_toolkit) on page 210 calibrate_termination (::quartus::external_memif_toolkit) on page 211 configure_driver (::quartus::external_memif_toolkit) on page 212 create_connection_report (::quartus::external_memif_toolkit) on page 212 create_toolkit_report (::quartus::external_memif_toolkit) on page 213 driver_margining (::quartus::external_memif_toolkit) on page 214 establish_connection (::quartus::external_memif_toolkit) on page 215 generate_eye_diagram (::quartus::external_memif_toolkit) on page 216 get_connection_commands (::quartus::external_memif_toolkit) on page 217 get_connection_info (::quartus::external_memif_toolkit) on page 217 get_connection_interfaces (::quartus::external_memif_toolkit) on page 218 get_connection_report_info (::quartus::external_memif_toolkit) on page 219 get_connection_report_types (::quartus::external_memif_toolkit) on page 220 get_connection_types (::quartus::external_memif_toolkit) on page 221 get_connections (::quartus::external_memif_toolkit) on page 221 get_device_names (::quartus::external_memif_toolkit) on page 222 get_hardware_names (::quartus::external_memif_toolkit) on page 222 get_setting_types (::quartus::external_memif_toolkit) on page 223 get_toolkit_report_types (::quartus::external_memif_toolkit) on page 224 initialize_connections (::quartus::external_memif_toolkit) on page 224 link_project_to_device (::quartus::external_memif_toolkit) on page 225 read_setting (::quartus::external_memif_toolkit) on page 226 reindex_connections (::quartus::external_memif_toolkit) on page 227 reset_tg2 (::quartus::external_memif_toolkit) on page 228 run_connection_command (::quartus::external_memif_toolkit) on page 228 set_active_interface (::quartus::external_memif_toolkit) on page 229 set_stress_pattern (::quartus::external_memif_toolkit) on page 230 terminate_connection (::quartus::external_memif_toolkit) on page 230 terminate_connections (::quartus::external_memif_toolkit) on page 231 unlink_project_from_device (::quartus::external_memif_toolkit) on page 232 write_connection_target_report (::quartus::external_memif_toolkit) on page 232

#### 3.1.10.1. apply\_setting (::quartus::external\_memif\_toolkit)

The following table displays information for the **apply\_setting** Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::external_memif_toolkit on page 210	
<b>Syntax</b>	apply_setting [-h   -help] [-long_help] -id <name> [-index <index> ] [-rank <rank> ] -type <type> -value <value>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-id <name>	The connection ID to communicate with
	-index <index>	Index of the target setting within the connection
	-rank <rank>	Rank (shadow register) of the target setting within the connection
	-type <type>	The type of setting on the EMIF interface
	-value <value>	Value to apply
continued...		

<b>Description</b>	Applies the specified memory interface setting for the specified target connection.		
<b>Example Usage</b>	<pre> project_open dut initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  foreach conn [get_connections] {     foreach type [get_setting_types -id \$conn] {         apply_setting -id \$conn -type \$type -index 0 -value 0     } }  terminate_connections project_close </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The specified setting type <string> is illegal. Please specify a valid setting type. The list of valid types is available by running get_setting_types.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: The specified setting is outside the legal range.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.2. calibrate\_termination (::quartus::external\_memif\_toolkit)

The following table displays information for the calibrate\_termination Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210		
<b>Syntax</b>	<code>calibrate_termination [-h   -help] [-long_help] -id &lt;name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-id &lt;name&gt;</code>	The connection ID to communicate with	
<b>Description</b>	<code>Test termination settings on the interface.</code>		
<b>Example Usage</b>	<code>This command currently contains no example usage.</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	<code>TCL_OK</code>	<code>0</code>	INFO: Operation successful
continued...			

	TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.3. configure\_driver (::quartus::external\_memif\_toolkit)

The following table displays information for the configure\_driver Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
<b>Syntax</b>	configure_driver [-h   -help] [-long_help] [-data <i>&lt;data&gt;</i> ] -id <i>&lt;name&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-data <i>&lt;data&gt;</i>	Address/data pairs to be written to the driver configuration block	
	-id <i>&lt;name&gt;</i>	The connection ID to communicate with	
<b>Description</b>	Configures the traffic generator.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <i>&lt;string&gt;</i> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.4. create\_connection\_report (::quartus::external\_memif\_toolkit)

The following table displays information for the create\_connection\_report Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
<b>Syntax</b>	create_connection_report [-h   -help] [-long_help] -id <name> -report_type <name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-id <name>	The connection ID to communicate with	
	-report_type <name>	The report type to generate	
continued...			

<b>Description</b>	<p>Create a report of the specified type for the connection id.</p> <p>The resulting report is then available for query using the report TCL package.</p>		
<b>Example Usage</b>	<pre>load_package external_memif_toolkit load_package report  project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  set conn [lindex [get_connections -type emif] 0] establish_connection -id \$conn  create_connection_report -id \$conn -report_type summary  load_report_database -type emit  set report_panel_names [get_report_panel_names] post_message -type info "Found the following report panels:" foreach panel_name \$report_panel_names {     post_message -type info "    \$panel_name" }  unload_report  terminate_connections  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: An error occurred trying to create the report <string> for the target <string>.
	TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The specified report type <string> is illegal. The legal report types are: <string> .
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.5. create\_toolkit\_report (::quartus::external\_memif\_toolkit)

The following table displays information for the create\_toolkit\_report Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::external_memif_toolkit on page 210	
<b>Syntax</b>	create_toolkit_report [-h   -help] [-long_help] -report_type <name>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-report_type <name>	The report type to generate
<i>continued...</i>		

<b>Description</b>	<p>Create a toolkit report of the specified type. These reports are general toolkit reports, not connection specific reports.</p> <p>The resulting report is then available for query using the report TCL package.</p>		
<b>Example Usage</b>	<pre>load_package external_memif_toolkit load_package report  project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  create_toolkit_report -report_type discovered_connections create_toolkit_report -report_type detailed_connections  load_report_database -type emit  set report_panel_names [get_report_panel_names] post_message -type info "Found the following report panels:" foreach panel_name \$report_panel_names {     post_message -type info "    \$panel_name" }  unload_report  terminate_connections  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: An error occurred trying to create the report <string> for the target <string>.
	TCL_ERROR	1	ERROR: The specified report type <string> is illegal. The legal report types are: <string> .
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.6. driver\_margining (::quartus::external\_memif\_toolkit)

The following table displays information for the driver\_margining Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::external_memif_toolkit on page 210	
<b>Syntax</b>	<pre>driver_margining [-h   -help] [-long_help] [-adjust_delays] -fail_id &lt;fail_id&gt; -id &lt;name&gt; -pass_id &lt;pass_id&gt; -pnf_ids &lt;pnf_ids&gt; -resetsn_id &lt;resetsn_id&gt; [-skip_dm] [-skip_read] [-skip_write] [-step_size &lt;step_size&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-adjust_delays	Adjust delays on the interface based on driver margining results
	-fail_id <fail_id>	Connection ID of the In-System Probe which controls the fail signal from the driver
	-id <name>	The connection ID to communicate with
<b>continued...</b>		

	-pass_id <pass_id>	Connection ID of the In-System Probe which controls the pass signal from the driver	
	-pnf_ids <pnf_ids>	TCL list of PNF (pass not fail) connection IDs of In-System Probes from the driver	
	-resetsn_id <resetsn_id>	Connection ID of the In-System Source which controls the resetsn for the driver	
	-skip_dm	Skip driver margining on dm	
	-skip_read	Skip driver margining on read	
	-skip_write	Skip driver margining on write	
	-step_size <step_size>	Granularity of the driver margining operation, in terms of delay settings. Smaller values are more precise, but consume more time.	
Description			
	Performs read and write driver margining on the selected EMIF connection.		
Example Usage			
	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.7. establish\_connection (::quartus::external\_memif\_toolkit)

The following table displays information for the establish\_connection Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210		
<b>Syntax</b>	<code>establish_connection [-h   -help] [-long_help] [-connection_name &lt;name&gt; ] -id &lt;name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-connection_name &lt;name&gt;</code>	Optional nickname to use for a connection.	
	<code>-id &lt;name&gt;</code>	The connection ID to communicate with	
<b>Description</b>	Establishes a connection to a connection target.		
<b>Example Usage</b>	<pre>project_open dut initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof</pre>		
continued...			

	<pre>set conn [lindex [get_connections -type emif] 0] establish_connection -id \$conn  terminate_connections  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Could not establish a connection to target <i>&lt;string&gt;</i> .
	TCL_ERROR	1	ERROR: The specified connection ID <i>&lt;string&gt;</i> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The specified connection name <i>&lt;string&gt;</i> is illegal as a connection already exists with that name. Please specify a valid connection name.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.8. generate\_eye\_diagram (::quartus::external\_memif\_toolkit)

The following table displays information for the generate\_eye\_diagram Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
<b>Syntax</b>	generate_eye_diagram [-h   -help] [-long_help] -id <name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-id <name>	The connection ID to communicate with	
<b>Description</b>	Generates eye diagrams for the selected EMIF connection.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.9. get\_connection\_commands (::quartus::external\_memif\_toolkit)

The following table displays information for the `get_connection_commands` Tcl command:

Tcl Package and Version	Belongs to ::quartus::external_memif_toolkit on page 210		
Syntax	get_connection_commands [-h   -help] [-long_help] -id <name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-id <name>	The connection ID to communicate with	
Description	Returns a TCL list of supported commands for the specific target connection.		
Example Usage	<pre>project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  foreach conn [get_connections] {     puts "Connection : \$conn"     foreach cmd [get_connection_commands -id \$conn] {         puts "    Command : \$cmd"     } }  terminate_connections  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.10. get\_connection\_info (::quartus::external\_memif\_toolkit)

The following table displays information for the `get_connection_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210		
<b>Syntax</b>	<code>get_connection_info [-h   -help] [-long_help] [-hpath] -id &lt;name&gt; [-sld_type]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-hpath</code>	Queries the hierarchy name of the connection	
	<code>-id &lt;name&gt;</code>	The connection ID to communicate with	
<i>continued...</i>			

	-sld_type		Queries SLD type of a connection
Description	Queries information about a connection target.		
Example Usage	<pre>project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  foreach conn [get_connections] {     puts "Connection : \$conn"     puts "    Hierarchy Path : [get_connection_info -id \$conn -hpath]" }  terminate_connections  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: No information about the connection ID was queried. Please specify one query parameter.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.11. get\_connection\_interfaces (::quartus::external\_memif\_toolkit)

The following table displays information for the get\_connection\_interfaces Tcl command:

Tcl Package and Version	Belongs to ::quartus::external_memif_toolkit on page 210		
Syntax	get_connection_interfaces [-h   -help] [-long_help] -id <name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-id <name>	The connection ID to communicate with	
Description	Returns the interfaces available for the specified connection id.		
Example Usage	<pre>project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  set conn [lindex [get_connections -type emif] 0] establish_connection -id \$conn  get_connection_interfaces -id \$conn  terminate_connections  project_close</pre>		
Return Value	Code Name	Code	String Return
continued...			

TCL_OK	0	INFO: Operation successful
TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.12. get\_connection\_report\_info (::quartus::external\_memif\_toolkit)

The following table displays information for the `get_connection_report_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210		
<b>Syntax</b>	<code>get_connection_report_info [-h   -help] [-long_help] -id &lt;name&gt; [-name] -report_type &lt;name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-id &lt;name&gt;</code>	The connection ID to communicate with	
	<code>-name</code>	Queries the name of the report	
	<code>-report_type &lt;name&gt;</code>	The report type to generate	
<b>Description</b>	Queries info about a report type.		
<b>Example Usage</b>	<pre>project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  foreach conn [get_connections] {     puts "Connection : \$conn"     foreach rpt [get_connection_report_types -id \$conn] {         puts "    Report : \$rpt"         puts "    Report name : [get_connection_report_info -id \$conn -report_type \$rpt - name]"     } }  terminate_connections  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <i>&lt;string&gt;</i> is illegal. Please specify a valid connection ID.

continued...

	TCL_ERROR	1	ERROR: The specified report type <string> is illegal. The legal report types are: <string> .
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.13. get\_connection\_report\_types (::quartus::external\_memif\_toolkit)

The following table displays information for the get\_connection\_report\_types Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210		
<b>Syntax</b>	<code>get_connection_report_types [-h   -help] [-long_help] -id &lt;name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-id &lt;name&gt;</code>	The connection ID to communicate with	
<b>Description</b>	Returns a TCL list of supported report types for the specific target connection.		
<b>Example Usage</b>	<pre>project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  foreach conn [get_connections] {     puts "Connection : \$conn"     puts "    Supported report types: [get_connection_report_types -id \$conn]" }  terminate_connections  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <i>&lt;string&gt;</i> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run <code>link_project_to_device</code> to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use <code>initialize_connections</code> to initialize the toolkit.

### 3.1.10.14. get\_connection\_types (::quartus::external\_memif\_toolkit)

The following table displays information for the `get_connection_types` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
Syntax	get_connection_types [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Returns a list of valid connection target types.		
Example Usage	puts "Valid connection types are: [get_connection_types]"		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.10.15. get\_connections (::quartus::external\_memif\_toolkit)

The following table displays information for the `get_connections` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
<b>Syntax</b>	get_connections [-h   -help] [-long_help] [-type <name> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-type <name>	The type of the connection to connect to	
<b>Description</b>	Returns a TCL list of connection IDs for connections.		
<b>Example Usage</b>	<pre>project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  foreach conn [get_connections] {     puts "Connection : \$conn"     puts "    Hierarchy Path : [get_connection_info -id \$conn -hpath]" }  terminate_connections  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Supplying hardware_name and device_name is mutually exclusive to supplying type
	TCL_ERROR	1	ERROR: Both hardware_name and device_name must be supplied if either is supplied

continued...

*continued...*

	TCL_ERROR	1	ERROR: Connection type <i>&lt;string&gt;</i> is not a recognized connection type.
	TCL_ERROR	1	ERROR: No device name called <i>&lt;string&gt;</i> could be found on hardware named <i>&lt;string&gt;</i> .
	TCL_ERROR	1	ERROR: No hardware name called <i>&lt;string&gt;</i> could be found.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run <code>link_project_to_device</code> to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use <code>initialize_connections</code> to initialize the toolkit.

### 3.1.10.16. get\_device\_names (::quartus::external\_memif\_toolkit)

The following table displays information for the `get_device_names` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
<b>Syntax</b>	get_device_names [-h   -help] [-long_help] -hardware_name <name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-hardware_name <name>	The name of the hardware connection to use	
<b>Description</b>	Returns a list of device names found for the given hardware.		
<b>Example Usage</b>	<pre>project_open dut initialize_connections  foreach hw_name [get_hardware_names] {     foreach dev_name [get_device_names -hardware_name \$hw_name] {         puts "Found device name \$dev_name on hardware \$hw_name"     } }  terminate_connections project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No hardware name called <string> could be found.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.17. get\_hardware\_names (::quartus::external\_memif\_toolkit)

The following table displays information for the `get_hardware_names` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210	
<b>Syntax</b>	get_hardware_names [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
continued...		

<b>Description</b>	Returns a list of hardware names found.		
<b>Example Usage</b>	<pre> project_open dut initialize_connections  foreach hw_name [get_hardware_names] {     puts "Found hardware name \$hw_name" }  terminate_connections project_close </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.18. get\_setting\_types (::quartus::external\_memif\_toolkit)

The following table displays information for the get\_setting\_types Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210		
<b>Syntax</b>	<code>get_setting_types [-h   -help] [-long_help] -id &lt;name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-id &lt;name&gt;</code>	The connection ID to communicate with	
<b>Description</b>	Returns a TCL list of supported memory interface setting types for the specific target connection.		
<b>Example Usage</b>	<pre>project_open dut initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  foreach conn [get_connections] {     puts "Connection : \$conn"     puts "    Supported setting types: [get_setting_types -id \$conn]" }  terminate_connections project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <i>&lt;string&gt;</i> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run <code>link_project_to_device</code> to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use <code>initialize_connections</code> to initialize the toolkit.

### 3.1.10.19. get\_toolkit\_report\_types (::quartus::external\_memif\_toolkit)

The following table displays information for the `get_toolkit_report_types` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210		
<b>Syntax</b>	<code>get_toolkit_report_types [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div>Returns a TCL list of supported toolkit report types. These reports are general toolkit reports, not connection specific reports.</div>		
<b>Example Usage</b>	<pre>project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  puts "Supported toolkit report types: [get_toolkit_report_types]"  terminate_connections  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run <code>link_project_to_device</code> to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use <code>initialize_connections</code> to initialize the toolkit.

### 3.1.10.20. initialize\_connections (::quartus::external\_memif\_toolkit)

The following table displays information for the `initialize_connections` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
<b>Syntax</b>	initialize_connections [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Initializes the internal data structures of the toolkit. This command must be run before any other toolkit commands are executed.		
<b>Example Usage</b>	project_open dut  initialize_connections  terminate_connections  project_close		
continued...			

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Unable to find active revision. Specify an active revision name using <code>set_current_revision &lt;revision name&gt;</code> .
	TCL_ERROR	1	ERROR: The current project specifies a part that cannot be loaded. Verify the device family is correctly installed.
	TCL_ERROR	1	ERROR: The connection to the hardware drivers could not be established.
	TCL_ERROR	1	ERROR: Illegal connections detected
	TCL_ERROR	1	ERROR: The current project settings are invalid. Verify that all project settings are valid.
	TCL_ERROR	1	ERROR: The JTAG Debug Information (.jdi) file called <i>&lt;string&gt;</i> could not be found. Ensure this file exists or run <code>quartus_asm</code> to create it.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Could not initialize System Console. <i>&lt;string&gt;</i>
	TCL_ERROR	1	ERROR: Toolkit has already been initialized. Use <code>terminate_connections</code> to de-initialize the toolkit.

### 3.1.10.21. `link_project_to_device (::quartus::external_memif_toolkit)`

The following table displays information for the `link_project_to_device` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210		
<b>Syntax</b>	<code>link_project_to_device [-h   -help] [-long_help] -device_name &lt;name&gt; -hardware_name &lt;name&gt; [-jdi_file &lt;name&gt; ] [-sof_file &lt;name&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-device_name &lt;name&gt;</code>	The name of the device to connect to	
	<code>-hardware_name &lt;name&gt;</code>	The name of the hardware connection to use	
	<code>-jdi_file &lt;name&gt;</code>	Specifies the JTAG Debugging Information file to use when creating the design link.	
	<code>-sof_file &lt;name&gt;</code>	Specifies the SOF file to use when creating the design link.	
<b>Description</b>	Links the currently opened project to the specified target device on the specified hardware.		
<b>Example Usage</b>	<pre>project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  terminate_connections  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
<i>continued...</i>			

TCL_OK	0	INFO: Operation successful
TCL_ERROR	1	ERROR: An error occurred while linking the project to the device.
TCL_ERROR	1	ERROR: No device name called <i>&lt;string&gt;</i> could be found on hardware named <i>&lt;string&gt;</i> .
TCL_ERROR	1	ERROR: No hardware name called <i>&lt;string&gt;</i> could be found.
TCL_ERROR	1	ERROR: The JTAG Debug Information (.jdi) file called <i>&lt;string&gt;</i> could not be found. Ensure this file exists or run quartus_asm to create it.
TCL_ERROR	1	ERROR: A JTAG Debug Information (.jdi) file or a SOF file (.sof) is required for linking a project to a device, but no file was supplied. Ensure this file exists or run quartus_asm to create it.
TCL_ERROR	1	ERROR: The currently opened project has already been linked to a device. Use unlink_project_from_device to unlink the project from a device.
TCL_ERROR	1	ERROR: The SOF (.sof) file called <i>&lt;string&gt;</i> could not be found. Ensure this file exists or run quartus_asm to create it.
TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.22. read\_setting (::quartus::external\_memif\_toolkit)

The following table displays information for the read\_setting Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210	
<b>Syntax</b>	<code>read_setting [-h   -help] [-long_help] -id &lt;name&gt; [-index &lt;index&gt; ] [-rank &lt;rank&gt; ] -type &lt;type&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-id &lt;name&gt;</code>	The connection ID to communicate with
	<code>-index &lt;index&gt;</code>	Index of the target setting within the connection
	<code>-rank &lt;rank&gt;</code>	Rank (shadow register) of the target setting within the connection
	<code>-type &lt;type&gt;</code>	The type of setting on the EMIF interface
<b>Description</b>	Reads the specified memory interface setting for the specified target connection.	
<b>Example Usage</b>	<pre>project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  foreach conn [get_connections] {     foreach type [get_setting_types -id \$conn] {         read_setting -id \$conn -type \$type -index 0     } }</pre>	
continued...		

	<pre>         terminate_connections         project_close       </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <i>&lt;string&gt;</i> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The specified setting type <i>&lt;string&gt;</i> is illegal. Please specify a valid setting type. The list of valid types is available by running <code>get_setting_types</code> .
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run <code>link_project_to_device</code> to link a project to a device.
	TCL_ERROR	1	ERROR: The specified setting is outside the legal range.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use <code>initialize_connections</code> to initialize the toolkit.

### 3.1.10.23. `reindex_connections (::quartus::external_memif_toolkit)`

The following table displays information for the `reindex_connections` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
<b>Syntax</b>	reindex_connections [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Reinitializes the list of known hardware connections.		
<b>Example Usage</b>	<pre>project_open dut initialize_connections  foreach hw_name [get_hardware_names] {     puts "Found hardware name \$hw_name" }  reindex_connections  foreach hw_name [get_hardware_names] {     puts "Found hardware name \$hw_name" }  terminate_connections  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.24. reset\_tg2 (::quartus::external\_memif\_toolkit)

The following table displays information for the `reset_tg2` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
<b>Syntax</b>	reset_tg2 [-h   -help] [-long_help] -resetn_id <resetn_id> -tg2_id <tg2_id>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-resetn_id <resetn_id>	Connection ID of the resetn	
	-tg2_id <tg2_id>	Connection ID of the Traffic Generator 2.0 associated with this interface	
<b>Description</b>	Resets a Traffic Generator 2.0 instance.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.25. run\_connection\_command (::quartus::external\_memif\_toolkit)

The following table displays information for the `run_connection_command` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210	
<b>Syntax</b>	run_connection_command [-h   -help] [-long_help] -command_name <name> -id <name> [-payload <name> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-command_name <name>	The command name to execute
	-id <name>	The connection ID to communicate with
	-payload <name>	TCL list of parameter data to use when executing the command
<b>Description</b>	Executes a command of the specified type and for the connection id.	
<b>Example Usage</b>	<pre>project_open dut initialize_connections set hw_name [lindex [get_hardware_names] 0]</pre>	

continued...

*continued...*

	<pre> set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  set conn [lindex [get_connections -type emif] 0] establish_connection -id \$conn  run_connection_command -id \$conn -command_name nop  terminate_connections  project_close </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: An error occurred trying to execute the command <i>&lt;string&gt;</i> for the target <i>&lt;string&gt;</i> .
	TCL_ERROR	1	ERROR: The specified command name <i>&lt;string&gt;</i> is illegal. The legal command names are: <i>&lt;string&gt;</i> .
	TCL_ERROR	1	ERROR: The specified connection ID <i>&lt;string&gt;</i> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: No information about the report was queried. Please specify one query parameter.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.26. set\_active\_interface (::quartus::external\_memif\_toolkit)

The following table displays information for the set\_active\_interface Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
<b>Syntax</b>	set_active_interface [-h   -help] [-long_help] -id <i>&lt;name&gt;</i> -interface_id <i>&lt;name&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-id <i>&lt;name&gt;</i>	The connection ID to communicate with	
	-interface_id <i>&lt;name&gt;</i>	The interface ID to communicate with	
<b>Description</b>	Selects the active interface to debug for the specified connection id.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <i>&lt;string&gt;</i> is illegal. Please specify a valid connection ID.
continued...			

	TCL_ERROR	1	ERROR: The specified interface ID <string> is illegal. Please specify a valid interface ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.27. set\_stress\_pattern (::quartus::external\_memif\_toolkit)

The following table displays information for the set\_stress\_pattern Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210		
<b>Syntax</b>	<code>set_stress_pattern [-h   -help] [-long_help] -id &lt;name&gt; -value &lt;value&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-id &lt;name&gt;</code>	The connection ID to communicate with	
	<code>-value &lt;value&gt;</code>	1 to enable stress pattern in calibration, 0 to disable	
<b>Description</b>	Enable or disable the stress pattern for future calibrations.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <i>&lt;string&gt;</i> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run <code>link_project_to_device</code> to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use <code>initialize_connections</code> to initialize the toolkit.

### 3.1.10.28. terminate\_connection (::quartus::external\_memif\_toolkit)

The following table displays information for the terminate\_connection Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
<b>Syntax</b>	terminate_connection [-h   -help] [-long_help] -id <name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-id <name>	The connection ID to communicate with	
<b>Description</b>	Terminates a connection to a connection target.		
continued...			

<b>Example Usage</b>	<pre> project_open dut initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  set conn [lindex [get_connections -type emif] 0] establish_connection -id \$conn  terminate_connection -id \$conn  terminate_connections  project_close </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Connection ID <string> could not be terminated because the connection was not established.
	TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.29. terminate\_connections (::quartus::external\_memif\_toolkit)

The following table displays information for the terminate\_connections Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::external_memif_toolkit</a> on page 210		
Syntax	terminate_connections [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Deletes the internal data structures of the toolkit.		
Example Usage	<pre>project_open dut  puts "Preparing to initialize connections" initialize_connections  puts "Preparing to delete connections" terminate_connections  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.30. unlink\_project\_from\_device (::quartus::external\_memif\_toolkit)

The following table displays information for the unlink\_project\_from\_device Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::external_memif_toolkit on page 210		
<b>Syntax</b>	unlink_project_from_device [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Unlinks the currently opened project from the currently linked target device on the specified hardware.		
<b>Example Usage</b>	<pre>project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  unlink_project_from_device  link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  terminate_connections  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The JTAG Debug Information (.jdi) file called <string> could not be found. Ensure this file exists or run quartus_asm to create it.
	TCL_ERROR	1	ERROR: The currently opened project has not been linked to a device. Run link_project_to_device to link a project to a device.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.10.31. write\_connection\_target\_report (::quartus::external\_memif\_toolkit)

The following table displays information for the write\_connection\_target\_report Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::external_memif_toolkit</code> on page 210		
<b>Syntax</b>	<code>write_connection_target_report [-h   -help] [-long_help] -file &lt;name&gt; -id &lt;name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-file &lt;name&gt;</code>	File name of report to write	
	<code>-id &lt;name&gt;</code>	The connection ID to communicate with	
<i>continued...</i>			

<b>Description</b>	Writes the reports for the given connection target to a filename.		
<b>Example Usage</b>	<pre> project_open dut  initialize_connections  set hw_name [lindex [get_hardware_names] 0] set dev_name [lindex [get_device_names -hardware_name \$hw_name] 0] link_project_to_device -hardware_name \$hw_name -device_name \$dev_name -sof_file dut.sof  set conn [lindex [get_connections] 0] write_connection_target_report -id \$conn -file report.rpt  terminate_connections  project_close </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified connection ID <string> is illegal. Please specify a valid connection ID.
	TCL_ERROR	1	ERROR: No reports for connection ID <string> have been generated. Please run create_report_for_target before writing reports to file.
	TCL_ERROR	1	ERROR: Toolkit has not been initialized. Use initialize_connections to initialize the toolkit.

### 3.1.11. ::quartus::fif

The following table displays information for the **::quartus::fif** Tcl package:

<b>Tcl Package and Version</b>	::quartus::fif 1.0
<b>Description</b>	This package contains the set of Tcl functions for using the Fault Injection File (FIF) Driver.
<b>Availability</b>	This package is loaded by default in the following executable:  quartus_fif
<b>Tcl Commands</b>	<a href="#">check (::quartus::fif)</a> on page 233 <a href="#">dump (::quartus::fif)</a> on page 234 <a href="#">dump_cram_frame (::quartus::fif)</a> on page 234 <a href="#">dump_mem (::quartus::fif)</a> on page 235 <a href="#">dump_pr_bitstream (::quartus::fif)</a> on page 235 <a href="#">generate (::quartus::fif)</a> on page 236 <a href="#">get_frame_count (::quartus::fif)</a> on page 236 <a href="#">get_frame_size (::quartus::fif)</a> on page 237 <a href="#">get_sector_information_sdm_based_fpga (::quartus::fif)</a> on page 237 <a href="#">get_sensitive_location (::quartus::fif)</a> on page 238 <a href="#">get_sensitive_location_sdm_based_fpga (::quartus::fif)</a> on page 238 <a href="#">setup (::quartus::fif)</a> on page 239 <a href="#">setup_sdm_based_fpga (::quartus::fif)</a> on page 239 <a href="#">terminate (::quartus::fif)</a> on page 240

#### 3.1.11.1. check (::quartus::fif)

The following table displays information for the **check** Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::fif</a> on page 233
<b>Syntax</b>	check [-h   -help] [-long_help] -frame <frame> -index <index>
continued...	

Arguments	-h   -help		Short help
	-long_help		Long help with examples and possible return values
	-frame <frame>		CRAM frame ID
	-index <index>		CRAM frame bit location
Description	Check is the specified location contains sensitive bit. Returns 1, if the specified location contains sensitive bit. Returns 0, otherwise.		
Example Usage	check -frame 3 -index 100		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.

### 3.1.11.2. dump (::quartus::fif)

The following table displays information for the dump Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::fif</a> on page 233		
<b>Syntax</b>	dump [-h   -help] [-long_help] [-all]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-all	Option to display all information	
<b>Description</b>	Dump FIF driver contents.		
<b>Example Usage</b>	dump dump -all		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver operation failed with error <i>&lt;string&gt;</i> .
	TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.

### 3.1.11.3. dump\_cram\_frame (::quartus::fif)

The following table displays information for the dump\_cram\_frame Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::fif</a> on page 233		
<b>Syntax</b>	dump_cram_frame [-h   -help] [-long_help] [-all] -frame <i>&lt;frame&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
continued...			

	-all		Option to display all information
	-frame <frame>		CRAM Frame ID
<b>Description</b>	Dump CRAM frame information.		
<b>Example Usage</b>	dump_cram_frame -frame 3		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver operation failed with error <string>.
	TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.

#### 3.1.11.4. dump\_mem (::quartus::fif)

The following table displays information for the dump\_mem Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::fif on page 233		
<b>Syntax</b>	dump_mem [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help		Short help
	-long_help		Long help with examples and possible return values
<b>Description</b>	Dump memory usage.		
<b>Example Usage</b>	dump_mem		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

#### 3.1.11.5. dump\_pr\_bitstream (::quartus::fif)

The following table displays information for the dump\_pr\_bitstream Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::fif on page 233		
<b>Syntax</b>	dump_pr_bitstream [-h   -help] [-long_help] -id <id>		
<b>Arguments</b>	-h   -help		Short help
	-long_help		Long help with examples and possible return values
	-id <id>		Static PR Bitstream ID
<b>Description</b>	Dump static PR bitstream.		
<b>Example Usage</b>	dump_pr_bitstream -id 3		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
continued...			

TCL_ERROR	1	ERROR: FIF driver operation failed with error <i>&lt;string&gt;</i> .
TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.
TCL_ERROR	1	ERROR: Parameter <i>&lt;string&gt;</i> has exceeded range.
TCL_ERROR	1	ERROR: <i>&lt;string&gt;</i> mismatch. <i>&lt;string&gt;</i>

### 3.1.11.6. generate (::quartus::fif)

The following table displays information for the generate Tcl command:

Tcl Package and Version	Belongs to ::quartus::fif on page 233		
Syntax	generate [-h   -help] [-long_help] [-error_count <error_count> ] [-error_index <error_index> ] -frame <frame> -output <output>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-error_count <error_count>	Number of errors to be injected	
	-error_index <error_index>	CRAM frame error bit locations	
	-frame <frame>	CRAM frame ID	
	-output <output>	Output file name	
Description	Generates PR RBF file. Specifies the 'error_count' and 'error_index' to generate a PR RBF file with fault injected. Otherwise, the command will generate a PR RBF file without fault for external scrubbing.		
Example Usage	generate -frame 3 -output scrub.rbf generate -frame 3 -output inject.rbf -error_count 1 -error_index 100 generate -frame 3 -output inject.rbf -error_count 2 -error_index 100 200		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver operation failed with error <string>.
	TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.
	TCL_ERROR	1	ERROR: Missing parameter <string>.
	TCL_ERROR	1	ERROR: Parameter <string> has exceeded range.
	TCL_ERROR	1	ERROR: <string> mismatch. <string>
	TCL_ERROR	1	ERROR: Error writing to file (<string>).

### 3.1.11.7. get\_frame\_count (::quartus::fif)

The following table displays information for the get\_frame\_count Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::fif on page 233	
<b>Syntax</b>	get_frame_count [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
continued...		

	-long_help		Long help with examples and possible return values
<b>Description</b>	Returns total frame count.		
<b>Example Usage</b>	get_frame_count		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver operation failed with error <string>.
	TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.

### 3.1.11.8. get\_frame\_size (::quartus::fif)

The following table displays information for the get\_frame\_size Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::fif</a> on page 233		
<b>Syntax</b>	get_frame_size [-h   -help] [-long_help] -frame <i>&lt;frame&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-frame <i>&lt;frame&gt;</i>	CRAM frame ID	
<b>Description</b>	Returns frame size of the specific frame.		
<b>Example Usage</b>	get_frame_size -frame 3		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver operation failed with error <i>&lt;string&gt;</i> .
	TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.

### 3.1.11.9. get\_sector\_information\_sdm\_based\_fpga (::quartus::fif)

The following table displays information for the get\_sector\_information\_sdm\_based\_fpga Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::fif</code> on page 233		
<b>Syntax</b>	<code>get_sector_information_sdm_based_fpga [-h   -help] [-long_help] -sector_index &lt;sector_index&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-sector_index &lt;sector_index&gt;</code>	Sector Index	
<i>continued...</i>			

<b>Description</b>	Query information about sector with given index number.		
<b>Example Usage</b>	get_sector_information_sdm_based_fpga -sector_index 25		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver operation failed with error <string>.
	TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.
	TCL_ERROR	1	ERROR: Missing parameter <string>.

### 3.1.11.10. get\_sensitive\_location (::quartus::fif)

The following table displays information for the get\_sensitive\_location Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::fif</a> on page 233		
<b>Syntax</b>	get_sensitive_location [-h   -help] [-long_help] [-count <count> ] -frame <frame>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-count <count>	Option to return specific number of indexes	
	-frame <frame>	CRAM frame ID	
<b>Description</b>	Returns a list of sensitive locations of the specific frame.		
<b>Example Usage</b>	get_sensitive_location -frame 3 get_sensitive_location -frame 3 -count 10		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver operation failed with error <string>.
	TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.

### 3.1.11.11. get\_sensitive\_location\_sdm\_based\_fpga (::quartus::fif)

The following table displays information for the get\_sensitive\_location\_sdm\_based\_fpga Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::fif</code> on page 233	
<b>Syntax</b>	<code>get_sensitive_location_sdm_based_fpga [-h   -help] [-long_help] -bit_index &lt;bit_index&gt; -frame_index &lt;frame_index&gt; -sector_index &lt;sector_index&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
continued...		

	-bit_index <bit_index>	Bit Index	
	-frame_index <frame_index>	Frame Index	
	-sector_index <sector_index>	Sector Index	
Description	Check if the bit is sensitive or not at specific location.		
	get_sensitive_location_sdm_based_fpga -sector_index 25 -frame_index 4 -bit_index 3		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver operation failed with error <string>.
	TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.

### 3.1.11.12. setup (::quartus::fif)

The following table displays information for the setup Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::fif</a> on page 233		
<b>Syntax</b>	setup [-h   -help] [-long_help] -fif <fif> -rbf <rbf>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-fif <fif>	FIF filename	
	-rbf <rbf>	RBF filename	
<b>Description</b>	Setup FIF driver.		
<b>Example Usage</b>	setup -fif test.fif -rbf test.rbf		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver operation failed with error <string>.
	TCL_ERROR	1	ERROR: FIF driver has already been setup.

### 3.1.11.13. setup\_sdm\_based\_fpga (::quartus::fif)

The following table displays information for the setup\_sdm\_based\_fpga Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::fif on page 233	
<b>Syntax</b>	setup_sdm_based_fpga [-h   -help] [-long_help] -fif <fif>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values

*continued...*

	<code>-fif &lt;fif&gt;</code>		FIF filename
<b>Description</b>	Setup FIF driver for SDM based FPGA.		
<b>Example Usage</b>	<code>setup_sdm_based_fpga -fif test.fif</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver operation failed with error <string>.
	TCL_ERROR	1	ERROR: FIF driver has already been setup.
	TCL_ERROR	1	ERROR: FIF file is not compatible.

### 3.1.11.14. terminate (::quartus::fif)

The following table displays information for the terminate Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::fif</a> on page 233		
<b>Syntax</b>	terminate [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Terminate FIF driver.		
<b>Example Usage</b>	terminate		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FIF driver has not been setup. Use setup command to setup the FIF driver.

### 3.1.12. ::quartus::flng

The following table displays information for the **::quartus::flng** Tcl package:

<b>Tcl Package and Version</b>	<code>::quartus::flng 1.0</code>
<b>Description</b>	This package contains no general description.
<b>Availability</b>	<p>This package is loaded by default in the following executables:</p> <pre> hdb_debug qpro qpro_sh quartus quartus_cdb quartus_eda quartus_fit quartus_ipgenerate quartus_map quartus_sh quartus_syn quartus_tlg qunb </pre>
<i>continued...</i>	

<b>Tcl Commands</b>	<p> <code>flng::add_object (::quartus::flng)</code> on page 241  <code>flng::add_property (::quartus::flng)</code> on page 242  <code>flng::bind_flow (::quartus::flng)</code> on page 242  <code>flng::delete_object (::quartus::flng)</code> on page 243  <code>flng::get_default_flow_run_name (::quartus::flng)</code> on page 243  <code>flng::get_flow_list (::quartus::flng)</code> on page 244  <code>flng::get_next_available_id (::quartus::flng)</code> on page 244  <code>flng::get_object (::quartus::flng)</code> on page 245  <code>flng::get_objects (::quartus::flng)</code> on page 245  <code>flng::get_option (::quartus::flng)</code> on page 246  <code>flng::get_property (::quartus::flng)</code> on page 246  <code>flng::get_task_command (::quartus::flng)</code> on page 247  <code>flng::get_task_status_property (::quartus::flng)</code> on page 247  <code>flng::init_repository (::quartus::flng)</code> on page 248  <code>flng::list_properties (::quartus::flng)</code> on page 249  <code>flng::monitor_flow (::quartus::flng)</code> on page 249  <code>flng::run_flow (::quartus::flng)</code> on page 250  <code>flng::run_flow_command (::quartus::flng)</code> on page 250  <code>flng::set_option (::quartus::flng)</code> on page 251  <code>flng::set_property (::quartus::flng)</code> on page 252  <code>flng::write_task_assignment_digest (::quartus::flng)</code> on page 252  <code>flng::write_task_checkpoint_written (::quartus::flng)</code> on page 253  <code>flng::write_task_finished (::quartus::flng)</code> on page 254  <code>flng::write_task_started (::quartus::flng)</code> on page 255 </p>
---------------------	---

### 3.1.12.1. flng::add\_object (::quartus::flng)

The following table displays information for the `flng::add_object` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	flng::add_object [-h   -help] [-long_help] [-name <i>&lt;name&gt;</i> ] [-number <i>&lt;number&gt;</i> ] -type <i>&lt;type&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name&gt;</i>	The name of the new flow or task object.	
	-number <i>&lt;number&gt;</i>	The numeric part of the new FLNG object's name.	
	-type <i>&lt;type&gt;</i>	The type of the new FLNG object.	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to add object.
	TCL_ERROR	1	ERROR: Invalid object type ' <i>&lt;string&gt;</i> '.
	TCL_ERROR	1	ERROR: Object name is needed.
	TCL_ERROR	1	ERROR: Object number is needed.

### 3.1.12.2. flng::add\_property (::quartus::flng)

The following table displays information for the flng::add\_property Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	flng::add_property [-h   -help] [-long_help] -name <i>&lt;name&gt;</i> -object <i>&lt;object&gt;</i> -value <i>&lt;value&gt;</i> [-value_type <i>&lt;value_type&gt;</i> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name&gt;</i>	property name.	
	-object <i>&lt;object&gt;</i>	The object to which the new property belongs.	
	-value <i>&lt;value&gt;</i>	property value.	
	-value_type <i>&lt;value_type&gt;</i>	property value type.	
<b>Description</b>	Add a property (a name/value pair) to a generic object		
<b>Example Usage</b>	flng::add_property -object <i>&lt;object&gt;</i> -name <i>&lt;property name&gt;</i> -value <i>&lt;property value&gt;</i> -value_type <i>&lt;value type&gt;</i>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to add object property: ' <i>&lt;string&gt;</i> '.
	TCL_ERROR	1	ERROR: Invalid object '%s'.
	TCL_ERROR	1	ERROR: Invalid property value.
	TCL_ERROR	1	ERROR: Invalid property value type.
	TCL_ERROR	1	ERROR: Property ' <i>&lt;string&gt;</i> ' already exists. Cannot be added.

### 3.1.12.3. flng::bind\_flow (::quartus::flng)

The following table displays information for the flng::bind\_flow Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240	
<b>Syntax</b>	flng::bind_flow [-h   -help] [-long_help] [-end <i>&lt;end&gt;</i> ] -flow <i>&lt;flow&gt;</i> [-start <i>&lt;start&gt;</i> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-end <i>&lt;end&gt;</i>	The name of the last task to bind in a flow.
	-flow <i>&lt;flow&gt;</i>	The name of the flow to bind qsf.
	-start <i>&lt;start&gt;</i>	The name of the first task to bind in a flow
<b>Description</b>	This command currently contains no help description.	
continued...		

<b>Example Usage</b>	flng::bind_flow -flow flowname		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

#### 3.1.12.4. flng::delete\_object (::quartus::flng)

The following table displays information for the flng::delete\_object Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	flng::delete_object [-h   -help] [-long_help] -object <i>&lt;object&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-object <i>&lt;object&gt;</i>	Object to delete	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to delete object.

#### 3.1.12.5. flng::get\_default\_flow\_run\_name (::quartus::flng)

The following table displays information for the flng::get\_default\_flow\_run\_name Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	flng::get_default_flow_run_name [-h   -help] [-long_help] -flow <i>&lt;flow&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-flow <i>&lt;flow&gt;</i>	The flow name	
<b>Description</b>	Get the default flow run name.		
<b>Example Usage</b>	flng::get_default_flow_run		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to get object.

### 3.1.12.6. flng::get\_flow\_list (::quartus::flng)

The following table displays information for the flng::get\_flow\_list Tcl command:

Tcl Package and Version	Belongs to ::quartus::flng on page 240		
Syntax	flng::get_flow_list [-h   -help] [-long_help] -project <project> -project_path <project_path> -revision <revision>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-project <project>	The name of the project	
	-project_path <project_path>	The project path	
	-revision <revision>	The name of the revision	
Description	This command currently contains no help description.		
Example Usage	flng::get_flow_list -project project -revision revision		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.12.7. flng::get\_next\_available\_id (::quartus::flng)

The following table displays information for the flng::get\_next\_available\_id Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	flng::get_next_available_id [-h   -help] [-long_help] -type <i>&lt;type&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-type <i>&lt;type&gt;</i>	The type of the FLNG object.	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to get next available id
	TCL_ERROR	1	ERROR: Invalid object type ' <i>&lt;string&gt;</i> '.

### 3.1.12.8. flng::get\_object (::quartus::flng)

The following table displays information for the `flng::get_object` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::flng</a> on page 240		
Syntax	flng::get_object [-h   -help] [-long_help] [-name <name> ] [-number <number> ] [-properties <properties> ] -type <type>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <name>	The literal name of the objects to be retrieved.	
	-number <number>	The numerical part of the name of the objects to be retrieved.	
	-properties <properties>	Find object matching the specified properties.	
	-type <type>	The type of objects to be retrieved.	
Description	Find a flow engine object matching type and name.		
Example Usage	flng::get_object -type task -name synthesis		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to get object.

### 3.1.12.9. flng::get\_objects (::quartus::flng)

The following table displays information for the `flng::get_objects` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::flng</a> on page 240		
Syntax	flng::get_objects [-h   -help] [-long_help] [-name <name> ] [-number <number> ] [-properties <properties> ] -type <type>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <name>	The literal name of the objects to be retrieved.	
	-number <number>	The numerical part of the name of the objects to be retrieved.	
	-properties <properties>	Include only objects that the specified properties	
	-type <type>	The type of objects to be retrieved.	
Description	Get a list of specific existing Flow Engine objects		
Example Usage	flng::get_objects -type task		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Fail to get objects.

### 3.1.12.10. flng::get\_option (::quartus::flng)

The following table displays information for the flng::get\_option Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::flng</code> on page 240		
<b>Syntax</b>	<code>flng::get_option [-h   -help] [-long_help] -name &lt;name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name &lt;name&gt;</code>	option name.	
<b>Description</b>	Get option for the Flow Engine system		
<b>Example Usage</b>	<code>flng::get_option -name &lt;option name&gt;</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FLOW option ' <i>&lt;string&gt;</i> ' is invalid.

### 3.1.12.11. flng::get\_property (::quartus::flng)

The following table displays information for the flng::get\_property Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	flng::get_property [-h   -help] [-long_help] -name <i>&lt;name&gt;</i> -object <i>&lt;object&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name&gt;</i>	property name.	
	-object <i>&lt;object&gt;</i>	The object to which the property belongs.	
<b>Description</b>	Get the value of a generic object's property.		
<b>Example Usage</b>	flng::get_property -object <i>&lt;object&gt;</i> -name <i>&lt;property name&gt;</i>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid object '%s'.
	TCL_ERROR	1	ERROR: Property ' <i>&lt;string&gt;</i> ' is invalid.

### 3.1.12.12. flng::get\_task\_command (::quartus::flng)

The following table displays information for the `flng::get_task_command` Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::flng</code> on page 240		
Syntax	<code>flng::get_task_command [-h   -help] [-long_help] -task_instance &lt;task_instance&gt;</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-task_instance &lt;task_instance&gt;</code>	The name of the task_instance	
Description	This command currently contains no help description.		
Example Usage	<code>flng::get_task_command -task_instance task_instance</code>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.12.13. flng::get\_task\_status\_property (::quartus::flng)

The following table displays information for the `flng::get_task_status_property` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240	
<b>Syntax</b>	<code>flng::get_task_status_property [-h   -help] [-long_help] -property_name &lt;property_name&gt; -task_name &lt;ip_generation tile_ip_generation design_analysis logic_generation pcc_generation create_pcc_ip_projects pcc_run_all_dynamic_tasks analysis_and_synthesis analysis_and_elaboration synthesis sta_early eda_netlist_writer fitter fitter_implement fitter_plan fitter_place fitter_route fitter_fastforward_timing fitter_retime fitter_finalize sta_signoff power_analysis assembler sasic_handoff_flow countermeasures_flow rdm_handoff_flow ds_tool dr_tool simulation analysis_and_elaboration_lint&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-property_name &lt;property_name&gt;</code>	The name of the property to lookup
	<code>-task_name &lt;ip_generation tile_ip_generation design_analysis logic_generation pcc_generation create_pcc_ip_projects pcc_run_all_dynamic_tasks analysis_and_synthesis analysis_and_elaboration synthesis sta_early eda_netlist_writer fitter fitter_implement fitter_plan fitter_place fitter_route fitter_fastforward_timing fitter_retime fitter_finalize sta_signoff power_analysis assembler sasic_handoff_flow countermeasures_flow rdm_handoff_flow ds_tool dr_tool simulation analysis_and_elaboration_lint&gt;</code>	The name of the task
<b>continued...</b>		

<b>Description</b>	<p>Returns the task status property of the specified task. The valid property_name values are:</p> <ul style="list-style-type: none"> <li><b>status:</b> The status the task. The possible status are: no_status, scheduled, running and done.</li> <li><b>success:</b> If task status is done, success indicates whether it completed successfully.</li> <li><b>errors:</b> Returns the number of error messages.</li> <li><b>critical_warnings:</b> Returns the number of critical warning messages.</li> <li><b>elapsed_time:</b> Returns number seconds it the task has taken.</li> <li><b>id</b> A internal id for the object</li> <li><b>run</b> The name of the run</li> <li><b>name</b> A user friendly name of the object</li> <li><b>process_id</b> The process id that running the task</li> <li><b>hostname</b> The name of the machine running the task</li> <li><b>percent</b> The percent completed</li> <li><b>start_time</b> The time the task started</li> <li><b>last_updated</b> The time the task posted a progress update.</li> <li><b>end_time</b> The time the task finished</li> <li><b>result</b> The result of the execution.</li> <li><b>outdated</b> Returns true if the task has been updated by either assignments or source file.</li> <li><b>dni</b> Indicates if DNI database engine was active</li> <li><b>assignment_digest</b> Internal hash of all the assignments.</li> <li><b>checkpoint</b> Indicates if a checkpoint has been written out.</li> <li><b>imported_checkpoint</b> Indicates if the checkpoint was imported</li> </ul>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid status db property name
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: No revision is currently open. Open a revision.
	TCL_ERROR	1	ERROR: No task with the specified name exists.

### 3.1.12.14. flng::init\_repository (::quartus::flng)

The following table displays information for the flng::init\_repository Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::flng</code> on page 240	
<b>Syntax</b>	<code>flng::init_repository [-h   -help] [-long_help]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
<b>Description</b>	This command currently contains no help description.	
continued...		

<b>Example Usage</b>	<code>flng::init_repository</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.12.15. flng::list\_properties (::quartus::flng)

The following table displays information for the `flng::list_properties` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	flng:: <a href="#">list_properties</a> [-h   -help] [-long_help] -object <i>&lt;object&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-object <i>&lt;object&gt;</i>	The object whose properties are returned as a list of property names.	
<b>Description</b>	Get the list of property names from a generic object		
<b>Example Usage</b>	flng:: <a href="#">list_properties</a> -object <i>&lt;object&gt;</i>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid object '%s'.

### 3.1.12.16. flng::monitor\_flow (::quartus::flng)

The following table displays information for the `flng::monitor_flow` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	flng::monitor_flow [-h   -help] [-long_help] -flow <i>&lt;flow&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-flow <i>&lt;flow&gt;</i>	The name of the flow to run.	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	flng::monitor_flow -flow flowname		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.12.17. flng::run\_flow (::quartus::flng)

The following table displays information for the flng::run\_flow Tcl command:

Tcl Package and Version	Belongs to ::quartus::flng on page 240		
Syntax	flng::run_flow [-h   -help] [-long_help] [-enable_heartbeat <enable_heartbeat> ] [-end <end> ] -flow <flow> [-print_only] [-resume] [-start <start> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-enable_heartbeat <enable_heartbeat>	Output a regular heartbeat for Quartus to monitor this flow using Monitor Mode.	
	-end <end>	The name of the last task to run in a flow.	
	-flow <flow>	The name of the flow to run.	
	-print_only	Print what will be run and do not execute.	
	-resume	Resume executing flow from where it left off.	
	-start <start>	The name of the first task to run in a flow	
Description	This command currently contains no help description.		
Example Usage	flng::run_flow -flow flowname		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.12.18. flng::run\_flow\_command (::quartus::flng)

The following table displays information for the flng::run\_flow\_command Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240	
<b>Syntax</b>	flng::run_flow_command [-h   -help] [-long_help] [-command <command> ] [-end <end> ] -flow <flow> [-print_only] [-resume] [-start <start> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-command <command>	The command is used by "Custom" flow execution
	-end <end>	The name of the last task to run in a flow.
	-flow <flow>	The name of the flow to run.
	-print_only	Print what will be run and do not execute.
	-resume	Resume executing flow from where it left off.
	-start <start>	The name of the first task to run in a flow
<b>Description</b>	This command currently contains no help description.	
continued...		

<b>Example Usage</b>	<code>flng::run_flow_command -flow flowname</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: run_flow_command with specified flow '<string>' completed successfully.
	TCL_OK	0	WARNING: Option -command should be used with Custom flow. The option is ignored.
	TCL_ERROR	1	ERROR: Option -command <command> is needed for Custom flow
	TCL_ERROR	1	ERROR: Failed to create a specified flow '<string>'.
	TCL_ERROR	1	ERROR: Failed to initialize the flow repository.
	TCL_ERROR	1	ERROR: Failed to run compilation flow <string>. The expected compilation flow name is <string> for current opened project.
	TCL_ERROR	1	ERROR: Cannot find the end task '<string>'. Specify an existing task name.
	TCL_ERROR	1	ERROR: Cannot find the flow definition for specified flow '<string>'.
	TCL_ERROR	1	ERROR: Cannot find the start task '<string>'. Specify an existing task name.
	TCL_ERROR	1	ERROR: Please open Quartus project before executing the command.
	TCL_ERROR	1	ERROR: run_flow_command with specified flow '<string>' failed: <string>.

### 3.1.12.19. flng::set\_option (::quartus::flng)

The following table displays information for the `flng::set_option` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	flng::set_option [-h   -help] [-long_help] -name <i>&lt;name&gt;</i> -value <i>&lt;value&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name&gt;</i>	option name.	
	-value <i>&lt;value&gt;</i>	option value.	
<b>Description</b>	Set options for the Flow Engine system		
<b>Example Usage</b>	flng::set_option -name <option name> -value <option value>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: FLOW option ' <i>&lt;string&gt;</i> ' is invalid.

### 3.1.12.20. flng::set\_property (::quartus::flng)

The following table displays information for the flng::set\_property Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	flng::set_property [-h   -help] [-long_help] -name <i>&lt;name&gt;</i> -object <i>&lt;object&gt;</i> -value <i>&lt;value&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name&gt;</i>	property name.	
	-object <i>&lt;object&gt;</i>	The object to which the property belongs.	
	-value <i>&lt;value&gt;</i>	property value.	
<b>Description</b>	Update property in term of name/value pair to a generic flow object		
<b>Example Usage</b>	flng::set_property -object <i>&lt;object&gt;</i> -name <i>&lt;property name&gt;</i> -value <i>&lt;property value&gt;</i>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid object '%s'.
	TCL_ERROR	1	ERROR: Property ' <i>&lt;string&gt;</i> ' is invalid.

### 3.1.12.21. flng::write\_task\_assignment\_digest (::quartus::flng)

The following table displays information for the flng::write\_task\_assignment\_digest Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flng</a> on page 240		
<b>Syntax</b>	<code>flng::write_task_assignment_digest [-h   -help] [-long_help] [-digest &lt;digest&gt; ] -task_name &lt;ip_generation tile_ip_generation design_analysis logic_generation pcc_generation create_pcc_ip_projects pcc_run_all_dynamic_tasks analysis_and_synthesis analysis_and_elaboration synthesis sta_early eda_netlist_writer fitter fitter_implement fitter_plan fitter_place fitter_route fitter_fastforward_timing fitter_retime fitter_finalize sta_signoff power_analysis assembler sasic_handoff_flow countermeasures_flow rdm_handoff_flow ds_tool dr_tool simulation analysis_and_elaboration_lint&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-digest &lt;digest&gt;</code>	The assignment digest. If not specified, gets current digest.	
	<code>-task_name &lt;ip_generation tile_ip_generation design_analysis logic_generation pcc_generation create_pcc_ip_projects pcc_run_all_dynamic_tasks analysis_and_synthesis analysis_and_elaboration synthesis sta_early eda_netlist_writer fitter fitter_implement fitter_plan fitter_place fitter_route fitter_fastforward_timing fitter_retime </code>	The name of the task	
<b>continued...</b>			

	<i>fitter_finalize sta_signoff  power_analysis assembler  sasic_handoff_flow  countermeasures_flow  rdm_handoff_flow ds_tool dr_tool  simulation  analysis_and_elaboration_lint&gt;</i>		
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: No revision is currently open. Open a revision.
	TCL_ERROR	1	ERROR: No task with the specified name exists.
	TCL_ERROR	1	ERROR: Unable to access status db

### 3.1.12.22. flng::write\_task\_checkpoint\_written (::quartus::flng)

The following table displays information for the  
flng::write\_task\_checkpoint\_written Tcl command:

Tcl Package and Version	Belongs to ::quartus::flng on page 240	
Syntax	flng::write_task_checkpoint_written [-h   -help] [-long_help] [-checkpoint <checkpoint> ] -task_name <ip_generation tile_ip_generation design_analysis logic_generation pcc_generation create_pcc_ip_projects pcc_run_all_dynamic_tasks analysis_and_synthesis analysis_and_elaboration synthesis sta_early eda_netlist_writer fitter fitter_implement fitter_plan fitter_place fitter_route fitter_fastforward_timing fitter_retime fitter_finalize sta_signoff power_analysis assembler sasic_handoff_flow countermeasures_flow rdm_handoff_flow ds_tool dr_tool simulation analysis_and_elaboration_lint>	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-checkpoint <checkpoint>	name of checkpoint that has been written.
	-task_name <ip_generation tile_ip_generation design_analysis logic_generation pcc_generation create_pcc_ip_projects pcc_run_all_dynamic_tasks analysis_and_synthesis analysis_and_elaboration synthesis sta_early eda_netlist_writer fitter fitter_implement fitter_plan fitter_place fitter_route fitter_fastforward_timing fitter_retime fitter_finalize sta_signoff power_analysis assembler sasic_handoff_flow countermeasures_flow rdm_handoff_flow ds_tool dr_tool simulation analysis_and_elaboration_lint>	The name of the task
continued...		

<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Failed to write to status db.
	TCL_ERROR	1	ERROR: No revision is currently open. Open a revision.
	TCL_ERROR	1	ERROR: No task with the specified name exists.
	TCL_ERROR	1	ERROR: Unable to access status db

### 3.1.12.23. flng::write\_task\_finished (::quartus::flng)

The following table displays information for the flng::write\_task\_finished Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::flng on page 240	
<b>Syntax</b>	<pre>flng::write_task_finished [-h   -help] [-long_help] [-critical_warnings &lt;critical_warnings&gt; ] -dni &lt;dni&gt; [-errors &lt;errors&gt; ] -success &lt;success&gt; -task &lt;ip_generation tile_ip_generation design_analysis logic_generation pcc_generation create_pcc_ip_projects pcc_run_all_dynamic_tasks analysis_and_synthesis analysis_and_elaboration synthesis sta_early eda_netlist_writer fitter fitter_implement fitter_plan fitter_place fitter_route fitter_fastforward_timing fitter_retime fitter_finalize sta_signoff power_analysis assembler asic_handoff_flow countermeasures_flow rdm_handoff_flow ds_tool dr_tool simulation analysis_and_elaboration_lint&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-critical_warnings <critical_warnings>	Set critical warnings message count
	-dni <dni>	Set to 1 if task runs in dni
	-errors <errors>	Set error message count
	-success <success>	Set to 1 if task finished successfully
	-task <ip_generation tile_ip_generation design_analysis logic_generation pcc_generation create_pcc_ip_projects pcc_run_all_dynamic_tasks analysis_and_synthesis analysis_and_elaboration synthesis sta_early eda_netlist_writer fitter fitter_implement fitter_plan fitter_place fitter_route fitter_fastforward_timing fitter_retime fitter_finalize sta_signoff power_analysis assembler asic_handoff_flow countermeasures_flow rdm_handoff_flow ds_tool dr_tool simulation analysis_and_elaboration_lint>	Specifies a task name
continued...		

<b>Description</b>	<pre>flng::write_task_finished -task analysis_and_synthesis -success 1 -errors 0 -critical_warnings 0 -dni 1</pre>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Cannot process -critical_warnigns argument.
	TCL_ERROR	1	ERROR: Cannot process -dni argument. Value should be 0 or 1
	TCL_ERROR	1	ERROR: Cannot process -errors argument.
	TCL_ERROR	1	ERROR: Cannot process -success argument. Value should be 0 or 1
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: No revision is currently open. Open a revsion.
	TCL_ERROR	1	ERROR: No task with the specified name exists.
	TCL_ERROR	1	ERROR: Unable to access status db

### 3.1.12.24. flng::write\_task\_started (::quartus::flng)

The following table displays information for the flng::write\_task\_started Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::flng on page 240	
<b>Syntax</b>	<pre>flng::write_task_started [-h   -help] [-long_help] -dni &lt;dni&gt; -task &lt;ip_generation tile_ip_generation design_analysis logic_generation pcc_generation create_pcc_ip_projects pcc_run_all_dynamic_tasks analysis_and_synthesis analysis_and_elaboration synthesis sta_early eda_netlist_writer fitter fitter_implement fitter_plan fitter_place fitter_route fitter_fastforward_timing fitter_retime fitter_finalize sta_signoff power_analysis assembler sasic_handoff_flow countermeasures_flow rdm_handoff_flow ds_tool dr_tool simulation analysis_and_elaboration_lint&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-dni <dni>	Set to 1 if task runs in dni
	-task <ip_generation  tile_ip_generation design_analysis  logic_generation pcc_generation  create_pcc_ip_projects  pcc_run_all_dynamic_tasks  analysis_and_synthesis  analysis_and_elaboration synthesis  sta_early eda_netlist_writer fitter  fitter_implement fitter_plan  fitter_place fitter_route  fitter_fastforward_timing fitter_retime  fitter_finalize sta_signoff  power_analysis assembler  sasic_handoff_flow  countermeasures_flow	Specifies a task name
continued...		

	<code>rdm_handoff_flow ds_tool dr_tool simulation analysis_and_elaboration_lint&gt;</code>		
<b>Description</b>	<code>flng::write_task_started -task analysis_and_synthesis -dni 1</code>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Cannot process -dni argument. Value should be 0 or 1
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: No revision is currently open. Open a revision.
	TCL_ERROR	1	ERROR: Unable to access status db

### 3.1.13. ::quartus::flow

The following table displays information for the **::quartus::flow** Tcl package:

<b>Tcl Package and Version</b>	::quartus::flow 1.1
<b>Description</b>	This package contains the set of Tcl functions for running flows or command-line executables.
<b>Availability</b>	<p>This package is loaded by default in the following executables:</p> <pre>qpro qpro_sh quartus quartus_cdb quartus_sh</pre> <p>This package is available for loading in the following executables:</p> <pre>hdb_debug quartus_drc quartus_eda quartus_fit quartus_ipgenerate quartus_map quartus_si quartus_sim quartus_sta quartus_stp quartus_syn quartus_tlg</pre>
<b>Tcl Commands</b>	<pre>execute_flow (::quartus::flow) on page 257 execute_module (::quartus::flow) on page 259 get_flow_templates (::quartus::flow) on page 260 get_status_db_property (::quartus::flow) on page 261 write_flow_assignment_digest (::quartus::flow) on page 261 write_flow_finished (::quartus::flow) on page 262 write_flow_started (::quartus::flow) on page 262 write_flow_template (::quartus::flow) on page 263</pre>

### 3.1.13.1. execute\_flow (::quartus::flow)

The following table displays information for the execute\_flow Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::flow on page 256	
<b>Syntax</b>	<pre>execute_flow [-h   -help] [-long_help] [-analysis_and_elaboration] [-check_ios] [-check_netlist] [-compile] [-dni] [-dont_export_assignments] [-eco &lt;value&gt; ] [-export_database] [-finalize] [-flow_args &lt;Tcl list of name value pairs args to pass to the flow&gt; ] [-generate_functional_sim_netlist] [-implement] [-import_database] [-incremental_compilation_export] [-incremental_compilation_import] [-ip_upgrade] [-quick_elaboration] [-signalprobe] [-simulation]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-analysis_and_elaboration	Option to run Analysis & Elaboration
	-check_ios	Option to run I/O assignment analysis
	-check_netlist	Option to run Check and Save Netlist
	-compile	Option to run a full compilation
	-dni	Option to request flow be executed in DNI mode.
	-dont_export_assignments	Option not to export assignments to file. By default, this command exports assignments before running command-line executables.
	-eco <value>	Option to run a Fitter ECO compilation
	-export_database	Option to export a version-compatible database
	-finalize	Option to run algorithms to prepare design for programming.
	-flow_args <Tcl list of name value pairs args to pass to the flow>	Option to specify flow args
	-generate_functional_sim_netlist	Option to generate a functional simulation netlist
	-implement	Option to run compilation up to route stage and skipping all time intensive algorithms after.
	-import_database	Option to import a version-compatible database
	-incremental_compilation_export	Option to export a design partition into a Quartus Prime Exported Partition (QXP) file
	-incremental_compilation_import	Option to import one or more Quartus Prime Exported Partition (QXP) files into the design partitions of the current project
	-ip_upgrade	Option to run a ip upgrade
	-quick_elaboration	Option to run Quick Elaboration
	-signalprobe	Option to run a Signal Probe compilation
	-simulation	Option to run simulation
continued...		

<b>Description</b>	<p>Runs one or more of the command-line executables using one of the predefined flows, such as "-compile" or "-signalprobe". You can run only one flow at a time, so you must use only one option.</p> <p>Some flows have limited device support or other limitations based on the features used. See documentation for the features in question for details.</p> <p>The "-export_database" and "-import_database" options use the value of the VER_COMPATIBLE_DB_DIR assignment for the version-compatible database files directory, defaulting to "export_db".</p> <p>The "-incremental_compilation_export" option uses the value of the INCREMENTAL_COMPILATION_EXPORT_FILE global assignment for the path of the Quartus Prime Exported Partition (QXP) file to be created. The value of the INCREMENTAL_COMPILATION_EXPORT_PARTITION_NAME global assignment should specify the name of the partition to be exported. The value of the INCREMENTAL_COMPILATION_EXPORT_NETLIST_TYPE global assignment (which can either have value POST_SYNTH or POST_FIT) determines whether post-synthesis or post-fitting results should be exported. Finally, the value of the INCREMENTAL_COMPILATION_EXPORT_ROUTING global assignment specifies whether routing should be exported when a post-fit netlist is generated.</p> <p>The "-incremental_compilation_import" option uses the following partition assignments to determine the location of the QXP files, and how importation should be performed, on a per-partition basis:</p> <pre>PARTITION_IMPORT_FILE PARTITION_IMPORT_PROMOTE_ASSIGNMENTS PARTITION_IMPORT_NEW_ASSIGNMENTS PARTITION_IMPORT_EXISTING_ASSIGNMENTS PARTITION_IMPORT_EXISTING_LOGICLOCK_REGIONS</pre> <p>All assignments are exported first automatically, as if you called the "export_assignments" command first, unless the -dont_export_assignments option is specified.</p> <p>You must use the Tcl command "catch" to determine whether the predefined flow ran successfully or not, as in the following example:</p> <pre>if {[catch {execute_flow -compile} result]} {     puts "\nResult: \$result\n"     puts "ERROR: Compilation failed. See report files.\n" } else {     puts "\nINFO: Compilation was successful.\n" }</pre>		
<b>Example Usage</b>	<pre># To run quartus_map, quartus_fit, quartus_sta, quartus_asm # or other executables based on options. (Refer to "Using # Compilation Flows," "Compiling Designs," and "Specifying # Compiler Settings" in Quartus Prime online Help for more # information.) execute_flow -compile  # To determine if compilation was successful or not # and print out a personalized message. if {[catch {execute_flow -compile} result]} {     puts "\nResult: \$result\n"     puts "ERROR: Compilation failed. See report files.\n" } else {     puts "\nINFO: Compilation was successful.\n" }  # To perform a full compilation execute_flow -compile # To perform a ip_upgrade with flow_args to specify variation_files execute_flow -ip_upgrade -flow_args "variation_files=\"%a.ip;b.ip\""</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't run multiple flows simultaneously. Wait for current flow to complete.
	TCL_ERROR	1	ERROR: Flow doesn't exist: <string>. Make sure the specified flow exists.
<i>continued...</i>			

TCL_ERROR	1	ERROR: The flow args are invalid. It should be a legal Tcl list.
TCL_ERROR	1	ERROR: Only one flow option is allowed. Only one flow can be run for a single command call. If multiple flows are required, use multiple commands.
TCL_ERROR	1	ERROR: Can't find active revision. Make sure there is an open, active revision name. Use the -revision option of project_open, project_new, or use set_current_revision.
TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
TCL_ERROR	1	ERROR: Error(s) found while running an executable. See report file(s) for error message(s). Message log indicates which executable was run last.
TCL_ERROR	1	ERROR: Option -<string> is illegal in the Quartus Prime User Interface. Specify a different option or use a similar command from the Processing menu.
TCL_ERROR	1	ERROR: At least one option is required. Specify at least one option.

### 3.1.13.2. execute\_module (::quartus::flow)

The following table displays information for the execute\_module Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::flow on page 256	
<b>Syntax</b>	execute_module [-h   -help] [-long_help] [-args <arguments> ] [-classic] [-dni] [-dont_export_assignments] [-tool <asm cdb drc eda fit map syn pow sta stp sim si cpf ipg pfg qtlg quick_elaboration sh> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-args <arguments>	Option to specify arguments for the executable
	-classic	Option to request flow be executed in Classic mode.
	-dni	Option to request tool option be executed in DNI mode.
	-dont_export_assignments	Option not to export assignments to file. By default, this command exports assignments before running command-line executables.
	-tool <asm cdb drc eda fit map syn pow sta stp sim si cpf ipg pfg qtlg quick_elaboration sh>	Option to run the specified executable
<b>Description</b>	<p>Runs one of the command-line executables, such as quartus_map or quartus_fit. If the -args option is specified, the arguments are passed to the command-line executable.</p> <p>All assignments are exported automatically first, as if the "export_assignments" command was called first, unless -dont_export_assignments option is specified.</p> <p>You must use the Tcl command "catch" to determine whether the command-line executable ran successfully or not, as in the following example:</p> <pre>if {[catch {execute_module -tool map} result]} {     puts "\nResult: \$result\n"     puts "ERROR: Analysis &amp; Synthesis failed. See the report file.\n"</pre>	

**continued...**

	<pre> } else {     puts "\nINFO: Analysis &amp; Synthesis was successful.\n" } </pre>		
<b>Example Usage</b>	<pre> # Run quartus_map using device family Stratix and device part EP1S10B672C6. execute_module -tool map -args "--family=Stratix --part=EP1S10B672C6"  # Compile using a set of executables execute_module -tool map execute_module -tool fit execute_module -tool sta execute_module -tool asm execute_module -tool eda  # To determine if Analysis &amp; Synthesis was successful or not # and print out a personalized message. if {[catch {execute_module -tool map} result]} {     puts "\nResult: \$result\n"     puts "ERROR: Analysis &amp; Synthesis failed. See the report file.\n" } else {     puts "\nINFO: Analysis &amp; Synthesis was successful.\n" } </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't run multiple flows simultaneously. Wait for current flow to complete.
	TCL_ERROR	1	ERROR: Can't find active revision. Make sure there is an open, active revision name. Use the -revision option of project_open, project_new, or use set_current_revision.
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: Error(s) found while running an executable. See report file(s) for error message(s). Message log indicates which executable was run last.
	TCL_ERROR	1	ERROR: Option is required: -tool. Specify the -tool option.

### 3.1.13.3. get\_flow\_templates (::quartus::flow)

The following table displays information for the get\_flow\_templates Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flow</a> on page 256		
<b>Syntax</b>	get_flow_templates [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.

### 3.1.13.4. get\_status\_db\_property (::quartus::flow)

The following table displays information for the `get_status_db_property` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::flow</code> on page 256		
<b>Syntax</b>	<code>get_status_db_property [-h   -help] [-long_help] -property_name &lt;property_name&gt; -task_name &lt;task_name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-property_name &lt;property_name&gt;</code>	The name of the property to lookup	
	<code>-task_name &lt;task_name&gt;</code>	The name of the task	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid status db property name
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: No revision is currently open. Open a revision.
	TCL_ERROR	1	ERROR: No task with the specified name exists.

### 3.1.13.5. write\_flow\_assignment\_digest (::quartus::flow)

The following table displays information for the `write_flow_assignment_digest` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::flow</code> on page 256		
<b>Syntax</b>	<code>write_flow_assignment_digest [-h   -help] [-long_help] [-digest &lt;digest&gt; ] -flow_name &lt;flow_name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-digest &lt;digest&gt;</code>	The assignment digest. If not specified, gets current digest.	
	<code>-flow_name &lt;flow_name&gt;</code>	The name of the flow that started	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
continued...			

*continued...*

	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: No revision is currently open. Open a revision.
	TCL_ERROR	1	ERROR: Unable to load status db

### 3.1.13.6. write\_flow\_finished (::quartus::flow)

The following table displays information for the write\_flow\_finished Tcl command:

Tcl Package and Version	Belongs to ::quartus::flow on page 256		
Syntax	write_flow_finished [-h   -help] [-long_help] [-critical_warnings <critical_warnings> ] [-errors <errors> ] -flow_name <flow_name> -success <success>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-critical_warnings <critical_warnings>	Set critical warnings message count	
	-errors <errors>	Set error message count	
	-flow_name <flow_name>	The name of the flow that finished	
	-success <success>	Set to 1 if flow finished successfully	
Description	This command currently contains no help description.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: No revision is currently open. Open a revision.

### 3.1.13.7. write\_flow\_started (::quartus::flow)

The following table displays information for the write\_flow\_started Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::flow</code> on page 256	
<b>Syntax</b>	<code>write_flow_started [-h   -help] [-long_help] -flow_name &lt;flow_name&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-flow_name &lt;flow_name&gt;</code>	The name of the flow that started
<b>Description</b>	This command currently contains no help description.	
<b>Example Usage</b>	This command currently contains no example usage.	
continued...		

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: No revision is currently open. Open a revision.

### 3.1.13.8. write\_flow\_template (::quartus::flow)

The following table displays information for the write\_flow\_template Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::flow</a> on page 256		
<b>Syntax</b>	write_flow_template [-h   -help] [-long_help] [-directory <directory> ] -flow_name <flow_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-directory <directory>	Optional name to use as destination for flow template directory	
	-flow_name <flow_name>	The name of the flow template to write	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.

### 3.1.14. ::quartus::insystem\_memory\_edit

The following table displays information for the ::quartus::insystem\_memory\_edit Tcl package:

<b>Tcl Package and Version</b>	::quartus::insystem_memory_edit 1.0
<b>Description</b>	This package contains the set of Tcl functions for reading and editing the contents of memory in an Intel device using the In-System Memory Content Editor.
<b>Availability</b>	This package is loaded by default in the following executables:  quartus_stp quartus_stp_tcl
<b>Tcl Commands</b>	begin_memory_edit (::quartus::insystem_memory_edit) on page 264 end_memory_edit (::quartus::insystem_memory_edit) on page 264 get_editable_mem_instances (::quartus::insystem_memory_edit) on page 265 read_content_from_memory (::quartus::insystem_memory_edit) on page 266 save_content_from_memory_to_file (::quartus::insystem_memory_edit) on page 267 update_content_to_memory_from_file (::quartus::insystem_memory_edit) on page 268 write_content_to_memory (::quartus::insystem_memory_edit) on page 269

### 3.1.14.1. begin\_memory\_edit (::quartus::insystem\_memory\_edit)

The following table displays information for the begin\_memory\_edit Tcl command:

Tcl Package and Version	Belongs to ::quartus::insystem_memory_edit on page 263		
Syntax	begin_memory_edit [-h   -help] [-long_help] -device_name <device name> -hardware_name <hardware name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-device_name <device name>	Name of the device that holds the editable memory instances	
	-hardware_name <hardware name>	Name of the hardware that connects to the JTAG chain	
Description	<p>Start the memory editing sequence. The editing sequence should be terminated with end_memory_edit. The sequence does not have to be terminated unless the device configuration is changed or a different device is edited.</p> <p>The hardware and device name can be obtained with the get_hardware_names and get_device_names commands from the jtag package.</p>		
Example Usage	<pre># Instance 0 is configured as {0 1024 8 RW ROM/RAM mem0}  # Initiate a editing sequence begin_memory_edit -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"  # Write memory content using binary string write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "0000001011011100"  # Read back memory content in binary string written puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 ]  # Write memory content using hexadecimal string write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "E2F1" -content_in_hex  # Read back memory content in hexadecimal string written puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 -content_in_hex]  # End the editing sequence end_memory_edit</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified device is not found.
	TCL_ERROR	1	ERROR: A memory edit sequence has been started. End it first before starting a another one.
	TCL_ERROR	1	ERROR: The specified hardware is not found.

### 3.1.14.2. end\_memory\_edit (::quartus::insystem\_memory\_edit)

The following table displays information for the end\_memory\_edit Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::insystem_memory_edit</a> on page 263
<b>Syntax</b>	end_memory_edit [-h   -help] [-long_help]
<i>continued...</i>	

Arguments	-h   -help		Short help
	-long_help		Long help with examples and possible return values
Description	Terminate the memory editing sequence. The sequence does not have to be terminated unless the device configuration is changed or a different device is edited.		
Example Usage	<pre># Instance 0 is configured as {0 1024 8 RW ROM/RAM mem0}  # Initiate a editing sequence begin_memory_edit -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"  # Write memory content using binary string write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "0000001011011100"  # Read back memory content in binary string written puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 ]  # Write memory content using hexadecimal string write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "E2F1" -content_in_hex  # Read back memory content in hexadecimal string written puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 -content_in_hex]  # End the editing sequence end_memory_edit</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: A memory edit sequence has not been started.

### 3.1.14.3. get\_editable\_mem\_instances (::quartus::insystem\_memory\_edit)

The following table displays information for the get\_editable\_mem\_instances Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::insystem_memory_edit</a> on page 263	
<b>Syntax</b>	get_editable_mem_instances [-h   -help] [-long_help] -device_name <device name> -hardware_name <hardware name>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-device_name <device name>	Name of the device that holds the editable memory instances
	-hardware_name <hardware name>	Name of the hardware that connects to the JTAG chain
<b>Description</b>	<p>Retrieve a list of editable memory, ROM, or lpm_constant instances.</p> <p>A list is returned, each element of which shows the configuration of each instance. This element is an another list that specifies the configuration in the following order: &lt;instance index&gt; &lt;depth&gt; &lt;width&gt; &lt;read/write mode&gt; &lt;instance type&gt; &lt;instance name&gt;. The &lt;read/write mode&gt; can be either "RW" or "W"; &lt;instance type&gt; can be either "ROM/RAM" or "CONSTANT". An example showing a list of two instances of different types is shown below:</p> <pre>{0 1024 8 RW ROM/RAM mem0} {1 1 32 RW CONSTANT con0}</pre>	
continued...		

continued...

	<p>The hardware and device name can be obtained with the <code>get_hardware_names</code> and <code>get_device_names</code> commands from the <code>jtag</code> package.</p> <p>It is recommended that you call this command before the <code>TCL</code> command, <code>begin_memory_edit</code>. Within a memory edit sequence, this command can be applied only to the same device, on which the memory edit sequence has started.</p>		
<b>Example Usage</b>	<pre># List information of all editable memories puts "Information on all editable memories:" puts "index,depth,width,mode,type,name" foreach instance [get_editable_mem_instances -hardware_name "USB-Blaster \[USB-0\]" - device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"] {     puts "[lindex \$instance 0],[lindex \$instance 1],[lindex \$instance 2],[lindex \$instance 3], [lindex \$instance 4],[lindex \$instance 5]" }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified device is not found.
	TCL_ERROR	1	ERROR: The specified hardware is not found.
	TCL_ERROR	1	ERROR: The TCL command <code>get_editable_mem_instances</code> is called within a memory edit sequence for a different device. End the memory edit first.
	TCL_ERROR	1	ERROR: An internal TCL interpreter error occurred.

#### 3.1.14.4. read\_content\_from\_memory (::quartus::insystem\_memory\_edit)

The following table displays information for the `read_content_from_memory` TCL command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::insystem_memory_edit</a> on page 263	
<b>Syntax</b>	read_content_from_memory [-h   -help] [-long_help] [-content_in_hex] -instance_index <i>&lt;instance index&gt;</i> -start_address <i>&lt;starting address&gt;</i> [-timeout <i>&lt;timeout&gt;</i> ] -word_count <i>&lt;word count&gt;</i>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-content_in_hex	The memory content string is represented in hexadecimal format
	-instance_index <i>&lt;instance index&gt;</i>	Index of the editable memory instance to read
	-start_address <i>&lt;starting address&gt;</i>	The lowest memory address to be read
	-timeout <i>&lt;timeout&gt;</i>	amount of time in milliseconds allocated before read times out. Defaults to 10 seconds
	-word_count <i>&lt;word count&gt;</i>	The number of contiguous memory words to be read
<b>Description</b>	<p>Retrieves the memory content represented in the bit stream from the specified editable memory instance starting from the specified address.</p> <p>The memory content string is in the same format as the input content string in the TCL command write_content_to_memory.</p>	
continued...		

Example Usage	<pre># Instance 0 is configured as {0 1024 8 RW ROM/RAM mem0}  # Initiate a editing sequence begin_memory_edit -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/ _HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"  # Write memory content using binary string write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "0000001011011100"  # Read back memory content in binary string written puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 -timeout 30000]  # Write memory content using hexadecimal string write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "E2F1" - content_in_hex  # Read back memory content in hexadecimal string written puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 - content_in_hex]  # End the editing sequence end_memory_edit</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: A memory edit sequence has not been started.
	TCL_ERROR	1	ERROR: The specified word count and the starting address exceeds the specified memory buffer size.
	TCL_ERROR	1	ERROR: The specified editable memory instance index is invalid.
	TCL_ERROR	1	ERROR: JTAG communication error is detected. It can be caused by the hardware failure or poor signal integrity in the JTAG chain.
	TCL_ERROR	1	ERROR: The device is locked by another application.

### 3.1.14.5. save\_content\_from\_memory\_to\_file (::quartus::insystem\_memory\_edit)

The following table displays information for the save\_content\_from\_memory\_to\_file Tcl command:

Tcl Package and Version	Belongs to ::quartus::insystem_memory_edit on page 263	
Syntax	save_content_from_memory_to_file [-h   -help] [-long_help] -instance_index <instance_index> -mem_file_path <path> -mem_file_type <type> [-timeout <timeout> ]	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-instance_index <instance_index>	Index of the editable memory instance to read
	-mem_file_path <path>	Path to the memory file in which to save the memory content
	-mem_file_type <type>	Type of the memory file such as "mif" or "hex"
	-timeout <timeout>	amount of time in milliseconds allocated before read times out. Defaults to 10 seconds
continued...		

<b>Description</b>	Retrieves the entire memory contents from the specified editable memory instance starting from address 0 and saves it into the specified memory file.		
<b>Example Usage</b>	<pre># Initiate a editing sequence begin_memory_edit -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"  # Write memory content using the hex memory file update_content_to_memory_from_file -instance_index 0 -mem_file_path "image_8x1024.hex" -mem_file_type hex  # Read memory content and save back to a hex memory file save_content_from_memory_to_file -instance_index 0 -mem_file_path "exported_image_8x1024.hex" -mem_file_type hex  # Write memory content using the mif memory file update_content_to_memory_from_file -instance_index 0 -mem_file_path "exported_image_8x1024.mif" -mem_file_type mif  # Read memory content and save back to a mif memory file save_content_from_memory_to_file -instance_index 0 -mem_file_path "image_8x1024.mif" -mem_file_type mif -timeout 30000  # End the editing sequence end_memory_edit</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: A memory edit sequence has not been started.
	TCL_ERROR	1	ERROR: The specified memory file cannot be written to.
	TCL_ERROR	1	ERROR: The specified file type is either invalid or unsupported by this command.
	TCL_ERROR	1	ERROR: The specified editable memory instance index is invalid.
	TCL_ERROR	1	ERROR: JTAG communication error is detected. It can be caused by the hardware failure or poor signal integrity in the JTAG chain.
	TCL_ERROR	1	ERROR: The device is locked by another application.

### 3.1.14.6. update\_content\_to\_memory\_from\_file (::quartus::insystem\_memory\_edit)

The following table displays information for the update\_content\_to\_memory\_from\_file Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::insystem_memory_edit on page 263	
<b>Syntax</b>	update_content_to_memory_from_file [-h   -help] [-long_help] -instance_index <instance_index> -mem_file_path <path> -mem_file_type <file type> [-timeout <timeout> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-instance_index <instance_index>	Index of the editable memory instance to modify
	-mem_file_path <path>	Path to the memory file to load the memory content
	-mem_file_type <file type>	Type of the memory file such as "mif" or "hex"
continued...		

	-timeout <timeout>		amount of time in milliseconds allocated before write times out. Defaults to 10 seconds
<b>Description</b>	Writes the data stored in the memory file into the specified memory instance starting from address 0.		
<b>Example Usage</b>	<pre># Initiate a editing sequence begin_memory_edit -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"  # Write memory content using the hex memory file update_content_to_memory_from_file -instance_index 0 -mem_file_path "image_8x1024.hex" -mem_file_type hex  # Read memory content and save back to a hex memory file save_content_from_memory_to_file -instance_index 0 -mem_file_path "exported_image_8x1024.hex" -mem_file_type hex  # Write memory content using the mif memory file update_content_to_memory_from_file -instance_index 0 -mem_file_path "exported_image_8x1024.mif" -mem_file_type mif -timeout 30000  # Read memory content and save back to a mif memory file save_content_from_memory_to_file -instance_index 0 -mem_file_path "image_8x1024.mif" -mem_file_type mif  # End the editing sequence end_memory_edit</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: A memory edit sequence has not been started.
	TCL_ERROR	1	ERROR: The specified memory file cannot be read because the content is corrupt or the configuration does not match the memory to be updated.
	TCL_ERROR	1	ERROR: The specified memory file cannot be opened.
	TCL_ERROR	1	ERROR: The specified file type is either invalid or unsupported by this command.
	TCL_ERROR	1	ERROR: The specified editable memory instance index is invalid.
	TCL_ERROR	1	ERROR: JTAG communication error is detected. It can be caused by the hardware failure or poor signal integrity in the JTAG chain.
	TCL_ERROR	1	ERROR: The device is locked by another application.

### 3.1.14.7. write\_content\_to\_memory (::quartus::insystem\_memory\_edit)

The following table displays information for the write\_content\_to\_memory Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::insystem_memory_edit</a> on page 263	
<b>Syntax</b>	<pre>write_content_to_memory [-h   -help] [-long_help] -content &lt;content string&gt; [-content_in_hex] -instance_index &lt;instance index&gt; -start_address &lt;starting address&gt; [-timeout &lt;timeout&gt;] -word_count &lt;word count&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-content <content string>	A string that represents all word values concatenated together in order in either binary or hexadecimal format
<i>continued...</i>		

	-content_in_hex	The memory content string is represented in hexadecimal format	
	-instance_index <instance index>	Index of the editable memory instance to modify	
	-start_address <starting address>	The lowest memory address to be modified	
	-timeout <timeout>	amount of time in milliseconds allocated before write times out. Defaults to 10 seconds	
	-word_count <word count>	The number of contiguous memory words to be modified	
Description	<p>Writes the data represented in the bit stream into the specified editable memory instance starting from the specified address. It returns the number of successful writes.</p> <p>The bit stream should be ordered by word from high address to low address, contiguously without gaps or delimiters. If the starting address is ADDR, and word count is N, the order is &lt;word @ ADDR + N - 1&gt; ... &lt;word @ ADDR + 1&gt;&lt;word @ ADDR&gt; In each word, the MSB is on the left, LSB is on the right. The bit stream can be in either binary or hexadecimal. For example, if the word width is 8, and two words, 1 and 128, are written to address 0 and 1 respectively, the bitstream should be "1000000000000001" in binary or "8001" in hexadecimal. The TCL command is</p> <pre>write_content_to_memory -instance_index 0 -start_address 0 -word_count 2 -content "1000000000000001" or write_content_to_memory -instance_index 0 -start_address 0 -word_count 2 -content "8001" -content_in_hex</pre>		
Example Usage	<pre># Instance 0 is configured as {0 1024 8 RW ROM/RAM mem0}  # Initiate a editing sequence begin_memory_edit -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/ _HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"  # Write memory content using binary string write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "0000001011011100" -timeout 30000  # Read back memory content in binary string written puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 ]  # Write memory content using hexadecimal string write_content_to_memory -instance_index 0 -start_address 575 -word_count 2 -content "E2F1" - content_in_hex  # Read back memory content in hexadecimal string written puts [read_content_from_memory -instance_index 0 -start_address 575 -word_count 2 - content_in_hex]  # End the editing sequence end_memory_edit</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Data specified in the string does not match the number of bits to update the memory of the specified number of words.
	TCL_ERROR	1	ERROR: A memory edit sequence has not been started.
	TCL_ERROR	1	ERROR: The specified word count and the starting address exceeds the specified memory buffer size.
	TCL_ERROR	1	ERROR: The specified editable memory instance index is invalid.

continued...

*continued...*

TCL_ERROR	1	ERROR: The specified editable memory instance index is invalid.
TCL_ERROR	1	ERROR: JTAG communication error is detected. It can be caused by the hardware failure or poor signal integrity in the JTAG chain.
TCL_ERROR	1	ERROR: The device is locked by another application.

### 3.1.15. ::quartus::insystem\_source\_probe

The following table displays information for the **::quartus::insystem\_source\_probe** Tcl package:

<b>Tcl Package and Version</b>	::quartus::insystem_source_probe 1.0
<b>Description</b>	This package contains the set of Tcl functions for using the In-System Sources and Probes feature to interact with your design in an Intel device.
<b>Availability</b>	This package is loaded by default in the following executables:  quartus_stp quartus_stp_tcl
<b>Tcl Commands</b>	<a href="#">end_insystem_source_probe (::quartus::insystem_source_probe)</a> on page 271 <a href="#">get_insystem_source_probe_instance_info (::quartus::insystem_source_probe)</a> on page 272 <a href="#">read_probe_data (::quartus::insystem_source_probe)</a> on page 273 <a href="#">read_source_data (::quartus::insystem_source_probe)</a> on page 273 <a href="#">start_insystem_source_probe (::quartus::insystem_source_probe)</a> on page 274 <a href="#">write_source_data (::quartus::insystem_source_probe)</a> on page 275

#### 3.1.15.1. end\_insystem\_source\_probe (::quartus::insystem\_source\_probe)

The following table displays information for the **end\_insystem\_source\_probe** Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::insystem_source_probe</a> on page 271		
<b>Syntax</b>	end_insystem_source_probe [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	This command releases the JTAG chain. Use when finished performing In-System Sources and Probes transactions.		
<b>Example Usage</b>	<pre>#List probe data of instance 0 start_insystem_source_probe -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)" puts "probe data of instance 0" puts [read_probe_data -instance_index 0] end_insystem_source_probe</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified device is not found.
	TCL_ERROR	1	ERROR: The specified hardware is not found.
continued...			

	TCL_ERROR	1	ERROR: An internal Tcl interpreter error occurred.
	TCL_ERROR	1	ERROR: No In-System Sources and Probes instance was found.
	TCL_ERROR	1	ERROR: The In-System Sources and Probes instance was not started. This command cannot be used unless the In-System Sources and Probes transaction is started.

### 3.1.15.2. get\_insystem\_source\_probe\_instance\_info (::quartus::insystem\_source\_probe)

The following table displays information for the get\_insystem\_source\_probe\_instance\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::insystem_source_probe</a> on page 271		
<b>Syntax</b>	get_insystem_source_probe_instance_info [-h   -help] [-long_help] -device_name <device name> -hardware_name <hardware name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-device_name <device name>	Name of the device programmed with the design that includes In-System Sources and Probes instances	
	-hardware_name <hardware name>	Name of the hardware that connects to the JTAG chain	
<b>Description</b>	<p>Returns a list of the available In-System Sources and Probes instances and their configuration.</p> <pre>{instance_index source_width probe_width instance_name}</pre> <p>Example:</p> <pre>{0 4 3 src1} {1 5 5 src2} {2 3 6 none}</pre>		
<b>Example Usage</b>	<pre># List information of all In-System Sources and Probes instances puts "Information on all In-System Sources and Probes instances:" puts "index,source_width,probe_width,name" foreach instance [get_insystem_source_probe_instance_info -hardware_name "USB-Blaster \ [USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)"] {     puts "[lindex \$instance 0],[lindex \$instance 1],[lindex \$instance 2],[lindex \$instance 3]" }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified device is not found.
	TCL_ERROR	1	ERROR: The specified hardware is not found.
	TCL_ERROR	1	ERROR: An internal Tcl interpreter error occurred.
	TCL_ERROR	1	ERROR: JTAG communication error detected. Errors can be caused by hardware failure or poor signal integrity in the JTAG chain.
	TCL_ERROR	1	ERROR: No In-System Sources and Probes instance was found.
	TCL_ERROR	1	ERROR: There is already an active In-System Sources and Probes session started. Unable to start another session.
TCL_ERROR	1	ERROR: The device is locked by another application.	

### 3.1.15.3. read\_probe\_data (::quartus::insystem\_source\_probe)

The following table displays information for the read\_probe\_data Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::insystem_source_probe</a> on page 271		
<b>Syntax</b>	read_probe_data [-h   -help] [-long_help] -instance_index <instance_index> [-value_in_hex]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-instance_index <instance_index>	Index of the In-System Sources and Probes instance to communicate with	
	-value_in_hex	Specifies that the value string is represented in hexadecimal format	
<b>Description</b>	<p>Retrieves the current value of the probes.</p> <p>A string is returned specifying the status of each probe, with the MSB on the left and LSB on the right. By default, the value is represented as a binary string. Optionally, the option -value_in_hex makes the value a hex string.</p>		
<b>Example Usage</b>	<pre>#List probe data of instance 0 start_insystem_sourc_probe -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)" puts "probe data of instance 0" puts [read_probe_data -instance_index 0] end_insystem_source_probe</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified device is not found.
	TCL_ERROR	1	ERROR: The specified hardware is not found.
	TCL_ERROR	1	ERROR: An internal Tcl interpreter error occurred.
	TCL_ERROR	1	ERROR: The specified In-System Sources and Probes instance index is invalid.
	TCL_ERROR	1	ERROR: No In-System Sources and Probes instance was found.

### 3.1.15.4. read\_source\_data (::quartus::insystem\_source\_probe)

The following table displays information for the read\_source\_data Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::insystem_source_probe</a> on page 271	
<b>Syntax</b>	read_source_data [-h   -help] [-long_help] -instance_index <instance_index> [-value_in_hex]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-instance_index <instance_index>	Index of the In-System Sources and Probes instance to communicate with
continued...		

	-value_in_hex	Specifies that the value string is represented in hexadecimal format	
Description	Retrieves the current value of the sources.  A string is returned specifying the status of each source, with the MSB on the left and LSB on the right. By default, the value is represented as a binary string. Optionally, the option -value_in_hex makes the value a hex string.		
Example Usage	#List source data of instance 0 start_insystem_source_probe -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)" puts "source data of instance 0" puts [read_source_data -instance_index 0] end_insystem_source_probe		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified device is not found.
	TCL_ERROR	1	ERROR: The specified hardware is not found.
	TCL_ERROR	1	ERROR: An internal Tcl interpreter error occurred.
	TCL_ERROR	1	ERROR: The specified In-System Sources and Probes instance index is invalid.
	TCL_ERROR	1	ERROR: No In-System Sources and Probes instance was found.

### 3.1.15.5. start\_insystem\_source\_probe (::quartus::insystem\_source\_probe)

The following table displays information for the start\_insystem\_source\_probe Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::insystem_source_probe on page 271		
<b>Syntax</b>	start_insystem_source_probe [-h   -help] [-long_help] -device_name <device name> -hardware_name <hardware name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-device_name <device name>	Name of the device that holds the In-System Sources and Probes instances	
	-hardware_name <hardware name>	Name of programming hardware connected to the JTAG chain	
<b>Description</b>	Use this command before beginning any In-System Sources and Probes transactions		
<b>Example Usage</b>	#List probe data of instance 0 start_insystem_source_probe -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)" puts "probe data of instance 0" puts [read_probe_data -instance_index 0] end_insystem_source_probe		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
continued...			

TCL_ERROR	1	ERROR: The specified device is not found.
TCL_ERROR	1	ERROR: The specified hardware is not found.
TCL_ERROR	1	ERROR: An internal Tcl interpreter error occurred.
TCL_ERROR	1	ERROR: JTAG communication error detected. Errors can be caused by hardware failure or poor signal integrity in the JTAG chain.
TCL_ERROR	1	ERROR: No In-System Sources and Probes instance was found.
TCL_ERROR	1	ERROR: There is already an active In-System Sources and Probes session started. Unable to start another session.
TCL_ERROR	1	ERROR: The device is locked by another application.

### 3.1.15.6. write\_source\_data (::quartus::insystem\_source\_probe)

The following table displays information for the write\_source\_data Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::insystem_source_probe</a> on page 271		
<b>Syntax</b>	write_source_data [-h   -help] [-long_help] -instance_index <i>&lt;instance_index&gt;</i> -value <i>&lt;value&gt;</i> [-value_in_hex]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-instance_index <i>&lt;instance_index&gt;</i>	Index of the In-System Sources and Probes instance to communicate with	
	-value <i>&lt;value&gt;</i>	Value for the source	
	-value_in_hex	Specify that the value string is represented in hexadecimal format	
<b>Description</b>	<p>Sets values for the sources.</p> <p>A value string is sent to the source values. MSB is on the left and LSB is on the right. The value string is truncated on the left (MSB) side if necessary.</p> <p>By default, the values are represented as a binary string. Optionally, the option -value_in_hex makes the values hex strings.</p>		
<b>Example Usage</b>	<pre>#List probe data of instance 0 start_insystem_source_probe -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1S25/_HARDCOPY_FPGA_PROTOTYPE (0x020030DD)" puts "write source data 10010" write_source_data -instance_index 0 -value "10010" puts "source data of instance 0" puts [read_source_data -instance_index 0] end_insystem_source_probe</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified device is not found.
	TCL_ERROR	1	ERROR: The specified hardware is not found.

continued...

	TCL_ERROR	1	ERROR: An internal Tcl interpreter error occurred.
	TCL_ERROR	1	ERROR: The specified In-System Sources and Probes instance index is invalid.
	TCL_ERROR	1	ERROR: No In-System Sources and Probes instance was found.

### 3.1.16. ::quartus::interactive\_synthesis

The following table displays information for the **::quartus::interactive\_synthesis** Tcl package:

<b>Tcl Package and Version</b>	::quartus::interactive_synthesis 1.0
<b>Description</b>	This package contains no general description.
<b>Availability</b>	This package is loaded by default in the following executables:  quartus quartus_syn
<b>Tcl Commands</b>	<a href="#">analyze_files (::quartus::interactive_synthesis)</a> on page 276 <a href="#">check_rtl_connections (::quartus::interactive_synthesis)</a> on page 277 <a href="#">dissolve_rtl_partition (::quartus::interactive_synthesis)</a> on page 277 <a href="#">dynamic_report (::quartus::interactive_synthesis)</a> on page 278 <a href="#">elaborate (::quartus::interactive_synthesis)</a> on page 279 <a href="#">get_entities (::quartus::interactive_synthesis)</a> on page 280 <a href="#">get_rtl_partition_name (::quartus::interactive_synthesis)</a> on page 280 <a href="#">get_rtl_partitions (::quartus::interactive_synthesis)</a> on page 281 <a href="#">init_synthesis_constraints_propagation_reporter (::quartus::interactive_synthesis)</a> on page 281 <a href="#">link_rtl_design (::quartus::interactive_synthesis)</a> on page 281 <a href="#">print_ipxact (::quartus::interactive_synthesis)</a> on page 282 <a href="#">report_rtl_assignments (::quartus::interactive_synthesis)</a> on page 282 <a href="#">report_rtl_parameters (::quartus::interactive_synthesis)</a> on page 283 <a href="#">report_rtl_stats (::quartus::interactive_synthesis)</a> on page 283 <a href="#">reset_rtl_design (::quartus::interactive_synthesis)</a> on page 284 <a href="#">sasic (::quartus::interactive_synthesis)</a> on page 284 <a href="#">save_rtl_design (::quartus::interactive_synthesis)</a> on page 285 <a href="#">set_sasic_handoff_flow (::quartus::interactive_synthesis)</a> on page 285 <a href="#">synthesize (::quartus::interactive_synthesis)</a> on page 286 <a href="#">uniquify (::quartus::interactive_synthesis)</a> on page 286 <a href="#">write_rtl_report (::quartus::interactive_synthesis)</a> on page 287

#### 3.1.16.1. analyze\_files (::quartus::interactive\_synthesis)

The following table displays information for the **analyze\_files** Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276	
<b>Syntax</b>	analyze_files [-h   -help] [-long_help] [-files <files_value> ] [-library <libray_value> ] [-lint]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-files <files_value>	Specifies the list of files to analyze
	-library <libray_value>	Specifies the target library for design units
	-lint	Enables lint
<b>Description</b>	This command currently contains no help description.	
continued...		

<b>Example Usage</b>	# Compile foo.sv into the default library analyze_files -files foo.sv		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.2. check\_rtl\_connections (::quartus::interactive\_synthesis)

The following table displays information for the `check_rtl_connections` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
Syntax	check_rtl_connections [-h   -help] [-long_help] [-panel_name <panel_name_value> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-panel_name <panel_name_value>	Specifies the name of the Check Connections report panel	
Description	This command currently contains no help description.		
Example Usage	# Report RTL connection issues to "Check RTL Connections" check_rtl_connections -panel_name "Check RTL Connections"		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.16.3. dissolve\_rtl\_partition (::quartus::interactive\_synthesis)

The following table displays information for the `dissolve_rtl_partition` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	dissolve_rtl_partition [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command
	TCL_ERROR	1	ERROR: Partition <i>&lt;string&gt;</i> not found

### 3.1.16.4. dynamic\_report (::quartus::interactive\_synthesis)

The following table displays information for the dynamic\_report Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::interactive_synthesis on page 276							
<b>Syntax</b>	dynamic_report [-h   -help] [-long_help] [-dump_all] [-dump_lines <dumplines_value>] [-filename <filename_value>] [-html] [-query <query_value>] -report <report_value> [-summary] [-xml]							
<b>Arguments</b>	-h   -help	Short help						
	-long_help	Long help with examples and possible return values						
	-dump_all	dump the entire target report						
	-dump_lines <dumplines_value>	dump first # of lines of the target report						
	-filename <filename_value>	Name of output file to be generated						
	-html	Option to generate output file in HTML format						
	-query <query_value>	Specifies the SQLite query						
	-report <report_value>	Specifies a target report to begin action with						
	-summary	give a summary of the target report						
	-xml	Option to generate output file in XML format						
<b>Description</b>	<p>API that allows user to act with a full report which is limited on showing items in GUI. The report is a dynamic reporting infrastructure from SQLite report database, independent of synthesis compilation.</p> <p>Use "-report" to target a report. This option is mandatory as further action depends on a certain report.</p> <p>Current available "report" values are:</p> <table> <thead> <tr> <th>Value</th><th>Report name in compilation</th><th>Database stored</th></tr> </thead> <tbody> <tr> <td>registers_removed</td><td>Registers Removed During Synthesis</td><td>./dynamic_report/registers_removed.sqlite</td></tr> </tbody> </table> <p>Use "-summary" to get a summary of the target report such as table name, column name that can be used in query.</p> <p>The format of the summary would be shown as:</p> <pre> ===== Database name: &lt;name of the database that the target report is saved&gt; Table name: &lt;table in the database that target report content locates&gt; Total size: &lt;total size of the report&gt; Column: &lt;1st column name of the report&gt; Column: &lt;2nd column name of the report&gt; ... ===== </pre> <p>Use "-query" to take a whole SQLite query as an argument.</p> <p>For example -query "SELECT * FROM &lt;table&gt; WHERE &lt;column&gt; = &lt;...&gt;" to get SELECT result from the database.</p> <p>If query command is incorrect, an error message with details will be issued.</p> <p>Use "-dump_all" to dump all content in the report.</p> <p>Use "-dump_lines" with a non-negative integer to dump first &lt;non-negative integer&gt; of lines in the report.</p> <p>The result of "-query", "-dump_all" and "-dump_lines" will be sent to an output file stored in local design directory.</p> <p>Use "-filename" to specify output filename. If no filename entered, output file will be named as report value.</p> <p>If the "-html" option is specified, the output file is generated in HTML format.</p> <p>If the "-xml" option is specified, the output file is generated in XML format.</p> <p>Otherwise, the output file is generated in ASCII format.</p> <p>"-html" option and "-xml" option are mutually exclusive. Please only specify one option.</p>		Value	Report name in compilation	Database stored	registers_removed	Registers Removed During Synthesis	./dynamic_report/registers_removed.sqlite
Value	Report name in compilation	Database stored						
registers_removed	Registers Removed During Synthesis	./dynamic_report/registers_removed.sqlite						
<b>Example Usage</b>	<pre> dynamic_report -report &lt;report name&gt; -query &lt;SQLite query&gt; -filename &lt;output file name&gt; -xml dynamic_report -report &lt;report name&gt; -dump_all -filename &lt;output file name&gt; dynamic_report -report &lt;report name&gt; -dump_lines &lt;number of lines&gt; -filename &lt;output file name&gt; -html dynamic_report -report &lt;report name&gt; -summary </pre>							

*continued...*

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: No specified filename provided. Use <i>&lt;string&gt;</i> as the default output file name
	TCL_OK	0	INFO: Successfully generated output file: <i>&lt;string&gt;</i> . <i>&lt;string&gt;</i> lines reported.
	TCL_OK	0	INFO: The report's database summary is shown as the following:\n <i>&lt;string&gt;</i>
	TCL_OK	0	WARNING: Summary content directly returns from terminal, further options(filename, html, and xml) are ignored.
	TCL_ERROR	1	ERROR: Can't create or overwrite file: <i>&lt;string&gt;</i> .
	TCL_ERROR	1	ERROR: Failed to open the SQLite database. Make sure you are running tcl command in the top level design directory not dynamic_report directory.\n If the SQLite database is not generated during compilation, please turn ON the qsf: synth_rpt_enable_dynamic_report and rerun synthesis compilation
	TCL_ERROR	1	ERROR: Invalid filename input. Make sure your input is not empty and does not contain any special characters or spaces.
	TCL_ERROR	1	ERROR: Illegal value: <i>&lt;string&gt;</i> . Specify a non-negative integer ranging from 1 to 999999999 for the option -dump_lines.
	TCL_ERROR	1	ERROR: The referred sqlite database does not exist. There's no Registers Removed During Synthesis report table generated in your design.
	TCL_ERROR	1	ERROR: This report name: <i>&lt;string&gt;</i> is currently not supported for dynamic reporting.\nPlease use dynamic_report -help to see current supported report.
	TCL_ERROR	1	ERROR: SQLite error: <i>&lt;string&gt;</i>

### 3.1.16.5. elaborate (::quartus::interactive\_synthesis)

The following table displays information for the elaborate Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276	
<b>Syntax</b>	elaborate [-h   -help] [-long_help] [-lint] [-recompile]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-lint	Enables linting
	-recompile	Enables recompile
<b>Description</b>	This command currently contains no help description.	
<b>Example Usage</b>	# Elaborate from the top-level hierarchy elaborate	
continued...		

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.6. get\_entities (::quartus::interactive\_synthesis)

The following table displays information for the get\_entities Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	get_entities [-h   -help] [-long_help] [-library <library_value> ] [-name <name_value> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-library <library_value>	Specifies the library filter	
	-name <name_value>	Specifies the name filter	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	# Get all "cpu" entities defined in all libraries set cpus [get_entities -entity cpu]		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.7. get\_rtl\_partition\_name (::quartus::interactive\_synthesis)

The following table displays information for the get\_rtl\_partition\_name Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	get_rtl_partition_name [-h   -help] [-long_help] [-name <name_value> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <name_value>	Specifies the name filter	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.8. get\_rtl\_partitions (::quartus::interactive\_synthesis)

The following table displays information for the get\_rtl\_partitions Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	get_rtl_partitions [-h   -help] [-long_help] [-name <i>&lt;name_value&gt;</i> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name_value&gt;</i>	Specifies the name filter	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	# Get partitions matching filter pr_region* set pr_regions [get_rtl_partitions -name pr_region*]		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.9. init\_synthesis\_constraints\_propagation\_reporter (::quartus::interactive\_synthesis)

The following table displays information for the init\_synthesis\_constraints\_propagation\_reporter Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
Syntax	init_synthesis_constraints_propagation_reporter [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	This command currently contains no help description.		
Example Usage	# Initialize constraints propagation reporter for synthesis init_synthesis_constraints_propagation_reporter		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.10. link\_rtl\_design (::quartus::interactive\_synthesis)

The following table displays information for the link\_rtl\_design Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276
<b>Syntax</b>	link_rtl_design [-h   -help] [-long_help] [-snapshot <snapshot_value> ]
continued...	

Arguments	-h   -help		Short help
	-long_help		Long help with examples and possible return values
	-snapshot <snapshot_value>		Specifies input snapshot
Description	This command currently contains no help description.		
Example Usage	# Link the RTL design for the current revision link_rtl_design		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.11. print\_ipxact (::quartus::interactive\_synthesis)

The following table displays information for the print\_ipxact Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	print_ipxact [-h   -help] [-long_help] -print_ipxact_file <file_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-print_ipxact_file <file_name>	Specifies the source file to print	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	# Generate the IP-XACT for foo.v print_ipxact -print_ipxact_file foo.v		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.12. report\_rtl\_assignments (::quartus::interactive\_synthesis)

The following table displays information for the report\_rtl\_assignments Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	report_rtl_assignments [-h   -help] [-long_help] [-instance <instance_name> ] [-panel_name <panel_name_value> ] [-partition <partition_value> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-instance <instance_name>	Specifies the hierarchy path of the instance to report (supports wildcards)	
continued...			

	-panel_name <panel_name_value>			Specifies the name of the report panel
	-partition <partition_value>			Specifies the hierarchy path of the partition(s) to report (supports wildcards)
<b>Description</b>	This command currently contains no help description.			
<b>Example Usage</b>	report_rtl_assignments -panel_name "Source Assignments for Top partition" -partition			
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>	
	TCL_OK	0	INFO: Operation successful	

### 3.1.16.13. report\_rtl\_parameters (::quartus::interactive\_synthesis)

The following table displays information for the report\_rtl\_parameters Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	report_rtl_parameters [-h   -help] [-long_help] [-instance <i>&lt;instance_name&gt;</i> ] [-panel_name <i>&lt;panel_name_value&gt;</i> ] [-partition <i>&lt;partition_value&gt;</i> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-instance <i>&lt;instance_name&gt;</i>	Specifies the hierarchy path of the instance to report (supports wildcards)	
	-panel_name <i>&lt;panel_name_value&gt;</i>	Specifies the name of the report panel	
	-partition <i>&lt;partition_value&gt;</i>	Specifies the hierarchy path of the partition(s) to report (supports wildcards)	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	report_rtl_parameters -panel_name "RTL Parameters for Top partition" -partition		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.16.14. report\_rtl\_stats (::quartus::interactive\_synthesis)

The following table displays information for the report\_rtl\_stats Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	report_rtl_stats [-h   -help] [-long_help] [-filename <filename_value> ] -partition <partition_value> [-stdout]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-filename <filename_value>	Specifies the output filename for the RTL report	
	-partition <partition_value>	Specifies the hierarchy path of the partition to synthesize	
continued...			

	-stdout		Report to standard output
Description	This command currently contains no help description.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.16.15. reset\_rtl\_design (::quartus::interactive\_synthesis)

The following table displays information for the reset\_rtl\_design Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	reset_rtl_design [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	# Resets the current RTL design. This must be # called prior to calling link_rtl_design again reset_rtl_design		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.16. sasic (::quartus::interactive\_synthesis)

The following table displays information for the sasic Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	sasic [-h   -help] [-long_help] [-handoff]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-handoff	Runs SASIC handoff flow	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	# Run SASIC handoff sasic -handoff		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.17. save\_rtl\_design (::quartus::interactive\_synthesis)

The following table displays information for the save\_rtl\_design Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
Syntax	save_rtl_design [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	This command currently contains no help description.		
Example Usage	# Saves the current RTL design for partition Top save_rtl_design -partition    # Saves all partitions in the current RTL design at a particular snapshot # Currently only allow partitioned and synthesized snapshot save_rtl_design -snapshot synthesized		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Snapshot <i>&lt;string&gt;</i> is invalid for save
	TCL_ERROR	1	ERROR: You must open a project before you can use this command
	TCL_ERROR	1	ERROR: Partition <i>&lt;string&gt;</i> not found

### 3.1.16.18. set\_sasic\_handoff\_flow (::quartus::interactive\_synthesis)

The following table displays information for the set\_sasic\_handoff\_flow Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	set_sasic_handoff_flow [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	# Set SASIC handoff flow set_sasic_handoff_flow		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.16.19. synthesize (::quartus::interactive\_synthesis)

The following table displays information for the synthesize Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	synthesize [-h   -help] [-long_help] -partition <i>&lt;partition_value&gt;</i> [-recompile]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-partition <i>&lt;partition_value&gt;</i>	Specifies the hierarchy path of the partition to synthesize	
	-recompile	Enables incremental resynthesis algorithm	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	<pre># Run synthesis on Top partition synthesize -partition   # Run a re-synthesis on Top partition synthesize -partition   -recompile # Run a synthesis on ocs partition synthesize -partition   -techmap # Run high-level synthesis on Top partition synthesize -partition   -flow hls # Run post-high-level synthesis on Top partition synthesize -partition   -flow post_hls # This is the default and is equivalent to "synthesize -partition  " synthesize -partition   -flow full</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command
	TCL_ERROR	1	ERROR: Partition <i>&lt;string&gt;</i> not found

### 3.1.16.20. uniquify (::quartus::interactive\_synthesis)

The following table displays information for the uniquify Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
<b>Syntax</b>	uniquify [-h   -help] [-long_help] [-analysis_and_elab_report] [-recompile]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-analysis_and_elab_report	Print synthesis reports after analysis and elaboration	
	-recompile	Enables recompile	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	<pre># Run uniquify on all partitions as required uniquify  # Run uniquify on one specific partition uniquify -partition cpu_left</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
<i>continued...</i>			

TCL_OK	0	INFO: Operation successful
TCL_ERROR	1	ERROR: You must open a project before you can use this command
TCL_ERROR	1	ERROR: Current design not found
TCL_ERROR	1	ERROR: Partition <string> not found

### 3.1.16.21. write\_rtl\_report (::quartus::interactive\_synthesis)

The following table displays information for the write\_rtl\_report Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::interactive_synthesis</a> on page 276		
Syntax	write_rtl_report [-h   -help] [-long_help] [-ascii] [-filename <filename_value> ] [-qdb] [-xml]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-ascii	Specfies ASCII as the output format	
	-filename <filename_value>	Specifies the output filename for the RTL report	
	-qdb	Specifies binary as the output format	
	-xml	Specifies XML as the output format	
Description	This command currently contains no help description.		
Example Usage	<pre># Write the RTL report to the QDB database in binary forat write_rtl_report -qdb  # Write the RTL report to the default ASCII report file write_rtl_report -ascii  # Write the RTL report to the XML file write_rtl_report -xml -filename report.xml</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command

### 3.1.17. ::quartus::ipdrc

The following table displays information for the ::quartus::ipdrc Tcl package:

Tcl Package and Version	::quartus::ipdrc 1.0
Description	This package contains no general description.
Availability	This package is available for loading in the following executables:  quartus_cdb quartus_syn
continued...	

<b>Tcl Commands</b>	<a href="#">ipdrc::get_device_speed (::quartus::ipdrc)</a> on page 288 <a href="#">ipdrc::get_ip_hpaths (::quartus::ipdrc)</a> on page 288 <a href="#">ipdrc::get_ip_name (::quartus::ipdrc)</a> on page 289 <a href="#">ipdrc::get_ip_pma_modulation (::quartus::ipdrc)</a> on page 289 <a href="#">ipdrc::get_ip_speed (::quartus::ipdrc)</a> on page 290 <a href="#">ipdrc::get_ip_type (::quartus::ipdrc)</a> on page 290 <a href="#">ipdrc::get_ip_xcvr_type (::quartus::ipdrc)</a> on page 290 <a href="#">ipdrc::set_ip_info (::quartus::ipdrc)</a> on page 291
---------------------	---

### 3.1.17.1. ipdrc::get\_device\_speed (::quartus::ipdrc)

The following table displays information for the `ipdrc::get_device_speed` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::ipdrc</a> on page 287		
Syntax	ipdrc::get_device_speed [-h   -help] [-long_help] -core <core> -hpath <hpath> -xcvr <xcvr>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-core <core>	Core speed grade of the target device	
	-hpath <hpath>	Hierarchical path of an instance	
	-xcvr <xcvr>	Transceiver speed grade of the target device	
Description	IPDRC get device speed --This command returns the max speed of a device given core grade (1~4) and transceiver grade (1~3)		
Example Usage	ipdrc::get_device_speed -hpath \$hpath -core \$core -xcvr \$xcvr		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.17.2. ipdrc::get\_ip\_hpaths (::quartus::ipdrc)

The following table displays information for the `ipdrc::get_ip_hpaths` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::ipdrc</a> on page 287		
<b>Syntax</b>	ipdrc::get_ip_hpaths [-h   -help] [-long_help] [-filter <i>&lt;filter&gt;</i> ] [-ip_name <i>&lt;ip_name&gt;</i> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-filter <i>&lt;filter&gt;</i>	Filter searches against parameters stored in the JSON file. Format: {param_id value} 2 strings connected by 1 space	
	-ip_name <i>&lt;ip_name&gt;</i>	IP name to search for	
<b>Description</b>	IPDRC get IP hpaths --This command returns a list of IP hpaths based on prescribed filterings; by default returns every existing hpath		
<i>continued...</i>			

<b>Example Usage</b>	<code>ipdrc::get_ip_hpaths -ip_name \$ip_name -filter \$filter</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.17.3. ipdrc::get\_ip\_name (::quartus::ipdrc)

The following table displays information for the `ipdrc::get_ip_name` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::ipdrc</code> on page 287		
<b>Syntax</b>	<code>ipdrc::get_ip_name [-h   -help] [-long_help] -type &lt;type&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-type &lt;type&gt;</code>	Identifier representing an IP type	
<b>Description</b>	IPDRC get IP name --This command returns the actual IP name corresponding to a given IP type		
<b>Example Usage</b>	<code>ipdrc::get_ip_name -type \$type</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.17.4. ipdrc::get\_ip\_pma\_modulation (::quartus::ipdrc)

The following table displays information for the `ipdrc::get_ip_pma_modulation` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::ipdrc</code> on page 287		
<b>Syntax</b>	<code>ipdrc::get_ip_pma_modulation [-h   -help] [-long_help] -hpath &lt;hpath&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-hpath &lt;hpath&gt;</code>	Hierarchical path of an instance	
<b>Description</b>	IPDRC get IP PMA modulation --This command returns the PMA modulation mode of an IP instance		
<b>Example Usage</b>	<code>ipdrc::get_ip_pma_modulation -hpath \$hpath</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.17.5. ipdrc::get\_ip\_speed (::quartus::ipdrc)

The following table displays information for the `ipdrc::get_ip_speed` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::ipdrc</code> on page 287		
<b>Syntax</b>	<code>ipdrc::get_ip_speed [-h   -help] [-long_help] -hpath &lt;hpath&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-hpath &lt;hpath&gt;</code>	Hierarchical path of an instance	
<b>Description</b>	IPDRC get IP speed --This command returns the transceiver speed of an IP instance		
<b>Example Usage</b>	<code>ipdrc::get_ip_speed -hpath \$hpath</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.17.6. ipdrc::get\_ip\_type (::quartus::ipdrc)

The following table displays information for the `ipdrc::get_ip_type` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::ipdrc</code> on page 287		
<b>Syntax</b>	<code>ipdrc::get_ip_type [-h   -help] [-long_help] -hpath <i>&lt;hpath&gt;</i></code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-hpath <i>&lt;hpath&gt;</i></code>	Hierarchical path of an instance	
<b>Description</b>	<div>IPDRC get IP type --This command returns the IP type of an instance</div>		
<b>Example Usage</b>	<code>ipdrc::get_ip_type -hpath \$hpath</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.17.7. ipdrc::get\_ip\_xcvr\_type (::quartus::ipdrc)

The following table displays information for the `ipdrc::get_ip_xcvr_type` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::ipdrc</code> on page 287		
<b>Syntax</b>	<code>ipdrc::get_ip_xcvr_type [-h   -help] [-long_help] -hpath &lt;hpath&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<i>continued...</i>			

	<code>-hpath &lt;hpath&gt;</code>		Hierarchical path of an instance
<b>Description</b>	IPDRC get IP XCVR type --This command returns the XCVR type of an IP instance		
<b>Example Usage</b>	<code>ipdrc::get_ip_xcvr_type -hpath \$hpath</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.17.8. ipdrc::set\_ip\_info (::quartus::ipdrc)

The following table displays information for the `ipdrc::set_ip_info` Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::ipdrc</code> on page 287		
Syntax	<code>ipdrc::set_ip_info [-h   -help] [-long_help] -file &lt;file&gt;</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-file &lt;file&gt;</code>	JSON file containing instances information of the design	
Description	IPDRC set IP info --This command initializes the content of the static IPDRC_CHECK_UTILS object with the given JSON file		
Example Usage	<code>ipdrc::set_ip_info -file \$file</code>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.18. ::quartus::ipgen

The following table displays information for the `::quartus::ipgen` Tcl package:

<b>Tcl Package and Version</b>	<code>::quartus::ipgen 1.0</code>
<b>Description</b>	This package contains no general description.
<b>Availability</b>	This package is loaded by default in the following executable: quartus_ipgenerate
<b>Tcl Commands</b>	<a href="#">clear_ip_generation_dirs (::quartus::ipgen)</a> on page 292 <a href="#">generate_ip_file (::quartus::ipgen)</a> on page 292 <a href="#">generate_project_ip_files (::quartus::ipgen)</a> on page 293 <a href="#">get_project_ip_files (::quartus::ipgen)</a> on page 295

### 3.1.18.1. clear\_ip\_generation\_dirs (::quartus::ipgen)

The following table displays information for the `clear_ip_generation_dirs` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::ipgen</a> on page 291		
<b>Syntax</b>	clear_ip_generation_dirs [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	<div>This command removes all the generation directories for the Platform Designer IP files in the opened project. All the content in the generation directories will be removed.</div>		
<b>Example Usage</b>	<pre># Remove all the generation directories for the Platform Designer IP files in the opened project project_open my_project clear_ip_generation_dirs</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: The command failed with an unknown error.

### 3.1.18.2. generate\_ip\_file (::quartus::ipgen)

The following table displays information for the `generate_ip_file` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::ipgen</a> on page 291	
<b>Syntax</b>	generate_ip_file [-h   -help] [-long_help] [-clean] [-clear_ip_generation_dirs] [-modelsim_flow <i>&lt;qrun traditional&gt;</i> ] [-simulation <i>&lt;verilog vhdl&gt;</i> ] [-simulator <i>&lt;modelsim vcs vcsmx riviera xcelium&gt;</i> ] [-synthesis <i>&lt;verilog vhdl&gt;</i> ] <i>&lt;file&gt;</i>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-clean	Specify whether pre-existing generation directories should be cleared before generation.
	-clear_ip_generation_dirs	Specify whether pre-existing generation directories should be cleared before generation.
	-modelsim_flow <i>&lt;qrun traditional&gt;</i>	Specifies the Modelsim flow used for simulation script generation. Valid values are qrun or traditional.
	-simulation <i>&lt;verilog vhdl&gt;</i>	Set the simulation target type. Valid values are verilog or vhdl.
	-simulator <i>&lt;modelsim vcs vcsmx riviera xcelium&gt;</i>	Set the simulator target type. Valid values are modelsim, vcs, vcsmx, riviera, and/or xcelium.
	-synthesis <i>&lt;verilog vhdl&gt;</i>	Set the synthesis target type. Valid values are verilog or vhdl.
	<i>&lt;file&gt;</i>	A Platform Designer IP file path. -file="path1;path2"
<b>continued.</b>		

Description	<p>This command generates the files for a specified Platform Designer IP in the opened project.</p> <p>--synthesis &lt;value&gt;: Specify the synthesis target type. Valid values are verilog or vhdl. This is not a required option. When not specified, it defaults to verilog.</p> <p>--simulation &lt;value&gt;: Specify the simulation target type. Valid values are verilog or vhdl. This is not a required option. When not specified, no simulation files are generated.</p> <p>--simulator &lt;value&gt;: Specify the simulator target type. Valid values are modelsim, vcs, vcsmx, riviera, xcelium. This is not a required option. When not specified, simulation files for all simulators are generated.</p> <p>--modelsim_flow &lt;value&gt;: Specify the Modelsim flow used for simulation script generation. Valid values are qrun or traditional. This is not a required option. When not specified, it defaults to qrun.</p> <p>--clear_ip_generation_dirs: Specify whether pre-existing generation directories should be cleared before generation. This is not a required option. When not specified, the generation directories will not be cleared.</p> <p>--clean: Specify whether pre-existing generation directories should be cleared before generation. This option is a short version of the clear_ip_generation_dirs option. This is not a required option. When not specified, the generation directories will not be cleared.</p>		
Example Usage	<pre># generate the specified Platform Designer IP in the project with the specified targets. Clear any pre-existing # generation directories before performing the generation. project_open my_project generate_ip_file my_ip_file.qsys -synthesis verilog -simulation verilog -simulator modelsim - clear_ip_generation_dirs</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The file <string> does not exist in project.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: The command failed with an unknown error.

### 3.1.18.3. generate\_project\_ip\_files (::quartus::ipgen)

The following table displays information for the generate\_project\_ip\_files Tcl command:

Tcl Package and Version	Belongs to ::quartus::ipgen on page 291	
Syntax	<pre>generate_project_ip_files [-h   -help] [-long_help] [-clean] [- clear_ip_generation_dirs] [-modelsim_flow &lt;qrun traditional&gt; ] [-parallel &lt;on off&gt; ] [-simulation &lt;verilog vhdl&gt; ] [-simulator &lt;modelsim vcs vcsmx riviera xcelium&gt; ] [- synthesis &lt;verilog vhdl&gt; ]</pre>	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-clean	Specify whether pre-existing generation directories should be cleared before generation.
continued...		

	-clear_ip_generation_dirs	Specify whether pre-existing generation directories should be cleared before generation.	
	-modelsim_flow <qrun traditional>	Specifies the Modelsim flow used for simulation script generation. Valid values are qrun or traditional.	
	-parallel <on off>	Specify whether to allow parallel IP generation. Specify off to disable parallel	
	-simulation <verilog vhdl>	Set the simulation target type. Valid values are verilog or vhdl.	
	-simulator <modelsim vcs vcsmx riviera xcelium>	Set the simulator target type. Valid values are modelsim, vcs, vcsmx, riviera, and/or xcelium.	
	-synthesis <verilog vhdl>	Set the synthesis target type. Valid values are verilog or vhdl.	
Description	<p>This command generates the files for all Platform Designer IP in the opened project. If no option is specified, this command generates the verilog synthesis target only.</p> <p>--synthesis &lt;value&gt;: Specify the synthesis target type. Valid values are verilog or vhdl. This is not a required option. When not specified, it defaults to verilog.</p> <p>--simulation &lt;value&gt;: Specify the simulation target type. Valid values are verilog or vhdl. This is not a required option. When not specified, no simulation files are generated.</p> <p>--simulator &lt;value&gt;: Specify the simulator target type. Valid values are modelsim, vcs, vcsmx, riviera, and/or xcelium. This is not a required option. When not specified, simulation files for all simulators are generated.</p> <p>--modelsim_flow &lt;value&gt;: Specify the Modelsim flow used for simulation script generation. Valid values are qrun or traditional. This is not a required option. When not specified, it defaults to qrun.</p> <p>--clear_ip_generation_dirs: Specify whether pre-existing generation directories should be cleared before generation. This is not a required option. When not specified, the generation directories will not be cleared.</p> <p>--clean: Specify whether pre-existing generation directories should be cleared before generation. This option is a short version of the clear_ip_generation_dirs option. This is not a required option. When not specified, the generation directories will not be cleared.</p> <p>--parallel &lt;on,off&gt;: Specify whether to allow parallel IP generation. When this is on, parallel processing will be enable if project or global Quartus setting is enabled. When this setting is off, parallel is disabled regardless of project or global Quartus settings.</p>		
Example Usage	<pre># generate all the Platform Designer IP in the project with the specified targets. Clear any pre-existing # generation directories before performing the generation. project_open my_project generate_project_ip_files -synthesis verilog -simulation verilog -simulator modelsim -clear_ip_generation_dirs</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The file <string> does not exist in project.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: The command failed with an unknown error.

### 3.1.18.4. get\_project\_ip\_files (::quartus::ipgen)

The following table displays information for the `get_project_ip_files` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::ipgen</a> on page 291		
Syntax	get_project_ip_files [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	This command returns a Tcl list containing the full path of the Platform Designer IP files (.qsys or .ip) found in the opened project.		
Example Usage	<pre>project_open my_project get_project_ip_files</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: The command failed with an unknown error.

### 3.1.19. ::quartus::iptclgen

The following table displays information for the `::quartus::iptclgen` Tcl package:

<b>Tcl Package and Version</b>	<code>::quartus::iptclgen 1.0</code>
<b>Description</b>	This package contains the set of Tcl functions for generating Memory IP.
<b>Availability</b>	This package is available for loading in the following executables: <pre>qpro qpro_sh quartus quartus_cdb quartus_sh</pre>
<b>Tcl Commands</b>	<a href="#">compute_pll (::quartus::iptclgen)</a> on page 295 <a href="#">generate_vhdl_simgen_model (::quartus::iptclgen)</a> on page 296 <a href="#">parse_hdl (::quartus::iptclgen)</a> on page 297 <a href="#">parse_tcl (::quartus::iptclgen)</a> on page 298

#### 3.1.19.1. compute\_pll (::quartus::iptclgen)

The following table displays information for the `compute_pll` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::iptclgen</a> on page 295
<b>Syntax</b>	<code>compute_pll [-h   -help] [-long_help] -family &lt;family&gt; -input_freq &lt;input_freq&gt; -output_freqs &lt;output_freqs&gt; -output_phases &lt;output_phases&gt; -pll_type &lt;pll_type&gt; -speed_grade &lt;speed_grade&gt; -temp_dir &lt;temp_dir&gt;</code>
continued...	

Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-family <family>	Device family	
	-input_freq <input_freq>	input frequency in Mhz	
	-output_freqs <output_freqs>	desired output frequencys	
	-output_phases <output_phases>	desired output phase shifts	
	-pll_type <pll_type>	pll type	
	-speed_grade <speed_grade>	Device speed grade	
	-temp_dir <temp_dir>	temporary directory	
Description	Parses the HDL file specified and saves output to the file name specified.		
Example Usage	compute_pll -family "stratix iii" -pll_type "fast_pll" -input_freq 100 -output_freqs "100, 200, 333"		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid Intel FPGA IP Name: <string>. Specify a legal port type.
	TCL_ERROR	1	ERROR: Illegal number of arguments. Specify %u argument(s) for option <string>.
	TCL_ERROR	1	ERROR: No open project. Open an existing project or create a new project.

### 3.1.19.2. generate\_vhdl\_simgen\_model (::quartus::iptclgen)

The following table displays information for the generate\_vhdl\_simgen\_model Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::iptclgen</a> on page 295	
<b>Syntax</b>	generate_vhdl_simgen_model [-h   -help] [-long_help] -blackbox <i>&lt;blackbox&gt;</i> -family <i>&lt;family&gt;</i> -files <i>&lt;files&gt;</i> -result_dir <i>&lt;result_dir&gt;</i> -temp_dir <i>&lt;temp_dir&gt;</i> -top_level_name <i>&lt;top_level_name&gt;</i>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-blackbox <i>&lt;blackbox&gt;</i>	comma-separated list of modules that should be blackboxed
	-family <i>&lt;family&gt;</i>	family name
	-files <i>&lt;files&gt;</i>	comma seperated list of files
	-result_dir <i>&lt;result_dir&gt;</i>	result directory for .vho file. Must already exist
	-temp_dir <i>&lt;temp_dir&gt;</i>	temp_dir
	-top_level_name <i>&lt;top_level_name&gt;</i>	top level entity name
<i>continued...</i>		

<b>Description</b>	Creates a temporary project in the temporary directory, creates the simgen model and copies the model to result_dir.		
<b>Example Usage</b>	generate_vhdl_simgen_model -family "stratix iii" -files "mycore.v,subcore.v" -top_level_name "mycore.v" -temp_dir "c:/temp" -result_dir "c:/outdir" -blackbox "blackboxme"		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No open project. Open an existing project or create a new project.

### 3.1.19.3. parse\_hdl (::quartus::iptclgen)

The following table displays information for the `parse_hdl` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::iptclgen</a> on page 295		
Syntax	parse_hdl [-h   -help] [-long_help] -core_params <core_params> -indir_name <indir_name> -inhdl_files <inhdl_files> [-module_list <module_list> ] -module_name <module_name> -outdir_name <outdir_name> -supported_params <supported_params>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-core_params <core_params>	Comma-delimited list of core parameters	
	-indir_name <indir_name>	input directory of hdl files	
	-inhdl_files <inhdl_files>	input hdl name	
	-module_list <module_list>	list of modules to uniquify name	
	-module_name <module_name>	toplevel module name	
	-outdir_name <outdir_name>	output directory of hdl files	
	-supported_params <supported_params>	Comma-delimited list of supported core parameters	
Description	Parses the HDL file specified and saves output to the file name specified.		
Example Usage	parse_hdl -inhdl_files rldram_dev.v -core_params "USE_CLK, STRATIXIII" -outdir_name "/project/hdl"		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid Intel FPGA IP Name: <string>. Specify a legal port type.
	TCL_ERROR	1	ERROR: Illegal number of arguments. Specify %u argument(s) for option <string>.
	TCL_ERROR	1	ERROR: No open project. Open an existing project or create a new project.

### 3.1.19.4. parse\_tcl (::quartus::iptclgen)

The following table displays information for the parse\_tcl Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::iptclgen</a> on page 295		
Syntax	parse_tcl [-h   -help] [-long_help] [-core_params <core_params> ] [-core_sub_params <core_sub_params> ] -indir_name <indir_name> -intcl_files <intcl_files> -module_name <module_name> -outdir_name <outdir_name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-core_params <core_params>	Comma-delimited list of core parameters	
	-core_sub_params <core_sub_params>	map of parameter-to-value pairs to replace	
	-indir_name <indir_name>	input directory of tcl files	
	-intcl_files <intcl_files>	input tcl name	
	-module_name <module_name>	toplevel module name	
	-outdir_name <outdir_name>	output directory of tcl files	
Description	Parses the HDL file specified and saves output to the file name specified.		
Example Usage	parse_tcl -intcl_files rldram_dev.v -core_params "USE_CLK, STRATIXIII" -outdir_name "/project/tcl"		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid Intel FPGA IP Name: <string>. Specify a legal port type.
	TCL_ERROR	1	ERROR: Illegal number of arguments. Specify %u argument(s) for option <string>.
	TCL_ERROR	1	ERROR: No open project. Open an existing project or create a new project.

### 3.1.20. ::quartus::jtag

The following table displays information for the **::quartus::jtag** Tcl package:

<b>Tcl Package and Version</b>	::quartus::jtag 1.0
<b>Description</b>	This package contains the set of Tcl functions for controlling the JTAG chain using Intel programming hardware.
<b>Availability</b>	This package is loaded by default in the following executables:  quartus_stp quartus_stp_tcl
<b>Tcl Commands</b>	<a href="#">close_device (::quartus::jtag)</a> on page 299 <a href="#">device_dr_shift (::quartus::jtag)</a> on page 300 <a href="#">device_ir_shift (::quartus::jtag)</a> on page 301 <a href="#">device_lock (::quartus::jtag)</a> on page 302
continued...	

```

device_run_test_idle (::quartus::jtag) on page 303
device_unlock (::quartus::jtag) on page 304
device_virtual_dr_shift (::quartus::jtag) on page 305
device_virtual_ir_shift (::quartus::jtag) on page 307
get_device_names (::quartus::jtag) on page 308
get_hardware_names (::quartus::jtag) on page 309
open_device (::quartus::jtag) on page 310

```

### 3.1.20.1. close\_device (::quartus::jtag)

The following table displays information for the `close_device` Tcl command:

Tcl Package and Version	Belongs to ::quartus::jtag on page 298		
Syntax	close_device [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	End the shared communication with the opened device.		
Example Usage	<pre># List all available programming hardware, and select the USBBlaster. # (Note: this example assumes only one USBBlaster connected.) puts "Programming Hardware:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbbblaster_name \$hardware_name     } } puts "\nSelect JTAG chain connected to \$usbbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain. puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbbblaster_name] {     puts \$device_name     if { [string match "@1*" \$device_name] } {         set test_device \$device_name     } } puts "\nSelect device: \$test_device.\n";  # Open device open_device -hardware_name \$usbbblaster_name -device_name \$test_device  # Retrieve device id code. # IDCODE instruction value is 6; The ID code is 32 bits long.  # IR and DR shift should be locked together to ensure that other applications # will not change the instruction register before the id code value is shifted # out while the instruction register is still holding the IDCODE instruction. device_lock -timeout 10000 device_ir_shift -ir_value 6 -no_captured_ir_value puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]" device_unlock  # Close device close_device</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No device has been opened.
	TCL_ERROR	1	ERROR: A device was locked.

### 3.1.20.2. device\_dr\_shift (::quartus::jtag)

The following table displays information for the device\_dr\_shift Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::jtag on page 298	
<b>Syntax</b>	device_dr_shift [-h   -help] [-long_help] [-dr_value <data register value> ] -length <data register length> [-no_captured_dr_value] [-value_in_hex]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-dr_value <data register value>	Value of string operand type in either default binary or hexadecimal format to be written into the data register in the JTAG tap controller of the open device
	-length <data register length>	Length of the data register in the JTAG tap controller in the open device
	-no_captured_dr_value	Option not to return the data instruction register value. If this is specified, this DR scan may be packed together with the subsequent IR or DR scan until the device is unlocked or a captured value is requested
	-value_in_hex	Option to specify that the value string is represented in hexadecimal format
<b>Description</b>	<p>Writes the specified value into the data register of the JTAG tap controller of the open device. Returns the captured data register value. The captured value return can be disabled to improve the JTAG communication speed by packing multiple IR or DR scans together.</p> <p>The value is specified using either a binary string or a hexadecimal string. The bit on the left most side is the first bit shifted in. For example, using binary string "010001", the first bit shifted into the dr register is 1; the last bit is 0. The same string can be represented in hexadecimal as "11".</p> <p>The device must be locked before you can perform this operation.</p>	
<b>Example Usage</b>	<pre># List all available programming hardware, and select the USB-Blaster. # (Note: this example assumes only one USB-Blaster is connected.) puts "Programming Hardware:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbbblaster_name \$hardware_name     } } puts "\nSelect JTAG chain connected to \$usbbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain. puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbbblaster_name] {     puts \$device_name     if { [string match "@1*" \$device_name] } {         set test_device \$device_name     } } puts "\nSelect device: \$test_device.\n";  # Open device open_device -hardware_name \$usbbblaster_name -device_name \$test_device  # Retrieve device id code. # IDC CODE instruction value is 6; The ID code is 32 bits long.  # IR and DR shift should be locked together to ensure that other applications # will not change the instruction register before the id code value is shifted # out while the instruction register is still holding the IDC CODE instruction. device_lock -timeout 10000</pre>	

*continued...*

	<pre>device_ir_shift -ir_value 6 -no_captured_ir_value puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]" device_unlock  # Close device close_device</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Captured value cannot be disabled at the time when no value is shifted into data register.
	TCL_ERROR	1	ERROR: A device has not been locked; exclusive communication must be obtained first.
	TCL_ERROR	1	ERROR: A device has been locked by another application; exclusive communication cannot be granted within the specified timeout period.
	TCL_ERROR	1	ERROR: The length of the value string specified does not match the length parameter specified.

### 3.1.20.3. device\_ir\_shift (::quartus::jtag)

The following table displays information for the device\_ir\_shift Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::jtag</a> on page 298	
<b>Syntax</b>	device_ir_shift [-h   -help] [-long_help] -ir_value <i>&lt;instruction register value&gt;</i> [-no_captured_ir_value]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-ir_value <i>&lt;instruction register value&gt;</i>	Value to be written into the instruction register in the JTAG tap controller of the open device. Operand must be of a TCL numerical type such as decimal (10), hexadecimal (0xa), or octal number (012)
	-no_captured_ir_value	Option to not return the captured instruction register value. If this is specified, this IR scan may be packed together with the subsequent IR or DR scan until the device is unlocked or a captured value is requested
<b>Description</b>	<p>Writes the specified value into the instruction register of the JTAG tap controller of the open device. Returns the captured instruction register value. The captured value return can be disabled to improve the JTAG communication speed by packing multiple IR or DR scans together.</p> <p>The instruction register length is determined automatically by the Quartus Prime JTAG server.</p> <p>The device must be locked first before this operation.</p>	
<b>Example Usage</b>	<pre># List all available programming hardware, and select the USB-Blaster. # (Note: this example assumes only one USB-Blaster is connected.) puts "Programming Hardware:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbbblaster_name \$hardware_name     } } puts "\nSelect JTAG chain connected to \$usbbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain.</pre>	

continued...

*continued...*

	<pre>puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbbblaster_name] {     puts \$device_name     if { [string match "@1*" \$device_name] } {         set test_device \$device_name     } } puts "\nSelect device: \$test_device.\n";  # Open device open_device -hardware_name \$usbbblaster_name -device_name \$test_device  # Retrieve device id code. # IDCODE instruction value is 6; The ID code is 32 bits long.  # IR and DR shift should be locked together to ensure that other applications # will not change the instruction register before the id code value is shifted # out while the instruction register is still holding the IDCODE instruction. device_lock -timeout 10000 device_ir_shift -ir_value 6 -no_captured_ir_value puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]" device_unlock  # Close device close_device</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: A device has not been locked; exclusive communication must be obtained first.
	TCL_ERROR	1	ERROR: A device has been locked by another application; exclusive communication cannot be granted within the specified timeout period.

### 3.1.20.4. device\_lock (::quartus::jtag)

The following table displays information for the device\_lock Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::jtag on page 298	
<b>Syntax</b>	device_lock [-h   -help] [-long_help] -timeout <timeout>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-timeout <timeout>	The amount of time in millisecond to wait for the access to the device.
<b>Description</b>	<p>Obtain an exclusive JTAG communication to the device for the subsequent IR and DR shift operations. The device must be locked before any instruction and/or data register shift operation.</p> <p>This should be used as little time as possible as it denies the access of other applications to this chain. The command, unlock, should be called as soon as possible to allow other applications to access the device.</p>	
<b>Example Usage</b>	<pre># List all available programming hardware, and select the USBBlaster. # (Note: this example assumes only one USBBlaster connected.) puts "Programming Hardware:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbbblaster_name \$hardware_name     } } puts "\nSelect JTAG chain connected to \$usbbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain.</pre>	

*continued...*

<pre>puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbbaster_name] {     puts \$device_name     if { [string match "@1*" \$device_name] } {         set test_device \$device_name     } } puts "\nSelect device: \$test_device.\n";  # Open device open_device -hardware_name \$usbbaster_name -device_name \$test_device  # Retrieve device id code. # IDCODE instruction value is 6; The ID code is 32 bits long.  # IR and DR shift should be locked together to ensure that other applications # will not change the instruction register before the id code value is shifted # out while the instruction register is still holding the IDCODE instruction. device_lock -timeout 10000 device_ir_shift -ir_value 6 -no_captured_ir_value puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]" device_unlock  # Close device close_device</pre>			
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No device has been opened.
	TCL_ERROR	1	ERROR: JTAG communication error is detected. It can be caused by the hardware failure and signal integrity in the JTAG chain. Try to restart.
	TCL_ERROR	1	ERROR: A device was locked.
	TCL_ERROR	1	ERROR: A device has been locked by another application; exclusive communication cannot be granted within the specified timeout period.

### 3.1.20.5. device\_run\_test\_idle (::quartus::jtag)

The following table displays information for the `device_run_test_idle` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::jtag</code> on page 298	
<b>Syntax</b>	<code>device_run_test_idle [-h   -help] [-long_help] [-num_clocks &lt;state cycle count&gt; ]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-num_clocks &lt;state cycle count&gt;</code>	The number of times the Run_Test_Idle state is cycled through. If not specified, this value is 1
<b>Description</b>	<p>Drive the JTAG controller into the Run_Test_Idle state for a number cycles specified with the <code>-num_clocks</code> option.</p> <p>The device must be locked before you can perform this operation.</p>	
<b>Example Usage</b>	<pre># List all available programming hardware, and select the USB-Blaster. # (Note: this example assumes only one USB-Blaster is connected.) puts "Programming Hardware:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbbaster_name \$hardware_name     } }</pre>	
continued...		

	<pre> } puts "\nSelect JTAG chain connected to \$usbbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain. puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbbblaster_name] {     puts \$device_name     if { [string match "@1*" \$device_name] } {         set test_device \$device_name     } } puts "\nSelect device: \$test_device.\n";  # Open device open_device -hardware_name \$usbbblaster_name -device_name \$test_device  # Retrieve device id code. # IDCODE instruction value is 6; The ID code is 32 bits long.  # IR and DR shift should be locked together to ensure that other applications # will not change the instruction register before the id code value is shifted # out while the instruction register is still holding the IDCODE instruction. device_lock -timeout 10000 device_ir_shift -ir_value 6 -no_captured_ir_value puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]"  # Goto the Run_Test_Idle state and stay there for 8 cycles. device_run_test_idle -num_clocks 8 device_unlock  # Close device close_device </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: A device has not been locked; exclusive communication must be obtained first.
	TCL_ERROR	1	ERROR: A device has been locked by another application; exclusive communication cannot be granted within the specified timeout period.

### 3.1.20.6. device\_unlock (::quartus::jtag)

The following table displays information for the device\_unlock Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::jtag on page 298	
<b>Syntax</b>	device_unlock [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<b>Description</b>	Release the exclusive JTAG communication lock on the device.	
<b>Example Usage</b>	<pre> # List all available programming hardware, and select the USBBlaster. # (Note: this example assumes only one USBBlaster connected.) puts "Programming Hardware:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbbblaster_name \$hardware_name     } } puts "\nSelect JTAG chain connected to \$usbbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain. puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbbblaster_name] {     puts \$device_name     if { [string match "@1*" \$device_name] } {         set test_device \$device_name     } } </pre>	

*continued...*

	<pre>     }   }   puts "\nSelect device: \$test_device.\n";    # Open device   open_device -hardware_name \$usbbaster_name -device_name \$test_device    # Retrieve device id code.   # IDCODE instruction value is 6; The ID code is 32 bits long.    # IR and DR shift should be locked together to ensure that other applications   # will not change the instruction register before the id code value is shifted   # out while the instruction register is still holding the IDCODE instruction.   device_lock -timeout 10000   device_ir_shift -ir_value 6 -no_captured_ir_value   puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]"   device_unlock    # Close device   close_device </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No device has been opened.
	TCL_ERROR	1	ERROR: JTAG communication error is detected. It can be caused by the hardware failure and signal integrity in the JTAG chain. Try to restart.
	TCL_ERROR	1	ERROR: A device has not been locked; exclusive communication must be obtained first.

### 3.1.20.7. device\_virtual\_dr\_shift (::quartus::jtag)

The following table displays information for the device\_virtual\_dr\_shift Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::jtag</a> on page 298	
Syntax	<code>device_virtual_dr_shift [-h   -help] [-long_help] [-dr_value &lt;data register value&gt; ] -instance_index &lt;instance index&gt; -length &lt;data register length&gt; [-no_captured_dr_value] [-show_equivalent_device_ir_dr_shift] [-value_in_hex]</code>	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-dr_value <data register value>	Value of string operand type in either default binary or hexadecimal format to be written into the data register in this instance
	-instance_index <instance index>	The index of the virtual JTAG instance
	-length <data register length>	Length of the data register in this instance
	-no_captured_dr_value	Option to not return the data instruction register value
	-show_equivalent_device_ir_dr_shift	Option to show equivalent device ir dr shifts performed by this command
	-value_in_hex	Option to specify that the value string is represented in hexadecimal format
Description	<p>Writes the specified value into the data register of the JTAG tap controller of the open device. Returns the captured data register value. The captured value return can be disabled to improve the JTAG communication speed by packing multiple IR or DR scans</p>	

*continued...*

	<p>together.</p> <p>The value is specified using either a binary string or a hexadecimal string. The bit on the left most side is the first bit shifted in. For example, using the binary string "010001", the first bit shifted into the dr register is 1; the last bit is 0. The same string can be represented in hexadecimal as "11".</p> <p>The device must be locked first, and the target instance must be activated using the device_virtual_ir_shift command before this operation. Moreover, the device should be locked before the virtual IR shift operation to prevent another application from activating another instance.</p>		
<b>Example Usage</b>	<pre># List all available programming hardware, and select the USB-Blaster. # (Note: this example assumes only one USB-Blaster is connected.) puts "Programming Hardware:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbbblaster_name \$hardware_name     } } puts "\nSelect JTAG chain connected to \$usbbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain. puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbbblaster_name] {     puts \$device_name     if { [string match "@1*" \$device_name] } {         set test_device \$device_name     } } puts "\nSelect device: \$test_device.\n";  # Open device open_device -hardware_name \$usbbblaster_name -device_name \$test_device  # The follow virtual JTAG IR and DR shift sequence engage with # the example virtual JTAG instance. # # Two instructions: SAMPLE (1) FEED (2) # SAMPLE instruction samples a 8-bit bus; the captured value shows the number of sample # performed. # FEED instruction supplies a 8-bit value to the logic connected to this instance. # Both data registers corresponding to the IR are 8 bit wide.  # Send SAMPLE instruction to IR, read captured IR for the sampling number. # Capture the DR register for the current sampled value. device_lock -timeout 10000 puts "Current LED Value (sample #[device_virtual_ir_shift -instance_index 0 -ir_value 1]):" [device_virtual_dr_shift -instance_index 0 -length 8 -value_in_hex] device_unlock  # Send FEED instruction to IR, read a two-digit hex string from the console, # then send the new value to the DR register. puts "\nType in 2 digits in hexadecimal to update the LED:" gets stdin update_value  device_lock -timeout 10000 device_virtual_ir_shift -instance_index 0 -ir_value 2 -no_captured_ir_value device_virtual_dr_shift -instance_index 0 -length 8 -dr_value \$update_value -value_in_hex - no_captured_dr_value device_unlock  # Close device close_device</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Captured value cannot be disabled at the time when no value is shifted into data register.
	TCL_ERROR	1	ERROR: The specified virtual JTAG instance cannot be found.
	TCL_ERROR	1	ERROR: One of the options, mfg_id, type_id and version is specified, but not all. All of them are required.
<b>continued...</b>			

TCL_ERROR	1	ERROR: A device has not been locked; exclusive communication must be obtained first.
TCL_ERROR	1	ERROR: A device has been locked by another application; exclusive communication cannot be granted within the specified timeout period.
TCL_ERROR	1	ERROR: The length of the value string specified does not match the length parameter specified.

### 3.1.20.8. device\_virtual\_ir\_shift (::quartus::jtag)

The following table displays information for the `device_virtual_ir_shift` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::jtag</code> on page 298	
<b>Syntax</b>	<code>device_virtual_ir_shift [-h   -help] [-long_help] -instance_index &lt;instance index&gt; -ir_value &lt;instruction register value&gt; [-no_captured_ir_value] [-show_equivalent_device_ir_dr_shift]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-instance_index &lt;instance index&gt;</code>	The index of the virtual JTAG instance
	<code>-ir_value &lt;instruction register value&gt;</code>	Value to be written into the instruction register in this instance. Operand must be of a TCL numerical type such as decimal (10), hexadecimal (0xa), or octal number (012)
	<code>-no_captured_ir_value</code>	Option to not return the captured instruction register value. If this is specified, this IR scan may be packed together with the subsequent IR or DR scan until the device is unlocked or a captured value is requested
	<code>-show_equivalent_device_ir_dr_shift</code>	Option to show equivalent device ir and dr shifts performed by this command
<b>Description</b>	<p>Writes the specified value into the instruction register of the specified virtual JTAG instance in the open device. Returns the captured instruction register value. You can disable the captured value return to improve the JTAG communication speed by packing multiple IR or DR scans together.</p> <p>The command also activates the target instance such that the consequent virtual DR shift operations are applied to this instance before the device is unlocked. Before any virtual DR shift operation, this command must be executed first to activate the instance.</p> <p>The device must be locked first before this operation.</p>	
<b>Example Usage</b>	<pre># List all available programming hardwares, and select the USBBlaster. # (Note: this example assumes only one USBBlaster connected.) puts "Programming Hardwares:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbblaster_name \$hardware_name     } } puts "\nSelect JTAG chain connected to \$usbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain. puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbblaster_name] {     puts \$device_name }</pre>	

continued...

	<pre>         if { [string match "@1*" \$device_name] } {             set test_device \$device_name         }     }     puts "\nSelect device: \$test_device.\n";      # Open device     open_device -hardware_name \$usbblaster_name -device_name \$test_device      # The follow virtual JTAG IR and DR shift sequence engage with     # the example virtual JTAG instance.     #     # Two instructions: SAMPLE (1) FEED (2)     # SAMPLE instruction samples a 8-bit bus; the captured value shows the number of sample     # performed.     # FEED instruction supplies a 8-bit value to the logic connected to this instance.     # Both data registers corresponding to the IR are 8 bit wide.      # Send SAMPLE instruction to IR, read captured IR for the sampling number.     # Capture the DR register for the current sampled value.     device_lock -timeout 10000     puts "Current LED Value (sample #[device_virtual_ir_shift -instance_index 0 -ir_value 1]):     [device_virtual_dr_shift -instance_index 0 -length 8 -value_in_hex]"     device_unlock      # Send FEED instruction to IR, read a two-digit hex string from the console,     # then send the new value to the DR register.     puts "\nType in 2 digits in hexadecimal to update the LED:"     gets stdin update_value     device_lock -timeout 10000     device_virtual_ir_shift -instance_index 0 -ir_value 2 -no_captured_ir_value     device_virtual_dr_shift -instance_index 0 -length 8 -dr_value \$update_value -value_in_hex -     no_captured_dr_value     device_unlock      # Close device     close_device     </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The specified virtual JTAG instance cannot be found.
	TCL_ERROR	1	ERROR: One of the options, mfg_id, type_id and version is specified, but not all. All of them are required.
	TCL_ERROR	1	ERROR: A device has not been locked; exclusive communication must be obtained first.

### 3.1.20.9. get\_device\_names (::quartus::jtag)

The following table displays information for the get\_device\_names Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::jtag</a> on page 298	
<b>Syntax</b>	get_device_names [-h   -help] [-long_help] -hardware_name <i>&lt;hardware name&gt;</i>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-hardware_name <i>&lt;hardware name&gt;</i>	The name of the programming hardware that connects to the JTAG chain. The name can be obtained from command: get_hardware_names.
<b>Description</b>	<p>Retrieves a list of names of the devices on the JTAG chain to which the specified programming hardware is connected.</p> <p>The name of the device is in the following format: &lt;number on circuit board&gt;: &lt;JTAG ID code&gt;: &lt;device name&gt;. For example, in the device name @1: 0x082000DD: EP20K200C, @1 indicates that it is the</p>	
continued...		

	first device on the circuit board, 0x082000DD is the JTAG ID code for the device, and EP20K200C is the device name.		
<b>Example Usage</b>	<pre># List all available programming hardware, and select the USBBlaster. # (Note: this example assumes only one USBBlaster connected.) puts "Programming Hardware:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbbblaster_name \$hardware_name     } } puts "\nSelect JTAG chain connected to \$usbbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain. puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbbblaster_name] {     puts \$device_name     if { [string match "@1*" \$device_name] } {         set test_device \$device_name     } } puts "\nSelect device: \$test_device.\n";  # Open device open_device -hardware_name \$usbbblaster_name -device_name \$test_device  # Retrieve device id code. # IDCODE instruction value is 6; The ID code is 32 bits long.  # IR and DR shift should be locked together to ensure that other applications # will not change the instruction register before the id code value is shifted # out while the instruction register is still holding the IDCODE instruction. device_lock -timeout 10000 device_ir_shift -ir_value 6 -no_captured_ir_value puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]" device_unlock  # Close device close_device</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No device is detected in the specified JTAG chain.
	TCL_ERROR	1	ERROR: The specified hardware is not found.

### 3.1.20.10. get\_hardware\_names (::quartus::jtag)

The following table displays information for the get\_hardware\_names Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::jtag on page 298	
<b>Syntax</b>	get_hardware_names [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<b>Description</b>	<p>Retrieves a list of the names of the programming hardware attached to and configured for the JTAG server.</p> <p>The hardware name is in the following format: &lt;hardware type&gt; [&lt;port&gt;].</p> <p>For example, in the hardware name USB-Blaster [USB-0], USB-Blaster is the name of the programming hardware, and USB-0 is the name of the port to which the hardware is connected.</p>	
continued...		

<b>Example Usage</b>	<pre> # List all available programming hardware, and select the USB-Blaster. # (Note: this example assumes only one USB-Blaster is connected.) puts "Programming Hardware:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbbblaster_name \$hardware_name     } } puts "\nSelect JTAG chain connected to \$usbbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain. puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbbblaster_name] {     puts \$device_name     if { [string match "@1*" \$device_name] } {         set test_device \$device_name     } } puts "\nSelect device: \$test_device.\n";  # Open device open_device -hardware_name \$usbbblaster_name -device_name \$test_device  # Retrieve device id code. # IDCODE instruction value is 6; The ID code is 32 bits long.  # IR and DR shift should be locked together to ensure that other applications # will not change the instruction register before the id code value is shifted # out while the instruction register is still holding the IDCODE instruction. device_lock -timeout 10000 device_ir_shift -ir_value 6 -no_captured_ir_value puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]" device_unlock  # Close device close_device </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No programming hardware is attached to the JTAG server or it is not configured properly.

### 3.1.20.11. open\_device (::quartus::jtag)

The following table displays information for the open\_device Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::jtag</code> on page 298	
<b>Syntax</b>	<code>open_device [-h   -help] [-long_help] -device_name &lt;device name&gt; -hardware_name &lt;hardware name&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-device_name &lt;device name&gt;</code>	The name of the device on the JTAG chain. The name can be obtained from command: <code>get_device_names</code>
	<code>-hardware_name &lt;hardware name&gt;</code>	The name of the programming hardware that connects to the JTAG chain. The name can be obtained from command: <code>get_hardware_names</code>
<b>Description</b>	<p>Initiate a shared JTAG communication with the device. The command, <code>close_device</code>, is called to end the communication with the device.</p> <p>Only one device can be opened per process. Multiple devices can be opened in multiple processes.</p>	
<i>continued...</i>		

<b>Example Usage</b>	<pre> # List all available programming hardware, and select the USBBlaster. # (Note: this example assumes only one USBBlaster connected.) puts "Programming Hardware:" foreach hardware_name [get_hardware_names] {     puts \$hardware_name     if { [string match "USB-Blaster*" \$hardware_name] } {         set usbbblaster_name \$hardware_name     } } puts "\nSelect JTAG chain connected to \$usbbblaster_name.\n";  # List all devices on the chain, and select the first device on the chain. puts "\nDevices on the JTAG chain:" foreach device_name [get_device_names -hardware_name \$usbbblaster_name] {     puts \$device_name     if { [string match "@1*" \$device_name] } {         set test_device \$device_name     } } puts "\nSelect device: \$test_device.\n";  # Open device open_device -hardware_name \$usbbblaster_name -device_name \$test_device  # Retrieve device id code. # IDCODE instruction value is 6; The ID code is 32 bits long.  # IR and DR shift should be locked together to ensure that other applications # will not change the instruction register before the id code value is shifted # out while the instruction register is still holding the IDCODE instruction. device_lock -timeout 10000 device_ir_shift -ir_value 6 -no_captured_ir_value puts "IDCODE: 0x[device_dr_shift -length 32 -value_in_hex]" device_unlock  # Close device close_device </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: A device was opened. Only one device can be open at a time within this process. Close previously opened device first.
	TCL_ERROR	1	ERROR: The specified device is not found.
	TCL_ERROR	1	ERROR: The specified hardware is not found.

### 3.1.21. ::quartus::logic\_analyzer\_interface

The following table displays information for the **::quartus::logic\_analyzer\_interface** Tcl package:

<b>Tcl Package and Version</b>	::quartus::logic_analyzer_interface 1.0
<b>Description</b>	This package contains the set of Tcl functions for querying and modifying the Logic Analyzer Interface output pin state in an Intel device.
<b>Availability</b>	This package is loaded by default in the following executables:  quartus_stp quartus_stp_tcl
<b>Tcl Commands</b>	<a href="#">begin_logic_analyzer_interface_control (::quartus::logic_analyzer_interface) on page 312</a> <a href="#">change_bank_to_output_pin (::quartus::logic_analyzer_interface) on page 313</a> <a href="#">end_logic_analyzer_interface_control (::quartus::logic_analyzer_interface) on page 314</a> <a href="#">get_current_state_of_output_pin (::quartus::logic_analyzer_interface) on page 315</a> <a href="#">tristate_output_pin (::quartus::logic_analyzer_interface) on page 316</a>

### 3.1.21.1. begin\_logic\_analyzer\_interface\_control (::quartus::logic\_analyzer\_interface)

The following table displays information for the  
begin\_logic\_analyzer\_interface\_control Tcl command:

Tcl Package and Version	Belongs to ::quartus::logic_analyzer_interface on page 311		
Syntax	begin_logic_analyzer_interface_control [-h   -help] [-long_help] -device_name <device name> -file_path <file path> -hardware_name <hardware name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-device_name <device name>	Name of the device to be controlled	
	-file_path <file path>	Path of the Logic Analyzer Interface (.lai) file	
	-hardware_name <hardware name>	Name of the hardware that connects to the JTAG chain	
Description	<div>Starts the Logic Analyzer Interface control sequence to query the Logic Analyzer Interface output pin state and change output pins state. The control sequence should be terminated with end_logic_analyzer_interface_control.</div> <div>The hardware and device name can be obtained by using get_hardware_names and get_device_names respectively from the jtag package.</div>		
Example Usage	<pre># Start a new control sequence. begin_logic_analyzer_interface_control -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1C20 (0x020840DD)" -file_path "lai_demo.lai"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Change input bank source to the output pins change_bank_to_output_pin -instance_name "auto_lai_0" -bank_name "Bank 1"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Change input bank source to the output pins change_bank_to_output_pin -instance_name "auto_lai_0" -bank_index 0  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Tristate the output pins tristate_output_pin -instance_name "auto_lai_0"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # End the control sequence. end_logic_analyzer_interface_control</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: A Logic Analyzer Interface control sequence has been started already.

continued...

TCL_ERROR	1	ERROR: The specified device is not found.
TCL_ERROR	1	ERROR: The Logic Analyzer Interface file (.lai) cannot be opened, or it is an invalid file.
TCL_ERROR	1	ERROR: The specified hardware is not found.

### 3.1.21.2. change\_bank\_to\_output\_pin (::quartus::logic\_analyzer\_interface)

The following table displays information for the `change_bank_to_output_pin` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::logic_analyzer_interface</a> on page 311		
Syntax	change_bank_to_output_pin [-h   -help] [-long_help] [-bank_index <bank index> ] [-bank_name <bank name> ] -instance_name <instance name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-bank_index <bank index>	Index of the bank on the mux to be used as the source of the output pins	
	-bank_name <bank name>	Name of the bank to be used as the source of the output pins	
	-instance_name <instance name>	Name of the Logic Analyzer Interface instance to change	
Description	Change the Logic Analyzer Interface output pin's source on the specified instance to use the specified bank.		
Example Usage	<pre># Start a new control sequence. begin_logic_analyzer_interface_control -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1C20 (0x020840DD)" -file_path "lai_demo.lai"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Change input bank source to the output pins change_bank_to_output_pin -instance_name "auto_lai_0" -bank_name "Bank 1"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Change input bank source to the output pins change_bank_to_output_pin -instance_name "auto_lai_0" -bank_index 0  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Tristate the output pins tristate_output_pin -instance_name "auto_lai_0"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # End the control sequence. end_logic_analyzer_interface_control</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No Logic Analyzer Interface control sequence has been started.

continued...

TCL_ERROR	1	ERROR: The specified device is not found.
TCL_ERROR	1	ERROR: The specified hardware is not found.
TCL_ERROR	1	ERROR: The specified Logic Analyzer Interface instance in the file is not compatible with the instance in the device.
TCL_ERROR	1	ERROR: JTAG communication error is detected. It can be caused by the hardware failure or poor signal integrity in the JTAG chain.
TCL_ERROR	1	ERROR: The specified bank cannot be found in the Logic Analyzer Interface instance.
TCL_ERROR	1	ERROR: The specified Logic Analyzer Interface instance cannot be found.
TCL_ERROR	1	ERROR: The version of the specified Logic Analyzer Interface instance is not supported in this release of software.

### 3.1.21.3. end\_logic\_analyzer\_interface\_control (::quartus::logic\_analyzer\_interface)

The following table displays information for the end\_logic\_analyzer\_interface\_control Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::logic_analyzer_interface</a> on page 311	
<b>Syntax</b>	end_logic_analyzer_interface_control [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<b>Description</b>	Terminate the Logic Analyzer Interface control sequence.	
<b>Example Usage</b>	<pre># Start a new control sequence. begin_logic_analyzer_interface_control -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1C20 (0x020840DD)" -file_path "lai_demo.lai"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Change input bank source to the output pins change_bank_to_output_pin -instance_name "auto_lai_0" -bank_name "Bank 1"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Change input bank source to the output pins change_bank_to_output_pin -instance_name "auto_lai_0" -bank_index 0  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Tristate the output pins tristate_output_pin -instance_name "auto_lai_0"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # End the control sequence. end_logic_analyzer_interface_control</pre>	
continued...		

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No Logic Analyzer Interface control sequence has been started.

#### 3.1.21.4. get\_current\_state\_of\_output\_pin (::quartus::logic\_analyzer\_interface)

The following table displays information for the `get_current_state_of_output_pin` Tcl command:

Tcl Package and Version	Belongs to ::quartus::logic_analyzer_interface on page 311		
Syntax	get_current_state_of_output_pin [-h   -help] [-long_help] -instance_name <instance_name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-instance_name <instance_name>	Name of the Logic Analyzer Interface instance to change	
Description	<p>Query the device to get the current state of the output pins of the specified instance.</p> <p>The result is either the bank name or "tristated".</p>		
Example Usage	<pre># Start a new control sequence. begin_logic_analyzer_interface_control -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1C20 (0x020840DD)" -file_path "lai_demo.lai"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Change input bank source to the output pins change_bank_to_output_pin -instance_name "auto_lai_0" -bank_name "Bank 1"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Change input bank source to the output pins change_bank_to_output_pin -instance_name "auto_lai_0" -bank_index 0  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Tristate the output pins tristate_output_pin -instance_name "auto_lai_0"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # End the control sequence. end_logic_analyzer_interface_control</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No Logic Analyzer Interface control sequence has been started.
	TCL_ERROR	1	ERROR: The specified device is not found.
	TCL_ERROR	1	ERROR: The specified hardware is not found.

continued...

*continued...*

	TCL_ERROR	1	ERROR: The specified Logic Analyzer Interface instance in the file is not compatible with the instance in the device.
	TCL_ERROR	1	ERROR: JTAG communication error is detected. It can be caused by the hardware failure or poor signal integrity in the JTAG chain.
	TCL_ERROR	1	ERROR: The specified Logic Analyzer Interface instance cannot be found.
	TCL_ERROR	1	ERROR: The version of the specified Logic Analyzer Interface instance is not supported in this release of software.

### 3.1.21.5. tristate\_output\_pin (::quartus::logic\_analyzer\_interface)

The following table displays information for the `tristate_output_pin` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::logic_analyzer_interface</a> on page 311		
<b>Syntax</b>	tristate_output_pin [-h   -help] [-long_help] -instance_name <i>&lt;instance name&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-instance_name <i>&lt;instance name&gt;</i>	Name of the Logic Analyzer Interface instance to change	
<b>Description</b>	Tristate the output pins of the specified Logic Analyzer Interface instance.		
<b>Example Usage</b>	<pre># Start a new control sequence. begin_logic_analyzer_interface_control -hardware_name "USB-Blaster \[USB-0\]" -device_name "@1: EP1C20 (0x020840DD)" -file_path "lai_demo.lai"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Change input bank source to the output pins change_bank_to_output_pin -instance_name "auto_lai_0" -bank_name "Bank 1"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Change input bank source to the output pins change_bank_to_output_pin -instance_name "auto_lai_0" -bank_index 0  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # Tristate the output pins tristate_output_pin -instance_name "auto_lai_0"  # Query the output pin state. puts "Current output pin state of instance auto_lai_0:" puts [get_current_state_of_output_pin -instance_name "auto_lai_0"]  # End the control sequence. end_logic_analyzer_interface_control</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No Logic Analyzer Interface control sequence has been started.
	TCL_ERROR	1	ERROR: The specified device is not found.

continued..

TCL_ERROR	1	ERROR: The specified hardware is not found.
TCL_ERROR	1	ERROR: The specified Logic Analyzer Interface instance in the file is not compatible with the instance in the device.
TCL_ERROR	1	ERROR: JTAG communication error is detected. It can be caused by the hardware failure or poor signal integrity in the JTAG chain.
TCL_ERROR	1	ERROR: The specified Logic Analyzer Interface instance cannot be found.
TCL_ERROR	1	ERROR: The version of the specified Logic Analyzer Interface instance is not supported in this release of software.

### 3.1.22. ::quartus::misc

The following table displays information for the **::quartus::misc** Tcl package:

<b>Tcl Package and Version</b>	::quartus::misc 1.0
<b>Description</b>	This package contains a set of Tcl functions for performing miscellaneous tasks.
<b>Availability</b>	<p>This package is loaded by default in the following executables:</p> <pre> hdb_debug qacv qpro qpro_sh quartus quartus_cdb quartus_drc quartus_eda quartus_fit quartus_ipc quartus_ipd quartus_ipgenerate quartus_map quartus_sh quartus_si quartus_sim quartus_sta quartus_stp </pre>
<b>Tcl Commands</b>	<pre> checksum (::quartus::misc) on page 318 disable_natural_bus_naming (::quartus::misc) on page 318 enable_natural_bus_naming (::quartus::misc) on page 319 escape_brackets (::quartus::misc) on page 320 foreach_in_collection (::quartus::misc) on page 321 get_collection_size (::quartus::misc) on page 323 get_environment_info (::quartus::misc) on page 324 get_message_count (::quartus::misc) on page 324 init_tk (::quartus::misc) on page 325 load (::quartus::misc) on page 325 load_package (::quartus::misc) on page 326 post_message (::quartus::misc) on page 327 qerror (::quartus::misc) on page 328 qexec (::quartus::misc) on page 328 qexit (::quartus::misc) on page 329 record_tcl_cmd (::quartus::misc) on page 329 stopwatch (::quartus::misc) on page 330 </pre>

### 3.1.22.1. checksum (::quartus::misc)

The following table displays information for the checksum Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::misc</a> on page 317		
<b>Syntax</b>	checksum [-h   -help] [-long_help] [-algorithm <crc32 adler32> ] <input_file>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-algorithm <crc32 adler32>	Option to specify the checksum algorithm. Uses the CRC-32 algorithm by default.	
	<input_file>	Option to specify the input file	
<b>Description</b>	Returns the checksum value in hexadecimal format based on the specified algorithm which defaults to crc32.		
<b>Example Usage</b>	<pre>set file "one_wire.sof" # Use CRC-32 puts "\$file -&gt; [checksum \$file]" puts "\$file -&gt; [checksum \$file -algorithm crc32]" # Use ADLER-32 puts "\$file -&gt; [checksum \$file -algorithm adler32]"</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't read file: <string>. Make sure the file exists and is not a directory, and you have permission to read the file.

### 3.1.22.2. disable\_natural\_bus\_naming (::quartus::misc)

The following table displays information for the disable\_natural\_bus\_naming Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::misc</a> on page 317	
<b>Syntax</b>	disable_natural_bus_naming [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<b>Description</b>	<p>Disables natural bus naming.</p> <p>You may choose to disable natural bus naming to string match patterns such as "in\[024\]". In this example, you are string matching the names "in0", "in2", and "in4".</p> <p>Note that if you disable natural bus naming, then square brackets must be escaped twice (\\\[ or \\]) so that the strings are interpreted as bus names during a string match, such as:</p> <pre>set bus_name "address\[0\]" string match [escape_brackets \$bus_name] \$bus_name</pre> <p>The "escape_brackets" command escapes "address\[0\]" into "address\\\[0\\]".</p> <p>To enable natural bus naming again, type "enable_natural_bus_naming".</p>	

continued...

*continued...*

	For more information about natural bus naming, type "enable_natural_bus_naming -h".		
<b>Example Usage</b>	# Disables natural bus naming disable_natural_bus_naming		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.22.3. enable\_natural\_bus\_naming (::quartus::misc)

The following table displays information for the enable\_natural\_bus\_naming Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::misc on page 317		
<b>Syntax</b>	enable_natural_bus_naming [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	<p>Enables natural bus naming so that square brackets for bus names do not have to be escaped to prevent Tcl from interpreting them as sub-commands.</p> <p>Bus names have the following format:</p> <p>&lt;bus name&gt;[&lt;bus index&gt;] or &lt;bus name&gt;[*]</p> <p>The &lt;bus name&gt; portion is a string of alphanumeric characters. The &lt;bus index&gt; portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the &lt;bus index&gt; is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[*]" are supported bus names.</p> <p>Many Quartus Prime Tcl commands allow bus names in their arguments, such as:</p> <p>set_location_assignment -to address[10] Pin_M20</p> <p>If natural bus naming is enabled, you can just use address[10] instead of having to escape the square brackets into address\[10\].</p> <p>There are also Quartus Prime Tcl commands that take Tcl string match patterns in their arguments, such as:</p> <p>get_all_instance_assignments -name location -to address[10]</p> <p>Since Tcl string matching take string patterns containing special characters from the set ".*?\" as values, address[10] would be interpreted incorrectly. By enabling natural bus naming, these Tcl commands will automatically detect address[10] as a bus name so that you don't have to doubly escape the brackets into address\\[10\\].</p> <p>To disable natural bus naming, type "disable_natural_bus_naming".</p> <p>For more information on the effects of disabling natural bus naming, type "disable_natural_bus_naming -h".</p>		
<b>Example Usage</b>	# Enables natural bus naming enable_natural_bus_naming		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.22.4. escape\_brackets (::quartus::misc)

The following table displays information for the escape\_brackets Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::misc on page 317	
<b>Syntax</b>	escape_brackets [-h   -help] [-long_help] <str>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	<str>	String to escape
<b>Description</b>	<p>Escapes square brackets in bus name patterns for use in string matching. Also escapes the escape character; for example, the string "\" is escaped into "\\\".</p> <p>Note that natural bus naming is supported by default. This means that bus names, not bus name patterns, are automatically detected and do not need to be escaped by using this command. Bus names have the following format:</p> <pre>&lt;bus name&gt;[&lt;bus index&gt;] or &lt;bus name&gt;[*]</pre> <p>The &lt;bus name&gt; portion is a string of alphanumeric characters. The &lt;bus index&gt; portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the &lt;bus index&gt; is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[*]" are supported bus names.</p> <p>All other uses of square brackets must be escaped if you do not intend to use the brackets as part of a string pattern in a string match. For example, the bus name pattern "a\[0-2\]" must be escaped using this "escape_brackets" command since the "0-2" does not satisfy the &lt;bus index&gt; requirement to be a bus name.</p> <p>Many Quartus Prime Tcl commands allow string matching in option arguments. A common error is using bus name patterns in these arguments, such as:</p> <pre>address\[0-2\]</pre> <p>Square brackets for bus name patterns must already be preceded by an escape character (\[ or \]) to prevent Tcl from interpreting them as sub-commands. String matching, however, also uses square brackets to match any character between the brackets. The previous example, when used as a string match pattern, searches for the string patterns address0, address1, and address2. It does not search for address[0], address[1], and address[2].</p> <p>Therefore, for arguments that support string matching, square brackets must be escaped twice (\\\[ or \\]) so that the strings are interpreted as bus name patterns. For example, to search for address[0], address[0], and address[2], type the following string match pattern:</p> <pre>address\\\[0-2\\]</pre> <p>or, equivalently,</p> <pre>"address[escape_brackets \[0-2][escape_brackets \]]"</pre> <p>Quartus Prime Tcl commands do not convert bus name patterns automatically, since they cannot determine if the string is intended as a bus name pattern or a regular string match pattern. Therefore, "escape_brackets" is provided for your convenience.</p> <p>You may choose to disable natural bus naming in order to string match patterns such as "in\[024\]". In this example, you are string matching the names "in0", "in2", and "in4".</p> <p>To disable natural bus naming, type</p> <pre>"disable_natural_bus_naming".</pre> <p>Note that if you disable natural bus naming, then square brackets must be escaped twice (\\\[ or \\]) so that the strings are interpreted as bus names during a string match, such as:</p> <pre>set bus_name "address\[0\]" string match [escape_brackets \$bus_name] \$bus_name</pre>	

continued...

	<p>The "escape_brackets" command escapes "address\[0\]" into "address\\\[0\\]".</p> <p>To enable natural bus naming again, type "enable_natural_bus_naming".</p> <p>For more information about natural bus naming, type "enable_natural_bus_naming -h".</p>		
<b>Example Usage</b>	<pre># Get all location assignments for bus address[] set address_names address[*] set address_locations [get_all_instance_assignments -to \$address_names] -name LOCATION  # Get location assignment for bus address[0] set address_names address[0] set address_locations [get_all_instance_assignments -to \$address_names] -name LOCATION  # Get location assignments for bus address[0], # address[1], and address[2] set address_names address[0-2] set address_locations [get_all_instance_assignments -to [escape_brackets \$address_names]] - name LOCATION</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.22.5. foreach\_in\_collection (::quartus::misc)

The following table displays information for the foreach\_in\_collection Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::misc</a> on page 317									
<b>Syntax</b>	foreach_in_collection [-h   -help] [-long_help] <variable_name> <collection> <body>									
<b>Arguments</b>	-h   -help	Short help								
	-long_help	Long help with examples and possible return values								
	<variable_name>	Variable name								
	<collection>	Collection								
	<body>	Body								
<b>Description</b>	<p>Accesses each element of a collection.</p> <p>Some Tcl commands return a collection. The following table shows examples of commands that return a collection:</p> <table><tr><th>Tcl package</th><th>Tcl commands (returning a collection)</th></tr><tr><td>-----</td><td>-----</td></tr><tr><td>::quartus::project</td><td>get_all_quartus_defaults get_all_global_assignments get_all_instance_assignments get_all_parameters get_names assignment_group (only for the "-get_members" and "-get_exceptions" options)</td></tr><tr><td>::quartus::chip_editor</td><td>get_nodes get_iports get_oports</td></tr></table> <p>The command is used in the following format:</p> <pre>foreach_in_collection &lt;variable name&gt; &lt;collection&gt; {      # This is the body of "foreach_in_collection"     ... }</pre>		Tcl package	Tcl commands (returning a collection)	-----	-----	::quartus::project	get_all_quartus_defaults get_all_global_assignments get_all_instance_assignments get_all_parameters get_names assignment_group (only for the "-get_members" and "-get_exceptions" options)	::quartus::chip_editor	get_nodes get_iports get_oports
Tcl package	Tcl commands (returning a collection)									
-----	-----									
::quartus::project	get_all_quartus_defaults get_all_global_assignments get_all_instance_assignments get_all_parameters get_names assignment_group (only for the "-get_members" and "-get_exceptions" options)									
::quartus::chip_editor	get_nodes get_iports get_oports									
continued...										

	<p>Unlike a Tcl list, a collection is a container specific to the Quartus II software, whose elements can be accessed by using the "foreach_in_collection" command.</p>
<b>Example Usage</b>	<pre>## Get a collection of global assignments set collection_of_global_assignments [get_all_global_assignments -name *] ## Display the collection string representation puts \$collection_of_global_assignments ## Iterate through the collection and display ## the information for each global assignment foreach_in_collection global \$collection_of_global_assignments {      set sect_id [lindex \$global 0]     set name [lindex \$global 1]     set value [lindex \$global 2]      ## Now, display the content of the global assignment     puts "Section ID (\$sect_id)"     puts "Assignment Name (\$name)"     puts "Assignment Value (\$value)" }  ## Get a collection of instance assignments set collection_of_instance_assignments [get_all_instance_assignments -name *] ## Display the collection string representation puts \$collection_of_instance_assignments ## Iterate through the collection and display ## the information for each instance assignment foreach_in_collection instance \$collection_of_instance_assignments {      set sect_id [lindex \$instance 0]     set src [lindex \$instance 1]     set dest [lindex \$instance 2]     set name [lindex \$instance 3]     set value [lindex \$instance 4]      ## Now, display the content of the instance assignment     puts "Section ID (\$sect_id)"     puts "Source (\$src)"     puts "Destination (\$dest)"     puts "Assignment Name (\$name)"     puts "Assignment Value (\$value)" }  ## Get a collection of parameters set collection_of_parameters [get_all_parameters -name *] ## Display the collection string representation puts \$collection_of_parameters ## Iterate through the collection and display ## the information for each parameter foreach_in_collection parameter \$collection_of_parameters {      set dest [lindex \$parameter 0]     set name [lindex \$parameter 1]     set value [lindex \$parameter 2]      ## Now, display the content of the parameter     puts "Destination (\$dest)"     puts "Parameter Name (\$name)"     puts "Parameter Value (\$value)" }  ## Get a collection of all node name ids from a successful ## compilation set collection_of_name_ids [get_names -filter *] ## Display the collection string representation puts \$collection_of_name_ids ## Iterate through the collection and display ## the information for each name id foreach_in_collection name_id \$collection_of_name_ids {      set parent_name_id [get_name_info -info parent_name_id \$name_id]     set base_name [get_name_info -info base_name \$name_id]     set entity_name [get_name_info -info entity_name \$name_id]     set instance_name [get_name_info -info instance_name \$name_id]     set full_path [get_name_info -info full_path \$name_id]     set short_full_path [get_name_info -info short_full_path \$name_id]     set node_type [get_name_info -info node_type \$name_id]     set creator [get_name_info -info creator \$name_id]     set signaltap1i [get_name_info -info signaltap1i \$name_id]     set file_location [get_name_info -info file_location \$name_id]      ## Now, display information about the name     puts "Parent Name Id (\$parent_name_id)"     puts "Base Name (\$base_name)"     puts "Entity Name (\$entity_name)" }</pre>

*continued...*

	<pre> puts "Instance Name (\$instance_name)" puts "Full Path (\$full_path)" puts "Short Full Path (\$short_full_path)" puts "Node Type (\$node_type)" puts "Creator (\$creator)" puts "SignalTapII (\$signaltapii)" puts "File location (\$file_location)" }  # Display the members of a particular assignment group named "tgl" foreach_in_collection member [assignment_group "tgl" -get_members] {      # Print the name of the member     puts \$member }  # Display the exception to a particular assignment group named "tgl" foreach_in_collection exception [assignment_group "tgl" -get_exceptions] {      # Print the name of the exception     puts \$exception } </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.22.6. get\_collection\_size (::quartus::misc)

The following table displays information for the `get_collection_size` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::misc</a> on page 317		
<b>Syntax</b>	get_collection_size [-h   -help] [-long_help] [ <collection> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<collection>	Collection	
<b>Description</b>	<p>Returns the size of a collection.</p> <p>Unlike a Tcl list, a collection is a container specific to the Quartus Prime software, whose elements can be accessed by using the "foreach_in_collection" command.</p>		
<b>Example Usage</b>	<pre>## Displays the number of global assignments project_open chiptrip set num_global_asgns [get_collection_size [get_all_global_assignments -name {*}}] puts \$num_global_asgns project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Collection does not exist with name: <string>. Specify the collection name returned by a Tcl command that supports foreach_in_collection. Note a valid collection name can become invalid if the variable holding the collection goes out of scope, as well as a result of some built-in TCL commands, for example 'string length'.
	TCL_ERROR	1	ERROR: Nested calls to foreach_in_collection with the same collection name <string> are not allowed. Specify a different collection name for the other collection.

### 3.1.22.7. get\_environment\_info (::quartus::misc)

The following table displays information for the `get_environment_info` Tcl command:

Tcl Package and Version	Belongs to ::quartus::misc on page 317		
Syntax	get_environment_info [-h   -help] [-long_help] [-num_logical_processors] [-num_physical_processors] [-operating_system]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-num_logical_processors	Option to return the number of available logical processors (cores including hyper-threading)	
	-num_physical_processors	Option to return the number of available physical processors (sockets)	
	-operating_system	Option to return the operating system name	
Description	Returns information about the system environment depending on the options specified.		
Example Usage	# Get the number of physical processors available on my computer. get_environment_info -num_physical_processors		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: At least one option is required. Specify at least one option.
	TCL_ERROR	1	ERROR: Multiple options used. Choose only one option for this command.

### 3.1.22.8. get\_message\_count (::quartus::misc)

The following table displays information for the `get_message_count` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::misc</code> on page 317	
<b>Syntax</b>	<code>get_message_count [-h   -help] [-long_help] -type &lt;info extra_info warning critical_warning error&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-type &lt;info extra_info warning critical_warning error&gt;</code>	Type of message
<b>Description</b>	<div>Get a count of messages of a specific message type.</div> <div>The message type can be "info", "warning", "critical_warning", or "error".</div>	
<b>Example Usage</b>	<pre># Get count of error messages get_message_count -type error  # Get count of warning messages get_message_count -type warning</pre>	
continued...		

*continued...*

	# Get count of critical warning messages get_message_count -type critical_warning		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal message type: <i>&lt;string&gt;</i> . Specify info, warning, critical_warning, or error.
	TCL_ERROR	1	ERROR: Missing required positional argument: <i>&lt;string&gt;</i> . Specify the <i>&lt;string&gt;</i> argument.
	TCL_ERROR	1	ERROR: You specified <i>&lt;string&gt;</i> arguments to the -args option. However, you can pass a maximum of <i>&lt;string&gt;</i> arguments.

### 3.1.22.9. init\_tk (::quartus::misc)

The following table displays information for the `init_tk` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::misc</a> on page 317		
Syntax	init_tk [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	<div>Initializes a Tk window. If you are using Tk functionality in Tcl, you must run this command first before running any Tcl scripts.</div>		
Example Usage	<pre># Initialize the Tk library init_tk  # Create a top level and add a title toplevel .top wm title .top "Hello World"  # Add widgets button .top.hello -text Hello -command {puts stdout "Hello, World!"} pack .top.hello -padx 20 -pady 10  # Without "tkwait", the script finishes at this point and the # window is destroyed. The "tkwait" command prevents the # script from finishing until the you close the window. tkwait window .top</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.22.10. load (::quartus::misc)

The following table displays information for the `load` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::misc</a> on page 317		
<b>Syntax</b>	load [-h   -help] [-long_help] <load_args>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
continued...			

	<load_args>		Arguments to load
<b>Description</b>	<p>Loads machine code and initializes new commands.</p> <p>This command works exactly like Tcl's native "load" command.</p>		
<b>Example Usage</b>	<p>Refer to documentation for Tcl's native "load" command at the Tcl/Tk web site at <a href="http://www.tcl.tk">www.tcl.tk</a>.</p>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't load library: <string>. The operating system reports the following error: <string>

### 3.1.22.11. load\_package (::quartus::misc)

The following table displays information for the load\_package Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::misc</code> on page 317		
<b>Syntax</b>	<code>load_package [-h   -help] [-long_help] [-version &lt;version number&gt; ] &lt;package name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-version &lt;version number&gt;</code>	Option to specify the Quartus Prime Tcl package version to load	
	<code>&lt;package name&gt;</code>	Name of Quartus Prime Tcl package to load	
<b>Description</b>	<p>Loads the specified Quartus Prime Tcl package with the specified version number. If you do not specify the "-version" option, the latest version is loaded by default.</p> <p>The Quartus Prime Tcl package names have the "::quartus::" prefix, such as "::quartus::project". For convenience, you can omit the "::quartus::" prefix when you use the &lt;package name&gt; argument.</p> <p>This command is similar to the "package require" command. The advantage of using "load_package" is that you can alternate freely between different versions of the same package.</p> <p>For example, if you loaded version 2.0, and now want to load version 1.0, you can type:</p> <pre>"load_package -version 1.0 &lt;package name&gt;".</pre>		
<b>Example Usage</b>	<pre># Load version 1.0 of the ::quartus::project package load_package project -version 1.0  # Load version 2.0 of the ::quartus::project package load_package project -version 2.0</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Tcl package <string> does not exist. Specify an available Quartus Prime Tcl package. Type help for a list of available Quartus Prime Tcl packages.

continued...

*continued...*

TCL_ERROR	1	ERROR: Tcl package <string> version <string> does not exist. Specify an available Quartus Prime Tcl package. Type help for a list of available Quartus Prime Tcl packages.
TCL_ERROR	1	ERROR: Tcl package <string> is only available in Quartus Pro Edition
TCL_ERROR	1	ERROR: Tcl package <string> is only available in Quartus Standard Edition

### 3.1.22.12. post\_message (::quartus::misc)

The following table displays information for the `post_message` Tcl command:

Tcl Package and Version	Belongs to ::quartus::misc on page 317		
Syntax	post_message [-h   -help] [-long_help] [-type <info extra_info warning critical_warning error> ] [ <string> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-type <info extra_info warning critical_warning error>	Type of message to display	
	<string>	Message to be displayed	
Description	<p>Displays messages and sub-messages of the specified type.</p> <p>The message type can be "info", "warning", "critical_warning", or "error".</p> <p>If you do not use the -type option, the default message type is "info".</p> <p>The "extra_info" type is deprecated. Messages with this type will not be displayed. Use the "info" type instead.</p> <p>Use the -submsgs option to group messages indented under a message. The -submsgs option posts each string in a Tcl list of strings as a sub-message. The sub-messages have the same message type as the main message.</p>		
Example Usage	<pre># Display an error message post_message -type error "Can't open file test.tcl"  # Display an info message post_message "Generated output file: test.out" # OR post_message -type info "Generated output file: test.out"  # Display an info message with a sub-message post_message "Generated output file: test.out" -submsgs [list "Ouput file saved in project directory"]  # Display a warning message post_message -type warning "Defaulting fmax to 155.55mhz"  # Display a critical warning message post_message -type critical_warning "Invalid fmax was specified - defaulting to 155.55mhz"</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Error(s) found while processing handle: <string>. Make sure you specified a valid Quartus Prime message handle for the -<string> option and passed the correct

continued...

*continued...*

			number of arguments to the -<string> option. Also check that you passed the correct message type to the -<string> option.
	TCL_ERROR	1	ERROR: Illegal message type: <string>. Specify info, warning, critical_warning, or error.
	TCL_ERROR	1	ERROR: Missing required positional argument: <string>. Specify the <string> argument.
	TCL_ERROR	1	ERROR: You specified <string> arguments to the -args option. However, you can pass a maximum of <string> arguments.

### 3.1.22.13. qerror (::quartus::misc)

The following table displays information for the qerror Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::misc</a> on page 317		
Syntax	qerror [-h   -help] [-long_help] [-error_null] [-over_malloc] [-qt_segfault] [-std_segfault]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-error_null	Option to error by dereferencing null	
	-over_malloc	Option to error by malloc'ing INT_MAX	
	-qt_segfault	Accesses an element at an invalid index in a QT container	
	-std_segfault	Accesses an element at an invalid index in a std container	
Description			
	This command currently contains no help description.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.22.14. qxexec (::quartus::misc)

The following table displays information for the qxexec Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::misc</a> on page 317		
<b>Syntax</b>	qexec [-h   -help] [-long_help] <i>&lt;command&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<i>&lt;command&gt;</i>	Command	
<b>Description</b>	<div>Runs the specified shell command from within a Tcl shell or script.</div> <div>Usage for this command is as follows: qexec "&lt;command&gt;"</div>		
continued...			

<b>Example Usage</b>	<code>qexec ls</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.22.15. qexit (::quartus::misc)

The following table displays information for the `qexit` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::misc</a> on page 317		
Syntax	qexit [-h   -help] [-long_help] [-error] [-success]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-error	Option to exit with an equivalent Quartus Prime error code	
	-success	Option to exit with an equivalent Quartus Prime success code	
Description	<p>Exits the Quartus Prime software.</p> <p>The Quartus Prime Tcl command "qexit" is equivalent to the Tcl command "exit".</p> <p>When used with a particular option, this command exits the Quartus Prime software with the corresponding Quartus Prime exit code. For example, typing "qexit -success" is equivalent to typing "exit 0". When the "-success" option is specified, the corresponding Quartus Prime exit code is "0".</p> <p>If no option is specified, the default exit code is the same as for the "-success" option.</p>		
Example Usage	<p>1) To exit the Quartus Prime software with an equivalent Quartus Prime success code, type:</p> <pre>qexit -success</pre> <p>2) To exit the Quartus Prime software with an equivalent Quartus Prime error code, type:</p> <pre>qexit -error</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.22.16. record\_tcl\_cmd (::quartus::misc)

The following table displays information for the `record_tcl_cmd` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::misc</a> on page 317		
<b>Syntax</b>	record_tcl_cmd [-h   -help] [-long_help] [-filename <file name> ] <start_end>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-filename <file name>	Option to specify an user filename	
	<start_end>	To start or end recording	
continued...			

<b>Description</b>	Start or end to record Tcl commands.		
<b>Example Usage</b>	1) Type "record_tcl_cmd" start -filename user.rec To start record Tcl commands with filename "user.rec"		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.22.17. stopwatch (::quartus::misc)

The following table displays information for the stopwatch Tcl command:

Tcl Package and Version	Belongs to ::quartus::misc on page 317		
Syntax	stopwatch [-h   -help] [-long_help] [-lap_time] [-number_format] [-reset] [-start]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-lap_time	Option to get the lap time	
	-number_format	Option to show the lap time in seconds without appending the "s", i.e. seconds, character	
	-reset	Option to reset the stopwatch	
	-start	Option to start the stopwatch	
Description	Provides a stopwatch interface.		
Example Usage	<pre># Begin the stopwatch stopwatch -start exec sleep 1 # Get the lap time puts [stopwatch -lap_time] exec sleep 1 # Get the lap time puts [stopwatch -lap_time] # Reset the stopwatch stopwatch -reset</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.23. ::quartus::names

The following table displays information for the ::quartus::names Tcl package:

Tcl Package and Version	::quartus::names 1.0
Description	This package contains no general description.
Availability	<div>This package is available for loading in the following executables:</div> <div><div>qpro_sh</div><div>quartus_asm</div><div>quartus_cdb</div><div>quartus_eda</div></div>
continued...	

	<pre>quartus_fit quartus_map quartus_pow quartus_sh quartus_sta quartus_syn</pre>
<b>Tcl Commands</b>	<pre>get_assignment (::quartus::names) on page 331 set_assignment (::quartus::names) on page 331</pre>

### 3.1.23.1. get\_assignment (::quartus::names)

The following table displays information for the get\_assignment Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::names</a> on page 330		
<b>Syntax</b>	get_assignment [-h   -help] [-long_help] -dict -name <ASSIGNMENT_NAME> [-to <ASSIGNMENT_TO> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-dict	Indicates this command should return it's result as a Tcl dict object.	
	-name <ASSIGNMENT_NAME>	The assignment name to get the value of.	
	-to <ASSIGNMENT_TO>	The node to retrieve the assignment value from (omitting this will retrieve the global assignment value, if any).	
<b>Description</b>	<p>Gets the assignment's value. If -to is specified, tries to get the assignment value on the given node, as long as the assignment targeted the node using it's -to field. If -to is not specified, the global value is returned (if any).</p> <p>If the assignment is not found, a Tcl error is produced. If the assignment is found and the -dict option is given, a Tcl dict object is returned with the assignment 'name' (the given input), and the 'value' retrieved from the found assignment. In addition, if the assignment has a 'to' or 'from' field, those fields will also exist in the returned dict.</p>		
<b>Example Usage</b>	# Returns fitter seed get_assignment SEED		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No assignment matching the name <string> was found.

### 3.1.23.2. set\_assignment (::quartus::names)

The following table displays information for the set\_assignment Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::names</a> on page 330		
<b>Syntax</b>	set_assignment [-h   -help] [-long_help] -name <ASSIGNMENT_NAME> [-to <INSTANCE_NAME> ] -value <VALUE>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <ASSIGNMENT_NAME>	The assignment name to set.	
continued...			

	<code>-to &lt;INSTANCE_NAME&gt;</code>		The node to which the assignment should be applied.
	<code>-value &lt;VALUE&gt;</code>		The value to set the assignment to.
<b>Description</b>	Sets the assignment to the given value. If <code>-to</code> is specified, tries to set the assignment value to the given node. If <code>-to</code> is not specified, this applies to global assignments.		
<b>Example Usage</b>	<code>set_assignment SEED 9</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No assignment matching the name <i>&lt;string&gt;</i> was found.

### 3.1.24. ::quartus::periph

The following table displays information for the **::quartus::periph** Tcl package:

<b>Tcl Package and Version</b>	::quartus::periph 1.0
<b>Description</b>	This package contains the set of Tcl functions for interacting with the Interface Planner plans.
<b>Availability</b>	This package is available for loading in the following executable:  quartus_fit
<b>Tcl Commands</b>	blueprint::initialize (::quartus::periph) on page 337 blueprint::shutdown (::quartus::periph) on page 347 periph::check_plan (::quartus::periph) on page 333 periph::get_cell_info (::quartus::periph) on page 333 periph::get_cells (::quartus::periph) on page 334 periph::get_location_info (::quartus::periph) on page 335 periph::get_placement_info (::quartus::periph) on page 336 periph::get_placements (::quartus::periph) on page 337 periph::load_floorplan (::quartus::periph) on page 338 periph::place_cells (::quartus::periph) on page 338 periph::remove_invalid_reports (::quartus::periph) on page 339 periph::report_all (::quartus::periph) on page 340 periph::report_cell_connectivity (::quartus::periph) on page 340 periph::report_cell_placement_reasons (::quartus::periph) on page 341 periph::report_cells (::quartus::periph) on page 341 periph::report_clocks (::quartus::periph) on page 342 periph::report_legal_cell_locations (::quartus::periph) on page 342 periph::report_location_types (::quartus::periph) on page 343 periph::report_locations (::quartus::periph) on page 343 periph::report_noc_performance (::quartus::periph) on page 344 periph::report_regions (::quartus::periph) on page 344 periph::report_summary (::quartus::periph) on page 345 periph::reset_plan (::quartus::periph) on page 345 periph::save_floorplan (::quartus::periph) on page 346 periph::set_clock_type (::quartus::periph) on page 346 periph::undo_last_placement (::quartus::periph) on page 347 periph::unplace_cells (::quartus::periph) on page 348 periph::update_pdpw (::quartus::periph) on page 348 periph::update_plan (::quartus::periph) on page 349 periph::write_plan (::quartus::periph) on page 349

### 3.1.24.1. `periph::check_plan (::quartus::periph)`

The following table displays information for the `periph::check_plan` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332		
<b>Syntax</b>	periph::check_plan [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Checks the legality of the current plan		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize periph::update_plan periph::check_plan project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.2. `periph::get_cell_info (::quartus::periph)`

The following table displays information for the `periph::get_cell_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332	
<b>Syntax</b>	periph::get_cell_info [-h   -help] [-long_help] [-children] [-guide_cell_id] [-ip_type] [-links] [-location] [-name] [-parent] [-type] <cell_id>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-children	Return the the cell id of the children cells
	-guide_cell_id	Returns the guide cell's elem_id
	-ip_type	Returns the IP type if the cell is an IP cell or an empty string otherwise
	-links	Return the given design element's connections to other cells
	-location	Returns the location ID if the cell is placed or an empty string otherwise
	-name	Return the cell name of the cell id
	-parent	Return the the cell id of the parent cells
	-type	Return the the type of the cell
	<cell_id>	Single cell id
<b>Description</b>	Gets information about the specified cell (referenced by cell ID). You can obtain cell using the periph::get_cells Tcl command.	
continued...		

<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize periph::update_plan  foreach cell [periph::get_cells -type IO_CLUSTER] {     puts "Found cell ID \$cell named [periph::get_cell_info -name \$cell]" }  blueprint::shutdown project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied cell id <string> is invalid.
	TCL_ERROR	1	ERROR: At least one cell ID must be supplied, but no cell IDs were supplied
	TCL_ERROR	1	ERROR: <string> cell IDs were expected but <string> were supplied

### 3.1.24.3. periph::get\_cells (::quartus::periph)

The following table displays information for the periph::get\_cells Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332	
<b>Syntax</b>	periph::get_cells [-h   -help] [-long_help] [-atom_only] [-instance_only] [-ip_only] [-num_location <num_location> ] [-physical_only] [-placed] [-toplevel_only] [-type <type> ] [-unplaced] [ <filter> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-atom_only	Return only atom cells
	-instance_only	Return only instance cells
	-ip_only	Return only instance cells that are IP instances
	-num_location <num_location>	Specify a specific number of available locations the cell should have
	-physical_only	Return only physical cells
	-placed	Return only placed cells
	-toplevel_only	Return only toplevel cells
	-type <type>	Return only cells of the given types
	-unplaced	Return only unplaced cells
	<filter>	Object filter
<b>Description</b>	<p>Returns a list of cells IDs in the design. All cell names in the collection match the specified pattern. Wildcards can be used to select multiple cells at once.</p> <p>When you use the wildcard matching, use pipe characters to separate one hierarchy level from the next. They are treated as special characters and are taken into account when string matching with wildcards is performed. When this matching scheme is enabled, the specified pattern is matched against absolute cell names: the names that include the entire hierarchical path. A full cell name can contain multiple pipe characters in it to reflect the hierarchy. All</p>	
continued...		

	hierarchy levels in the pattern are matched level by level. Any included wildcards refer to only one hierarchical level. For example, "*" and "* *" produce different collections since they refer to the highest hierarchical level and second highest hierarchical level respectively.		
<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize periph::update_plan  foreach cell [periph::get_cells -type IO_CLUSTER] {     puts "Found cell ID \$cell named [periph::get_cell_info -name \$cell]" }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied number of locations <string> is invalid.
	TCL_ERROR	1	ERROR: <string> number of locations were expected but <string> were supplied

#### 3.1.24.4. periph::get\_location\_info (::quartus::periph)

The following table displays information for the `periph::get_location_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332	
<b>Syntax</b>	<code>periph::get_location_info [-h   -help] [-long_help] [-children] [-gid] [-name] [-parents] [-placed_cells] [-properties] [-type] &lt;location_id&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-children</code>	Query the children location IDs
	<code>-gid</code>	Query the gid of the location IDs
	<code>-name</code>	Return the location name of the location id
	<code>-parents</code>	Query the parent location IDs
	<code>-placed_cells</code>	Return the placed cells at the location id
	<code>-properties</code>	Return the device location properties in json
	<code>-type</code>	Return the location type of the location id
	<code>&lt;location_id&gt;</code>	location id
<b>Description</b>	Gets information about the specified location (referenced by location ID). You can obtain location using the <code>periph::get_locations</code> Tcl command or using the <code>periph::get_cell_info -location</code> Tcl command	
<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize periph::update_plan  foreach cell [periph::get_cells -placed] {     puts "Found cell ID \$cell named [periph::get_cell_info -name \$cell] placed in location</pre>	

*continued...*

	<pre>[periph::get_cell_info -location \$cell] named [periph::get_location_info -name [periph::get_cell_info -location \$cell]]" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied location id <string> is invalid.
	TCL_ERROR	1	ERROR: The supplied type <string> is invalid.
	TCL_ERROR	1	ERROR: At least one device location ID must be supplied, but no location IDs were supplied
	TCL_ERROR	1	ERROR: At least one type must be supplied, but no types were supplied
	TCL_ERROR	1	ERROR: <string> location IDs were expected but <string> were supplied
	TCL_ERROR	1	ERROR: <string> types were expected but <string> were supplied

### 3.1.24.5. periph::get\_placement\_info (::quartus::periph)

The following table displays information for the `periph::get_placement_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332		
<b>Syntax</b>	periph::get_placement_info [-h   -help] [-long_help] [-placement] <placement_id>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-placement	Return the placement as a list of cell/id pairs	
	<placement_id>	Single placement id	
<b>Description</b>	Return information about a given placement		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied placement id <string> is invalid.
	TCL_ERROR	1	ERROR: At least one placement ID must be supplied, but no placement IDs were supplied
	TCL_ERROR	1	ERROR: <string> placement IDs were expected but <string> were supplied

### 3.1.24.6. `periph::get_placements (::quartus::periph)`

The following table displays information for the `periph::get_placements` Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::periph</code> on page 332		
Syntax	<code>periph::get_placements [-h   -help] [-long_help] &lt;cell_id&gt;</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>&lt;cell_id&gt;</code>	Single cell id	
Description	Returns a vector of placements for the supplied cell		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied cell id <code>&lt;string&gt;</code> is not a placeable cell.
	TCL_ERROR	1	ERROR: The supplied cell id <code>&lt;string&gt;</code> is invalid.
	TCL_ERROR	1	ERROR: At least one cell ID must be supplied, but no cell IDs were supplied
	TCL_ERROR	1	ERROR: <code>&lt;string&gt;</code> cell IDs were expected but <code>&lt;string&gt;</code> were supplied

### 3.1.24.7. `blueprint::initialize (::quartus::periph)`

The following table displays information for the `blueprint::initialize` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332	
<b>Syntax</b>	<code>blueprint::initialize [-h   -help] [-long_help] [-load_compiler_snapshot] [-read_settings_files &lt;on off&gt; ]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-load_compiler_snapshot</code>	Initialize the Interface Planner placement state with the latest compiler snapshot. Use <code>periph::compiler_snapshot_exists</code> to check if a compiler snapshot can be loaded
	<code>-read_settings_files &lt;on off&gt;</code>	Option to identify that settings files should be read from disk
<b>Description</b>	<div>Initialize the Interface Planner planning engine. Initialization consists of loading all required databases from disk for the design and device. Once initialization is complete, the constraints have not yet been applied and must be done before placement can begin.</div> <div>After the assignments have been created, they can be applied to the project by running the <code>plan::update_platform</code> Tcl command.</div>	
continued...		

<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize periph::update_plan blueprint::shutdown  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.8. periph::load\_floorplan (::quartus::periph)

The following table displays information for the `periph::load_floorplan` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332		
<b>Syntax</b>	periph::load_floorplan [-h   -help] [-long_help] -filename <i>&lt;filename&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-filename <i>&lt;filename&gt;</i>	Filename to load	
<b>Description</b>	Load the floorplan from a Interface Planner floorplan file		
<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize  periph::update_plan  periph::place_cells -unplaced_cells periph::save_floorplan -filename onewire_blueprint_floorplan.plan  periph::load_floorplan -filename onewire_blueprint_floorplan.plan  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.9. periph::place\_cells (::quartus::periph)

The following table displays information for the `periph::place_cells` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332		
<b>Syntax</b>	<code>periph::place_cells [-h   -help] [-long_help] [-cell_location &lt;cell_location&gt; ] [-cells &lt;cells&gt; ] [-dont_revert_on_fail] [-fixed_cells] [-placement &lt;placement&gt; ] [-unplaced_cells]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-cell_location &lt;cell_location&gt;</code>	Cell location id pair to place cells into	
	<code>-cells &lt;cells&gt;</code>	One or more cell ids	
<i>continued...</i>			

	-dont_revert_on_fail		Option to specify that the best partial placement should be saved on the undo stack upon a placement failure
	-fixed_cells		Place all unplaced cells
	-placement <i>&lt;placement&gt;</i>		Place cells according to a placement. A placement is a special object that comes from the <code>periph::get_placements</code> Tcl command
	-unplaced_cells		Place all unplaced cells
Description	Performs a placement on the supplied cells		
Example Usage	<pre>project_open onewire_nf blueprint::initialize periph::update_plan periph::place_cells -unplaced_cells periph::check_plan project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied cell id <i>&lt;string&gt;</i> is invalid.
	TCL_ERROR	1	ERROR: The supplied cell id / location id pair <i>&lt;string&gt;</i> is invalid.
	TCL_ERROR	1	ERROR: The supplied location id <i>&lt;string&gt;</i> is invalid.
	TCL_ERROR	1	ERROR: The supplied placement id <i>&lt;string&gt;</i> is invalid.
	TCL_ERROR	1	ERROR: At least one cell ID must be supplied, but no cell IDs were supplied
	TCL_ERROR	1	ERROR: At least one device location ID must be supplied, but no location IDs were supplied
	TCL_ERROR	1	ERROR: At least one placement ID must be supplied, but no placement IDs were supplied
	TCL_ERROR	1	ERROR: <i>&lt;string&gt;</i> cell IDs were expected but <i>&lt;string&gt;</i> were supplied
	TCL_ERROR	1	ERROR: <i>&lt;string&gt;</i> location IDs were expected but <i>&lt;string&gt;</i> were supplied
	TCL_ERROR	1	ERROR: <i>&lt;string&gt;</i> placement IDs were expected but <i>&lt;string&gt;</i> were supplied

### 3.1.24.10. `periph::remove_invalid_reports (::quartus::periph)`

The following table displays information for the `periph::remove_invalid_reports` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332	
<b>Syntax</b>	<code>periph::remove_invalid_reports [-h   -help] [-long_help]</code>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<i>continued...</i>		

<b>Description</b>	Remove all invalid report		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.11. `periph::report_all` (`::quartus::periph`)

The following table displays information for the `periph::report_all` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332		
<b>Syntax</b>	<code>periph::report_all [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Create all default summary reports		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.12. `periph::report_cell_connectivity` (`::quartus::periph`)

The following table displays information for the `periph::report_cell_connectivity` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332		
<b>Syntax</b>	periph::report_cell_connectivity [-h   -help] [-long_help] [-fanins] [-fanouts] [-panel_name <i>&lt;name&gt;</i> ] <i>&lt;cell_id&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-fanins	Report only the fanins of the cell	
	-fanouts	Report only the fanouts of the cell	
	-panel_name <i>&lt;name&gt;</i>	Sends the results to the panel and specifies the name of the new panel	
	<i>&lt;cell_id&gt;</i>	Single cell id	
<b>Description</b>	Creates a report of the connectivity for a cell.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.13. `periph::report_cell_placement_reasons (::quartus::periph)`

The following table displays information for the `periph::report_cell_placement_reasons` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::periph</a> on page 332		
Syntax	periph::report_cell_placement_reasons [-h   -help] [-long_help] [-panel_name <name> ] <cell_id>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	<cell_id>	Single cell id	
Description	Creates a report of all the locations a particular cell can be placed and the reasons it cannot be placed there		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.24.14. `periph::report_cells (::quartus::periph)`

The following table displays information for the `periph::report_cells` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332		
<b>Syntax</b>	periph::report_cells [-h   -help] [-long_help] [-name <name> ] [-panel_name <name> ] [-placed] [-type <type> ] [-unplaced]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <name>	Filter the list of placed cells specifying a name. Wildcards are supported.	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-placed	Report the list of placed cells	
	-type <type>	Filter the list of placed cells specifying a list of types	
	-unplaced	Report the list of unplaced cells	
<b>Description</b>	Returns a list of periphery cells based on the specified criteria.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.15. `periph::report_clocks (::quartus::periph)`

The following table displays information for the `periph::report_clocks` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332		
<b>Syntax</b>	<code>periph::report_clocks [-h   -help] [-long_help] [-panel_name &lt;name&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-panel_name &lt;name&gt;</code>	Sends the results to the panel and specifies the name of the new panel	
<b>Description</b>	Show the signals that are using low-skew routing networks (clock networks) in the device. If applicable, also show any signals that were considered for automatic clock network promotion, but were not promoted.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.16. `periph::report_legal_cell_locations (::quartus::periph)`

The following table displays information for the `periph::report_legal_cell_locations` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332		
<b>Syntax</b>	<code>periph::report_legal_cell_locations [-h   -help] [-long_help] [-panel_name &lt;name&gt; ] &lt;cell_id&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-panel_name &lt;name&gt;</code>	Sends the results to the panel and specifies the name of the new panel	
	<code>&lt;cell_id&gt;</code>	Single cell id	
<b>Description</b>	<div>Creates a report of the legal periphery cell locations of a cell</div>		
<b>Example Usage</b>	<div>This command currently contains no example usage.</div>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.17. `periph::report_location_types (::quartus::periph)`

The following table displays information for the `periph::report_location_types` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332		
<b>Syntax</b>	<code>periph::report_location_types [-h   -help] [-long_help] [-panel_name &lt;name&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-panel_name &lt;name&gt;</code>	Sends the results to the panel and specifies the name of the new panel	
<b>Description</b>	Creates a report of the location types in the periphery		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.18. `periph::report_locations (::quartus::periph)`

The following table displays information for the `periph::report_locations` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332		
<b>Syntax</b>	periph::report_locations [-h   -help] [-long_help] [-panel_name <name> ] <type>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	<type>	location type to query	
<b>Description</b>	Creates a report of the locations for the requested type in the periphery		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.19. `periph::report_noc_performance (::quartus::periph)`

The following table displays information for the `periph::report_noc_performance` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332		
<b>Syntax</b>	periph::report_noc_performance [-h   -help] [-long_help] [-iniu_freq <iniu_freq> ] [-panel_name <name> ] [-tniu_freq <tniu_freq> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-iniu_freq <iniu_freq>	Specify the INIU frequency used in the report	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-tniu_freq <tniu_freq>	Specify the TNIU frequency used in the report	
<b>Description</b>	Show the performance of the NoC given the current placement of the NoC elements.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.20. `periph::report_regions (::quartus::periph)`

The following table displays information for the `periph::report_regions` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332		
<b>Syntax</b>	periph::report_regions [-h   -help] [-long_help] [-panel_name <name> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
<b>Description</b>	This command currently contains no help description.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.21. `periph::report_summary` (`::quartus::periph`)

The following table displays information for the `periph::report_summary` Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::periph</code> on page 332		
Syntax	<code>periph::report_summary [-h   -help] [-long_help] [-panel_name &lt;name&gt; ]</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-panel_name &lt;name&gt;</code>	Sends the results to the panel and specifies the name of the new panel	
Description	This command currently contains no help description.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.24.22. `periph::reset_plan` (`::quartus::periph`)

The following table displays information for the `periph::reset_plan` Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::periph</code> on page 332		
Syntax	<code>periph::reset_plan [-h   -help] [-long_help]</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
Description	Reverts the current design to be unplaced and without assignments applied		
Example Usage	<pre>project_open onewire_nf blueprint::initialize periph::update_plan periph::reset_plan blueprint::shutdown project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.24.23. `periph::save_floorplan (::quartus::periph)`

The following table displays information for the `periph::save_floorplan` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::periph</a> on page 332		
Syntax	periph::save_floorplan [-h   -help] [-long_help] -filename <filename>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-filename <filename>	Filename to write to	
Description	Write the Interface Planner floorplan that can be reloaded in Interface Planner		
Example Usage	<pre>project_open onewire_nf  blueprint::initialize  periph::update_plan  set io_cells [periph::get_cells -unplaced -type IO_CLUSTER] periph::place_cells -cells \$io_cells  periph::save_floorplan -filename onewire_blueprint_floorplan.plan  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.24.24. `periph::set_clock_type (::quartus::periph)`

The following table displays information for the `periph::set_clock_type` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332		
<b>Syntax</b>	<code>periph::set_clock_type [-h   -help] [-long_help] [-cell_id &lt;cell_id&gt; ] [-cell_name &lt;cell_name&gt; ] -type &lt;type&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-cell_id &lt;cell_id&gt;</code>	Single cell id	
	<code>-cell_name &lt;cell_name&gt;</code>	Cell name, returned from <code>periph::get_cell_info -name</code>	
	<code>-type &lt;type&gt;</code>	The type of the clock type	
<b>Description</b>	<div>This command currently contains no help description.</div>		
<b>Example Usage</b>	<div>This command currently contains no example usage.</div>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The supplied clock cell id <i>&lt;string&gt;</i> is invalid.
<i>continued...</i>			

	TCL_ERROR	1	ERROR: The supplied clock type <i>&lt;string&gt;</i> is invalid.
	TCL_ERROR	1	ERROR: At least one clock type must be supplied, but no clock types were supplied
	TCL_ERROR	1	ERROR: <i>&lt;string&gt;</i> clock types were expected but <i>&lt;string&gt;</i> were supplied

### 3.1.24.25. blueprint::shutdown (::quartus::periph)

The following table displays information for the `blueprint::shutdown` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332		
<b>Syntax</b>	<code>blueprint::shutdown [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Shutdown Interface Planner.		
<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize periph::update_plan blueprint::shutdown  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.26. periph::undo\_last\_placement (::quartus::periph)

The following table displays information for the `periph::undo_last_placement` Tcl command:

Tcl Package and Version	Belongs to ::quartus::periph on page 332		
Syntax	periph::undo_last_placement [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Undo the last placement or unplacement operation		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.24.27. `periph::unplace_cells (::quartus::periph)`

The following table displays information for the `periph::unplace_cells` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332		
<b>Syntax</b>	<code>periph::unplace_cells [-h   -help] [-long_help] [-cells &lt;cells&gt; ] [-placed_cells]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-cells &lt;cells&gt;</code>	One or more cell ids	
	<code>-placed_cells</code>	Unplace all placed cells	
<b>Description</b>	<div>Removes the placement from the specified cells. Any constraints for the cells remain, but the cell no longer has a placement.</div>		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize periph::update_plan periph::unplace_cells -placed_cells periph::check_plan project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.28. `periph::update_pdpw (::quartus::periph)`

The following table displays information for the `periph::update_pdpw` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332		
<b>Syntax</b>	periph::update_pdpw [-h   -help] [-long_help] [-assignments] [-placement]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-assignments	Indicates assignment model needs updating	
	-placement	Indicates placement needs updating	
<b>Description</b>	Update everything that needs updating in pdpw. This essentially sends a single TCL command to pdpw to update everything as needed. Used in the TCL proc source wrapper only.		
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize periph::update_pdpw -pdp_state [blueprint_internal::get_pdp_state]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.29. `periph::update_plan (::quartus::periph)`

The following table displays information for the `periph::update_plan` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::periph</code> on page 332		
<b>Syntax</b>	<code>periph::update_plan [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div>Applies all changes to constraints and reloads them into Interface Planner. After the platform has been updated with the constraints, placement operations can be performed.</div>		
<b>Example Usage</b>	<pre>project_open onewire_nf  blueprint::initialize periph::update_plan blueprint::shutdown  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.24.30. `periph::write_plan (::quartus::periph)`

The following table displays information for the `periph::write_plan` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::periph</a> on page 332	
<b>Syntax</b>	periph::write_plan [-h   -help] [-long_help] [-clocks] [-disabled] -filename <filename> [-force] [-other_locations] [-pin_locations]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-clocks	Write out clock assignments
	-disabled	Write out disabled assignments
	-filename <filename>	Filename to write to
	-force	Force the creation of the plan
	-other_locations	Write out other location assignments
	-pin_locations	Write out pin location assignments
<b>Description</b>	Export the floorplan constraints Tcl script	
<b>Example Usage</b>	<pre>project_open onewire_nf blueprint::initialize periph::update_plan periph::place_cells -unplaced_cells periph::check_plan</pre>	
continued...		

*continued...*

	<pre>periph::write_plan -filename onewire_blueprint_assignments.tcl project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.25. ::quartus::pfg

The following table displays information for the **::quartus::pfg** Tcl package:

Tcl Package and Version	::quartus::pfg 1.0
Description	This package contains the set of Tcl functions for using the Programming File Generator (PFG).
Availability	This package is loaded by default in the following executable: quartus_pfg
Tcl Commands	<a href="#">test (::quartus::pfg)</a> on page 350

#### 3.1.25.1. test (::quartus::pfg)

The following table displays information for the **test** Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::pfg</a> on page 350		
Syntax	test [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Dispaly general information		
Example Usage	test		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.26. ::quartus::proj\_asgn

The following table displays information for the **::quartus::proj\_asgn** Tcl package:

Tcl Package and Version	::quartus::proj_asgn 1.0
Description	<p>This package contains the set of Tcl functions for making project-wide assignments.</p> <p>In versions before 4.0 of this package, the full path of the source file assignment was returned when you accessed the assignment through the "get_global_assignment" or "get_all_global_assignments" command.</p> <p>In version 4.0 of this package, the actual value of the source file assignment stored in the Quartus Prime Settings File (.qsf) is returned. To get the resolved full path of the file, use</p>
continued...	

	<p>the "resolve_file_path" command. For more information about resolving file names and view an example, type "resolve_file_path -long_help".</p> <p>In version 5.0 of this package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the following commands:</p> <pre> get_all_quartus_defaults get_all_global_assignments get_all_instance_assignments get_all_parameters </pre> <p>These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.gsf) and Quartus Prime Default Settings File (.qdf) assignments.</p> <p>In addition, the new "assignment_group" command replaces the deprecated "timegroup" command.</p> <p>In version 6.0, all Tcl commands designed to process Timing Analyzer assignments have been moved to the ::quartus::timing_assignment package.</p>
<b>Availability</b>	<p>This package is loaded by default in the following executables:</p> <pre> qpro quartus </pre>
<b>Tcl Commands</b>	<pre> create_revision (::quartus::proj_asgn) on page 351 generate_project_tcl (::quartus::proj_asgn) on page 352 get_name_info (::quartus::proj_asgn) on page 353 get_names (::quartus::proj_asgn) on page 355 get_top_level_entity (::quartus::proj_asgn) on page 357 is_fitter_in_qhd_mode (::quartus::proj_asgn) on page 358 </pre>

### 3.1.26.1. create\_revision (::quartus::proj\_asgn)

The following table displays information for the create\_revision Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::proj_asgn</a> on page 350	
<b>Syntax</b>	create_revision [-h   -help] [-long_help] [-based_on <revision_name> ] [-copy_results] [-new_rev_type <revision_type> ] [-root_partition_qdb_file <qdb_file> ] [-set_current] <revision_name>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-based_on <revision_name>	Revision name on which new revision bases its settings
	-copy_results	Option to copy results from "based_on" revision
	-new_rev_type <revision_type>	The type of the newly created revision
	-root_partition_qdb_file <qdb_file>	The Partition Database (.qdb) file for the root partition
	-set_current	Option to set new revision as current revision
	<revision_name>	Revision name
<b>Description</b>	<p>Creates the specified revision. If the revision is not included in the current project, a new revision is created in the project with default settings.</p> <p>If you specify the "-set_current" option, this command sets the newly created revision as the current revision.</p>	
continued...		

	If you specify the "-based_on" option, the command creates a new revision in the project based on the settings of the based-on revision specified by the option.		
<b>Example Usage</b>	<pre>## Create a new revision called "tmp" create_revision tmp  ## Create a new revision called "tmp" ## and set it as the current revision create_revision tmp -set_current ## This method is the same as create_revision tmp set_current_revision tmp  ## Create a new revision called "speed_ch" ## with settings based on "chiptrip" ## and set it as the current revision create_revision speed_ch -based_on chiptrip -set_current</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Revision is already the current revision: <i>&lt;string&gt;</i> . No action is required.
	TCL_ERROR	1	ERROR: Based-on revision is not included in the current project: <i>&lt;string&gt;</i> . Make sure the based-on revision name is spelled correctly and included in the current project.
	TCL_ERROR	1	ERROR: Can't create revision because the current project uses the device family: <i>&lt;string&gt;</i> . Change the device family or create the revision in another project that uses a different device family.
	TCL_ERROR	1	ERROR: Can't create file: <i>&lt;string&gt;</i> . Make sure you have permission to write to the specified file.
	TCL_ERROR	1	ERROR: Unable to create a new 'Persona Implementation' revision based on an existing 'Persona Implementation' revision. Specify another revision type or change the base revision.
	TCL_ERROR	1	ERROR: Can't create revision: <i>&lt;string&gt;</i> . Specify a legal revision name.
	TCL_ERROR	1	ERROR: Can't remove file: <i>&lt;string&gt;</i> . Make sure the file is not read-only and you have permission to write to the specified file.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Didn't create revision because it is already included in current project: <i>&lt;string&gt;</i> . If you want a new revision, specify a different revision name.

### 3.1.26.2. generate\_project\_tcl (::quartus::proj\_asgn)

The following table displays information for the generate\_project\_tcl Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::proj_asgn on page 350	
<b>Syntax</b>	generate_project_tcl [-h   -help] [-long_help] -filename <i>&lt;filename&gt;</i> [-include_default_assignments] [-overwrite]	
<b>Arguments</b>	-h   -help	Short help
continued...		

	-long_help	Long help with examples and possible return values	
	-filename <filename>	Tcl Filename	
	-include_default_assignments	Option to include default assignments in the tcl file.	
	-overwrite	Option to overwrite an existing tcl file	
Description	With currently opened, write a tcl file that can create the project and populate it current set of assignments in the qsf.		
Example Usage	<pre>## Generate a tcl file to create the current project. generate_project_tcl -filename create_project.tcl          ## Generate a tcl file to create the current project and         ## also include the default assignments. generate_project_tcl -filename create_project.tcl -include_default_assignments</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Failed when attempting to read qsf file.
	TCL_ERROR	1	ERROR: Failed when attempting to write tcl file.
	TCL_ERROR	1	ERROR: Project is not open, and path and project name was not specified. Open an existing project, or specify the path and project name in the command.
	TCL_ERROR	1	ERROR: Tcl file already exist. Please use -overwrite option to overwrite

### 3.1.26.3. get\_name\_info (::quartus::proj\_asgn)

The following table displays information for the get\_name\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::proj_asgn</a> on page 350		
<b>Syntax</b>	<code>get_name_info [-h   -help] [-long_help] [-info &lt;parent_name_id base_name entity_name entity_definition instance_name full_path short_full_path node_type creator signal tap ii file_location library children parameters&gt; ] [-observable_type &lt;all pre_synthesis post_synthesis post_fitter post_asm stp_pre_synthesis&gt; ] &lt;name_id&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-info &lt;parent_name_id base_name entity_name entity_definition instance_name full_path short_full_path node_type creator signal tap ii file_location library children parameters&gt;</code>	Option to specify the type of information to display.	
	<code>-observable_type &lt;all pre_synthesis post_synthesis post_fitter post_asm stp_pre_synthesis&gt;</code>	Option to specify the observable type of the name ID	
	<code>&lt;name_id&gt;</code>	Option to specify the node name ID	
<b>Description</b>	Displays the specified type of information for the specified node name id. Type "get_names -long_help" to view how to get a collection of node name IDs.		
<b>continued...</b>			

	<p>If the "-observable_type" option is not specified, the default value is "all". The specified observable type must have the same observable type as specified in the "get_names" Tcl command which returned the currently specified node name id.</p> <p>The value for "-observable_type" option can be one of the following:</p> <table> <tr> <th>Observable Type</th><th>Description</th></tr> <tr> <td>all</td><td>Use post-Fitter information. If it is not available, post-synthesis information is used. Otherwise, pre-synthesis information is used if it exists.</td></tr> <tr> <td>pre_synthesis</td><td>Use pre-synthesis information.</td></tr> <tr> <td>post_synthesis</td><td>Use post-synthesis information.</td></tr> <tr> <td>post_fitter</td><td>Use post-Fitter information.</td></tr> <tr> <td>post_asm</td><td>Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.</td></tr> <tr> <td>stp_pre_synthesis</td><td>Use Signal Tap pre-synthesis information.</td></tr> </table> <p>The info type for the "-info" option can be one of the following:</p> <table> <tr> <th>Info Type</th><th>Description</th></tr> <tr> <td>parent_name_id</td><td>The name id for the node's parent.</td></tr> <tr> <td>base_name</td><td>The node name, which consists of an entity name and/or an instance name separated by a colon if necessary.</td></tr> <tr> <td>entity_name</td><td>The entity name.</td></tr> <tr> <td>entity_definition</td><td>The entity definition.</td></tr> <tr> <td>instance_name</td><td>The instance name.</td></tr> <tr> <td>full_path</td><td>The full hierarchy path name, which consists of entity name(s) and/or the instance name(s). This path name excludes the current focus entity. If there is nothing shown, the name id is the current focus entity's name id.</td></tr> <tr> <td>short_full_path</td><td>The short full hierarchy path name, which consists of the instance name(s). This path name excludes the current focus entity. If nothing is shown, the name id is the current focus entity's name id.</td></tr> <tr> <td>node_type</td><td>The node type, which can be one of the types supported by "get_names", namely, "input", "output", "bidirectional", "register", "combinational", "hierarchy", "memory", or "bus". If "pin" type was specified for "get_names" command, the node type shown here is expanded to be "input", "output", or "bidirectional". Node type value of "qsf" indicates name originates from qsf settings file.</td></tr> <tr> <td>creator</td><td>The creator of the node, which is either "user_entered" or "compiler_generated".</td></tr> <tr> <td>signaltapii</td><td>If this node can be connected to a Signal Tap embedded logic analyzer, 1 is shown. Otherwise, 0 is shown.</td></tr> <tr> <td>file_location</td><td>The source file location. For example, the source file location for the entity chiptrip is "chiptrip.v". To get the full path to the source file, use the command "resolve_file_path" which exists only in version 4.0 or later of ::quartus::project package.</td></tr> <tr> <td>library</td><td>Library associated with the instance name.</td></tr> <tr> <td>children</td><td>Collection of all the children names of the specified name. The children will include all the names in the specified hierarchy.</td></tr> <tr> <td>parameters</td><td>Collection of parameters associated with the name. Each element of the collection is a triplet that contains the name, value and the type of the parameter.</td></tr> </table>	Observable Type	Description	all	Use post-Fitter information. If it is not available, post-synthesis information is used. Otherwise, pre-synthesis information is used if it exists.	pre_synthesis	Use pre-synthesis information.	post_synthesis	Use post-synthesis information.	post_fitter	Use post-Fitter information.	post_asm	Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.	stp_pre_synthesis	Use Signal Tap pre-synthesis information.	Info Type	Description	parent_name_id	The name id for the node's parent.	base_name	The node name, which consists of an entity name and/or an instance name separated by a colon if necessary.	entity_name	The entity name.	entity_definition	The entity definition.	instance_name	The instance name.	full_path	The full hierarchy path name, which consists of entity name(s) and/or the instance name(s). This path name excludes the current focus entity. If there is nothing shown, the name id is the current focus entity's name id.	short_full_path	The short full hierarchy path name, which consists of the instance name(s). This path name excludes the current focus entity. If nothing is shown, the name id is the current focus entity's name id.	node_type	The node type, which can be one of the types supported by "get_names", namely, "input", "output", "bidirectional", "register", "combinational", "hierarchy", "memory", or "bus". If "pin" type was specified for "get_names" command, the node type shown here is expanded to be "input", "output", or "bidirectional". Node type value of "qsf" indicates name originates from qsf settings file.	creator	The creator of the node, which is either "user_entered" or "compiler_generated".	signaltapii	If this node can be connected to a Signal Tap embedded logic analyzer, 1 is shown. Otherwise, 0 is shown.	file_location	The source file location. For example, the source file location for the entity chiptrip is "chiptrip.v". To get the full path to the source file, use the command "resolve_file_path" which exists only in version 4.0 or later of ::quartus::project package.	library	Library associated with the instance name.	children	Collection of all the children names of the specified name. The children will include all the names in the specified hierarchy.	parameters	Collection of parameters associated with the name. Each element of the collection is a triplet that contains the name, value and the type of the parameter.
Observable Type	Description																																												
all	Use post-Fitter information. If it is not available, post-synthesis information is used. Otherwise, pre-synthesis information is used if it exists.																																												
pre_synthesis	Use pre-synthesis information.																																												
post_synthesis	Use post-synthesis information.																																												
post_fitter	Use post-Fitter information.																																												
post_asm	Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.																																												
stp_pre_synthesis	Use Signal Tap pre-synthesis information.																																												
Info Type	Description																																												
parent_name_id	The name id for the node's parent.																																												
base_name	The node name, which consists of an entity name and/or an instance name separated by a colon if necessary.																																												
entity_name	The entity name.																																												
entity_definition	The entity definition.																																												
instance_name	The instance name.																																												
full_path	The full hierarchy path name, which consists of entity name(s) and/or the instance name(s). This path name excludes the current focus entity. If there is nothing shown, the name id is the current focus entity's name id.																																												
short_full_path	The short full hierarchy path name, which consists of the instance name(s). This path name excludes the current focus entity. If nothing is shown, the name id is the current focus entity's name id.																																												
node_type	The node type, which can be one of the types supported by "get_names", namely, "input", "output", "bidirectional", "register", "combinational", "hierarchy", "memory", or "bus". If "pin" type was specified for "get_names" command, the node type shown here is expanded to be "input", "output", or "bidirectional". Node type value of "qsf" indicates name originates from qsf settings file.																																												
creator	The creator of the node, which is either "user_entered" or "compiler_generated".																																												
signaltapii	If this node can be connected to a Signal Tap embedded logic analyzer, 1 is shown. Otherwise, 0 is shown.																																												
file_location	The source file location. For example, the source file location for the entity chiptrip is "chiptrip.v". To get the full path to the source file, use the command "resolve_file_path" which exists only in version 4.0 or later of ::quartus::project package.																																												
library	Library associated with the instance name.																																												
children	Collection of all the children names of the specified name. The children will include all the names in the specified hierarchy.																																												
parameters	Collection of parameters associated with the name. Each element of the collection is a triplet that contains the name, value and the type of the parameter.																																												
<b>Example Usage</b>	<pre># Get the name id of the current focus entity set current_focus_entity_id [get_top_level_entity]  # The full path name of the current focus entity # is empty because the full path excludes the # current focus entity set msg "Full path of the current focus entity =&gt; ("</pre>																																												
	<i>continued...</i>																																												

	<pre> append msg [get_name_info -info full_path \$current_focus_entity_id] append msg " )" puts \$msg puts ""  # Get the node type of the current focus entity # The node type should be a hierarchy type set msg "Node type of the current focus entity =&gt; ( " append msg [get_name_info -info node_type \$current_focus_entity_id] append msg " )" puts \$msg </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Compiler database does not exist for revision name: <string>. At the minimum, run Analysis & Synthesis (quartus_map) with the specified revision name before using this Tcl command.
	TCL_ERROR	1	ERROR: Illegal info type: <string>. Specify parent_name_id, base_name, entity_name, instance_name, full_path, short_full_path, node_type, creator, or signaltapii.
	TCL_ERROR	1	ERROR: Illegal name id: <string>. Specify a name id that exists in a compiled Quartus Prime project.
	TCL_ERROR	1	ERROR: Invalid name id for top level entity: <string>. Specify a valid top level entity id value. In Quartus Prime Pro, get_name_info query through integer value is only supported for get_top_level_entity TCL command. For other names query, please refer to get_names TCL command.
	TCL_ERROR	1	ERROR: Invalid name id: <string>. Specify an integer greater than or equal to zero.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Post-Assembler compiler database does not exist for revision name: <string>. Run Assembler (quartus_asm) with the specified revision name before using this Tcl command.

### 3.1.26.4. get\_names (::quartus::proj\_asgn)

The following table displays information for the get\_names Tcl command:

Tcl Package and Version	Belongs to ::quartus::proj_asgn on page 350	
Syntax	<pre> get_names [-h   -help] [-long_help] [-entity &lt;wildcard&gt; ] -filter &lt;wildcard&gt; [-library &lt;wildcard&gt; ] [-node_type &lt;all comb reg pin input output bidir hierarchy mem bus qsf state_machine assigned unassigned all_reg partition virtual&gt; ] [-observable_type &lt;all pre_synthesis post_synthesis post_fitter post_asm stp_pre_synthesis&gt; ] </pre>	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <wildcard>	Option to specify the entity to get names from hierarchies instantiated by the entity
	-filter <wildcard>	Option to specify the node's full path name and/or wildcard character(s)
	-library <wildcard>	Option to specify the containing library
continued...		

	<code>-node_type &lt;all comb reg pin input output bidir hierarchy mem bus qsf state_machine assigned unassigned all_reg partition virtual&gt;</code>	Option to filter based on the specified node type.														
	<code>-observable_type &lt;all pre_synthesis post_synthesis post_fitter post_asm stp_pre_synthesis&gt;</code>	Option to filter based on the specified observable type														
Description	<p>Returns a filtered output collection of all matching node name IDs found in a compiled Quartus Prime project.</p> <p>To access each element of the output collection, use the Tcl command "foreach_in_collection". To see example usage, type "get_names -long_help" or "foreach_in_collection -long_help".</p> <p>If the "-node_type" option is not specified, the default value is "all". Similarly, if the "-observable_type" option is not specified, the default value is "all".</p> <p>The node type "pin" includes "input", "output", "bidir", "assinged" and "unassigned". The node type "qsf" include names from qsf settings file. The node type "all" includes all node types. The node type "all_reg" includes all node types and register post-fitting</p> <p>The value for "-observable_type" option can be one of the following:</p> <table><tr><th>Observable Type</th><th>Description</th></tr><tr><td>all</td><td>Use post-Fitter information. If it is not available, post-Synthesis information is used. Otherwise, pre-synthesis information is used if it exists.</td></tr><tr><td>pre_synthesis</td><td>Use pre-synthesis information.</td></tr><tr><td>post_synthesis</td><td>Use post-synthesis information.</td></tr><tr><td>post_fitter</td><td>Use post-Fitter information.</td></tr><tr><td>post_asm</td><td>Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.</td></tr><tr><td>stp_pre_synthesis</td><td>Use Signal Tap pre-synthesis information.</td></tr></table>		Observable Type	Description	all	Use post-Fitter information. If it is not available, post-Synthesis information is used. Otherwise, pre-synthesis information is used if it exists.	pre_synthesis	Use pre-synthesis information.	post_synthesis	Use post-synthesis information.	post_fitter	Use post-Fitter information.	post_asm	Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.	stp_pre_synthesis	Use Signal Tap pre-synthesis information.
Observable Type	Description															
all	Use post-Fitter information. If it is not available, post-Synthesis information is used. Otherwise, pre-synthesis information is used if it exists.															
pre_synthesis	Use pre-synthesis information.															
post_synthesis	Use post-synthesis information.															
post_fitter	Use post-Fitter information.															
post_asm	Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.															
stp_pre_synthesis	Use Signal Tap pre-synthesis information.															
Example Usage	<pre># Search for a single post-Fitter pin with the name accel and # make assignments set accel_name_id [get_names -filter accel -node_type pin -observable_type post_fitter] foreach_in_collection name_id \$accel_name_id {      # Get the full path name of the node     set target [get_name_info -info full_path \$name_id]      # Set multicycle assignment     set_multicycle_assignment -to \$target 2      # Set location assignment     set_location_assignment -to \$target Pin_E22 } # Search for nodes of any post-Fitter node type with name length &lt;= 5 # The default node type is "all" set name_ids [get_names -filter ????? -observable_type post_fitter] foreach_in_collection name_id \$name_ids {      # Print the name id     puts \$name_id      # Print the node type     puts [get_name_info -info node_type \$name_id]      # Print the full path (which excludes the current     # focus entity from the path)     puts [get_name_info -info full_path \$name_id] } # Search for nodes of any post-Fitter node type that end in "eed". # The default node type is "all" set name_ids [get_names -filter *eed -observable_type post_fitter] foreach_in_collection name_id \$name_ids {      # Print the name id     puts \$name_id      # Print the node type     puts [get_name_info -info node_type \$name_id]</pre>															

continued..

continued...

	<pre># Print the full path (which excludes the current # focus entity from the path) puts [get_name_info -info full_path \$name_id] }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Get names cannot return <string> because the name was found in a partition that's not the root partition. Refine your get_names search pattern to exclude child partitions
	TCL_ERROR	1	ERROR: Compiler database does not exist for revision name: <string>. At the minimum, run Analysis & Synthesis (quartus_map) with the specified revision name before using this Tcl command.
	TCL_ERROR	1	ERROR: Illegal node type: <string>. Specify all, comb, reg, pin, hierarchy, or bus.
	TCL_ERROR	1	ERROR: Illegal observable type: <string>. Specify all, pre_synthesis, post_synthesis, or post_fitter.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Post-Assembler compiler database does not exist for revision name: <string>. Run Assembler (quartus_asm) with the specified revision name before using this Tcl command.

### 3.1.26.5. get\_top\_level\_entity (::quartus::proj\_asgn)

The following table displays information for the `get_top_level_entity` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::proj_asgn</a> on page 350		
<b>Syntax</b>	get_top_level_entity [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Returns the name id for the current focus entity.		
<b>Example Usage</b>	<pre># Get the name id of the current focus entity set current_focus_entity_id [get_top_level_entity]  # Print out the entity name of the current focus entity set msg "Entity name of the current focus entity =&gt; (" append msg [get_name_info -info entity_name \$current_focus_entity_id] append msg ")" puts "" puts \$msg</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
continued...			

	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Compiler database does not exist for revision name: <i>&lt;string&gt;</i> . At the minimum, run Analysis & Synthesis (quartus_map) with the specified revision name before using this Tcl command.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.26.6. is\_fitter\_in\_qhd\_mode (::quartus::proj\_asgn)

The following table displays information for the `is_fitter_in_qhd_mode` Tcl command:

Tcl Package and Version	Belongs to ::quartus::proj_asgn on page 350		
Syntax	is_fitter_in_qhd_mode [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Returns true if we're running in QHD mode		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.27. ::quartus::project

The following table displays information for the `::quartus::project` Tcl package:

Tcl Package and Version	::quartus::project 7.0
Description	<p>This package contains the set of Tcl functions for making project-wide assignments.</p> <p>In versions before 4.0 of this package, the full path of the source file assignment was returned when you accessed the assignment through the "get_global_assignment" or "get_all_global_assignments" command.</p> <p>In version 4.0 of this package, the actual value of the source file assignment stored in the Quartus Prime Settings File (.qsf) is returned. To get the resolved full path of the file, use the "resolve_file_path" command. For more information about resolving file names and view an example, type "resolve_file_path -long_help".</p> <p>In version 5.0 of this package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the following commands:</p> <pre>get_all_quartus_defaults get_all_global_assignments get_all_instance_assignments get_all_parameters</pre> <p>These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) and Quartus Prime Default Settings File (.qdf) assignments.</p> <p>In addition, the new "assignment_group" command replaces the deprecated "timegroup" command.</p>

continued...

	<p>In version 6.0, all Tcl commands designed to process Timing Analyzer assignments have been moved to the <code>::quartus::timing_assignment</code> package.</p>
<b>Availability</b>	<p>This package is loaded by default in the following executables:</p> <pre> hdb_debug qpro_sh quartus_asm quartus_bpps quartus_cdb quartus_design quartus_eda quartus_fit quartus_idb quartus_ipd quartus_ipgenerate quartus_map quartus_sh quartus_si quartus_sim quartus_sta quartus_stp quartus_syn quartus_tlg </pre>
<b>Tcl Commands</b>	<pre> close_side_revision (::quartus::project) on page 360 create_revision (::quartus::project) on page 360 delete_revision (::quartus::project) on page 362 execute_assignment_batch (::quartus::project) on page 362 export_assignments (::quartus::project) on page 363 generate_project_tcl (::quartus::project) on page 364 get_all_assignment_names (::quartus::project) on page 365 get_all_assignments (::quartus::project) on page 366 get_all_global_assignments (::quartus::project) on page 369 get_all_instance_assignments (::quartus::project) on page 371 get_all_parameters (::quartus::project) on page 374 get_all_quartus_defaults (::quartus::project) on page 376 get_all_user_option_names (::quartus::project) on page 378 get_assignment_info (::quartus::project) on page 378 get_assignment_name_info (::quartus::project) on page 379 get_current_project (::quartus::project) on page 380 get_current_revision (::quartus::project) on page 380 get_database_version (::quartus::project) on page 381 get_global_assignment (::quartus::project) on page 381 get_instance_assignment (::quartus::project) on page 383 get_location_assignment (::quartus::project) on page 384 get_name_info (::quartus::project) on page 385 get_names (::quartus::project) on page 387 get_parameter (::quartus::project) on page 389 get_project_directory (::quartus::project) on page 390 get_project_revisions (::quartus::project) on page 390 get_revision_description (::quartus::project) on page 391 get_top_level_entity (::quartus::project) on page 392 get_user_option (::quartus::project) on page 392 is_database_version_compatible (::quartus::project) on page 393 is_fitter_in_qhd_mode (::quartus::project) on page 393 is_project_open (::quartus::project) on page 394 open_side_revision (::quartus::project) on page 394 project_archive (::quartus::project) on page 395 project_clean (::quartus::project) on page 396 project_close (::quartus::project) on page 397 project_exists (::quartus::project) on page 398 project_new (::quartus::project) on page 398 project_open (::quartus::project) on page 400 project_restore (::quartus::project) on page 401 remove_all_global_assignments (::quartus::project) on page 402 remove_all_instance_assignments (::quartus::project) on page 404 remove_all_parameters (::quartus::project) on page 406 resolve_file_path (::quartus::project) on page 408 revision_exists (::quartus::project) on page 409 set_current_revision (::quartus::project) on page 410 set_global_assignment (::quartus::project) on page 410 set_high_effort_fmax_optimization_assignments (::quartus::project) on page 413 set_instance_assignment (::quartus::project) on page 413 set_io_assignment (::quartus::project) on page 415 set_location_assignment (::quartus::project) on page 417 set_parameter (::quartus::project) on page 418 set_power_file_assignment (::quartus::project) on page 420 set_revision_description (::quartus::project) on page 421 set_user_option (::quartus::project) on page 422 test_assignment_trait (::quartus::project) on page 422 </pre>

### 3.1.27.1. close\_side\_revision (::quartus::project)

The following table displays information for the close\_side\_revision Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	close_side_revision [-h   -help] [-long_help] <revision_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<revision_name>	Revision name	
<b>Description</b>	<p>Closes the specified revision name, if it has already been opened as a side revision. Closing the revision will causes any changed assignments to be written to disk, and must be done before the revision can be set again as the current revision.</p>		
<b>Example Usage</b>	<pre>## Create and open "new_rev" as a side revision. Apply an assignment and close the revision. create_revision new_rev -based_on my_rev -copy_results open_side_revision new_rev set_global_assignment -name OPTIMIZATION_TECHNIQUE "Area" -revision new_rev close_side_revision new_rev</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Revision is already the current revision: <string>. No action is required.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Revision file does not exist: <string>.qsf. Use delete_revision to delete the revision from the current project. Then use create_revision to create the revision and its .qsf before setting <string> as the current revision.
	TCL_ERROR	1	ERROR: Revision is not included in the current project: <string> . Use the create_revision command to create the revision.
	TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.27.2. create\_revision (::quartus::project)

The following table displays information for the create\_revision Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	create_revision [-h   -help] [-long_help] [-based_on <revision_name> ] [-copy_results] [-new_rev_type <revision_type> ] [-root_partition_qdb_file <qdb_file> ] [-set_current] <revision_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-based_on <revision_name>	Revision name on which new revision bases its settings	
	-copy_results	Option to copy results from "based_on" revision	
continued...			

	-new_rev_type <revision_type>	The type of the newly created revision	
	-root_partition_qdb_file <qdb_file>	The Partition Database (.qdb) file for the root partition	
	-set_current	Option to set new revision as current revision	
	<revision_name>	Revision name	
Description	<p>Creates the specified revision. If the revision is not included in the current project, a new revision is created in the project with default settings.</p> <p>If you specify the "-set_current" option, this command sets the newly created revision as the current revision.</p> <p>If you specify the "-based_on" option, the command creates a new revision in the project based on the settings of the based-on revision specified by the option.</p>		
Example Usage	<pre>## Create a new revision called "tmp" create_revision tmp  ## Create a new revision called "tmp" ## and set it as the current revision create_revision tmp -set_current ## This method is the same as create_revision tmp set_current_revision tmp  ## Create a new revision called "speed_ch" ## with settings based on "chiptrip" ## and set it as the current revision create_revision speed_ch -based_on chiptrip -set_current</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Revision is already the current revision: <string>. No action is required.
	TCL_ERROR	1	ERROR: Based-on revision is not included in the current project: <string>. Make sure the based-on revision name is spelled correctly and included in the current project.
	TCL_ERROR	1	ERROR: Can't create revision because the current project uses the device family: <string>. Change the device family or create the revision in another project that uses a different device family.
	TCL_ERROR	1	ERROR: Can't create file: <string>. Make sure you have permission to write to the specified file.
	TCL_ERROR	1	ERROR: Unable to create a new 'Persona Implementation' revision based on an existing 'Persona Implementation' revision. Specify another revision type or change the base revision.
	TCL_ERROR	1	ERROR: Can't create revision: <string>. Specify a legal revision name.
	TCL_ERROR	1	ERROR: Can't remove file: <string>. Make sure the file is not read-only and you have permission to write to the specified file.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Didn't create revision because it is already included in current project: <string>. If you want a new revision, specify a different revision name.

### 3.1.27.3. delete\_revision (::quartus::project)

The following table displays information for the delete\_revision Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	delete_revision [-h   -help] [-long_help] [-remove_results] <revision_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-remove_results	Option to delete the database files	
	<revision_name>	Revision name	
<b>Description</b>	Deletes the specified revision from the current project. The corresponding <revision name>.qsf file is deleted as well.		
<b>Example Usage</b>	## Delete the revision called "tmp" delete_revision tmp		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't delete the current revision: <string>. Specify a different revision name.
	TCL_ERROR	1	ERROR: Can't delete revision because it is not included in the current project: <string> . Specify a revision name that is included in the project.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.27.4. execute\_assignment\_batch (::quartus::project)

The following table displays information for the execute\_assignment\_batch Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	execute_assignment_batch [-h   -help] [-long_help] <tcl commands>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	<tcl commands>	Tcl list of Tcl commands
<b>Description</b>	<p>Iterates through the specified Tcl list of Tcl commands and executes each command sequentially in batch mode.</p> <p>In batch mode, Tcl commands that set Quartus Prime Settings File (.qsf) assignments are optimized to prevent them from repeatedly write-locking and write-unlocking the QSF during consecutive calls, thereby slowing down the execution.</p> <p>Currently, only the following commands are supported:</p> <pre>assignment_group remove_all_global_assignments remove_all_instance_assignments remove_all_parameters set_global_assignment</pre>	

continued...

	<pre> set_instance_assignment set_io_assignment set_location_assignment set_parameter set_power_file_assignment </pre>		
<b>Example Usage</b>	<pre> project_open one_wire set tcl_cmds [list [list set_global_assignment -name FAMILY StratixII] \                   [list set_global_assignment -name DEVICE AUTO] \                   [list set_global_assignment -name TOP_LEVEL_ENTITY one_wire] \                   [list set_global_assignment -name SAVE_DISK_SPACE OFF] \                   [list set_location_assignment PIN_1 -to in1] \                   [list set_instance_assignment -name MULTICYCLE 4 -from in1 -to out1] \                   [list set_parameter -name STYLE FAST]] execute_assignment_batch \$tcl_cmds project_close </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Unsupported Tcl command: <string>. Specify one of the supported Tcl commands listed in the help description for <string> -h.

### 3.1.27.5. export\_assignments (::quartus::project)

The following table displays information for the export\_assignments Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	export_assignments [-h   -help] [-long_help] [-reorganize] [-report_write_failure]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-reorganize	Option to reorganize the Quartus Prime Settings File (.qsf)
	-report_write_failure	Option to report error if write fail
<b>Description</b>	<p>Exports assignments for the current revision to the Quartus Prime Settings File (.qsf).</p> <p>Assignments created or modified during an open project are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <ol style="list-style-type: none"><li>1) export_assignments</li><li>2) project_close (unless "-dont_export_assignments" is specified)</li></ol> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p>	
<b>Example Usage</b>	<pre>## The most common use of export_assignments is to ## call it before doing a system call ## to call a compiler command-line executable project_open \$project_name set_global_assignment -name FAMILY Stratix  ## Before calling quartus_map, ## write out the FAMILY assignment export_assignments  ## Now, call quartus_map qexec "[file join \$::quartus(binpath) quartus_map] \$project_name"</pre>	
continued...		

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <i>&lt;string&gt;</i> . Specify a legal entity name.
	TCL_ERROR	1	ERROR: Can't write settings file *.qsf. Make sure the *.qsf file is writeable.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.27.6. generate\_project\_tcl (::quartus::project)

The following table displays information for the generate\_project\_tcl Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	generate_project_tcl [-h   -help] [-long_help] -filename <i>&lt;filename&gt;</i> [-include_default_assignments] [-overwrite]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-filename <i>&lt;filename&gt;</i>	Tcl Filename	
	-include_default_assignments	Option to include default assignments in the tcl file.	
	-overwrite	Option to overwrite an existing tcl file	
<b>Description</b>	With currently opened, write a tcl file that can create the project and populate it current set of assignments in the qsf.		
<b>Example Usage</b>	<pre>## Generate a tcl file to create the current project. generate_project_tcl -filename create_project.tcl          ## Generate a tcl file to create the current project and         ## also include the default assignments. generate_project_tcl -filename create_project.tcl -include_default_assignments</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Failed when attempting to read qsf file.
	TCL_ERROR	1	ERROR: Failed when attempting to write tcl file.
	TCL_ERROR	1	ERROR: Project is not open, and path and project name was not specified. Open an existing project, or specify the path and project name in the command.
	TCL_ERROR	1	ERROR: Tcl file already exist. Please use -overwrite option to overwrite

### 3.1.27.7. get\_all\_assignment\_names (::quartus::project)

The following table displays information for the `get_all_assignment_names` Tcl command:

Tcl Package and Version	Belongs to ::quartus::project on page 358																								
Syntax	get_all_assignment_names [-h   -help] [-long_help] [-family <family> ] [-module <all ip_generate map tlg fit tan asm eda drc power generic> ] [-type <all global instance> ]																								
Arguments	-h   -help	Short help																							
	-long_help	Long help with examples and possible return values																							
	-family <family>	Option to filter based on the specified device family. Defaults to all families.																							
	-module <all ip_generate map tlg fit tan asm eda drc power generic>	Option to filter based on the specified flow module. Defaults to all.																							
	-type <all global instance>	Option to filter based on the specified assignment type. Defaults to all.																							
Description	<p>Returns a filtered output list of all available, matching assignment names.</p> <p>The module option takes one of the following values:</p> <table><tr><th>Module</th><th>Description</th></tr><tr><td>ip_generate</td><td>IP Generation assignment names</td></tr><tr><td>tlg</td><td>Support Logic Generation assignment names</td></tr><tr><td>map</td><td>Analysis &amp; Synthesis assignment names</td></tr><tr><td>fit</td><td>Fitter assignment names</td></tr><tr><td>asm</td><td>Assembler assignment names</td></tr><tr><td>eda</td><td>EDA Netlist Writer assignment names</td></tr><tr><td>drc</td><td>Design Assistant assignment names</td></tr><tr><td>power</td><td>Power Analyzer assignment names</td></tr><tr><td>generic</td><td>Other assignment names not included in any of the above flow modules</td></tr><tr><td>all</td><td>All assignment names</td></tr></table>			Module	Description	ip_generate	IP Generation assignment names	tlg	Support Logic Generation assignment names	map	Analysis & Synthesis assignment names	fit	Fitter assignment names	asm	Assembler assignment names	eda	EDA Netlist Writer assignment names	drc	Design Assistant assignment names	power	Power Analyzer assignment names	generic	Other assignment names not included in any of the above flow modules	all	All assignment names
Module	Description																								
ip_generate	IP Generation assignment names																								
tlg	Support Logic Generation assignment names																								
map	Analysis & Synthesis assignment names																								
fit	Fitter assignment names																								
asm	Assembler assignment names																								
eda	EDA Netlist Writer assignment names																								
drc	Design Assistant assignment names																								
power	Power Analyzer assignment names																								
generic	Other assignment names not included in any of the above flow modules																								
all	All assignment names																								
Example Usage	<pre>## Print out all available global assignments foreach i [get_all_assignment_names -type global] {     puts \$i }  ## Print out all available global assignments ## for the Stratix family foreach i [get_all_assignment_names -type global -family Stratix] {     puts \$i }  ## Print out all available global assignments ## for the Stratix family required ## by the Analysis &amp; Synthesis module foreach i [get_all_assignment_names -type global -family Stratix -module map] {     puts \$i }</pre>																								
Return Value	Code Name	Code	String Return																						
	TCL_OK	0	INFO: Operation successful																						
	TCL_OK	0	INFO: Assignment <string> is not supported in this edition of the Quartus Prime software.																						
continued...																									

	TCL_ERROR	1	ERROR: Illegal flow module: <string>. Specify <string>, <string>, <string>, <string>, <string>, <string>, or <string>.
	TCL_ERROR	1	ERROR: Illegal type: <string>. Specify <string>, <string>, or <string>.
	TCL_ERROR	1	ERROR: Illegal device family: <string>. Specify a legal device family.

### 3.1.27.8. get\_all\_assignments (::quartus::project)

The following table displays information for the get\_all\_assignments Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project on page 358																
<b>Syntax</b>	get_all_assignments [-h   -help] [-long_help] [-entity <entity_name> ] [-fall] [-from <source> ] -name <name> [-rise] [-section_id <section id> ] [-tag <data> ] [-to <destination> ] -type <global instance parameter default>																
<b>Arguments</b>	-h   -help	Short help															
	-long_help	Long help with examples and possible return values															
	-entity <entity_name>	Entity name															
	-fall	Option applies to falling edge															
	-from <source>	Source name (string pattern is matched using Tcl string matching)															
	-name <name>	Assignment name (string pattern is matched using Tcl string matching)															
	-rise	Option applies to rising edge															
	-section_id <section id>	Section id															
	-tag <data>	Option to tag data to this assignment															
	-to <destination>	Destination name (string pattern is matched using Tcl string matching)															
	-type <global instance parameter default>	Option to specify the type of assignments to return															
<b>Description</b>	<p>Returns a collection of all matching global, instance, parameter, or default assignment ids. To iterate through each assignment id in this collection, use the Tcl command "foreach_in_collection".</p> <p>To view details for the assignment that is associated with the assignment id, use the Tcl command "get_assignment_info".</p> <p>The "get_all_assignments" command is easier to use than the deprecated commands listed in Table 1.</p> <p>* Table 1. The -type Option</p> <table> <tr> <th>Value for -type Option</th><th>Deprecated Tcl command</th><th>Description</th></tr> <tr> <td>default</td><td>get_all_quartus_defaults</td><td>Returns only default assignments.</td></tr> <tr> <td>global</td><td>get_all_global_assignments</td><td>Returns only global assignments.</td></tr> <tr> <td>instance</td><td>get_all_instance_assignments</td><td>Returns only instance assignments.</td></tr> <tr> <td>parameter</td><td>get_all_parameters</td><td>Returns only parameter assignments.</td></tr> </table> <p>The "-name" option is not case sensitive.</p>		Value for -type Option	Deprecated Tcl command	Description	default	get_all_quartus_defaults	Returns only default assignments.	global	get_all_global_assignments	Returns only global assignments.	instance	get_all_instance_assignments	Returns only instance assignments.	parameter	get_all_parameters	Returns only parameter assignments.
Value for -type Option	Deprecated Tcl command	Description															
default	get_all_quartus_defaults	Returns only default assignments.															
global	get_all_global_assignments	Returns only global assignments.															
instance	get_all_instance_assignments	Returns only instance assignments.															
parameter	get_all_parameters	Returns only parameter assignments.															

*continued...*

The "-to" and "-from" options are case sensitive.

These options can take string patterns containing special characters from the set ".\*\[]" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

```
<bus name>[<bus index>] or <bus name>[*]
```

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character "\*" used for string matching. Notice that the <bus index> is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[\*]" are supported bus names and can be used as follows:

```
# To match index 0 of bus "a", type:
get_all_assignments -type instance -name LOCATION -to a[0]
```

```
# To match all indices of bus "a", type:
get_all_assignments -type instance -name LOCATION -to a[*]
```

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

```
get_all_assignments -type instance LOCATION -to "a[escape_brackets \[\]\[0-2\][escape_brackets \]]"
```

For more information about escaping square brackets, type "escape\_brackets -h".

This Tcl command reads in the global, instance, and parameter assignments found in the Quartus Prime Settings File (.qsf) and reads in the default assignments found inside the Quartus Prime Default Settings File (.qdf).

If you tagged data by making assignments with the -tag option, then the information can be searched using the -tag option.

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one clock section each containing its own set of clock assignments. To uniquely identify sections of this type, use the -section\_id option.

For entity-specific assignments, use the "-entity" option to retrieve assignments from a specific entity. If the "-entity" option is not specified, the value for the FOCUS\_ENTITY\_NAME assignment is used. If the FOCUS\_ENTITY\_NAME value is not found, the revision name is used.

#### Example Usage

```
## View all the timing requirements using wildcards
## to match TSU_REQUIREMENT, TCO_REQUIREMENT,
## and others.
foreach_in_collection asgn_id [get_all_assignments -type instance -name *_REQUIREMENT] {

    set from [get_assignment_info $asgn_id -from]
    set to [get_assignment_info $asgn_id -to]
    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    set entity [get_assignment_info $asgn_id -entity]
    set sid [get_assignment_info $asgn_id -section_id]
    set tag [get_assignment_info $asgn_id -tag]

    puts "$entity: $name ($from -> $to) = $value"
}

## View all global assignments
foreach_in_collection asgn_id [get_all_assignments -type global -name *] {

    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    set entity [get_assignment_info $asgn_id -entity]
    set sid [get_assignment_info $asgn_id -section_id]
    set tag [get_assignment_info $asgn_id -tag]

    puts "$entity: $name = $value"
}

## View all project-wide default parameter values
foreach_in_collection asgn_id [get_all_assignments -type parameter -name *] {

    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
```

*continued...*

```

set tag    [get_assignment_info $asgn_id -tag]

puts "$name = $value"
}

## View all entity-specific parameter values
foreach_in_collection asgn_id [get_all_assignments -type parameter -name * -to *] {

    set dest [get_assignment_info $asgn_id -to]
    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    set tag   [get_assignment_info $asgn_id -tag]

    puts "$name (-> $dest) = $value"
}

## View all default assignments
foreach_in_collection asgn_id [get_all_assignments -type default -name * -to *] {

    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]

    puts "$name = $value"
}

```

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Assignment <string> is not supported in this edition of the Quartus Prime software.

### 3.1.27.9. get\_all\_global\_assignments (::quartus::project)

The following table displays information for the `get_all_global_assignments` Tcl command:

Tcl Package and Version	Belongs to ::quartus::project on page 358			
Syntax	get_all_global_assignments [-h   -help] [-long_help] [-entity <entity_name> ] [-fall] -name <name> [-rise] [-section_id <section id> ] [-tag <data> ]			
Arguments	-h   -help	Short help		
	-long_help	Long help with examples and possible return values		
	-entity <entity_name>	Entity to which assignment belongs		
	-fall	Option applies to falling edge		
	-name <name>	Assignment name (string pattern is matched using Tcl string matching)		
	-rise	Option applies to rising edge		
	-section_id <section id>	Section id		
	-tag <data>	Option to tag data to this assignment		
Description	<div>Returns a filtered output collection of all matching global assignment values. To access each element of the output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".</div> <div>In version 5.0 of the ::quartus::project package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the "get_all_global_assignments" command. These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) assignments. The "get_all_global_assignments" command is still supported for backward compatibility.</div> <div>The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set "*?\" as the value. The value is matched using Tcl string matching.</div> <div>This Tcl command reads the global assignments found in the Quartus Prime Settings File (.qsf). This Tcl command filters the assignment data in the .qsf and outputs the data based on the values given by the "-name" option.</div> <div>Each element of the collection is a list with the following format: { {&lt;Section Id&gt;} {&lt;Assignment name&gt;} {&lt;Assignment value&gt;} {&lt;Entity name&gt;} {&lt;Tag data&gt;} }</div> <div>Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a &lt;Section Id&gt; is used. &lt;Section Id&gt; can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a &lt;Section Id&gt; and the associated &lt;Section Id&gt; description:</div> <table><tr><td>Section Id</td><td>Description</td></tr></table>		Section Id	Description
Section Id	Description

### 3.1.27.10. get\_all\_instance\_assignments (::quartus::project)

The following table displays information for the get\_all\_instance\_assignments Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	get_all_instance_assignments [-h   -help] [-long_help] [-entity <entity_name> ] [-fall] [-from <source> ] -name <name> [-rise] [-section_id <section id> ] [-tag <data> ] [-to <destination> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <entity_name>	Entity to which assignment belongs
	-fall	Option applies to falling edge
	-from <source>	Source of assignment (string pattern is matched using Tcl string matching)
	-name <name>	Assignment name (string pattern is matched using Tcl string matching)
	-rise	Option applies to rising edge
	-section_id <section id>	Section id
	-tag <data>	Option to tag data to this assignment
	-to <destination>	Destination of assignment (string pattern is matched using Tcl string matching)
<b>Description</b>	<p>Returns a filtered output collection of all matching instance assignment values. To access each element of this output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".</p> <p>In version 5.0 of the ::quartus::project package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the "get_all_instance_assignments" command. These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) assignments. The "get_all_instance_assignments" command is still supported for backward compatibility.</p>	
continued...		

The "-name" option is not case sensitive.  
The "-to" and "-from" options are case sensitive.

These options can take string patterns containing special characters from the set "\*?\" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

```
<bus name>[<bus index>] or <bus name>[*]
```

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character "\*" used for string matching. Notice that the <bus index> is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[\*]" are supported bus names and can be used as follows:

```
# To match index 0 of bus "a", type:
get_all_instance_assignments -name LOCATION -to a[0]

# To match all indices of bus "a", type:
get_all_instance_assignments -name LOCATION -to a[*]
```

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

```
get_all_instance_assignments -name LOCATION -to "a[escape_brackets \[\][0-2][escape_brackets \]]"
```

For more information about escaping square brackets, type "escape\_brackets -h".

This Tcl command reads in the instance assignments found in the Quartus Prime Settings File (.qsf). The command filters the assignments data found in the .qsf and outputs the data based on the values specified by the "-name", "-from", and "-to" options.

Each element of the collection is a list with the following format:

```
{ <Section Id> {<Source>} {<Destination>} {<Assignment name>} {<Assignment value>} {<Entity name>} {<Tag data>}}
```

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a <Section Id> is used. <Section Id> can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a <Section Id> and the associated <Section Id> description:

Section Id	Description
CHIP	Same as revision name
LOGICLOCK_REGION	A unique name
EDA_TOOL_SETTINGS	A unique name
CLIQUE	A unique name
BREAKPOINT	A unique name
CLOCK	A unique name
AUTO_INSERT_SLD_NODE_ENTITY	A unique name

If you tagged data by making assignments with the -tag option, then the information will be displayed in the <Tag data> field.

For entity-specific assignments, use the "-entity" option to retrieve the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS\_ENTITY\_NAME assignment is used. If the FOCUS\_ENTITY\_NAME value is not found, the revision name is used.

#### Example Usage

```
## Print out all the timing requirements
## using the foreach_in_collection method.
## Use wildcards to catch TSU_REQUIREMENT, TCO_REQUIREMENT,
## and others.
set asgn_col [get_all_instance_assignments -name *_REQUIREMENT]

foreach_in_collection asgn $asgn_col {
    ## Each element in the collection has the following
    ## format: { {} {<Source>} {<Destination>} {<Assignment name>} {<Assignment value>}
    {<Entity name>} {<Tag data>} }
    set from [lindex $asgn 1]
```

*continued...*

```

set to      [lindex $asgn 2]
set name    [lindex $asgn 3]
set value   [lindex $asgn 4]
set entity  [lindex $asgn 5]
set tag     [lindex $asgn 6]

puts "$entity: $name ($from -> $to) = $value"
}

## Get all the location assignments with
## the destination bus name "timeo".
set bus_name "timeo"
set location_asgns [get_all_instance_assignments -name LOCATION -to $bus_name[*]]

```

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Assignment is not an instance assignment: <i>&lt;string&gt;</i> -- it is a global assignment. Specify an instance assignment name or use the global assignment commands.

	TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <i>&lt;string&gt;</i> . Specify a legal entity name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for the <i>-&lt;string&gt;</i> option is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Options cannot be specified together: <i>-&lt;string&gt;</i> , <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Specify only one or two of the three options.
	TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Ignored assignment: <i>&lt;string&gt;</i> . The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Found two options: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Choose one of the options.
	TCL_ERROR	1	ERROR: Illegal assignment name: <i>&lt;string&gt;</i> . Specify a legal assignment name. To view the list of legal assignment names, run <code>get_all_assignment_names</code> .
	TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.27.11. get\_all\_parameters (::quartus::project)

The following table displays information for the get\_all\_parameters Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project on page 358	
<b>Syntax</b>	get_all_parameters [-h   -help] [-long_help] [-entity <entity_name> ] [-fall] -name <name> [-rise] [-tag <data> ] [-to <destination> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <entity_name>	Entity to which parameter belongs
	-fall	Option applies to falling edge
	-name <name>	Parameter name (string pattern is matched using Tcl string matching)
	-rise	Option applies to rising edge
	-tag <data>	Option to tag data to this assignment
	-to <destination>	Destination of the parameter (string pattern is matched using Tcl string matching)
<b>Description</b>	<p>Returns a filtered output collection of all matching parameter values. To access each element of this output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".</p> <p>In version 5.0 of ::quartus::project package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the "get_all_parameters" command. These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) assignments. The "get_all_parameters" command is still supported for backward compatibility.</p> <p>The "-name" option is not case sensitive. The "-to" option is case sensitive.</p> <p>If the "-to" argument is specified, the function returns the parameter values for the current entity. The values are retrieved from the PARAMETERS section of the entity. Otherwise, the function returns the project-wide default parameter values obtained from the DEFAULT_PARAMETERS section.</p> <p>This Tcl command filters the parameter data found in the Quartus Prime Settings File (.qsf) and outputs the data based on the values specified by the "-name" and "-to" options. These options can take string patterns containing special characters from the set ".*\[]" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:</p> <pre>&lt;bus name&gt;[&lt;bus index&gt;] or &lt;bus name&gt;[*]</pre> <p>The &lt;bus name&gt; portion is a string of alphanumeric characters. The &lt;bus index&gt; portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the &lt;bus index&gt; is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[*]" are supported bus names and can be used as follows:</p> <pre># To match index 0 of bus "a", type: get_all_parameters -name * -to a[0]  # To match all indices of bus "a", type: get_all_parameters -name * -to a[*]</pre> <p>All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:</p> <pre>get_all_parameters -name * -to "a[escape_brackets \[\][0-2][escape_brackets \]]"</pre>	

*continued...*

	<p>For more information about escaping square brackets, type "escape_brackets -h".</p> <p>Each element of the collection is a list with the following format:  <code>{ {&lt;Destination&gt;} {&lt;Parameter name&gt;} {&lt;Parameter value&gt;} {&lt;Entity name&gt;} {&lt;Tag data&gt;} }</code></p> <p>If you tagged data by making assignments with the -tag option, then the information will be displayed in the &lt;Tag data&gt; field.</p> <p>Use the "-entity" option to retrieve the parameter values from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p>		
Example Usage	<pre>## Display all project-wide default parameter values set parameter_col [get_all_parameters -name *]  foreach_in_collection parameter \$parameter_col {      ## Each element in the collection has the following     ## format: { { } {&lt;Parameter name&gt;} {&lt;Parameter value&gt;} { } { } }     set name [lindex \$parameter 1]     set value [lindex \$parameter 2]      ## Now, display the content of the parameter     puts "Parameter Name (\$name)"     puts "Parameter Value (\$value)" }  ## Display all entity-specific parameter values foreach_in_collection parameter [get_all_parameters -name * -to *] {      ## Each element in the collection has the following     ## format: { {&lt;Destination&gt;} {&lt;Parameter name&gt;} {&lt;Parameter value&gt;} { } { } }     set dest [lindex \$parameter 0]     set name [lindex \$parameter 1]     set value [lindex \$parameter 2]      ## Now, display the content of the parameter     puts "Destination (\$dest)"     puts "Parameter Name (\$name)"     puts "Parameter Value (\$value)" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Illegal default parameter: <string>. Specify a legal default parameter name.
	TCL_ERROR	1	ERROR: Illegal parameter: <string>. Specify a legal parameter name.
	TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.27.12. get\_all\_quartus\_defaults (::quartus::project)

The following table displays information for the get\_all\_quartus\_defaults Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::project</a> on page 358																	
Syntax	get_all_quartus_defaults [-h   -help] [-long_help] [-fall] [-name <name> ] [-rise] [-section_id <section id> ] [-tag <data> ]																	
Arguments	-h   -help	Short help																
	-long_help	Long help with examples and possible return values																
	-fall	Option applies to falling edge																
	-name <name>	Assignment name (string pattern is matched using Tcl string matching)																
	-rise	Option applies to rising edge																
	-section_id <section id>	Section id																
	-tag <data>	Option to tag data to this assignment																
Description	<p>Returns a filtered output collection of all matching default assignment values. To access each element of the output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".</p> <p>In version 5.0 of ::quartus::project package, two new Tcl commands "get_all_assignments" and "get_assignment_info" have been introduced to replace the "get_all_quartus_defaults" command. These two new commands simplify the interface to retrieve information about Quartus Prime Settings File (.qsf) assignments. The "get_all_quartus_defaults" command is still supported for backward compatibility.</p> <p>The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set ".*\[\]" as the value. The value is matched using Tcl string matching.</p> <p>This Tcl command reads in the default assignments found inside the Quartus Prime Default Settings File (.qdf). It filters the assignments data found inside the .qdf and outputs the data based on the values specified by the "-name" option.</p> <p>Each element of the collection is a list with the following format: { {&lt;Section Id&gt;} {&lt;Assignment name&gt;} {&lt;Assignment value&gt;} }</p> <p>Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a &lt;Section Id&gt; is used. &lt;Section Id&gt; can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a &lt;Section Id&gt; and the associated &lt;Section Id&gt; description:</p> <table><tr><th>Section Id</th><th>Description</th></tr><tr><td>CHIP</td><td>Same as revision name</td></tr><tr><td>LOGICLOCK_REGION</td><td>A unique name</td></tr><tr><td>EDA_TOOL_SETTINGS</td><td>A unique name</td></tr><tr><td>CLIQUE</td><td>A unique name</td></tr><tr><td>BREAKPOINT</td><td>A unique name</td></tr><tr><td>CLOCK</td><td>A unique name</td></tr><tr><td>AUTO_INSERT_SLD_NODE_ENTITY</td><td>A unique name</td></tr></table>		Section Id	Description	CHIP	Same as revision name	LOGICLOCK_REGION	A unique name	EDA_TOOL_SETTINGS	A unique name	CLIQUE	A unique name	BREAKPOINT	A unique name	CLOCK	A unique name	AUTO_INSERT_SLD_NODE_ENTITY	A unique name
Section Id	Description																	
CHIP	Same as revision name																	
LOGICLOCK_REGION	A unique name																	
EDA_TOOL_SETTINGS	A unique name

### 3.1.27.13. get\_all\_user\_option\_names (::quartus::project)

The following table displays information for the get\_all\_user\_option\_names Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::project</a> on page 358		
Syntax	get_all_user_option_names [-h   -help] [-long_help] [-name <name> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <name>	User option name (string pattern is matched using Tcl string matching)	
Description	<p>Returns a filtered output list of all available, matching user option names.</p> <p>If the "-name" option is not specified, all available user option names are returned. Otherwise, only the matching user option names are returned.</p> <p>The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set ".*\[\]" as the value. The value is matched using Tcl string matching.</p>		
Example Usage	<pre>## Print out all available user option names foreach i [get_all_user_option_names] {     puts \$i }  ## Display all user option names that contain ## the word "talkback" and also display the ## value for each of the user option names foreach i [get_all_user_option_names -name *talkback*] {     set name \$i     set value [get_user_option -name \$i]     puts "\$name = \$value" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.27.14. get\_assignment\_info (::quartus::project)

The following table displays information for the get\_assignment\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	get_assignment_info [-h   -help] [-long_help] [-comments] [-entity] [-from] [-get_tcl_command] [-name] [-section_id] [-tag] [-to] [-value] <asgn_id>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-comments	Option to get the assignment comment
	-entity	Option to get the assignment entity
	-from	Option to get the assignment source
	-get_tcl_command	Option to get the tcl command that sets the assignment
continued...		

	-name	Option to get the assignment name	
	-section_id	Option to get the assignment section id	
	-tag	Option to get the assignment tag	
	-to	Option to get the assignment destination	
	-value	Option to get the assignment value	
	<asgn_id>	Assignment id	
Description	Returns information for the assignment id based on the specified option.  The assignment id is obtained from the "get_all_assignments" Tcl command.		
Example Usage	<pre>## View all the instance assignments foreach_in_collection asgn_id [get_all_assignments -type instance -name *] {      set from [get_assignment_info \$asgn_id -from]     set to [get_assignment_info \$asgn_id -to]     set name [get_assignment_info \$asgn_id -name]     set value [get_assignment_info \$asgn_id -value]     set entity [get_assignment_info \$asgn_id -entity]     set tag [get_assignment_info \$asgn_id -tag]      puts "\$entity: \$name (\$from -&gt; \$to) = \$value" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal assignment id: <string>. Specify a legal assignment id that was retrieved from the Tcl command get_all_assignments.

### 3.1.27.15. get\_assignment\_name\_info (::quartus::project)

The following table displays information for the get\_assignment\_name\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	get_assignment_name_info [-h   -help] [-long_help] <name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<name>	Assignment name	
<b>Description</b>	Returns information for the specified assignment name.		
<b>Example Usage</b>	<pre>## View information for all assignment names foreach name [get_all_assignment_names] {     puts [get_assignment_name_info \$name] }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
continued...			

	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Assignment <string> is not supported in this edition of the Quartus Prime software.
	TCL_ERROR	1	ERROR: Illegal assignment name: <string>. Specify a legal assignment name. To view the list of legal assignment names, run get_all_assignment_names.

### 3.1.27.16. get\_current\_project (::quartus::project)

The following table displays information for the get\_current\_project Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	get_current_project [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Returns the name of the current project.		
<b>Example Usage</b>	# Get the current name for # the currently open project "chiptrip" project_open chiptrip set project_name [get_current_project] project_close		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.27.17. get\_current\_revision (::quartus::project)

The following table displays information for the get\_current\_revision Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	get_current_revision [-h   -help] [-long_help] [ <i>&lt;project_name&gt;</i> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	<i>&lt;project_name&gt;</i>	Project name
<b>Description</b>	Returns the name of the current revision for the specified project. If the project name is not specified, the current project name is used.	
<b>Example Usage</b>	<pre># Get the current revision name for # the currently open project "chiptrip" project_open chiptrip set revision_name [get_current_revision] project_close  # Get the current revision name for # a project that is not currently open set revision_name [get_current_revision chiptrip]</pre>	
continued...		

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Project does not exist or has illegal name characters: <i>&lt;string&gt;</i> . Specify a legal project name.
	TCL_ERROR	1	ERROR: Project name was not specified or open project does not exist. Open an existing project or specify the project name.

### 3.1.27.18. get\_database\_version (::quartus::project)

The following table displays information for the `get_database_version` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	get_database_version [-h   -help] [-long_help] <i>&lt;project_name&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<i>&lt;project_name&gt;</i>	Project name	
<b>Description</b>	Return the project's database version. This is the version of software that the database was created.		
<b>Example Usage</b>	## Print message on database version set db_version [get_database_version chiptrip] post_message "The database is created from \"\${db_version}\""		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The input project <i>&lt;string&gt;</i> is not found.

### 3.1.27.19. get\_global\_assignment (::quartus::project)

The following table displays information for the `get_global_assignment` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	get_global_assignment [-h   -help] [-long_help] [-entity <entity_name> ] [-fall] [-front] -name <name> [-rise] [-section_id <section id> ] [-tag <data> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <entity_name>	Entity to which assignment belongs
	-fall	Option applies to falling edge
	-front	Option to return the first assignment if there is more than one assignment found
	-name <name>	Assignment name
	-rise	Option applies to rising edge
continued...		

	-section_id <section id>		Section id
	-tag <data>		Option to tag data to this assignment
<b>Description</b>	<p>Returns the value of the global assignment.</p> <p>The "-name" option is not case sensitive.</p> <p>For entity-specific assignments, use the "-entity" option to retrieve the assignment from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p>		
<b>Example Usage</b>	<pre>## Get the value of the FAMILY assignment get_global_assignment -name FAMILY</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Assignment <string> is not supported in this edition of the Quartus Prime software.
	TCL_ERROR	1	ERROR: Assignment is not a global assignment: <string> -- it is an instance assignment. Specify a global assignment name or use the instance assignment commands.
	TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: Value <string> for the -<string> option is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Option -<string> for <string> assignment is illegal. Specify a legal option or remove the option.
	TCL_ERROR	1	ERROR: Options cannot be specified together: -<string>, -<string> and -<string>. Specify only one or two of the three options.
	TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Ignored assignment: <string>. The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Found two options: -<string> and -<string>. Choose one of the options.
	TCL_ERROR	1	ERROR: Illegal assignment name: <string>. Specify a legal assignment name. To view the list of legal assignment names, run get_all_assignment_names.
	TCL_ERROR	1	ERROR: An unknown error has occurred.
	TCL_ERROR	1	ERROR: Assignment <string> has multiple values. Use the <string> command to get all values or use the <string> -front command to get the first value.

### 3.1.27.20. get\_instance\_assignment (::quartus::project)

The following table displays information for the `get_instance_assignment` Tcl command:

Tcl Package and Version	Belongs to ::quartus::project on page 358		
Syntax	get_instance_assignment [-h   -help] [-long_help] [-entity <entity_name> ] [-fall] [-from <source> ] [-front] -name <name> [-rise] [-section_id <section id> ] [-tag <data> ] [-to <destination> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-entity <entity_name>	Entity to which assignment belongs	
	-fall	Option applies to falling edge	
	-from <source>	Source of assignment	
	-front	Option to return the first assignment if there is more than one assignment found	
	-name <name>	Assignment name	
	-rise	Option applies to rising edge	
	-section_id <section id>	Section id	
	-tag <data>	Option to tag data to this assignment	
	-to <destination>	Destination of assignment	
Description	<p>Returns the value of the instance assignment.</p> <p>The "-name" option is not case sensitive. The "-entity", "-to", and "-from" options are case sensitive.</p> <p>For entity-specific assignments, use the "-entity" option to retrieve the assignment from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p>		
Example Usage	## Get the TSU_REQUIREMENT from mypin to any register set value [get_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT] puts "TSU_REQUIREMENT(mypin->*) = \$value"		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Assignment is not an instance assignment: <string> -- it is a global assignment. Specify an instance assignment name or use the global assignment commands.
	TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.

continued...

*continued...*

TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <i>&lt;string&gt;</i> . Specify a legal entity name.
TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for the <i>-&lt;string&gt;</i> option is illegal. Specify a legal value.
TCL_ERROR	1	ERROR: Options cannot be specified together: <i>-&lt;string&gt;</i> , <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Specify only one or two of the three options.
TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.
TCL_ERROR	1	ERROR: Ignored assignment: <i>&lt;string&gt;</i> . The assignment is no longer supported.
TCL_ERROR	1	ERROR: Found two options: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Choose one of the options.
TCL_ERROR	1	ERROR: Illegal assignment name: <i>&lt;string&gt;</i> . Specify a legal assignment name. To view the list of legal assignment names, run <code>get_all_assignment_names</code> .
TCL_ERROR	1	ERROR: An unknown error has occurred.
TCL_ERROR	1	ERROR: Assignment <i>&lt;string&gt;</i> has multiple values. Use the <i>&lt;string&gt;</i> command to get all values or use the <i>&lt;string&gt;</i> - front command to get the first value.

### 3.1.27.21. `get_location_assignment (::quartus::project)`

The following table displays information for the `get_location_assignment` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	get_location_assignment [-h   -help] [-long_help] [-fall] [-rise] [-tag <data> ] -to <destination>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-fall	Option applies to falling edge	
	-rise	Option applies to rising edge	
	-tag <data>	Option to tag data to this assignment	
	-to <destination>	Destination of assignment	
<b>Description</b>	<p>Returns the value of a location assignment.</p> <p>The "-chip" option is not case sensitive.</p> <p>The "-to" option is case sensitive.</p>		
<b>Example Usage</b>	get_location_assignment -to dst		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

continued...

*continued...*

TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.27.22. get\_name\_info (::quartus::project)

The following table displays information for the get\_name\_info Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::project</a> on page 358																					
Syntax	get_name_info [-h   -help] [-long_help] [-info <parent_name_id base_name entity_name entity_definition instance_name full_path short_full_path node_type creator signaltapii file_location library children parameters> ] [-observable_type <all pre_synthesis post_synthesis post_fitter post_asm stp_pre_synthesis> ] <name_id>																					
Arguments	-h   -help	Short help																				
	-long_help	Long help with examples and possible return values																				
	-info <parent_name_id base_name entity_name entity_definition instance_name full_path short_full_path node_type creator signaltapii file_location library children parameters>	Option to specify the type of information to display.																				
	-observable_type <all pre_synthesis post_synthesis post_fitter post_asm stp_pre_synthesis>	Option to specify the observable type of the name ID																				
	<name_id>	Option to specify the node name ID																				
Description	<p>Displays the specified type of information for the specified node name id. Type "get_names -long_help" to view how to get a collection of node name IDs.</p> <p>If the "-observable_type" option is not specified, the default value is "all". The specified observable type must have the same observable type as specified in the "get_names" Tcl command which returned the currently specified node name id.</p> <p>The value for "-observable_type" option can be one of the following:</p> <table><tr><th>Observable Type</th><th>Description</th></tr><tr><td>all</td><td>Use post-Fitter information. If it is not available, post-synthesis information is used. Otherwise, pre-synthesis information is used if it exists.</td></tr><tr><td>pre_synthesis</td><td>Use pre-synthesis information.</td></tr><tr><td>post_synthesis</td><td>Use post-synthesis information.</td></tr><tr><td>post_fitter</td><td>Use post-Fitter information.</td></tr><tr><td>post_asm</td><td>Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.</td></tr><tr><td>stp_pre_synthesis</td><td>Use Signal Tap pre-synthesis information.</td></tr></table> <p>The info type for the "-info" option can be one of the following:</p> <table><tr><th>Info Type</th><th>Description</th></tr><tr><td>parent_name_id</td><td>The name id for the node's parent.</td></tr><tr><td>base_name</td><td>The node name, which consists of an entity name and/or an instance name</td></tr></table>		Observable Type	Description	all	Use post-Fitter information. If it is not available, post-synthesis information is used. Otherwise, pre-synthesis information is used if it exists.	pre_synthesis	Use pre-synthesis information.	post_synthesis	Use post-synthesis information.	post_fitter	Use post-Fitter information.	post_asm	Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.	stp_pre_synthesis	Use Signal Tap pre-synthesis information.	Info Type	Description	parent_name_id	The name id for the node's parent.	base_name	The node name, which consists of an entity name and/or an instance name
Observable Type	Description																					
all	Use post-Fitter information. If it is not available, post-synthesis information is used. Otherwise, pre-synthesis information is used if it exists.																					
pre_synthesis	Use pre-synthesis information.																					
post_synthesis	Use post-synthesis information.																					
post_fitter	Use post-Fitter information.																					
post_asm	Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.																					
stp_pre_synthesis	Use Signal Tap pre-synthesis information.																					
Info Type	Description																					
parent_name_id	The name id for the node's parent.																					
base_name	The node name, which consists of an entity name and/or an instance name																					

continued...

**continued...**

	<p>entity_name separated by a colon if necessary. The entity name.</p> <p>entity_definition The entity definition.</p> <p>instance_name The instance name.</p> <p>full_path The full hierarchy path name, which consists of entity name(s) and/or the instance name(s). This path name excludes the current focus entity. If there is nothing shown, the name id is the current focus entity's name id.</p> <p>short_full_path The short full hierarchy path name, which consists of the instance name(s). This path name excludes the current focus entity. If nothing is shown, the name id is the current focus entity's name id.</p> <p>node_type The node type, which can be one of the types supported by "get_names", namely, "input", "output", "bidirectional", "register", "combinational", "hierarchy", "memory", or "bus". If "pin" type was specified for "get_names" command, the node type shown here is expanded to be "input", "output", or "bidirectional". Node type value of "qsf" indicates name originates from qsf settings file.</p> <p>creator The creator of the node, which is either "user_entered" or "compiler_generated".</p> <p>signaltapii If this node can be connected to a Signal Tap embedded logic analyzer, 1 is shown. Otherwise, 0 is shown.</p> <p>file_location The source file location. For example, the source file location for the entity chiptrip is "chiptrip.v". To get the full path to the source file, use the command "resolve_file_path" which exists only in version 4.0 or later of ::quartus::project package.</p> <p>library Library associated with the instance name.</p> <p>children Collection of all the children names of the specified name. The children will include all the names in the specified hierarchy.</p> <p>parameters Collection of parameters associated with the name. Each element of the collection is a triplet that contains the name, value and the type of the parameter.</p>		
<b>Example Usage</b>	<pre># Get the name id of the current focus entity set current_focus_entity_id [get_top_level_entity]  # The full path name of the current focus entity # is empty because the full path excludes the # current focus entity set msg "Full path of the current focus entity =&gt; (" append msg [get_name_info -info full_path \$current_focus_entity_id] append msg ")" puts \$msg puts ""  # Get the node type of the current focus entity # The node type should be a hierarchy type set msg "Node type of the current focus entity =&gt; (" append msg [get_name_info -info node_type \$current_focus_entity_id] append msg ")" puts \$msg</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Compiler database does not exist for revision name: <string>. At the minimum, run Analysis & Synthesis (quartus_map) with the specified revision name before using this Tcl command.
	TCL_ERROR	1	ERROR: Illegal info type: <string>. Specify parent_name_id, base_name, entity_name, instance_name, full_path, short_full_path, node_type, creator, or signaltapii.
continued...			

TCL_ERROR	1	ERROR: Illegal name id: <i>&lt;string&gt;</i> . Specify a name id that exists in a compiled Quartus Prime project.
TCL_ERROR	1	ERROR: Invalid name id for top level entity: <i>&lt;string&gt;</i> . Specify a valid top level entity id value. In Quartus Prime Pro, get_name_info query through integer value is only supported for get_top_level_entity TCL command. For other names query, please refer to get_names TCL command.
TCL_ERROR	1	ERROR: Invalid name id: <i>&lt;string&gt;</i> . Specify an integer greater than or equal to zero.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.
TCL_ERROR	1	ERROR: Post-Assembler compiler database does not exist for revision name: <i>&lt;string&gt;</i> . Run Assembler (quartus_asm) with the specified revision name before using this Tcl command.

### 3.1.27.23. get\_names (::quartus::project)

The following table displays information for the get\_names Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project on page 358	
<b>Syntax</b>	<pre>get_names [-h   -help] [-long_help] [-entity &lt;wildcard&gt; ] -filter &lt;wildcard&gt; [-library &lt;wildcard&gt; ] [-node_type &lt;all comb reg pin input output bidir hierarchy mem bus qsf state_machine assigned unassigned all_reg partition virtual&gt; ] [-observable_type &lt;all pre_synthesis post_synthesis post_fitter post_asm stp_pre_synthesis&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <wildcard>	Option to specify the entity to get names from hierarchies instantiated by the entity
	-filter <wildcard>	Option to specify the node's full path name and/or wildcard character(s)
	-library <wildcard>	Option to specify the containing library
	-node_type <all comb reg pin input output bidir hierarchy mem bus qsf state_machine assigned unassigned all_reg partition virtual>	Option to filter based on the specified node type.
	-observable_type <all pre_synthesis post_synthesis post_fitter post_asm stp_pre_synthesis>	Option to filter based on the specified observable type
<b>Description</b>	<p>Returns a filtered output collection of all matching node name IDs found in a compiled Quartus Prime project.</p> <p>To access each element of the output collection, use the Tcl command "foreach_in_collection". To see example usage, type "get_names -long_help" or "foreach_in_collection -long_help".</p> <p>If the "-node_type" option is not specified, the default value is "all". Similarly, if the "-observable_type" option is not specified, the default value is "all".</p> <p>The node type "pin" includes "input", "output", "bidir", "assigned" and "unassigned".          The node type "qsf" include names from qsf settings file.          The node type "all" includes all node types.          The node type "all_reg" includes all node types and register post-fitting</p> <p>The value for "-observable_type" option can be one of</p>	

**continued...**

	the following:		
	Observable Type	Description	
	-----	-----	
	all	Use post-Fitter information. If it is not available, post-Synthesis information is used. Otherwise, pre-synthesis information is used if it exists.	
	pre_synthesis	Use pre-synthesis information.	
	post_synthesis	Use post-synthesis information.	
	post_fitter	Use post-Fitter information.	
	post_asm	Use post-Assembler information. The post-Assembler information is only supported for designs using the HardCopy II device family.	
	stp_pre_synthesis	Use Signal Tap pre-synthesis information.	
Example Usage	<pre># Search for a single post-Fitter pin with the name accel and # make assignments set accel_name_id [get_names -filter accel -node_type pin -observable_type post_fitter] foreach_in_collection name_id \$accel_name_id {      # Get the full path name of the node     set target [get_name_info -info full_path \$name_id]      # Set multicycle assignment     set_multicycle_assignment -to \$target 2      # Set location assignment     set_location_assignment -to \$target Pin_E22 } # Search for nodes of any post-Fitter node type with name length &lt;= 5 # The default node type is "all" set name_ids [get_names -filter ????? -observable_type post_fitter] foreach_in_collection name_id \$name_ids {      # Print the name id     puts \$name_id      # Print the node type     puts [get_name_info -info node_type \$name_id]      # Print the full path (which excludes the current     # focus entity from the path)     puts [get_name_info -info full_path \$name_id] } # Search for nodes of any post-Fitter node type that end in "eed". # The default node type is "all" set name_ids [get_names -filter *eed -observable_type post_fitter] foreach_in_collection name_id \$name_ids {      # Print the name id     puts \$name_id      # Print the node type     puts [get_name_info -info node_type \$name_id]      # Print the full path (which excludes the current     # focus entity from the path)     puts [get_name_info -info full_path \$name_id] } }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Get names cannot return <string> because the name was found in a partition that's not the root partition. Refine your get_names search pattern to exclude child partitions
	TCL_ERROR	1	ERROR: Compiler database does not exist for revision name: <string>. At the minimum, run Analysis & Synthesis (quartus_map) with the specified revision name before using this Tcl command.
	TCL_ERROR	1	ERROR: Illegal node type: <string>. Specify all, comb, reg, pin, hierarchy, or bus.
continued...			

	TCL_ERROR	1	ERROR: Illegal observable type: <string>. Specify all, pre_synthesis, post_synthesis, or post_fitter.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Post-Assembler compiler database does not exist for revision name: <string>. Run Assembler (quartus_asm) with the specified revision name before using this Tcl command.

### 3.1.27.24. get\_parameter (::quartus::project)

The following table displays information for the get\_parameter Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	get_parameter [-h   -help] [-long_help] [-entity <entity_name> ] [-fall] -name <name> [-rise] [-tag <data> ] [-to <destination> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-entity <entity_name>	Entity to which parameter belongs	
	-fall	Option applies to falling edge	
	-name <name>	Parameter name	
	-rise	Option applies to rising edge	
	-tag <data>	Option to tag data to this assignment	
	-to <destination>	Destination of parameter	
<b>Description</b>	<p>Returns the value of the parameter.</p> <p>The "-name" option is not case sensitive. The "-to" option is case sensitive.</p> <p>If the "-to" argument is specified, the function returns the parameter value for the current entity. The value is retrieved from the PARAMETERS section of the entity. Otherwise, the function returns the project-wide default parameter value obtained from the DEFAULT_PARAMETERS section.</p> <p>Use the "-entity" option to retrieve the parameter from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p>		
<b>Example Usage</b>	<pre>## Get project-wide, default parameter value get_parameter -name WIDTH  ## Get entity-specific parameter value get_parameter -name inst1 -to SIZE</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.

continued...

	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Illegal default parameter: <i>&lt;string&gt;</i> . Specify a legal default parameter name.
	TCL_ERROR	1	ERROR: Illegal parameter: <i>&lt;string&gt;</i> . Specify a legal parameter name.
	TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.27.25. get\_project\_directory (::quartus::project)

The following table displays information for the `get_project_directory` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::project</a> on page 358		
Syntax	get_project_directory [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Returns the project directory for currently open project.		
Example Usage	<pre>project_open one_wire # Print the current project directory puts [get_project_directory] project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.27.26. get\_project\_revisions (::quartus::project)

The following table displays information for the `get_project_revisions` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project</code> on page 358		
<b>Syntax</b>	<code>get_project_revisions [-h   -help] [-long_help] [ <i>&lt;project_name&gt;</i> ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code><i>&lt;project_name&gt;</i></code>	Project name	
<b>Description</b>	<div>Returns a list of revisions included in the specified project. If the project name is not specified, the current project name is used by default.  The first element in the list of revisions is the current revision and is the same as the return value for the "get_current_revision" command.</div>		
continued...			

<b>Example Usage</b>	<pre># Set the device family assignment to Stratix # for all revisions project_open chiptrip set original_revision [get_current_revision]  foreach revision [get_project_revisions] {     puts "\$revision"     set_current_revision \$revision     set_global_assignment -name FAMILY Stratix     export_assignments }  set_current_revision \$original_revision project_close  # Open the project with the first available revision # and set the device family assignment to Stratix set revision [lindex [get_project_revisions chiptrip] 0] open_project -revision \$revision chiptrip set_global_assignment -name FAMILY Stratix project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Project does not exist or has illegal name characters: <string>. Specify a legal project name.
	TCL_ERROR	1	ERROR: Project name was not specified or open project does not exist. Open an existing project or specify the project name.

### 3.1.27.27. get\_revision\_description (::quartus::project)

The following table displays information for the `get_revision_description` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::project</a> on page 358		
Syntax	get_revision_description [-h   -help] [-long_help] [ <revision_name> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<revision_name>	Revision name	
Description	Returns the description for the specified revision.		
Example Usage	<pre>## Get the description for the current revision project_open chiptrip set revision_name [get_current_revision] get_revision_description \$revision_name project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Revision is not included in the current project: <string> . Use the create_revision command to create the revision.
	TCL_ERROR	1	ERROR: Project name was not specified or open project does not exist. Open an existing project or specify the project name.

### 3.1.27.28. get\_top\_level\_entity (::quartus::project)

The following table displays information for the get\_top\_level\_entity Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project on page 358		
<b>Syntax</b>	get_top_level_entity [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Returns the name id for the current focus entity.		
<b>Example Usage</b>	<pre># Get the name id of the current focus entity set current_focus_entity_id [get_top_level_entity]  # Print out the entity name of the current focus entity set msg "Entity name of the current focus entity =&gt; (" append msg [get_name_info -info entity_name \$current_focus_entity_id] append msg ")" puts "" puts \$msg</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Compiler database does not exist for revision name: <string>. At the minimum, run Analysis & Synthesis (quartus_map) with the specified revision name before using this Tcl command.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.27.29. get\_user\_option (::quartus::project)

The following table displays information for the get\_user\_option Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	get_user_option [-h   -help] [-long_help] -name <i>&lt;name&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name&gt;</i>	User option name	
<b>Description</b>	<p>Returns the user option value for the name specified by the "-name" option.</p> <p>To get a list of all available user option names, use the "get_all_user_option_names" command.</p>		
<b>Example Usage</b>	<pre>## Get the value for the user option ## "TALKBACK_ENABLED" set value [get_user_option -name TALKBACK_ENABLED] puts "TALKBACK_ENABLED = \$value"</pre>		
continued...			

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal user option name: <i>&lt;string&gt;</i> . Specify a legal user option name. To get a list of legal names, use the <code>get_all_user_option_names</code> command.

### 3.1.27.30. `is_database_version_compatible (::quartus::project)`

The following table displays information for the `is_database_version_compatible` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	is_database_version_compatible [-h   -help] [-long_help] <i>&lt;project_name&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<i>&lt;project_name&gt;</i>	Project name	
<b>Description</b>	<p>Checks whether a project's database is compatible with current version of the software. Returns 1, if the database is compatible; returns 0, otherwise.</p> <p>Mainly this check is for databases that are restored from another version of the software</p>		
<b>Example Usage</b>	<pre>## Check project database version compatibility if [is_database_version_compatible chiptrip] {     # proceed if compatible }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.27.31. `is_fitter_in_qhd_mode (::quartus::project)`

The following table displays information for the `is_fitter_in_qhd_mode` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project</code> on page 358		
<b>Syntax</b>	<code>is_fitter_in_qhd_mode [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Returns true if we're running in QHD mode		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.27.32. is\_project\_open (::quartus::project)

The following table displays information for the is\_project\_open Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	is_project_open [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Checks whether a project is currently open. Returns 1, if a project is currently open; returns 0, otherwise.		
<b>Example Usage</b>	<pre>## Close the project if open if [is_project_open] {     project_close }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.27.33. open\_side\_revision (::quartus::project)

The following table displays information for the open\_side\_revision Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	open_side_revision [-h   -help] [-long_help] <revision_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<revision_name>	Revision name	
<b>Description</b>	<p>Loads the specified revision name into memory, without making it the current revision. Required step before assignments can be modified on the side with the use of the -revision option in get/set/remove assignments.</p> <p>Changes are not saved until close_side_revision is called.</p> <p>The specified revision cannot be the current revision, and once opened, cannot be made the current revision until it is closed.</p>		
<b>Example Usage</b>	<pre>## Create and open "new_rev" as a side revision. Apply an assignment and close the revision.  create_revision new_rev -based_on my_rev -copy_results open_side_revision new_rev set_global_assignment -name OPTIMIZATION_TECHNIQUE "Area" -revision new_rev close_side_revision new_rev</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Revision is already the current revision: <string>. No action is required.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

continued...

*continued...*

TCL_ERROR	1	ERROR: Revision file does not exist: <string>.qsf. Use delete_revision to delete the revision from the current project. Then use create_revision to create the revision and its .qsf before setting <string> as the current revision.
TCL_ERROR	1	ERROR: Revision is not included in the current project: <string> . Use the create_revision command to create the revision.
TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.27.34. project\_archive (::quartus::project)

The following table displays information for the project\_archive Tcl command:

Tcl Package and Version	Belongs to ::quartus::project on page 358															
Syntax	project_archive [-h   -help] [-long_help] [-all_revisions] [-include_libraries] [-include_outputs] [-overwrite] [-use_file_set <file_set> ] [-version_compatible_database] <archive_name>															
Arguments	-h   -help	Short help														
	-long_help	Long help with examples and possible return values														
	-all_revisions	Option to archive all revisions														
	-include_libraries	Option to include related system libraries														
	-include_outputs	Option to include output files in archive														
	-overwrite	Option to overwrite any currently existing archive file														
	-use_file_set <file_set>	Option to create the archive using the specified file set														
	-version_compatible_database	Option to include version-compatible database if supported														
	<archive_name>	Archive file name														
Description	<div>Archives an open project and its related files into a Quartus Prime Archive File (.qar).</div> <div>The description of operations is as follows:</div> <table><thead><tr><th>Option</th><th>Description</th></tr></thead><tbody><tr><td>use_file_set</td><td>Creates the archive using the specified file set. By default, the 'basic' file set is used. For more information about file sets, type:  quartus_sh --archive -list_file_sets</td></tr><tr><td>all_revisions</td><td>Archives all revisions.</td></tr><tr><td>overwrite</td><td>Overwrites existing archive file.</td></tr><tr><td>include_outputs</td><td>Includes output files in archive.</td></tr><tr><td>include_libraries</td><td>Includes related Megafunction and IP library files.</td></tr><tr><td>version_compatible_database</td><td>Includes version-compatible database if supported.</td></tr></tbody></table>		Option	Description	use_file_set	Creates the archive using the specified file set. By default, the 'basic' file set is used. For more information about file sets, type:  quartus_sh --archive -list_file_sets	all_revisions	Archives all revisions.	overwrite	Overwrites existing archive file.	include_outputs	Includes output files in archive.	include_libraries	Includes related Megafunction and IP library files.	version_compatible_database	Includes version-compatible database if supported.
Option	Description															
use_file_set	Creates the archive using the specified file set. By default, the 'basic' file set is used. For more information about file sets, type:  quartus_sh --archive -list_file_sets															
all_revisions	Archives all revisions.															
overwrite	Overwrites existing archive file.															
include_outputs	Includes output files in archive.															
include_libraries	Includes related Megafunction and IP library files.															
version_compatible_database	Includes version-compatible database if supported.															
Example Usage	<pre>## Default mode: Archive current revisions without output files or libraries project_archive chiptrip.qar  ## Archive all revisions without output files or libraries project_archive chiptrip.qar -all_revisions  ## Archive current revision with version-compatible database if supported</pre>															

continued...

**continued...**

	<pre>project_archive chiptrip.qar -version_compatible_database ## Same as first one, but overwrite any existing archive file project_archive chiptrip.qar -overwrite ## Include output files and libraries project_archive chiptrip.qar -include_outputs -include_libraries</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Error(s) found while archiving the project. See error message(s) for details.
	TCL_ERROR	1	ERROR: Project archive failed. Some files could not be processed. Refer to the Quartus Prime Archive Log File (<archive_name>.qarlog).
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.27.35. project\_clean (::quartus::project)

The following table displays information for the `project_clean` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	project_clean [-h   -help] [-long_help] [-current_version] [-revision <revision_name> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-current_version	Only clean project files for the current Quartus version.
	-revision <revision_name>	Revision to clean (if omitted, all revisions of the open project are cleaned). Revision name can contain wildcards (i.e., '*').
<b>Description</b>	<p>Cleans database and compiler-generated output for the specified revision (or all revisions if no revision is specified). Cleaning revisions removes database and other files generated by the Quartus Prime software, including report and programming files.</p> <p>This command closes the currently open project before cleaning.</p> <p>Specifically, this cleans all of the following files/folders (for all matching revisions):</p> <pre>&lt;revision&gt;*.rpt &lt;revision&gt;*.rpt.htm &lt;revision&gt;*.rpt.htm_files &lt;revision&gt;*.msf &lt;revision&gt;*.smsg &lt;revision&gt;*.summary &lt;revision&gt;.jdi &lt;revision&gt;.pin &lt;revision&gt;.pof &lt;revision&gt;.sof &lt;revision&gt;.done &lt;revision&gt;.sld (all revision files in the qdb and persona directories)</pre>	
<b>continued...</b>		

<b>Example Usage</b>	<pre>project_clean -revision "foo" # Cleans revision "foo" project_clean -revision "foo*" # Cleans all revisions starting with "foo" (e.g., "foo", "foobar") project_clean                # Cleans all revisions in project</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Failed when attempting to remove database files in <string> for revision <string>.
	TCL_ERROR	1	ERROR: Failed when attempting to remove file <string> for revision <string>.
	TCL_ERROR	1	ERROR: Couldn't delete file or folder named '<string>'.
	TCL_ERROR	1	ERROR: Couldn't open configuration settings...the settings object is currently locked.
	TCL_ERROR	1	ERROR: Can't access revision '<string>'. The revision may not exist, or there may be an error in the revision settings.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.27.36. project\_close (::quartus::project)

The following table displays information for the `project_close` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	project_close [-h   -help] [-long_help] [-dont_export_assignments]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-dont_export_assignments	Do not export assignments to file	
<b>Description</b>	<p>Closes an open project.</p> <p>The assignments created or modified during an open project are committed to the Quartus Prime Settings File (.qsf) during a "project_close", unless you use the "-dont_export_assignments" option.</p>		
<b>Example Usage</b>	<pre>## Close the project if open if [is_project_open] {     project_close } ## Close the project if open ## and do not export the assignments if [is_project_open] {     project_close -dont_export_assignments }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
continued...			

	TCL_ERROR	1	ERROR: Failed when attempting to write assignments back to QSF.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.27.37. project\_exists (::quartus::project)

The following table displays information for the `project_exists` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	project_exists [-h   -help] [-long_help] <project_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<project_name>	Project name	
<b>Description</b>	Checks whether a project exists. Returns 1, if a project exists; returns 0, otherwise.		
<b>Example Usage</b>	<pre>## Create project if one does not exist. ## Open existing project otherwise. if [project_exists chiptrip] {     project_open chiptrip } else {     project_new chiptrip }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.27.38. project\_new (::quartus::project)

The following table displays information for the `project_new` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	project_new [-h   -help] [-long_help] [-family <family> ] [-overwrite] [-part <part> ] [-revision <revision_name> ] <project_name>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-family <family>	Family name
	-overwrite	Option to overwrite existing project and revision
	-part <part>	Part name
	-revision <revision_name>	Revision name
	<project_name>	Project name
continued...		

<b>Description</b>	<p>Creates and opens a new project with the specified project name.</p> <p>If the "-revision" option is not specified, the project name is used to create the revision.</p> <p>Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <ol style="list-style-type: none"> <li>1) export_assignments</li> <li>2) project_close (unless "-dont_export_assignments" is specified)</li> </ol> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p>		
<b>Example Usage</b>	<pre>## Create project "chiptrip" and revision "chiptrip" project_new chiptrip  ## Create project "chiptrip" and revision "auto_max" project_new -revision auto_max chiptrip  ## Create project "chiptrip" and revision "chiptrip" ## Overwrite any Quartus Prime Settings File (.qsf) if it exists project_new chiptrip -overwrite  ## Create project "chiptrip" and revision "chiptrip" ## Set the FAMILY assignment to Stratix project_new chiptrip -family Stratix</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The -<string> option must also be used when you use the -<string> option. Specify both options.
	TCL_ERROR	1	ERROR: Can't create project: <string>. Specify a legal project name.
	TCL_ERROR	1	ERROR: Can't create revision: <string>. Specify a legal revision name using the -<string> option.
	TCL_ERROR	1	ERROR: Can't create revision: <string>. Specify a legal revision name.
	TCL_ERROR	1	ERROR: Can't create settings files for project: <string>. Make sure the .psf, .csf, and .ssf files are writeable.
	TCL_ERROR	1	ERROR: Can't open project: <string>
	TCL_ERROR	1	ERROR: Can't remove Quartus Prime Settings File: <string>. Make sure the file is writeable.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Found two options: -<string> and -<string>. Choose one of the options.
	TCL_ERROR	1	ERROR: Project already exists: <string>. Specify a different project name or use the -overwrite option.

### 3.1.27.39. project\_open (::quartus::project)

The following table displays information for the project\_open Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	project_open [-h   -help] [-long_help] [-current_revision] [-force] [-preserve_revision_order] [-revision <revision_name> ] <project_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-current_revision	Option to open the current revision automatically	
	-force	Option to open the project and overwrite the compilation database if the database version is incompatible.	
	-preserve_revision_order	Option to not move the revision to top in the qpf file and preserve existing revision ordering	
	-revision <revision_name>	Revision name	
	<project_name>	Project name	
<b>Description</b>	<p>Opens an existing project. To create a new project, use the project_new command.</p> <p>If the -revision option is not specified, the project name is specified as the revision name.</p> <p>The project_open command gives an error when the compilation database version is not compatible with the current version of Quartus Prime software. You may specify the "-force" option to avoid the error and overwrite the database.</p>		
<b>Example Usage</b>	<pre>## Open project "chiptrip" and revision "chiptrip" project_open chiptrip  ## Open project "chiptrip" and revision "auto_max" project_open -revision auto_max chiptrip  ## Get the current revision before opening ## the project with the current revision set project_name chiptrip set current_revision [get_current_revision \$project_name] project_open -revision \$current_revision \$project_name puts [get_global_assignment -name FAMILY] project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Project is already open: <string>
	TCL_ERROR	1	ERROR: Can't open project: <string>. First close the currently open project: <string>.
	TCL_ERROR	1	ERROR: Can't open project: <string>
	TCL_ERROR	1	ERROR: Can't set revision: <string>. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
<b>continued...</b>			

TCL_ERROR	1	ERROR: Cannot open project: <i>&lt;string&gt;</i> . The project is not compatible with the installed version of the Quartus Prime software. Opening the project will overwrite the old project database. If you wish to overwrite the old project database, make sure to specify the <i>-&lt;string&gt;</i> option.
TCL_ERROR	1	ERROR: Can't open revision: <i>&lt;string&gt;</i> (project: <i>&lt;string&gt;</i> ). The revision is not compatible with the installed version of the Quartus Prime software. Opening the revision will overwrite the old revision database. If you wish to overwrite the old revision database, make sure to specify the <i>-&lt;string&gt;</i> option.
TCL_ERROR	1	ERROR: Found two options: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Choose one of the options.
TCL_ERROR	1	ERROR: Revision does not exist: <i>&lt;string&gt;</i> . Specify a legal revision name using the <i>-&lt;string&gt;</i> option.
TCL_ERROR	1	ERROR: Project does not exist or has illegal name characters: <i>&lt;string&gt;</i> . Specify a legal project name.

### 3.1.27.40. project\_restore (::quartus::project)

The following table displays information for the `project_restore` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	project_restore [-h   -help] [-long_help] [-destination <directory> ] [-overwrite] [-update_included_file_info] <archive_file>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-destination <directory>	Directory where restored files are placed	
	-overwrite	Option to overwrite files in destination directory	
	-update_included_file_info	Option to update included file information	
	<archive_file>	Archive file name	
<b>Description</b>	<p>Restores a Quartus Prime Archive File (.qar) that contains the project and its related files.</p> <p>By default, the archive is restored into the current directory. Use the "-destination" option to restore the files into a new directory.</p> <p>By default, the command fails if the archive already contains files in the destination directory. Use the "-overwrite" option to overwrite any existing files in the destination directory.</p>		
<b>Example Usage</b>	<pre>## Restore archive and expand files into current directory project_restore chiptrip.qar ## or project_restore chiptrip.qar -destination  ## Restore archive. Expand files into current directory, ## but overwrite any existing files in "." project_restore chiptrip.qar -destination . -overwrite  ## Restore project into a "restored" sub-directory project_restore chiptrip.qar -destination "restored" -overwrite</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
continued...			

TCL_OK	0	INFO: Operation successful
TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
TCL_ERROR	1	ERROR: Error(s) found while restoring the archive. See error message(s) for details.

### 3.1.27.41. remove\_all\_global\_assignments (::quartus::project)

The following table displays information for the `remove_all_global_assignments` Tcl command:

Tcl Package and Version	Belongs to ::quartus::project on page 358																	
Syntax	remove_all_global_assignments [-h   -help] [-long_help] [-entity <entity_name> ] [-fall] -name <name> [-rise] [-section_id <section id> ] [-tag <data> ]																	
Arguments	-h   -help	Short help																
	-long_help	Long help with examples and possible return values																
	-entity <entity_name>	Entity to which assignment belongs																
	-fall	Option applies to falling edge																
	-name <name>	Assignment name (string pattern is matched using Tcl string matching)																
	-rise	Option applies to rising edge																
	-section_id <section id>	Section id																
	-tag <data>	Option to tag data to this assignment																
Description	<p>Removes all matching global assignments.</p> <p>The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set <code>"*?\\[ ]"</code> as the value. The value is matched using Tcl string matching.</p> <p>This Tcl command reads the global assignments found in the Quartus Prime Settings File (.qsf). This Tcl command filters the assignments data found in the .qsf and removes the data based on the values specified by the "-name" option.</p> <p>Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a &lt;Section Id&gt; is used. &lt;Section Id&gt; can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a &lt;Section Id&gt; and the associated &lt;Section Id&gt; description:</p> <table><tr><th>Section Id</th><th>Description</th></tr><tr><td>CHIP</td><td>Same as revision name</td></tr><tr><td>LOGICLOCK_REGION</td><td>A unique name</td></tr><tr><td>EDA_TOOL_SETTINGS</td><td>A unique name</td></tr><tr><td>CLIQUE</td><td>A unique name</td></tr><tr><td>BREAKPOINT</td><td>A unique name</td></tr><tr><td>CLOCK</td><td>A unique name</td></tr><tr><td>AUTO_INSERT_SLD_NODE_ENTITY</td><td>A unique name</td></tr></table> <p>For entity-specific assignments, use the "-entity" option to remove the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the</p>		Section Id	Description	CHIP	Same as revision name	LOGICLOCK_REGION	A unique name	EDA_TOOL_SETTINGS	A unique name	CLIQUE	A unique name	BREAKPOINT	A unique name	CLOCK	A unique name	AUTO_INSERT_SLD_NODE_ENTITY	A unique name
	Section Id	Description																
CHIP	Same as revision name																	
LOGICLOCK_REGION	A unique name																	
EDA_TOOL_SETTINGS	A unique name																	
CLIQUE	A unique name																	
BREAKPOINT	A unique name																	
CLOCK	A unique name																	
AUTO_INSERT_SLD_NODE_ENTITY	A unique name																	
	continued...																	

	<p>FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p> <p>Assignments removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <ol style="list-style-type: none"> <li>1) export_assignments</li> <li>2) project_close (unless "--dont_export_assignments" is specified)</li> </ol> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p>		
Example Usage	<pre>## Remove all the registered source files remove_all_global_assignments -name SOURCE_FILE  # Using wildcards remove_all_global_assignments -name SOURCE*</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: <string> global assignment(s) were removed
	TCL_OK	0	WARNING: Ignored assignment: <string>. The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Assignment is not a global assignment: <string> -- it is an instance assignment. Specify a global assignment name or use the instance assignment commands.
	TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Value <string> for the -<string> option is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Option -<string> for <string> assignment is illegal. Specify a legal option or remove the option.
	TCL_ERROR	1	ERROR: Options cannot be specified together: -<string>, -<string> and -<string>. Specify only one or two of the three options.
	TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

continued...

	TCL_ERROR	1	ERROR: Found two options: -<string> and -<string>. Choose one of the options.
	TCL_ERROR	1	ERROR: Illegal assignment name: <string>. Specify a legal assignment name. To view the list of legal assignment names, run get_all_assignment_names.
	TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.27.42. remove\_all\_instance\_assignments (::quartus::project)

The following table displays information for the remove\_all\_instance\_assignments Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project on page 358	
<b>Syntax</b>	remove_all_instance_assignments [-h   -help] [-long_help] [-entity <entity_name> ] [-fall] [-from <source> ] -name <name> [-rise] [-section_id <section_id> ] [-tag <data> ] [-to <destination> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <entity_name>	Entity to which assignment belongs
	-fall	Option applies to falling edge
	-from <source>	Source of the assignment (string pattern is matched using Tcl string matching)
	-name <name>	Assignment name (string pattern is matched using Tcl string matching)
	-rise	Option applies to rising edge
	-section_id <section_id>	Section id
	-tag <data>	Option to tag data to this assignment
	-to <destination>	Destination of the assignment (string pattern is matched using Tcl string matching)
<b>Description</b>	<p>Removes all matching instance assignment values.</p> <p>The "-name" option is not case sensitive.</p> <p>The "-to" and "-from" options are case sensitive.</p> <p>These options can take string patterns containing special characters from the set "*?\" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:</p> <p>&lt;bus name&gt;[&lt;bus index&gt;] or &lt;bus name&gt;[*]</p> <p>The &lt;bus name&gt; portion is a string of alphanumeric characters. The &lt;bus index&gt; portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the &lt;bus index&gt; is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[*]" are supported bus names and can be used as follows:</p> <pre># To match index 0 of bus "a", type: remove_all_instance_assignments -name LOCATION -to a[0]  # To match all indices of bus "a", type: remove_all_instance_assignments -name LOCATION -to a[*]</pre> <p>All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:</p>	

continued...

```
remove_all_instance_assignments -name LOCATION -to "a[escape_brackets \[\][0-2\][escape_brackets \]]"
```

For more information about escaping square brackets, type "escape\_brackets -h".

This Tcl command reads the instance assignments found in the Quartus Prime Settings File (.qsf) and removes this data based on the values specified by the "-name", "-from", and "-to" options.

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a <Section Id> is used. <Section Id> can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a <Section Id> and the associated <Section Id> description:

Section Id	Description
CHIP	Same as revision name
LOGICLOCK_REGION	A unique name
EDA_TOOL_SETTINGS	A unique name
CLIQUE	A unique name
BREAKPOINT	A unique name
CLOCK	A unique name
AUTO_INSERT_SLD_NODE_ENTITY	A unique name

For entity-specific assignments, use the "-entity" option to remove the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS\_ENTITY\_NAME assignment is used. If the FOCUS\_ENTITY\_NAME value is not found, the revision name is used.

Assignments removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

```
1) export_assignments
2) project_close (unless "--dont_export_assignments" is specified)
```

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute\_flow" and "execute\_module" (part of the ::quartus::flow Tcl package) automatically call "export\_assignments" before they run command-line executables.

**Example Usage**

```
## Remove all the timing requirements
## Use wildcards to catch TSU_REQUIREMENT, TCO_REQUIREMENT,
## and others
remove_all_instance_assignments -name *_REQUIREMENT

## Remove all the location assignments with
## the destination bus name "timeo".
set bus_name "timeo"
remove_all_instance_assignments -name LOCATION -to $bus_name[*]
```

**Return Value**

Code Name	Code	String Return
TCL_OK	0	INFO: Operation successful
TCL_OK	0	INFO: <string> instance assignment(s) were removed
TCL_OK	0	WARNING: Ignored assignment: <string>. The assignment is no longer supported.
TCL_ERROR	1	ERROR: Assignment is not an instance assignment: <string> -- it is a global assignment. Specify an instance assignment name or use the global assignment commands.
TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.

*continued...*

TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <i>&lt;string&gt;</i> . Specify a legal entity name.
TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for the <i>-&lt;string&gt;</i> option is illegal. Specify a legal value.
TCL_ERROR	1	ERROR: Options cannot be specified together: <i>-&lt;string&gt;</i> , <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Specify only one or two of the three options.
TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.
TCL_ERROR	1	ERROR: Found two options: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Choose one of the options.
TCL_ERROR	1	ERROR: Illegal assignment name: <i>&lt;string&gt;</i> . Specify a legal assignment name. To view the list of legal assignment names, run <i>get_all_assignment_names</i> .
TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.27.43. remove\_all\_parameters (::quartus::project)

The following table displays information for the `remove_all_parameters` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	remove_all_parameters [-h   -help] [-long_help] [-entity <entity_name> ] [-fall] -name <name> [-rise] [-tag <data> ] [-to <destination> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <entity_name>	Entity to which parameter belongs
	-fall	Option applies to falling edge
	-name <name>	Parameter name (string pattern is matched using Tcl string matching)
	-rise	Option applies to rising edge
	-tag <data>	Option to tag data to this assignment
	-to <destination>	Destination of the parameter (string pattern is matched using Tcl string matching)
<b>Description</b>	<p>Removes all matching parameters.</p> <p>The "-name" option is not case sensitive. The "-to" option is case sensitive.</p> <p>If the "-to" argument is specified, the function removes the parameters from the current entity. The parameters are</p>	
continued...		

removed from the PARAMETERS section of the entity. Otherwise, the function removes the project-wide default parameters obtained from the DEFAULT\_PARAMETERS section.

This Tcl command filters the parameter data found in the Quartus Prime Settings File (.qsf) and removes the data based on the values specified by the "-name" and "-to" options. These options can take string patterns containing special characters from the set "\*?\\[]" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

```
<bus name>[<bus index>] or <bus name>[*]
```

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character "\*" used for string matching. Notice that the <bus index> is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[\*]" are supported bus names and can be used as follows:

```
# To match index 0 of bus "a", type:
remove_all_parameters -name * -to a[0]
```

```
# To match all indices of bus "a", type:
remove_all_parameters -name * -to a[*]
```

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

```
remove_all_parameters -name * -to "a[escape_brackets \\[\\[0-2\\][escape_brackets \\]]"
```

For more information about escaping square brackets, type "escape\_brackets -h".

Use the "-entity" option to remove the parameters from the specified entity. If the "-entity" option is not specified, the value for the FOCUS\_ENTITY\_NAME assignment is used. If the FOCUS\_ENTITY\_NAME value is not found, the revision name is used.

The parameters removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

- 1) export\_assignments
- 2) project\_close (unless "-dont\_export\_assignments" is specified)

These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute\_flow" and "execute\_module" (part of the ::quartus::flow Tcl package) automatically call "export\_assignments" before they run command-line executables.

#### Example Usage

```
## The following 3 examples remove project-wide,
## default parameter values
remove_all_parameters -name WIDTH
remove_all_parameters -name *ID*
remove_all_parameters -name *

## The following 3 examples remove entity-specific
## parameter values
remove_all_parameters -name inst1 -to SIZE
remove_all_parameters -name inst1 -to *IZ*
remove_all_parameters -name inst1 -to *
```

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: <string> parameter(s) were removed
	TCL_OK	0	INFO: Removed parameter: <string>
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.

*continued...*

TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
TCL_ERROR	1	ERROR: Parameter does not exist and cannot be removed: <i>&lt;string&gt;</i> . Specify an existing parameter name.
TCL_ERROR	1	ERROR: Illegal default parameter: <i>&lt;string&gt;</i> . Specify a legal default parameter name.
TCL_ERROR	1	ERROR: Illegal parameter: <i>&lt;string&gt;</i> . Specify a legal parameter name.
TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.27.44. resolve\_file\_path (::quartus::project)

The following table displays information for the resolve\_file\_path Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project on page 358	
<b>Syntax</b>	resolve_file_path [-h   -help] [-long_help] <file_name>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	<file_name>	Option to specify the file name
<b>Description</b>	<p>Returns the resolved full path of the specified file name. If the file does not exist, the original file name is returned.</p> <p>The Quartus Prime software resolves relative paths by searching for the file in the following directories in the following order:</p> <ol style="list-style-type: none"> <li>1) Project directory, which is the directory where the Quartus Prime Settings File (.qsf) is found.</li> <li>2) Project database directory, which is the "db" directory found under the project directory.</li> <li>3) Project library directories, which are the directories containing the user-specified libraries that are used only by the current project.</li> <li>4) User library directories, which are the directories containing the user-specified libraries that are used by all Quartus Prime projects.</li> <li>5) Quartus Prime library directory, which is the directory containing Quartus Prime libraries.</li> </ol>	
<b>Example Usage</b>	<pre>project_new chiptrip -overwrite  # Set one Verilog source file assignment set_global_assignment -name VERILOG_FILE chiptrip.v  # Display the resolved full path of the Verilog # source file assignment set filename [get_global_assignment -name VERILOG_FILE] set resolved_fullpath [resolve_file_path \$filename]  puts "Full Path: \$resolved_fullpath"  # Set more Verilog source file assignments set_global_assignment -name VERILOG_FILE auto_max.v set_global_assignment -name VERILOG_FILE speed_ch.v set_global_assignment -name VERILOG_FILE tick_cnt.v set_global_assignment -name VERILOG_FILE time_cnt.v  # Display the resolved full path of all the Verilog # source file assignments set file_asgns [get_all_global_assignments -name VERILOG_FILE] foreach_in_collection file_asgn \$file_asgns {</pre>	

*continued...*

	<pre> ## Each element in the collection has the following ## format: {} {VERILOG_FILE} {&lt;file_name&gt;}  set filename [lindex \$file_asgn 2] set resolved_fullpath [resolve_file_path \$filename]  puts "Full Path: \$resolved_fullpath" }  project_close </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.27.45. revision\_exists (::quartus::project)

The following table displays information for the `revision_exists` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	revision_exists [-h   -help] [-long_help] [-project <i>&lt;project_name&gt;</i> ] <i>&lt;revision_name&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-project <i>&lt;project_name&gt;</i>	Project name	
	<i>&lt;revision_name&gt;</i>	Revision name	
<b>Description</b>	<p>Checks whether the revision exists for the specified project or currently open project.</p> <p>Returns 1, if the revision exists; returns 0, otherwise.</p>		
<b>Example Usage</b>	<pre>## Check if the specified revision exists ## in the specified project if [revision_exists -ARG(project) chiptrip speed_ch] {     puts "Revision exists" } else {     puts "Revision does not exist" }  ## Create revision for the currently open ## project if it does not exist ## Set the current revision otherwise project_open chiptrip if [revision_exists speed_ch] {     set_current_revision speed_ch } else {     create_revision speed_ch } project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Project does not exist or has illegal name characters: <i>&lt;string&gt;</i> . Specify a legal project name.
	TCL_ERROR	1	ERROR: Project name was not specified or open project does not exist. Open an existing project or specify the project name.

### 3.1.27.46. set\_current\_revision (::quartus::project)

The following table displays information for the set\_current\_revision Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	set_current_revision [-h   -help] [-long_help] [-force] <revision_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-force	Option to open the revision and overwrite the compilation database if the database version is incompatible.	
	<revision_name>	Revision name	
<b>Description</b>	<p>Sets the specified revision name as the current revision. All assignments created or modified during an open project will also be saved to the Quartus Prime Settings File (.qsf).</p> <p>In 8.1 or later versions of Quartus Prime software, set_current_revision gives an error when the compilation database version is not compatible with the current version of Quartus Prime software. You may specify the "-force" option to avoid the error and overwrite the database.</p>		
<b>Example Usage</b>	<pre>## Sets "auto_max" as the current revision set_current_revision auto_max</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Revision is already the current revision: <string>. No action is required.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Revision file does not exist: <string>.qsf. Use delete_revision to delete the revision from the current project. Then use create_revision to create the revision and its .qsf before setting <string> as the current revision.
	TCL_ERROR	1	ERROR: Revision is not included in the current project: <string> . Use the create_revision command to create the revision.

### 3.1.27.47. set\_global\_assignment (::quartus::project)

The following table displays information for the set\_global\_assignment Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	set_global_assignment [-h   -help] [-long_help] [-comment <i>&lt;comment&gt;</i> ] [-disable] [-entity <i>&lt;entity_name&gt;</i> ] [-fall] -name <i>&lt;name&gt;</i> [-remove] [-rise] [-section_id <i>&lt;section id&gt;</i> ] [-tag <i>&lt;data&gt;</i> ] [ <i>&lt;value&gt;</i> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
continued...		

	<div>-comment &lt;comment&gt;</div> <div>Comment</div>		
	<div>-disable</div> <div>Option to disable assignment</div>		
	<div>-entity &lt;entity_name&gt;</div> <div>Entity to which to add assignment</div>		
	<div>-fall</div> <div>Option applies to falling edge</div>		
	<div>-name &lt;name&gt;</div> <div>Assignment name</div>		
	<div>-remove</div> <div>Option to remove assignment</div>		
	<div>-rise</div> <div>Option applies to rising edge</div>		
	<div>-section_id &lt;section id&gt;</div> <div>Section id</div>		
	<div>-tag &lt;data&gt;</div> <div>Option to tag data to this assignment</div>		
	<div>&lt;value&gt;</div> <div>Assignment value</div>		
<b>Description</b>	<p>Sets or removes a global assignment.</p> <p>Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands (from the ::quartus::project Tcl package):</p> <pre>1) export_assignments 2) project_close (unless -dont_export_assignments is specified as an argument to project_close)</pre> <p>You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands execute_flow and execute_module (from the ::quartus::flow Tcl package) call "export_assignments" before they run command-line executables.</p> <p>For entity-specific assignments, use the -entity option to force the assignment to specified entity. If the -entity option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p> <p>If the Quartus Prime Settings File contains a USER_LIBRARIES assignment and you call set_global_assignment to set a SEARCH_PATH or USER_LIBRARIES assignment, the existing USER_LIBRARIES assignment expands into one or more SEARCH_PATH assignments.</p> <p>Note that values that begin with a dash ("-") should be enclosed in a backslash followed by a quote. In the following example, -02 is enclosed by "\" at the beginning and the end.</p> <pre>set_global_assignment -name ARM_CPP_COMMAND_LINE \"-02\"</pre>		
<b>Example Usage</b>	<pre>## Specify Stratix as the family to use when compiling set_global_assignment -name FAMILY Stratix  ## If the family name has empty spaces, use quotes set_global_assignment -name FAMILY "Stratix GX"  ## or remove any empty space set_global_assignment -name FAMILY StratixGX</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Assignment <string> is not supported in this edition of the Quartus Prime software.
	TCL_OK	0	WARNING: Ignored assignment: <string>. The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Assignment is not a global assignment: <string> -- it is an instance assignment. Specify a global assignment name or use the instance assignment commands.

continued...

TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <i>&lt;string&gt;</i> . Specify a legal entity name.
TCL_ERROR	1	ERROR: The assignment <i>&lt;string&gt;</i> is from Design Template and can't be changed/removed.
TCL_ERROR	1	ERROR: File name <i>&lt;string&gt;</i> exceeds maximum of <i>&lt;string&gt;</i> characters. Specify a file name with fewer characters.
TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for the <i>-&lt;string&gt;</i> option is illegal. Specify a legal value.
TCL_ERROR	1	ERROR: Option <i>-&lt;string&gt;</i> for <i>&lt;string&gt;</i> assignment is illegal. Specify a legal option or remove the option.
TCL_ERROR	1	ERROR: Options cannot be specified together: <i>-&lt;string&gt;</i> , <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Specify only one or two of the three options.
TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for <i>&lt;string&gt;</i> assignment is illegal. Specify a legal value.
TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.
TCL_ERROR	1	ERROR: Found two options: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Choose one of the options.
TCL_ERROR	1	ERROR: The <i>-&lt;string&gt;</i> option is not required but was specified with the value: <i>&lt;string&gt;</i> . Delete the option.
TCL_ERROR	1	ERROR: The <i>-&lt;string&gt;</i> option is required but was not specified. Specify the required option.
TCL_ERROR	1	ERROR: Illegal assignment name: <i>&lt;string&gt;</i> . Specify a legal assignment name. To view the list of legal assignment names, run <code>get_all_assignment_names</code> .
TCL_ERROR	1	ERROR: An unknown error has occurred.
TCL_ERROR	1	ERROR: Assignment <i>&lt;string&gt;</i> cannot be removed -- it has multiple values. Specify one value to remove or use the <i>&lt;string&gt;</i> command to remove all values for the assignment.
TCL_ERROR	1	ERROR: Missing <i>&lt;&lt;string&gt;&gt;</i> for <i>&lt;string&gt;</i> assignment. Specify the required <i>&lt;string&gt;</i> .

### 3.1.27.48. set\_high\_effort\_fmax\_optimization\_assignments (::quartus::project)

The following table displays information for the `set_high_effort_fmax_optimization_assignments` Tcl command:

Tcl Package and Version	Belongs to ::quartus::project on page 358		
Syntax	set_high_effort_fmax_optimization_assignments [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Sets assignments that together implement the high-effort fmax optimization flow. This Tcl command only sets the assignments but does not run a compilation.		
Example Usage	<pre>## Open the project project_open \$project_name  ## Set assignments that implement the high-effort ## fmax optimization flow set_high_effort_fmax_optimization_assignments</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Set global assignment <string> to <string>.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.27.49. set\_instance\_assignment (::quartus::project)

The following table displays information for the `set_instance_assignment` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	set_instance_assignment [-h   -help] [-long_help] [-comment <i>&lt;comment&gt;</i> ] [-disable] [-entity <i>&lt;entity_name&gt;</i> ] [-fall] [-from <i>&lt;source&gt;</i> ] -name <i>&lt;name&gt;</i> [-remove] [-rise] [-section_id <i>&lt;section id&gt;</i> ] [-tag <i>&lt;data&gt;</i> ] [-to <i>&lt;destination&gt;</i> ] [ <i>&lt;value&gt;</i> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-comment <i>&lt;comment&gt;</i>	Comment
	-disable	Option to disable assignment
	-entity <i>&lt;entity_name&gt;</i>	Entity to which to add assignment
	-fall	Option applies to falling edge
continued...		

	-from <source>	Source of assignment	
	-name <name>	Assignment name	
	-remove	Option to remove assignment	
	-rise	Option applies to rising edge	
	-section_id <section id>	Section id	
	-tag <data>	Option to tag data to this assignment	
	-to <destination>	Destination of assignment	
	<value>	Assignment value	
Description	<p>Sets or removes an instance assignment.</p> <p>Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <p>1) export_assignments 2) project_close (unless "-dont_export_assignments" is specified)</p> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p> <p>For entity-specific assignments, use the "-entity" option to force the assignment to specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p>		
Example Usage	<pre>## Specify a TSU_REQUIREMENT of 2ns from mypin to any register set_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT 2ns  ## Remove the TSU_REQUIREMENT from mypin to all registers set_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT -remove  ## Specify the entity to which the assignment is added, ## use the -entity option ## This is needed if the top-level entity name is other than ## that of the project name ## The following command generates a top_level entity set_instance_assignment -from "mypin" -to * -entity top_level -name TSU_REQUIREMENT 2ns</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Ignored assignment: <string>. The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Assignment is not an instance assignment: <string> -- it is a global assignment. Specify an instance assignment name or use the global assignment commands.
	TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.

continued...

TCL_ERROR	1	ERROR: The assignment <i>&lt;string&gt;</i> is from Design Template and can't be changed/removed.
TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for the <i>-&lt;string&gt;</i> option is illegal. Specify a legal value.
TCL_ERROR	1	ERROR: Options cannot be specified together: <i>-&lt;string&gt;</i> , <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Specify only one or two of the three options.
TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for <i>&lt;string&gt;</i> assignment is illegal. Specify a legal value.
TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.
TCL_ERROR	1	ERROR: Found two options: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Choose one of the options.
TCL_ERROR	1	ERROR: The <i>-&lt;string&gt;</i> option is not required but was specified with the value: <i>&lt;string&gt;</i> . Delete the option.
TCL_ERROR	1	ERROR: The <i>-&lt;string&gt;</i> option is required but was not specified. Specify the required option.
TCL_ERROR	1	ERROR: Illegal assignment name: <i>&lt;string&gt;</i> . Specify a legal assignment name. To view the list of legal assignment names, run <code>get_all_assignment_names</code> .
TCL_ERROR	1	ERROR: An unknown error has occurred.
TCL_ERROR	1	ERROR: Assignment <i>&lt;string&gt;</i> cannot be removed -- it has multiple values. Specify one value to remove or use the <i>&lt;string&gt;</i> command to remove all values for the assignment.
TCL_ERROR	1	ERROR: Missing <i>&lt;&lt;string&gt;&gt;</i> for <i>&lt;string&gt;</i> assignment. Specify the required <i>&lt;string&gt;</i> .

### 3.1.27.50. set\_io\_assignment (::quartus::project)

The following table displays information for the `set_io_assignment` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358	
<b>Syntax</b>	<code>set_io_assignment [-h   -help] [-long_help] [-comment <i>&lt;comment&gt;</i>] [-disable] [-fall] [-io_standard <i>&lt;io standard&gt;</i>] [-name <i>&lt;name&gt;</i>] [-remove] [-rise] [-tag <i>&lt;data&gt;</i>] [ <i>&lt;value&gt;</i> ]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-comment <i>&lt;comment&gt;</i></code>	Comment
	<code>-disable</code>	Option to disable assignment
	<code>-fall</code>	Option applies to falling edge
	<code>-io_standard <i>&lt;io standard&gt;</i></code>	Option to specify the io standard
continued...		

	-name <name>		Assignment name
	-remove		Option to remove assignment
	-rise		Option applies to rising edge
	-tag <data>		Option to tag data to this assignment
	<value>		Assignment value
Description	<p>Sets or removes an io assignment.</p> <p>Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <p>1) export_assignments 2) project_close (unless "-dont_export_assignments" is specified)</p> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p>		
Example Usage	<pre>## Specify LVTTL as the IO Standard for OUTPUT_PIN_LOAD assignment set_io_assignment 30 -name OUTPUT_PIN_LOAD -io_standard LVTTL</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Ignored assignment: <string>. The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Assignment is not a global assignment: <string> -- it is an instance assignment. Specify a global assignment name or use the instance assignment commands.
	TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: File name <string> exceeds maximum of <string> characters. Specify a file name with fewer characters.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Value <string> for the -<string> option is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Option -<string> for <string> assignment is illegal. Specify a legal option or remove the option.
	TCL_ERROR	1	ERROR: Options cannot be specified together: -<string>, -<string> and -<string>. Specify only one or two of the three options.
	TCL_ERROR	1	ERROR: Value <string> for <string> assignment is illegal. Specify a legal value.

continued..

TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.
TCL_ERROR	1	ERROR: Found two options: -<string> and -<string>. Choose one of the options.
TCL_ERROR	1	ERROR: The -<string> option is not required but was specified with the value: <string>. Delete the option.
TCL_ERROR	1	ERROR: The -<string> option is required but was not specified. Specify the required option.
TCL_ERROR	1	ERROR: Illegal assignment name: <string>. Specify a legal assignment name. To view the list of legal assignment names, run get_all_assignment_names.
TCL_ERROR	1	ERROR: Assignment <string> cannot be removed -- it has multiple values. Specify one value to remove or use the <string> command to remove all values for the assignment.
TCL_ERROR	1	ERROR: Missing <<string>> for <string> assignment. Specify the required <string>.

### 3.1.27.51. set\_location\_assignment (::quartus::project)

The following table displays information for the set\_location\_assignment Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::project</a> on page 358	
Syntax	set_location_assignment [-h   -help] [-long_help] [-comment <i>&lt;comment&gt;</i> ] [-disable] [-fall] [-remove] [-rise] [-tag <i>&lt;data&gt;</i> ] -to <i>&lt;destination&gt;</i> [ <i>&lt;value&gt;</i> ]	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-comment <i>&lt;comment&gt;</i>	Comment
	-disable	Option to disable assignment
	-fall	Option applies to falling edge
	-remove	Option to remove assignment
	-rise	Option applies to rising edge
	-tag <i>&lt;data&gt;</i>	Option to tag data to this assignment
	-to <i>&lt;destination&gt;</i>	Destination of assignment
	<i>&lt;value&gt;</i>	Assignment value
Description	<p>Sets or removes a location assignment.</p> <p>Valid location assignments, and settings for those assignments for your design are determined by the target device, package type, and pin count.</p> <p>To explore possible assignments and settings for your design and device, in the Quartus Prime Assignment Editor, specify Location for Assignment Name, and then click Browse in the Value column. In the Location dialog box, explore assignable device resources in the Element list, and then use the lists that appear (based on the element selected) to determine locations</p>	
continued...		

	<p>of resources that can be specified as the value for the assignment.</p> <p>Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <ol style="list-style-type: none"> <li>1) export_assignments</li> <li>2) project_close (unless "-dont_export_assignments" is specified)</li> </ol> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p>		
<b>Example Usage</b>	set_location_assignment -to dst LOC		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: The assignment <string> is from Design Template and can't be changed/removed.
	TCL_ERROR	1	ERROR: Value <string> for <string> assignment is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Missing <<string>> for <string> assignment. Specify the required <string>.

### 3.1.27.52. set\_parameter (::quartus::project)

The following table displays information for the set\_parameter Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project on page 358	
<b>Syntax</b>	set_parameter [-h   -help] [-long_help] [-comment <comment> ] [-disable] [-fall] -name <name> [-remove] [-rise] [-tag <data> ] [ <value> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-comment <comment>	Comment
	-disable	Option to disable parameter
	-fall	Option applies to falling edge
	-name <name>	Parameter name
	-remove	Option to remove parameter
	-rise	Option applies to rising edge
continued...		

	-tag <data>		Option to tag data to this assignment
	<value>		Parameter value
<b>Description</b>	<p>Sets or removes the specified parameter name.</p> <p>The "-name" option is not case sensitive.</p> <p>The parameters created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <ol style="list-style-type: none"> <li>1) export_assignments</li> <li>2) project_close (unless "--dont_export_assignments" is specified)</li> </ol> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p> <p>set_parameter can be used to overwrite the parameters in the top-level entity of the design. A warning will be given if the parameter can not be applied.</p> <p>set_parameter assignments with "-entity" and "-to" are ignored and a critical warning is given if they are used.</p>		
<b>Example Usage</b>	<pre>## Set project-wide, default WIDTH parameter value set_parameter -name WIDTH 8</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Removed parameter: <string>
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Value <string> for <string> assignment is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: The -<string> option is not required but was specified with the value: <string>. Delete the option.
	TCL_ERROR	1	ERROR: The -<string> option is required but was not specified. Specify the required option.
	TCL_ERROR	1	ERROR: Parameter does not exist and cannot be removed: <string>. Specify an existing parameter name.
	TCL_ERROR	1	ERROR: An unknown error has occurred.
	TCL_ERROR	1	ERROR: Missing <<string>> for <string> assignment. Specify the required <string>.

### 3.1.27.53. set\_power\_file\_assignment (::quartus::project)

The following table displays information for the set\_power\_file\_assignment Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project on page 358	
<b>Syntax</b>	<pre>set_power_file_assignment [-h   -help] [-long_help] [-remove] [-saf_file &lt;saf_file&gt; ] [-section_id &lt;section_id&gt; ] [-to &lt;to&gt; ] [-vcd_end_time &lt;vcd_end_time&gt; ] [-vcd_file &lt;vcd_file&gt; ] [-vcd_start_time &lt;vcd_start_time&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-remove	Option to remove assignment
	-saf_file <saf_file>	SAF file name
	-section_id <section_id>	Section id
	-to <to>	Entity to which to apply power input file
	-vcd_end_time <vcd_end_time>	End time for VCD file parsing
	-vcd_file <vcd_file>	VCD file name
	-vcd_start_time <vcd_start_time>	Start time for VCD file parsing
<b>Description</b>	<p>Sets or removes a power input file assignment. Power input file assignments are specified using multiple global assignments, and a single instance assignment as illustrated in the following example:</p> <pre>set_global_assignment -name POWER_INPUT_FILE_NAME "test.vcd" -section_id test.vcd set_global_assignment -name POWER_INPUT_FILE_TYPE VCD -section_id test.vcd set_global_assignment -name POWER_VCD_FILE_START_TIME "10 ns" -section_id test.vcd set_global_assignment -name POWER_VCD_FILE_END_TIME "1000 ns" -section_id test.vcd set_instance_assignment -name POWER_READ_INPUT_FILE test.vcd -to test_design</pre> <p>The power input file assignment serves as a wrapper for all of the above assignments. If the "-remove" setting is not set, the set_power_file_assignment will also make the following assignment to enable the use of input files:</p> <pre>set_global_assignment -name POWER_USE_INPUT_FILES ON</pre> <p>If you do not specify a "-section_id", a new section identifier is created for the input file assignment. If a "-section_id" is specified and it does not already exist, it is used as the new section identifier. If a "-section_id" is specified and it does exist, the existing input file assignments are removed and a new input file assignment is created using the given parameters and section identifier.</p> <p>If an entity name given by "-to" is not specified, the input file assignment applies to the top level design entity.</p> <p>If the "-remove" setting is used, the input file assignment given by the "-section_id", "-vcd_file", or "-saf_file" is removed from the project.</p> <p>Assignments created or modified by using this Tcl command are saved to the Quartus Prime Settings File (.qsf).</p>	
<b>Example Usage</b>	<pre>## Specify an input SAF file applied to the top level entity ## A default section will be created set_power_file_assignment -saf_file test.saf  ## Specify an input VCD file applied to design_top counter1 ## Use the given section_id to create a new section set_power_file_assignment -vcd_file test.vcd -to design_top counter1 -section_id test.vcd  ## Update the previous input VCD file assignment to specify a ## start and end time</pre>	

*continued...*

<pre> set_power_file_assignment -vcd_file test.vcd -to design_top counter1 -vcd_start_time 10ns - vcd_end_time 100ns -section_id test.vcd  ## Remove the input SAF file assignment using the file name set_power_file_assignment -saf_file test.saf -remove  ## Remove the input VCD file assignment using the section identifier set_power_file_assignment -section_id test.vcd -remove </pre>			
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Compiler database does not exist for revision name: <i>&lt;string&gt;</i> . At the minimum, run Analysis & Synthesis (quartus_map) with the specified revision name before using this Tcl command.
	TCL_ERROR	1	ERROR: Exactly one of the following file name options must be specified: - <i>&lt;string&gt;</i> or - <i>&lt;string&gt;</i> .
	TCL_ERROR	1	ERROR: If - <i>&lt;string&gt;</i> is set, exactly one of the following options must be specified: - <i>&lt;string&gt;</i> , - <i>&lt;string&gt;</i> or - <i>&lt;string&gt;</i> . All other options must not be set.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: - <i>&lt;string&gt;</i> and - <i>&lt;string&gt;</i> cannot be used with - <i>&lt;string&gt;</i> option.

### 3.1.27.54. set\_revision\_description (::quartus::project)

The following table displays information for the set\_revision\_description Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	set_revision_description [-h   -help] [-long_help] -description <description> [ <revision_name> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-description <description>	Revision description	
	<revision_name>	Revision name	
<b>Description</b>	Sets the description for the specified revision.		
<b>Example Usage</b>	## Create a description for the revision "auto_max" set_revision_description auto_max -description "I am auto_max"		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Revision is not included in the current project: <string> . Use the create_revision command to create the revision.

### 3.1.27.55. set\_user\_option (::quartus::project)

The following table displays information for the set\_user\_option Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	set_user_option [-h   -help] [-long_help] -name <name> [ <value> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <name>	User option name	
	<value>	User option value	
<b>Description</b>	<p>Sets the user option value for the name specified by the "-name" option. The user option is written to the quartus2.ini file.</p> <p>To get a list of all available user option names, use the "get_all_user_option_names" command.</p>		
<b>Example Usage</b>	<pre>## Set TALKBACK_ENABLED to "on" set_user_option -name TALKBACK_ENABLED on</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal user option name: <string>. Specify a legal user option name. To get a list of legal names, use the get_all_user_option_names command.
	TCL_ERROR	1	ERROR: Illegal user option value: <string>. Specify a legal user option value.

### 3.1.27.56. test\_assignment\_trait (::quartus::project)

The following table displays information for the test\_assignment\_trait Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project</a> on page 358		
<b>Syntax</b>	test_assignment_trait [-h   -help] [-long_help] -name <name> -trait <trait_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <name>	Assignment name	
	-trait <trait_name>	Trait name	
<b>Description</b>	<p>Checks whether the assignment name has the specified trait. Returns 1, if the assignment name has the trait; returns 0, otherwise.</p>		
<b>Example Usage</b>	<pre>## Test if the assignment name is case-sensitive if {[test_assignment_trait -name VHDL_FILE -trait CASE_SENSITIVE]} {     puts "VHDL_FILE assignment is case-sensitive." }</pre>		
continued...			

	<pre> } else {     puts "VHDL_FILE assignment is not case-sensitive." } </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Assignment <i>&lt;string&gt;</i> is not supported in this edition of the Quartus Prime software.
	TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for the <i>-&lt;string&gt;</i> option is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Options cannot be specified together: <i>-&lt;string&gt;</i> , <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Specify only one or two of the three options.
	TCL_ERROR	1	ERROR: Ignored assignment: <i>&lt;string&gt;</i> . The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Illegal assignment name: <i>&lt;string&gt;</i> . Specify a legal assignment name. To view the list of legal assignment names, run <code>get_all_assignment_names</code> .
	TCL_ERROR	1	ERROR: Illegal trait: <i>&lt;string&gt;</i> . Specify a legal trait name.

### 3.1.28. ::quartus::project2

The following table displays information for the **::quartus::project2** Tcl package:

Tcl Package and Version	::quartus::project2 1.0
Description	This package contains no general description.
Availability	<p>This package is loaded by default in the following executables:</p> <pre> hdb_debug qpro qpro_sh quartus quartus_asm quartus_bpps quartus_cdb quartus_design quartus_eda quartus_fit quartus_idb quartus_ipd quartus_ipgenerate quartus_map quartus_sh quartus_si quartus_sim quartus_sta quartus_stp quartus_syn quartus_tlg </pre>
Tcl Commands	<pre> quartus::close_project (::quartus::project2) on page 424 quartus::open_project (::quartus::project2) on page 424 </pre>

### 3.1.28.1. quartus::close\_project (::quartus::project2)

The following table displays information for the `quartus::close_project` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project2</code> on page 423		
<b>Syntax</b>	<code>quartus::close_project [-h   -help] [-long_help] [-dont_export_assignments]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-dont_export_assignments</code>	Do not export assignments to file	
<b>Description</b>	<p>Closes an open project.</p> <p>The assignments created or modified during an open project are committed to the Quartus Prime Settings File (.qsf) during a "project_close", unless you use the "-dont_export_assignments" option.</p>		
<b>Example Usage</b>	<pre>## Close the project if open if [is_project_open] {     quartus::close_project } ## Close the project if open ## and do not export the assignments if [is_project_open] {     quartus::close_project -dont_export_assignments }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <code>&lt;string&gt;</code> . Specify a legal entity name.
	TCL_ERROR	1	ERROR: Failed when attempting to write assignments back to QSF.
	TCL_ERROR	1	ERROR: Can't write settings file *.qsf. Make sure the *.qsf file is writeable.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <code>&lt;string&gt;</code> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.28.2. quartus::open\_project (::quartus::project2)

The following table displays information for the `quartus::open_project` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project2</code> on page 423
<b>Syntax</b>	<code>quartus::open_project [-h   -help] [-long_help] [-current_revision] [-force] [-preserve_revision_order] [-revision &lt;revision_name&gt; ] &lt;project_name&gt;</code>
<i>continued...</i>	

Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-current_revision	Option to open the current revision automatically	
	-force	Option to open the project and overwrite the compilation database if the database version is incompatible.	
	-preserve_revision_order	Option to not move the revision to top in the qpf file and preserve existing revision ordering	
	-revision <revision_name>	Revision name	
	<project_name>	Project name	
Description	<p>Opens an existing project. To create a new project, use the "project_new" command.</p> <p>If the "-revision" option is not specified, the project name is used to open the revision.</p> <p>The project_open command gives an error when the compilation database version is not compatible with the current version of Quartus Prime software. You may specify the "-force" option to avoid the error and overwrite the database.</p>		
Example Usage	<pre>## Open project "chiptrip" and revision "chiptrip" quartus::open_project chiptrip  ## Open project "chiptrip" and revision "auto_max" quartus::open_project -revision auto_max chiptrip  ## Get the current revision before opening ## the project with the current revision set project_name chiptrip set current_revision [get_current_revision \$project_name] quartus::open_project -revision \$current_revision \$project_name puts [get_global_assignment -name FAMILY] project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Specified values of options -<string> and -<string> differ. Ignored value of -<string> option. No action is required.
	TCL_OK	0	WARNING: Project is already open: <string>
	TCL_ERROR	1	ERROR: Can't open project: <string>. First close the currently open project: <string>.
	TCL_ERROR	1	ERROR: Can't open project: <string>
	TCL_ERROR	1	ERROR: Can't set revision: <string>. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Cannot open project: <string>. The project is not compatible with the installed version of the Quartus Prime software. Opening the project will overwrite the old project database. If you wish to overwrite the old project database, make sure to specify the -<string> option.
	TCL_ERROR	1	ERROR: Can't open revision: <string> (project: <string>). The revision is not compatible with the installed version of the Quartus Prime software. Opening the revision will
continued...			

			overwrite the old revision database. If you wish to overwrite the old revision database, make sure to specify the -<string> option.
	TCL_ERROR	1	ERROR: Found two options: -<string> and -<string>. Choose one of the options.
	TCL_ERROR	1	ERROR: Revision does not exist: <string>. Specify a legal revision name using the -<string> option.
	TCL_ERROR	1	ERROR: Project does not exist or has illegal name characters: <string>. Specify a legal project name.
	TCL_ERROR	1	ERROR: Project name was not specified or open project does not exist. Open an existing project or specify the project name.

### 3.1.29. ::quartus::project\_ui

The following table displays information for the **::quartus::project\_ui** Tcl package:

<b>Tcl Package and Version</b>	::quartus::project_ui 2.0
<b>Description</b>	This package contains no general description.
<b>Availability</b>	This package is loaded by default in the following executables:  qpro quartus
<b>Tcl Commands</b>	<p>assignment_group (::quartus::project_ui) on page 427</p> <p>delete_revision (::quartus::project_ui) on page 429</p> <p>execute_assignment_batch (::quartus::project_ui) on page 429</p> <p>export_assignments (::quartus::project_ui) on page 430</p> <p>get_all_assignment_names (::quartus::project_ui) on page 431</p> <p>get_all_assignments (::quartus::project_ui) on page 432</p> <p>get_all_global_assignments (::quartus::project_ui) on page 435</p> <p>get_all_instance_assignments (::quartus::project_ui) on page 437</p> <p>get_all_parameters (::quartus::project_ui) on page 439</p> <p>get_all_quartus_defaults (::quartus::project_ui) on page 441</p> <p>get_all_user_option_names (::quartus::project_ui) on page 443</p> <p>get_assignment_info (::quartus::project_ui) on page 443</p> <p>get_assignment_name_info (::quartus::project_ui) on page 444</p> <p>get_current_project (::quartus::project_ui) on page 445</p> <p>get_current_revision (::quartus::project_ui) on page 445</p> <p>get_global_assignment (::quartus::project_ui) on page 446</p> <p>get_instance_assignment (::quartus::project_ui) on page 447</p> <p>get_location_assignment (::quartus::project_ui) on page 448</p> <p>get_parameter (::quartus::project_ui) on page 449</p> <p>get_project_directory (::quartus::project_ui) on page 450</p> <p>get_project_revisions (::quartus::project_ui) on page 450</p> <p>get_user_option (::quartus::project_ui) on page 451</p> <p>is_project_open (::quartus::project_ui) on page 452</p> <p>project_archive (::quartus::project_ui) on page 452</p> <p>project_close (::quartus::project_ui) on page 453</p> <p>project_exists (::quartus::project_ui) on page 454</p> <p>project_new (::quartus::project_ui) on page 455</p> <p>project_open (::quartus::project_ui) on page 456</p> <p>project_restore (::quartus::project_ui) on page 457</p> <p>remove_all_global_assignments (::quartus::project_ui) on page 458</p> <p>remove_all_instance_assignments (::quartus::project_ui) on page 460</p> <p>remove_all_parameters (::quartus::project_ui) on page 462</p> <p>resolve_file_path (::quartus::project_ui) on page 464</p> <p>revision_exists (::quartus::project_ui) on page 465</p> <p>set_current_revision (::quartus::project_ui) on page 466</p> <p>set_global_assignment (::quartus::project_ui) on page 467</p> <p>set_instance_assignment (::quartus::project_ui) on page 469</p> <p>set_io_assignment (::quartus::project_ui) on page 471</p> <p>set_location_assignment (::quartus::project_ui) on page 473</p> <p>set_parameter (::quartus::project_ui) on page 474</p> <p>set_power_file_assignment (::quartus::project_ui) on page 475</p> <p>set_user_option (::quartus::project_ui) on page 477</p> <p>test_assignment_trait (::quartus::project_ui) on page 478</p>

### 3.1.29.1. assignment\_group (::quartus::project\_ui)

The following table displays information for the assignment\_group Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project_ui on page 426	
<b>Syntax</b>	<pre>assignment_group [-h   -help] [-long_help] [-add_exception &lt;name&gt; ] [-add_member &lt;name&gt; ] [-comment &lt;comment&gt; ] [-disable] [-fall] [-get_exceptions] [-get_members] [-overwrite] [-remove] [-remove_exception &lt;name&gt; ] [-remove_member &lt;name&gt; ] [-rise] [-tag &lt;data&gt; ] &lt;group_name&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-add_exception <name>	Tcl list of exception names to add
	-add_member <name>	Tcl list of member names to add
	-comment <comment>	Comment
	-disable	Option to disable assignment
	-fall	Option applies to falling edge
	-get_exceptions	Option to get collection of assignment group exceptions
	-get_members	Option to get collection of assignment group members
	-overwrite	Option to overwrite existing assignment group with the same group name
	-remove	Option to remove assignment group
	-remove_exception <name>	Tcl list of exception names to remove
	-remove_member <name>	Tcl list of member names to remove
	-rise	Option applies to rising edge
	-tag <data>	Option to tag data to this assignment
	<group_name>	Assignment group name
<b>Description</b>	<p>Adds, removes, gets members of, or gets exceptions to an assignment group.</p> <p>The "assignment_group" command replaces the deprecated "timegroup" command.</p> <p>An assignment group is a custom group of registers and pins. You can use the "-add_member" option to specify register or pin names you want to include in the assignment group. You can use the "-add_exception" option to specify names you want to exclude from the assignment group.</p> <p>You can specify the names using wildcards, that is, using "?" or "*". For example, to add all registers and pins that start with a "b" except those that start with "b c " to a particular assignment group named "group_b", type:</p> <pre>assignment_group "group_b" -add_member "b*" -add_exception "b c *"</pre> <p>To remove members or exceptions from a assignment group, use the "-remove_member" or "-remove_exception" options respectively.</p> <p>The "-get_members" option returns a collection of members in the assignment group. The "-get_exceptions" option returns a collection of exceptions to the assignment group. To access each element of the collection, use the Tcl command "foreach_in_collection". To see example usage, type "assignment_group -long_help" or "foreach_in_collection -long_help".</p>	

*continued...*

	<p>Specifying registers and pins in terms of an assignment group allows you to set timing constraints easily. For example, to make a multicyle assignment from nodes "a1" and "a2" to nodes "b1", "b2", and "b3", type the following:</p> <pre>assignment_group "group_a" -add_member [list "a1" "a2"] assignment_group "group_b" -add_member [list "b1" "b2" "b3"]  set_multicycle_assignment -from "group_a" -to "group_b" 2</pre> <p>This command sets a multicyle assignment from every member of "group_a" to every member of "group_b". Quartus Prime timing analysis is optimized to use assignment groups in handling timing constraints.</p> <p>To disable assignment group assignments for the entire group, use the "--disable" option, for example:</p> <pre>assignment_group "group_a" -disable</pre> <p>To disable a particular assignment group assignment, use the "--disable" option with the "--add_member" or "--add_exception" options, for example:</p> <pre>assignment_group "group_a" -add_member "m1" -disable assignment_group "group_a" -add_exception "e1" -disable</pre> <p>Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <ol style="list-style-type: none"> <li>1) export_assignments</li> <li>2) project_close (unless "--dont_export_assignments" is specified)</li> </ol> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p>		
Example Usage	<pre># Make timing cut assignment from nodes starting # with "r" except those starting with "r s " # and except those starting with "r t " # to nodes "t1", "t2", and "t3" assignment_group "tg1" -add_member "r*" -add_exception "r s *" assignment_group "tg1" -add_exception "r t *"  assignment_group "tg2" -add_member [list "t1" "t2" "t3"]  set_timing_cut_assignment -from "group_a" -to "group_b" 2  # Remove the "t1" from a particular assignment group named "tg2" assignment_group "tg2" -remove_member "t1"  # Display the members of a particular assignment group named "tg1" foreach_in_collection member [assignment_group "tg1" -get_members] {      # Print the name of the member     puts \$member }  # Display the exceptions to a particular assignment group named "tg1" foreach_in_collection exception [assignment_group "tg1" -get_exceptions] {      # Print the name of the exception     puts \$exception }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: Can't set revision: <string>. Make sure there is an open, active revision name.
continued...			

	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Found two options: -<string> and -<string>. Choose one of the options.
	TCL_ERROR	1	ERROR: Revision does not exist: <string>. Specify a legal revision name using the -<string> option.

### 3.1.29.2. delete\_revision (::quartus::project\_ui)

The following table displays information for the delete\_revision Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project_ui</a> on page 426		
<b>Syntax</b>	delete_revision [-h   -help] [-long_help] <revision_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<revision_name>	Revision name	
<b>Description</b>	Deletes the specified revision from the current project. The corresponding <revision name>.qsf file is deleted as well.		
<b>Example Usage</b>	## Delete the revision called "tmp" delete_revision tmp		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't delete the current revision: <string>. Specify a different revision name.
	TCL_ERROR	1	ERROR: Can't delete revision because it is not included in the current project: <string> . Specify a revision name that is included in the project.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.29.3. execute\_assignment\_batch (::quartus::project\_ui)

The following table displays information for the execute\_assignment\_batch Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project_ui</a> on page 426		
<b>Syntax</b>	execute_assignment_batch [-h   -help] [-long_help] <i>&lt;tcl commands&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<i>&lt;tcl commands&gt;</i>	Tcl list of Tcl commands	
<b>Description</b>	<p>Iterates through the specified Tcl list of Tcl commands and executes each command sequentially in batch mode.</p> <p>In batch mode, Tcl commands that set Quartus Prime Settings File (.qsf) assignments are optimized to prevent them from repeatedly</p>		
continued...			

	<p>write-locking and write-unlocking the QSF during consecutive calls, thereby slowing down the execution.</p> <p>Currently, only the following commands are supported:</p> <pre> assignment_group remove_all_global_assignments remove_all_instance_assignments remove_all_parameters set_global_assignment set_instance_assignment set_io_assignment set_location_assignment set_parameter set_power_file_assignment </pre>		
<b>Example Usage</b>	<pre> project_open one_wire set tcl_cmds [list [list set_global_assignment -name FAMILY StratixII] \                   [list set_global_assignment -name DEVICE AUTO] \                   [list set_global_assignment -name TOP_LEVEL_ENTITY one_wire] \                   [list set_global_assignment -name SAVE_DISK_SPACE OFF] \                   [list set_location_assignment PIN_1 -to in1] \                   [list set_instance_assignment -name MULTICYCLE 4 -from in1 -to out1] \                   [list set_parameter -name STYLE FAST]] execute_assignment_batch \$tcl_cmds project_close </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Unsupported Tcl command: <string>. Specify one of the supported Tcl commands listed in the help description for <string> -h.

### 3.1.29.4. export\_assignments (::quartus::project\_ui)

The following table displays information for the export\_assignments Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426		
<b>Syntax</b>	<code>export_assignments [-h   -help] [-long_help] [-reorganize]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-reorganize</code>	Option to reorganize the Quartus Prime Settings File (.qsf)	
<b>Description</b>	<div>Exports assignments for the current revision to the Quartus Prime Settings File (.qsf).</div> <div>Assignments created or modified during an open project are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</div> <div>1) <code>export_assignments</code> 2) <code>project_close</code> (unless <code>"-dont_export_assignments"</code> is specified)</div> <div>These two Tcl commands reside in the <code>::quartus::project</code> Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands <code>"execute_flow"</code> and <code>"execute_module"</code> (part of the <code>::quartus::flow</code> Tcl package) automatically call <code>"export_assignments"</code> before they run command-line executables.</div>		
<b>Example Usage</b>	<pre>## The most common use of export_assignments is to ## call it before doing a system call ## to call a compiler command-line executable project_open \$project_name set_global_assignment -name FAMILY Stratix  ## Before calling quartus_map,</pre>		

continued...

	<pre>## write out the FAMILY assignment export_assignments  ## Now, call quartus_map qexec "[file join \$::quartus(binpath) quartus_map] \$project_name"</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <i>&lt;string&gt;</i> . Specify a legal entity name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.29.5. get\_all\_assignment\_names (::quartus::project\_ui)

The following table displays information for the `get_all_assignment_names` Tcl command:

Tcl Package and Version	Belongs to ::quartus::project_ui on page 426																									
Syntax	get_all_assignment_names [-h   -help] [-long_help] [-family <family> ] [-module <all ip_generate map tlg fit tan asm eda drc power generic> ] [-type <all global instance> ]																									
Arguments	-h   -help	Short help																								
	-long_help	Long help with examples and possible return values																								
	-family <family>	Option to filter based on the specified device family. Defaults to all families.																								
	-module <all ip_generate map tlg fit tan asm eda drc power generic>	Option to filter based on the specified flow module. Defaults to all.																								
	-type <all global instance>	Option to filter based on the specified assignment type. Defaults to all.																								
Description	<p>Returns a filtered output list of all available, matching assignment names.</p> <p>The module option takes one of the following values:</p> <table><tr><th>Module</th><th>Description</th></tr><tr><td>ip_generate</td><td>IP Generation assignment names</td></tr><tr><td>tlg</td><td>Support Logic Generation assignment names</td></tr><tr><td>map</td><td>Analysis &amp; Synthesis assignment names</td></tr><tr><td>fit</td><td>Fitter assignment names</td></tr><tr><td>asm</td><td>Assembler assignment names</td></tr><tr><td>eda</td><td>EDA Netlist Writer assignment names</td></tr><tr><td>drc</td><td>Design Assistant assignment names</td></tr><tr><td>power</td><td>Power Analyzer assignment names</td></tr><tr><td>generic</td><td>Other assignment names not included in any of the above flow modules</td></tr><tr><td>tan</td><td>Classic Timing Analyzer assignment names</td></tr><tr><td>all</td><td>All assignment names</td></tr></table>		Module	Description	ip_generate	IP Generation assignment names	tlg	Support Logic Generation assignment names	map	Analysis & Synthesis assignment names	fit	Fitter assignment names	asm	Assembler assignment names	eda	EDA Netlist Writer assignment names	drc	Design Assistant assignment names	power	Power Analyzer assignment names	generic	Other assignment names not included in any of the above flow modules	tan	Classic Timing Analyzer assignment names	all	All assignment names
Module	Description

### 3.1.29.6. get\_all\_assignments (::quartus::project\_ui)

The following table displays information for the get\_all\_assignments Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project_ui on page 426	
<b>Syntax</b>	<pre>get_all_assignments [-h   -help] [-long_help] [-entity &lt;entity_name&gt; ] [-fall] [-from &lt;source&gt; ] -name &lt;name&gt; [-rise] [-section_id &lt;section id&gt; ] [-tag &lt;data&gt; ] [-to &lt;destination&gt; ] -type &lt;global instance parameter default&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <entity_name>	Entity name
	-fall	Option applies to falling edge
	-from <source>	Source name (string pattern is matched using Tcl string matching)
	-name <name>	Assignment name (string pattern is matched using Tcl string matching)
	-rise	Option applies to rising edge
	-section_id <section id>	Section id
	-tag <data>	Option to tag data to this assignment
	-to <destination>	Destination name (string pattern is matched using Tcl string matching)
	-type <global instance parameter default>	Option to specify the type of assignments to return
<b>Description</b>	<p>Returns a collection of all matching global, instance, parameter, or default assignment ids. To iterate through each assignment id in this collection, use the Tcl command "foreach_in_collection".</p>	

*continued...*

To view details for the assignment that is associated with the assignment id, use the Tcl command "get\_assignment\_info".

The "get\_all\_assignments" command is easier to use than the deprecated commands listed in Table 1.

\* Table 1. The -type Option

Value for -type Option	Deprecated Tcl command	Description
default	get_all_quartus_defaults	Returns only default assignments.
global	get_all_global_assignments	Returns only global assignments.
instance	get_all_instance_assignments	Returns only instance assignments.
parameter	get_all_parameters	Returns only parameter assignments.

The "-name" option is not case sensitive.

The "-to" and "-from" options are case sensitive.

These options can take string patterns containing special characters from the set ".\*?\" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

<bus name>[<bus index>] or <bus name>[\*]

The <bus name> portion is a string of alphanumeric characters. The <bus index> portion is an integer greater than or equal to zero or it can be the character "\*" used for string matching. Notice that the <bus index> is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[\*]" are supported bus names and can be used as follows:

```
# To match index 0 of bus "a", type:
get_all_assignments -type instance -name LOCATION -to a[0]
```

```
# To match all indices of bus "a", type:
get_all_assignments -type instance -name LOCATION -to a[*]
```

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:

```
get_all_assignments -type instance LOCATION -to "a[escape_brackets \[\]\[0-2\][escape_brackets \]]"
```

For more information about escaping square brackets, type "escape\_brackets -h".

This Tcl command reads in the global, instance, and parameter assignments found in the Quartus Prime Settings File (.qsf) and reads in the default assignments found inside the Quartus Prime Default Settings File (.qdf).

If you tagged data by making assignments with the -tag option, then the information can be searched using the -tag option.

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one clock section each containing its own set of clock assignments. To uniquely identify sections of this type, use the -section\_id option.

For entity-specific assignments, use the "-entity" option to retrieve assignments from a specific entity. If the "-entity" option is not specified, the value for the FOCUS\_ENTITY\_NAME assignment is used. If the FOCUS\_ENTITY\_NAME value is not found, the revision name is used.

#### Example Usage

```
## View all the timing requirements using wildcards
## to match TSU_REQUIREMENT, TCO_REQUIREMENT,
## and others.
foreach_in_collection asgn_id [get_all_assignments -type instance -name *_REQUIREMENT] {

    set from [get_assignment_info $asgn_id -from]
    set to [get_assignment_info $asgn_id -to]
    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    set entity [get_assignment_info $asgn_id -entity]
    set sid [get_assignment_info $asgn_id -section_id]
    set tag [get_assignment_info $asgn_id -tag]
```

*continued...*

```

    puts "$entity: $name ($from -> $to) = $value"
}

## View all global assignments
foreach_in_collection asgn_id [get_all_assignments -type global -name *] {

    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    set entity [get_assignment_info $asgn_id -entity]
    set sid [get_assignment_info $asgn_id -section_id]
    set tag [get_assignment_info $asgn_id -tag]

    puts "$entity: $name = $value"
}

## View all project-wide default parameter values
foreach_in_collection asgn_id [get_all_assignments -type parameter -name *] {

    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    set tag [get_assignment_info $asgn_id -tag]

    puts "$name = $value"
}

## View all entity-specific parameter values
foreach_in_collection asgn_id [get_all_assignments -type parameter -name * -to *] {

    set dest [get_assignment_info $asgn_id -to]
    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]
    set tag [get_assignment_info $asgn_id -tag]

    puts "$name (-> $dest) = $value"
}

## View all default assignments
foreach_in_collection asgn_id [get_all_assignments -type default -name * -to *] {

    set name [get_assignment_info $asgn_id -name]
    set value [get_assignment_info $asgn_id -value]

    puts "$name = $value"
}

```

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Ignored assignment: <string>. The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Assignment is not an instance assignment: <string> -- it is a global assignment. Specify an instance assignment name or use the global assignment commands.

### 3.1.29.7. `get_all_global_assignments` (`::quartus::project_ui`)

The following table displays information for the `get_all_global_assignments` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426	
<b>Syntax</b>	<code>get_all_global_assignments [-h   -help] [-long_help] [-entity &lt;entity_name&gt; ] -name &lt;name&gt; [-section_id &lt;section id&gt; ] [-tag &lt;data&gt; ]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-entity &lt;entity_name&gt;</code>	Entity to which assignment belongs
	<code>-name &lt;name&gt;</code>	Assignment name (string pattern is matched using Tcl string matching)
	<code>-section_id &lt;section id&gt;</code>	Section id
	<code>-tag &lt;data&gt;</code>	Option to tag data to this assignment
<b>Description</b>	<p>Returns a filtered output collection of all matching global assignment values. To access each element of the output collection, use the Tcl command <code>foreach_in_collection</code>. To see example usage, type <code>foreach_in_collection -long_help</code>.</p> <p>The <code>-name</code> option is not case sensitive. This option can take string patterns containing special characters from the set <code>"*?\\[\\]"</code> as the value. The value is matched using Tcl string matching.</p> <p>This Tcl command reads the global assignments found in the Quartus Prime Settings File (<code>.qsf</code>). This Tcl command filters the assignment data in the <code>.qsf</code> and outputs the data based on the values given by the <code>-name</code> option.</p> <p>Each element of the collection is a list with the following format:</p> <pre>{ {&lt;Section Id&gt;} {&lt;Assignment name&gt;} {&lt;Assignment value&gt;} }</pre> <p>Certain sections in the <code>.qsf</code> can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one <code>CLOCK</code> section each containing its own set of clock assignments. To uniquely identify sections of this type, a <code>&lt;Section Id&gt;</code> is used. <code>&lt;Section Id&gt;</code> can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a <code>&lt;Section Id&gt;</code> and</p>	

*continued...*

	the associated <Section Id> description:  <table><tr><th>Section Id</th><th>Description</th></tr><tr><td>CHIP</td><td>Same as revision name</td></tr><tr><td>LOGICLOCK_REGION</td><td>A unique name</td></tr><tr><td>EDA_TOOL_SETTINGS</td><td>A unique name</td></tr><tr><td>CLIQUE</td><td>A unique name</td></tr><tr><td>BREAKPOINT</td><td>A unique name</td></tr><tr><td>CLOCK</td><td>A unique name</td></tr><tr><td>AUTO_INSERT_SLD_NODE_ENTITY</td><td>A unique name</td></tr></table> For entity-specific assignments, use the "-entity" option to retrieve the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.			Section Id	Description	CHIP	Same as revision name	LOGICLOCK_REGION	A unique name	EDA_TOOL_SETTINGS	A unique name	CLIQUE	A unique name	BREAKPOINT	A unique name	CLOCK	A unique name	AUTO_INSERT_SLD_NODE_ENTITY	A unique name

### 3.1.29.9. `get_all_parameters (::quartus::project_ui)`

The following table displays information for the `get_all_parameters` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426	
<b>Syntax</b>	<code>get_all_parameters [-h   -help] [-long_help] [-entity &lt;entity_name&gt; ] -name &lt;name&gt; [-tag &lt;data&gt; ] [-to &lt;destination&gt; ]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-entity &lt;entity_name&gt;</code>	Entity to which parameter belongs
	<code>-name &lt;name&gt;</code>	Parameter name (string pattern is matched using Tcl string matching)
	<code>-tag &lt;data&gt;</code>	Option to tag data to this assignment
	<code>-to &lt;destination&gt;</code>	Destination of the parameter (string pattern is matched using Tcl string matching)
<b>Description</b>	<p>Returns a filtered output collection of all matching parameter values. To access each element of this output collection, use the Tcl command <code>"foreach_in_collection"</code>. To see example usage, type <code>"foreach_in_collection -long_help"</code>.</p> <p>The <code>"-name"</code> option is not case sensitive. The <code>"-to"</code> option is case sensitive.</p> <p>If the <code>"-to"</code> argument is specified, the function returns the parameter values for the current entity. The values are retrieved from the <code>PARAMETERS</code> section of the entity. Otherwise, the function returns the project-wide default parameter values obtained from the <code>DEFAULT_PARAMETERS</code> section.</p> <p>This Tcl command filters the parameter data found in the Quartus Prime Settings File (.qsf) and outputs the data based on the values specified by the <code>"-name"</code> and <code>"-to"</code> options. These</p>	

*continued...*

	<p>options can take string patterns containing special characters from the set <code>"*?\"</code> as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:</p> <pre>&lt;bus name&gt;[&lt;bus index&gt;] or &lt;bus name&gt;[*]</pre> <p>The <code>&lt;bus name&gt;</code> portion is a string of alphanumeric characters. The <code>&lt;bus index&gt;</code> portion is an integer greater than or equal to zero or it can be the character <code>"*"</code> used for string matching. Notice that the <code>&lt;bus index&gt;</code> is enclosed by the square brackets <code>"["</code> and <code>"]"</code>. For example, <code>"a[0]"</code> and <code>"a[*]"</code> are supported bus names and can be used as follows:</p> <pre># To match index 0 of bus "a", type: get_all_parameters -name * -to a[0]  # To match all indices of bus "a", type: get_all_parameters -name * -to a[*]</pre> <p>All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus <code>"a"</code>, type:</p> <pre>get_all_parameters -name * -to "a[escape_brackets \[\]\[0-2\][escape_brackets \]]"</pre> <p>For more information about escaping square brackets, type <code>"escape_brackets -h"</code>.</p> <p>Each element of the collection is a list with the following format:</p> <pre>{ {&lt;Destination&gt;} {&lt;Parameter name&gt;} {&lt;Parameter value&gt;} }</pre> <p>Use the <code>"-entity"</code> option to retrieve the parameter values from the specified entity. If the <code>"-entity"</code> option is not specified, the value for the <code>FOCUS_ENTITY_NAME</code> assignment is used. If the <code>FOCUS_ENTITY_NAME</code> value is not found, the revision name is used.</p>		
Example Usage	<pre>## Display all project-wide default parameter values foreach_in_collection parameter [get_all_parameters -name *] {      set name [lindex \$parameter 1]     set value [lindex \$parameter 2]      ## Now, display the content of the parameter     puts "Parameter Name (\$name)"     puts "Parameter Value (\$value)" }  ## Display all entity-specific parameter values foreach_in_collection parameter [get_all_parameters -name * -to *] {      set dest [lindex \$parameter 0]     set name [lindex \$parameter 1]     set value [lindex \$parameter 2]      ## Now, display the content of the parameter     puts "Destination (\$dest)"     puts "Parameter Name (\$name)"     puts "Parameter Value (\$value)" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <code>&lt;string&gt;</code> . Specify a legal entity name.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
continued...			

TCL_ERROR	1	ERROR: Illegal default parameter: <string>. Specify a legal default parameter name.
TCL_ERROR	1	ERROR: Illegal parameter: <string>. Specify a legal parameter name.
TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.29.10. get\_all\_quartus\_defaults (::quartus::project\_ui)

The following table displays information for the `get_all_quartus_defaults` Tcl command:

Tcl Package and Version	Belongs to ::quartus::project_ui on page 426																	
Syntax	get_all_quartus_defaults [-h   -help] [-long_help] [-name <name> ] [-section_id <section id> ] [-tag <data> ]																	
Arguments	-h   -help	Short help																
	-long_help	Long help with examples and possible return values																
	-name <name>	Assignment name (string pattern is matched using Tcl string matching)																
	-section_id <section id>	Section id																
	-tag <data>	Option to tag data to this assignment																
Description	<p>Returns a filtered output collection of all matching default assignment values. To access each element of the output collection, use the Tcl command "foreach_in_collection". To see example usage, type "foreach_in_collection -long_help".</p> <p>The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set ".*?\\[]" as the value. The value is matched using Tcl string matching.</p> <p>This Tcl command reads in the default assignments found inside the Quartus Prime Default Settings File (.qdf). It filters the assignments data found inside the .qdf and outputs the data based on the values specified by the "-name" option.</p> <p>Each element of the collection is a list with the following format: { {&lt;Section Id&gt;} {&lt;Assignment name&gt;} {&lt;Assignment value&gt;} }</p> <p>Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a &lt;Section Id&gt; is used. &lt;Section Id&gt; can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a &lt;Section Id&gt; and the associated &lt;Section Id&gt; description:</p> <table><tr><th>Section Id</th><th>Description</th></tr><tr><td>CHIP</td><td>Same as revision name</td></tr><tr><td>LOGICLOCK_REGION</td><td>A unique name</td></tr><tr><td>EDA_TOOL_SETTINGS</td><td>A unique name</td></tr><tr><td>CLIQUE</td><td>A unique name</td></tr><tr><td>BREAKPOINT</td><td>A unique name</td></tr><tr><td>CLOCK</td><td>A unique name</td></tr><tr><td>AUTO_INSERT_SLD_NODE_ENTITY</td><td>A unique name</td></tr></table>		Section Id	Description	CHIP	Same as revision name	LOGICLOCK_REGION	A unique name	EDA_TOOL_SETTINGS	A unique name	CLIQUE	A unique name	BREAKPOINT	A unique name	CLOCK	A unique name	AUTO_INSERT_SLD_NODE_ENTITY	A unique name
Section Id	Description																	
CHIP	Same as revision name																	
LOGICLOCK_REGION	A unique name																	
EDA_TOOL_SETTINGS	A unique name																	
CLIQUE	A unique name																	
BREAKPOINT	A unique name																	
CLOCK	A unique name																	
AUTO_INSERT_SLD_NODE_ENTITY	A unique name																	
Example Usage	<pre>## Print out all the default assignments using ## the foreach_in_collection method  set default_asgns_col [get_all_quartus_defaults] foreach_in_collection default \$default_asgns_col {     set sect_id [lindex \$default 0]</pre>																	

continued...

continued...

	<pre> set name [lindex \$default 1] set value [lindex \$default 2]  ## Now, display the content of the assignment puts "Section ID (\$sect_id)" puts "Assignment Name (\$name)" puts "Assignment Value (\$value)" }  ## Using wildcards set default_asgns_col [get_all_quartus_defaults -name *] foreach_in_collection default \$default_asgns_col {     set sect_id [lindex \$default 0]     set name [lindex \$default 1]     set value [lindex \$default 2]      ## Now, display the content of the assignment     puts "Section ID (\$sect_id)"     puts "Assignment Name (\$name)"     puts "Assignment Value (\$value)" } </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Ignored assignment: <string>. The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Assignment is not a global assignment: <string> -- it is an instance assignment. Specify a global assignment name or use the instance assignment commands.
	TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Value <string> for the -<string> option is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Options cannot be specified together: -<string>, -<string> and -<string>. Specify only one or two of the three options.
	TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Found two options: -<string> and -<string>. Choose one of the options.
	TCL_ERROR	1	ERROR: Illegal assignment name: <string>. Specify a legal assignment name. To view the list of legal assignment names, run get_all_assignment_names.
	TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.29.11. get\_all\_user\_option\_names (::quartus::project\_ui)

The following table displays information for the `get_all_user_option_names` Tcl command:

Tcl Package and Version	Belongs to ::quartus::project_ui on page 426		
Syntax	get_all_user_option_names [-h   -help] [-long_help] [-name <name> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <name>	User option name (string pattern is matched using Tcl string matching)	
Description	<p>Returns a filtered output list of all available, matching user option names.</p> <p>If the "-name" option is not specified, all available user option names are returned. Otherwise, only the matching user option names are returned.</p> <p>The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set "**?\[]" as the value. The value is matched using Tcl string matching.</p>		
Example Usage	<pre>## Print out all available user option names foreach i [get_all_user_option_names] {     puts \$i }  ## Display all user option names that contain ## the word "talkback" and also display the ## value for each of the user option names foreach i [get_all_user_option_names -name *talkback*] {     set name \$i     set value [get_user_option -name \$i]     puts "\$name = \$value" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.29.12. get\_assignment\_info (::quartus::project\_ui)

The following table displays information for the `get_assignment_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426	
<b>Syntax</b>	<code>get_assignment_info [-h   -help] [-long_help] [-comments] [-entity] [-from] [-get_tcl_command] [-name] [-section_id] [-tag] [-to] [-value] &lt;asgn_id&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-comments</code>	Option to get the assignment comment
	<code>-entity</code>	Option to get the assignment entity
	<code>-from</code>	Option to get the assignment source
	<code>-get_tcl_command</code>	Option to get the tcl command that sets the assignment
continued...		

	-name	Option to get the assignment name	
	-section_id	Option to get the assignment section id	
	-tag	Option to get the assignment tag	
	-to	Option to get the assignment destination	
	-value	Option to get the assignment value	
	<asn_id>	Assignment id	
Description	Returns information for the assignment id based on the specified option.  The assignment id is obtained from the "get_all_assignments" Tcl command.		
Example Usage	<pre>## View all the instance assignments foreach_in_collection asn_id [get_all_assignments -type instance -name *] {      set from [get_assignment_info \$asn_id -from]     set to [get_assignment_info \$asn_id -to]     set name [get_assignment_info \$asn_id -name]     set value [get_assignment_info \$asn_id -value]     set entity [get_assignment_info \$asn_id -entity]     set tag [get_assignment_info \$asn_id -tag]      puts "\$entity: \$name (\$from -&gt; \$to) = \$value" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal assignment id: <string>. Specify a legal assignment id that was retrieved from the Tcl command get_all_assignments.

### 3.1.29.13. get\_assignment\_name\_info (::quartus::project\_ui)

The following table displays information for the get\_assignment\_name\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project_ui</a> on page 426		
<b>Syntax</b>	get_assignment_name_info [-h   -help] [-long_help] <name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<name>	Assignment name	
<b>Description</b>	Returns information for the specified assignment name.		
<b>Example Usage</b>	<pre>## View information for all assignment names foreach name [get_all_assignment_names] {     puts [get_assignment_name_info \$name] }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal assignment name: <string>. Specify a legal assignment name. To view the list of legal assignment names, run get_all_assignment_names.

### 3.1.29.14. get\_current\_project (::quartus::project\_ui)

The following table displays information for the `get_current_project` Tcl command:

Tcl Package and Version	Belongs to ::quartus::project_ui on page 426		
Syntax	get_current_project [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Returns the name of the current project.		
Example Usage	# Get the current name for # the currently open project "chiptrip" project_open chiptrip set project_name [get_current_project] project_close		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.29.15. get\_current\_revision (::quartus::project\_ui)

The following table displays information for the `get_current_revision` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426		
<b>Syntax</b>	<code>get_current_revision [-h   -help] [-long_help] [ &lt;project_name&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>&lt;project_name&gt;</code>	Project name	
<b>Description</b>	Returns the name of the current revision for the specified project. If the project name is not specified, the current project name is used.		
<b>Example Usage</b>	<pre># Get the current revision name for # the currently open project "chiptrip" project_open chiptrip set revision_name [get_current_revision] project_close  # Get the current revision name for # a project that is not currently open set revision_name [get_current_revision chiptrip]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Project does not exist or has illegal name characters: <code>&lt;string&gt;</code> . Specify a legal project name.
	TCL_ERROR	1	ERROR: Project name was not specified or open project does not exist. Open an existing project or specify the project name.

### 3.1.29.16. get\_global\_assignment (::quartus::project\_ui)

The following table displays information for the `get_global_assignment` Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project_ui on page 426		
<b>Syntax</b>	get_global_assignment [-h   -help] [-long_help] [-entity <entity_name> ] [-front] -name <name> [-section_id <section id> ] [-tag <data> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-entity <entity_name>	Entity to which assignment belongs	
	-front	Option to return the first assignment if there is more than one assignment found	
	-name <name>	Assignment name	
	-section_id <section id>	Section id	
	-tag <data>	Option to tag data to this assignment	
<b>Description</b>	<p>Returns the value of the global assignment.</p> <p>The "-name" option is not case sensitive.</p> <p>For entity-specific assignments, use the "-entity" option to retrieve the assignment from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p>		
<b>Example Usage</b>	<pre>## Get the value of the FAMILY assignment get_global_assignment -name FAMILY</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Ignored assignment: <string>. The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Assignment is not a global assignment: <string> -- it is an instance assignment. Specify a global assignment name or use the instance assignment commands.
	TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: Value <string> for the -<string> option is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Option -<string> for <string> assignment is illegal. Specify a legal option or remove the option.
continued...			

TCL_ERROR	1	ERROR: Options cannot be specified together: -<string>, -<string> and -<string>. Specify only one or two of the three options.
TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.
TCL_ERROR	1	ERROR: Found two options: -<string> and -<string>. Choose one of the options.
TCL_ERROR	1	ERROR: Illegal assignment name: <string>. Specify a legal assignment name. To view the list of legal assignment names, run get_all_assignment_names.
TCL_ERROR	1	ERROR: An unknown error has occurred.
TCL_ERROR	1	ERROR: Assignment <string> has multiple values. Use the <string> command to get all values or use the <string> -front command to get the first value.

### 3.1.29.17. get\_instance\_assignment (::quartus::project\_ui)

The following table displays information for the get\_instance\_assignment Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project_ui</a> on page 426	
<b>Syntax</b>	get_instance_assignment [-h   -help] [-long_help] [-entity <entity_name> ] [-from <source> ] [-front] -name <name> [-section_id <section id> ] [-tag <data> ] [-to <destination> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <entity_name>	Entity to which assignment belongs
	-from <source>	Source of assignment
	-front	Option to return the first assignment if there is more than one assignment found
	-name <name>	Assignment name
	-section_id <section id>	Section id
	-tag <data>	Option to tag data to this assignment
	-to <destination>	Destination of assignment
<b>Description</b>	<p>Returns the value of the instance assignment.</p> <p>The "-name" option is not case sensitive. The "-entity", "-to", and "-from" options are case sensitive.</p> <p>For entity-specific assignments, use the "-entity" option to retrieve the assignment from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p>	
<b>continued...</b>		

<b>Example Usage</b>	<pre>## Get the TSU_REQUIREMENT from mypin to any register set value [get_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT] puts "TSU_REQUIREMENT(mypin-&gt;*) = \$value"</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Ignored assignment: <i>&lt;string&gt;</i> . The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Assignment is not an instance assignment: <i>&lt;string&gt;</i> -- it is a global assignment. Specify an instance assignment name or use the global assignment commands.
	TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <i>&lt;string&gt;</i> . Specify a legal entity name.
	TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for the <i>-&lt;string&gt;</i> option is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Options cannot be specified together: <i>-&lt;string&gt;</i> , <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Specify only one or two of the three options.
	TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Found two options: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Choose one of the options.
	TCL_ERROR	1	ERROR: Illegal assignment name: <i>&lt;string&gt;</i> . Specify a legal assignment name. To view the list of legal assignment names, run <code>get_all_assignment_names</code> .
	TCL_ERROR	1	ERROR: An unknown error has occurred.
	TCL_ERROR	1	ERROR: Assignment <i>&lt;string&gt;</i> has multiple values. Use the <i>&lt;string&gt;</i> command to get all values or use the <i>&lt;string&gt;</i> - front command to get the first value.

### 3.1.29.18. get\_location\_assignment (::quartus::project\_ui)

The following table displays information for the `get_location_assignment` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project_ui</a> on page 426	
<b>Syntax</b>	<code>get_location_assignment [-h   -help] [-long_help] [-tag &lt;data&gt; ] -to &lt;destination&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-tag &lt;data&gt;</code>	Option to tag data to this assignment
continued...		

	-to <destination>		Destination of assignment
Description	Returns the value of a location assignment.  The "-chip" option is not case sensitive. The "-to" option is case sensitive.		
Example Usage	get_location_assignment -to dst		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.29.19. get\_parameter (::quartus::project\_ui)

The following table displays information for the `get_parameter` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426		
<b>Syntax</b>	<code>get_parameter [-h   -help] [-long_help] [-entity &lt;entity_name&gt; ] -name &lt;name&gt; [-tag &lt;data&gt; ] [-to &lt;destination&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-entity &lt;entity_name&gt;</code>	Entity to which parameter belongs	
	<code>-name &lt;name&gt;</code>	Parameter name	
	<code>-tag &lt;data&gt;</code>	Option to tag data to this assignment	
	<code>-to &lt;destination&gt;</code>	Destination of parameter	
<b>Description</b>	<p>Returns the value of the parameter.</p> <p>The "-name" option is not case sensitive. The "-to" option is case sensitive.</p> <p>If the "-to" argument is specified, the function returns the parameter value for the current entity. The value is retrieved from the PARAMETERS section of the entity. Otherwise, the function returns the project-wide default parameter value obtained from the DEFAULT_PARAMETERS section.</p> <p>Use the "-entity" option to retrieve the parameter from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p>		
<b>Example Usage</b>	<pre>## Get project-wide, default parameter value get_parameter -name WIDTH  ## Get entity-specific parameter value get_parameter -name inst1 -to SIZE</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
continued...			

TCL_OK	0	INFO: Operation successful
TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <i>&lt;string&gt;</i> . Specify a legal entity name.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.
TCL_ERROR	1	ERROR: Illegal default parameter: <i>&lt;string&gt;</i> . Specify a legal default parameter name.
TCL_ERROR	1	ERROR: Illegal parameter: <i>&lt;string&gt;</i> . Specify a legal parameter name.
TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.29.20. get\_project\_directory (::quartus::project\_ui)

The following table displays information for the `get_project_directory` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426		
<b>Syntax</b>	<code>get_project_directory [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Returns the project directory for currently open project.		
<b>Example Usage</b>	<pre>project_open one_wire # Print the current project directory puts [get_project_directory] project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.29.21. get\_project\_revisions (::quartus::project\_ui)

The following table displays information for the `get_project_revisions` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426		
<b>Syntax</b>	<code>get_project_revisions [-h   -help] [-long_help] [ &lt;project_name&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>&lt;project_name&gt;</code>	Project name	
<i>continued...</i>			

<b>Description</b>	<p>Returns a list of revisions included in the specified project. If the project name is not specified, the current project name is used by default.</p> <p>The first element in the list of revisions is the current revision and is the same as the return value for the "get_current_revision" command.</p>		
<b>Example Usage</b>	<pre># Set the device family assignment to Stratix # for all revisions project_open chiptrip set original_revision [get_current_revision]  foreach revision [get_project_revisions] {     puts "\$revision"     set_current_revision \$revision     set_global_assignment -name FAMILY Stratix     export_assignments }  set_current_revision \$original_revision project_close  # Open the project with the first available revision # and set the device family assignment to Stratix set revision [lindex [get_project_revisions chiptrip] 0] open_project -revision \$revision chiptrip set_global_assignment -name FAMILY Stratix project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Project does not exist or has illegal name characters: <string>. Specify a legal project name.
	TCL_ERROR	1	ERROR: Project name was not specified or open project does not exist. Open an existing project or specify the project name.

### 3.1.29.22. get\_user\_option (::quartus::project\_ui)

The following table displays information for the get\_user\_option Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project_ui</a> on page 426		
<b>Syntax</b>	get_user_option [-h   -help] [-long_help] -name <i>&lt;name&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name&gt;</i>	User option name	
<b>Description</b>	<p>Returns the user option value for the name specified by the "-name" option.</p> <p>To get a list of all available user option names, use the "get_all_user_option_names" command.</p>		
<b>Example Usage</b>	<pre>## Get the value for the user option ## "TALKBACK_ENABLED" set value [get_user_option -name TALKBACK_ENABLED] puts "TALKBACK_ENABLED = \$value"</pre>		
continued...			

*continued...*

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal user option name: <string>. Specify a legal user option name. To get a list of legal names, use the get_all_user_option_names command.

### 3.1.29.23. is\_project\_open (::quartus::project\_ui)

The following table displays information for the is\_project\_open Tcl command:

Tcl Package and Version	Belongs to ::quartus::project_ui on page 426		
Syntax	is_project_open [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Checks whether a project is currently open. Returns 1, if a project is currently open; returns 0, otherwise.		
Example Usage	<pre>## Close the project if open if [is_project_open] {     project_close }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.29.24. project\_archive (::quartus::project\_ui)

The following table displays information for the project\_archive Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project_ui</a> on page 426	
<b>Syntax</b>	project_archive [-h   -help] [-long_help] [-all_revisions] [-include_libraries] [-include_outputs] [-overwrite] [-use_file_set <file_set> ] [-version_compatible_database] <archive_name>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-all_revisions	Option to archive all revisions
	-include_libraries	Option to include related system libraries
	-include_outputs	Option to include output files in archive
	-overwrite	Option to overwrite any currently existing archive file
	-use_file_set <file_set>	Option to create the archive using the specified file set
	-version_compatible_database	Option to include version-compatible database if supported
	<archive_name>	Archive file name
<b>Description</b>	Archives an open project and its related files into a Quartus Prime Archive File (.qar).	
continued...		

continued...

	<p>The description of operations is as follows:</p> <table><tr><th>Option</th><th>Description</th></tr><tr><td>-----</td><td>-----</td></tr><tr><td>use_file_set</td><td>Creates the archive using the specified file set. By default, the 'basic' file set is used. For more information about file sets, type: quartus_sh --archive -list_file_sets</td></tr><tr><td>all_revisions</td><td>Archives all revisions.</td></tr><tr><td>overwrite</td><td>Overwrites existing archive file.</td></tr><tr><td>include_outputs</td><td>Includes output files in archive.</td></tr><tr><td>include_libraries</td><td>Includes related Megafuction and IP library files.</td></tr><tr><td>version_compatible_database</td><td>Includes version-compatible database if supported.</td></tr></table>			Option	Description	-----	-----	use_file_set	Creates the archive using the specified file set. By default, the 'basic' file set is used. For more information about file sets, type: quartus_sh --archive -list_file_sets	all_revisions	Archives all revisions.	overwrite	Overwrites existing archive file.	include_outputs	Includes output files in archive.	include_libraries	Includes related Megafuction and IP library files.	version_compatible_database	Includes version-compatible database if supported.
Option	Description																		
-----	-----																		
use_file_set	Creates the archive using the specified file set. By default, the 'basic' file set is used. For more information about file sets, type: quartus_sh --archive -list_file_sets																		
all_revisions	Archives all revisions.																		
overwrite	Overwrites existing archive file.																		
include_outputs	Includes output files in archive.																		
include_libraries	Includes related Megafuction and IP library files.																		
version_compatible_database	Includes version-compatible database if supported.																		
Example Usage	<pre>## Default mode: Archive current revisions without output files or libraries project_archive chiptrip.qar  ## Archive all revisions without output files or libraries project_archive chiptrip.qar -all_revisions  ## Archive current revision with version-compatible database if supported project_archive chiptrip.qar -version_compatible_database  ## Same as first one, but overwrite any existing archive file project_archive chiptrip.qar -overwrite  ## Include outut files and libraries project_archive chiptrip.qar -include_outputs -include_libraries</pre>																		
Return Value	Code Name	Code	String Return																
	TCL_OK	0	INFO: Operation successful																
	TCL_ERROR	1	ERROR: Error(s) found while archiving the project. See error message(s) for details.																
	TCL_ERROR	1	ERROR: Project archive failed. Some files could not be processed. Refer to the Quartus Prime Archive Log File (<archive_name>.qarlog).																
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.																
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.																

### 3.1.29.25. project\_close (::quartus::project\_ui)

The following table displays information for the `project_close` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426	
<b>Syntax</b>	<code>project_close [-h   -help] [-long_help] [-dont_export_assignments]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-dont_export_assignments</code>	Do not export assignments to file
<b>Description</b>	Closes an open project.	
	The assignments created or modified during an open project	
continued...		

	are committed to the Quartus Prime Settings File (.qsf) during a "project_close", unless you use the "-dont_export_assignments" option.		
<b>Example Usage</b>	<pre>## Close the project if open if [is_project_open] {     project_close } ## Close the project if open ## and do not export the assignments if [is_project_open] {     project_close -dont_export_assignments }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.29.26. project\_exists (::quartus::project\_ui)

The following table displays information for the project\_exists Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project_ui</a> on page 426		
<b>Syntax</b>	project_exists [-h   -help] [-long_help] <project_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<project_name>	Project name	
<b>Description</b>	Checks whether a project exists. Returns 1, if a project exists; returns 0, otherwise.		
<b>Example Usage</b>	<pre>## Create project if one does not exist. ## Open existing project otherwise. if [project_exists chiptrip] {     project_open chiptrip } else {     project_new chiptrip }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

## 3.1.29.27. project\_new (::quartus::project\_ui)

The following table displays information for the project\_new Tcl command:

Tcl Package and Version	Belongs to ::quartus::project_ui on page 426		
Syntax	project_new [-h   -help] [-long_help] [-family <family> ] [-overwrite] [-part <part> ] [-revision <revision_name> ] <project_name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-family <family>	Family name	
	-overwrite	Option to overwrite existing project and revision	
	-part <part>	Part name	
	-revision <revision_name>	Revision name	
	<project_name>	Project name	
Description	<p>Creates and opens a new project with the specified project name.</p> <p>If the "-revision" option is not specified, the project name is used to create the revision.</p> <p>Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <p>1) export_assignments 2) project_close (unless "-dont_export_assignments" is specified)</p> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p>		
Example Usage	<pre>## Create project "chiptrip" and revision "chiptrip" project_new chiptrip  ## Create project "chiptrip" and revision "auto_max" project_new -revision auto_max chiptrip  ## Create project "chiptrip" and revision "chiptrip" ## Overwrite any Quartus Prime Settings File (.qsf) if it exists project_new chiptrip -overwrite  ## Create project "chiptrip" and revision "chiptrip" ## Set the FAMILY assignment to Stratix project_new chiptrip -family Stratix</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The -<string> option must also be used when you use the -<string> option. Specify both options.
	TCL_ERROR	1	ERROR: Can't create project because device and family are mismatch: <string> and <string>.
	TCL_ERROR	1	ERROR: Can't create project because device is not installed: <string>.
	TCL_ERROR	1	ERROR: Can't create project because family requires specifying the part: <string>.
continued...			

TCL_ERROR	1	ERROR: Can't create project: <i>&lt;string&gt;</i> . Specify a legal project name.
TCL_ERROR	1	ERROR: Can't create revision: <i>&lt;string&gt;</i> . Specify a legal revision name using the <i>-&lt;string&gt;</i> option.
TCL_ERROR	1	ERROR: Can't create revision: <i>&lt;string&gt;</i> . Specify a legal revision name.
TCL_ERROR	1	ERROR: Can't create settings files for project: <i>&lt;string&gt;</i> . Make sure the .psf, .csf, and .ssf files are writeable.
TCL_ERROR	1	ERROR: Can't open project: <i>&lt;string&gt;</i>
TCL_ERROR	1	ERROR: Can't remove Quartus Prime Settings File: <i>&lt;string&gt;</i> . Make sure the file is writeable.
TCL_ERROR	1	ERROR: Can't create project with unknown device: <i>&lt;string&gt;</i> .
TCL_ERROR	1	ERROR: Can't create project with unknown device family: <i>&lt;string&gt;</i> .
TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
TCL_ERROR	1	ERROR: Found two options: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Choose one of the options.
TCL_ERROR	1	ERROR: Project already exists: <i>&lt;string&gt;</i> . Specify a different project name or use the <i>-overwrite</i> option.

### 3.1.29.28. project\_open (::quartus::project\_ui)

The following table displays information for the `project_open` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426	
<b>Syntax</b>	<code>project_open [-h   -help] [-long_help] [-current_revision] [-error_on_incompatible_database] [-revision &lt;revision_name&gt; ] &lt;project_name&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-current_revision</code>	Option to open the current revision automatically
	<code>-error_on_incompatible_database</code>	Option not to open the project and issue an error if the database version is incompatible
	<code>-revision &lt;revision_name&gt;</code>	Revision name
	<code>&lt;project_name&gt;</code>	Project name
<b>Description</b>	<p>Opens an existing project. To create a new project, use the "project_new" command.</p> <p>If the "-revision" option is not specified, the project name is used to open the revision.</p> <p>By default, opening the project overwrites the database created in a different version of the Quartus Prime software. However, if the "-error_on_incompatible_database" option is</p>	
continued...		

	specified, instead of opening the project, an error is issued when the database version differs from the current version of the Quartus Prime software.		
<b>Example Usage</b>	<pre>## Open project "chiptrip" and revision "chiptrip" project_open chiptrip  ## Open project "chiptrip" and revision "auto_max" project_open -revision auto_max chiptrip  ## Get the current revision before opening ## the project with the current revision set project_name chiptrip set current_revision [get_current_revision \$project_name] project_open -revision \$current_revision \$project_name puts [get_global_assignment -name FAMILY] project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Project is already open: <i>&lt;string&gt;</i>
	TCL_ERROR	1	ERROR: Can't open project: <i>&lt;string&gt;</i> . First close the currently open project: <i>&lt;string&gt;</i> .
	TCL_ERROR	1	ERROR: Can't open project: <i>&lt;string&gt;</i>
	TCL_ERROR	1	ERROR: Can't set revision: <i>&lt;string&gt;</i> . Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Cannot open project: <i>&lt;string&gt;</i> . The project is not compatible with the installed version of the Quartus Prime software. Opening the project will overwrite the old project database. If you wish to overwrite the old project database, make sure to specify the <i>-&lt;string&gt;</i> option.
	TCL_ERROR	1	ERROR: Can't open revision: <i>&lt;string&gt;</i> (project: <i>&lt;string&gt;</i> ). The revision is not compatible with the installed version of the Quartus Prime software. Opening the revision will overwrite the old revision database. If you wish to overwrite the old revision database, make sure to specify the <i>-&lt;string&gt;</i> option.
	TCL_ERROR	1	ERROR: Found two options: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Choose one of the options.
	TCL_ERROR	1	ERROR: Revision does not exist: <i>&lt;string&gt;</i> . Specify a legal revision name using the <i>-&lt;string&gt;</i> option.
	TCL_ERROR	1	ERROR: Project does not exist or has illegal name characters: <i>&lt;string&gt;</i> . Specify a legal project name.

### 3.1.29.29. project\_restore (::quartus::project\_ui)

The following table displays information for the `project_restore` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426	
<b>Syntax</b>	<code>project_restore [-h   -help] [-long_help] [-destination &lt;directory&gt; ] [-overwrite] [-update_included_file_info] &lt;archive_file&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
<b>continued...</b>		

	-long_help	Long help with examples and possible return values	
	-destination <directory>	Directory where restored files are placed	
	-overwrite	Option to overwrite files in destination directory	
	-update_included_file_info	Option to update included file information	
	<archive_file>	Archive file name	
Description	<p>Restores a Quartus Prime Archive File (.gar) that contains the project and its related files.</p> <p>By default, the archive is restored into the current directory. Use the "-destination" option to restore the files into a new directory.</p> <p>By default, the command fails if the archive already contains files in the destination directory. Use the "-overwrite" option to overwrite any existing files in the destination directory.</p>		
Example Usage	<pre>## Restore archive and expand files into current directory project_restore chiptrip.gar ## or project_restore chiptrip.gar -destination  ## Restore archive. Expand files into current directory, ## but overwrite any existing files in "." project_restore chiptrip.gar -destination . -overwrite  ## Restore project into a "restored" subdirectory project_restore chiptrip.gar -destination "restored" -overwrite</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Error(s) found while restoring the archive. See error message(s) for details.

### 3.1.29.30. remove\_all\_global\_assignments (::quartus::project\_ui)

The following table displays information for the remove\_all\_global\_assignments Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project_ui on page 426	
<b>Syntax</b>	remove_all_global_assignments [-h   -help] [-long_help] [-entity <entity_name> ] -name <name> [-section_id <section id> ] [-tag <data> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <entity_name>	Entity to which assignment belongs
	-name <name>	Assignment name (string pattern is matched using Tcl string matching)
	-section_id <section id>	Section id
	-tag <data>	Option to tag data to this assignment
continued...		

<b>Description</b>	<p>Removes all matching global assignments.</p> <p>The "-name" option is not case sensitive. This option can take string patterns containing special characters from the set ".*\[\]" as the value. The value is matched using Tcl string matching.</p> <p>This Tcl command reads the global assignments found in the Quartus Prime Settings File (.qsf). This Tcl command filters the assignments data found in the .qsf and removes the data based on the values specified by the "-name" option.</p> <p>Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one CLOCK section each containing its own set of clock assignments. To uniquely identify sections of this type, a &lt;Section Id&gt; is used. &lt;Section Id&gt; can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a &lt;Section Id&gt; and the associated &lt;Section Id&gt; description:</p> <table><tr><th>Section Id</th><th>Description</th></tr><tr><td>CHIP</td><td>Same as revision name</td></tr><tr><td>LOGICLOCK_REGION</td><td>A unique name</td></tr><tr><td>EDA_TOOL_SETTINGS</td><td>A unique name</td></tr><tr><td>CLIQUE</td><td>A unique name</td></tr><tr><td>BREAKPOINT</td><td>A unique name</td></tr><tr><td>CLOCK</td><td>A unique name</td></tr><tr><td>AUTO_INSERT_SLD_NODE_ENTITY</td><td>A unique name</td></tr></table> <p>For entity-specific assignments, use the "-entity" option to remove the assignment(s) from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p> <p>Assignments removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <ol style="list-style-type: none"><li>1) export_assignments</li><li>2) project_close (unless "-dont_export_assignments" is specified)</li></ol> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p>			Section Id	Description	CHIP	Same as revision name	LOGICLOCK_REGION	A unique name	EDA_TOOL_SETTINGS	A unique name	CLIQUE	A unique name	BREAKPOINT	A unique name	CLOCK	A unique name	AUTO_INSERT_SLD_NODE_ENTITY	A unique name

TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.29.31. remove\_all\_instance\_assignments (::quartus::project\_ui)

The following table displays information for the *remove\_all\_instance\_assignments* Tcl command:

<b>Tcl Package and Version</b>	Belongs to <i>::quartus::project_ui</i> on page 426	
<b>Syntax</b>	<i>remove_all_instance_assignments</i> [-h   -help] [-long_help] [-entity <i>&lt;entity_name&gt;</i> ] [-from <i>&lt;source&gt;</i> ] -name <i>&lt;name&gt;</i> [-section_id <i>&lt;section id&gt;</i> ] [-tag <i>&lt;data&gt;</i> ] [-to <i>&lt;destination&gt;</i> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-entity <i>&lt;entity_name&gt;</i>	Entity to which assignment belongs
	-from <i>&lt;source&gt;</i>	Source of the assignment (string pattern is matched using Tcl string matching)
	-name <i>&lt;name&gt;</i>	Assignment name (string pattern is matched using Tcl string matching)
	-section_id <i>&lt;section id&gt;</i>	Section id
	-tag <i>&lt;data&gt;</i>	Option to tag data to this assignment
	-to <i>&lt;destination&gt;</i>	Destination of the assignment (string pattern is matched using Tcl string matching)
<b>Description</b>	<p>Removes all matching instance assignment values.</p> <p>The "-name" option is not case sensitive.</p> <p>The "-to" and "-from" options are case sensitive.</p>	

*continued...*

These options can take string patterns containing special characters from the set `""?\[ ]` as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:

```
<bus name>[<bus index>] or <bus name>[*]
```

The `<bus name>` portion is a string of alphanumeric characters. The `<bus index>` portion is an integer greater than or equal to zero or it can be the character `"*"` used for string matching. Notice that the `<bus index>` is enclosed by the square brackets `"["` and `"]"`. For example, `"a[0]"` and `"a[*]"` are supported bus names and can be used as follows:

```
# To match index 0 of bus "a", type:
remove_all_instance_assignments -name LOCATION -to a[0]
```

```
# To match all indices of bus "a", type:
remove_all_instance_assignments -name LOCATION -to a[*]
```

All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus `"a"`, type:

```
remove_all_instance_assignments -name LOCATION -to "a[escape_brackets \[\][0-2\][escape_brackets \]]"
```

For more information about escaping square brackets, type `"escape_brackets -h"`.

This Tcl command reads the instance assignments found in the Quartus Prime Settings File (.qsf) and removes this data based on the values specified by the `"-name"`, `"-from"`, and `"-to"` options.

Certain sections in the .qsf can appear more than once. For example, because there may be more than one clock used in a project, there may be more than one `CLOCK` section each containing its own set of clock assignments. To uniquely identify sections of this type, a `<Section Id>` is used. `<Section Id>` can be one of three types. It can be the same as the revision name, or it can be some unique name. The following is a list of sections requiring a `<Section Id>` and the associated `<Section Id>` description:

Section Id	Description
CHIP	Same as revision name
LOGICLOCK_REGION	A unique name
EDA_TOOL_SETTINGS	A unique name
CLIQUE	A unique name
BREAKPOINT	A unique name
CLOCK	A unique name
AUTO_INSERT_SLD_NODE_ENTITY	A unique name

For entity-specific assignments, use the `"-entity"` option to remove the assignment(s) from the specified entity. If the `"-entity"` option is not specified, the value for the `FOCUS_ENTITY_NAME` assignment is used. If the `FOCUS_ENTITY_NAME` value is not found, the revision name is used.

Assignments removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:

```
1) export_assignments
2) project_close (unless "-dont_export_assignments" is specified)
```

These two Tcl commands reside in the `::quartus::project` Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands `"execute_flow"` and `"execute_module"` (part of the `::quartus::flow` Tcl package) automatically call `"export_assignments"` before they run command-line executables.

#### Example Usage

```
## Remove all the timing requirements
## Use wildcards to catch TSU_REQUIREMENT, TCO_REQUIREMENT,
## and others
remove_all_instance_assignments -name *_REQUIREMENT

## Remove all the location assignments with
## the destination bus name "timeo".
set bus_name "timeo"
remove_all_instance_assignments -name LOCATION -to $bus_name[*]
```

*continued...*

Return Value	Code Name	Code	String Return

	-long_help	Long help with examples and possible return values
	-entity <entity_name>	Entity to which parameter belongs
continued...		

	<div>-name &lt;name&gt;</div> <div>Parameter name (string pattern is matched using Tcl string matching)</div>
	<div>-tag &lt;data&gt;</div> <div>Option to tag data to this assignment</div>
	<div>-to &lt;destination&gt;</div> <div>Destination of the parameter (string pattern is matched using Tcl string matching)</div>
<b>Description</b>	<p>Removes all matching parameters.</p> <p>The "-name" option is not case sensitive. The "-to" option is case sensitive.</p> <p>If the "-to" argument is specified, the function removes the parameters from the current entity. The parameters are removed from the PARAMETERS section of the entity. Otherwise, the function removes the project-wide default parameters obtained from the DEFAULT_PARAMETERS section.</p> <p>This Tcl command filters the parameter data found in the Quartus Prime Settings File (.qsf) and removes the data based on the values specified by the "-name" and "-to" options. These options can take string patterns containing special characters from the set "*?\" as values. The values are matched using Tcl string matching. Note that bus names are automatically detected and do not need to be escaped. Bus names have the following format:</p> <p>&lt;bus name&gt;[&lt;bus index&gt;] or &lt;bus name&gt;[*]</p> <p>The &lt;bus name&gt; portion is a string of alphanumeric characters. The &lt;bus index&gt; portion is an integer greater than or equal to zero or it can be the character "*" used for string matching. Notice that the &lt;bus index&gt; is enclosed by the square brackets "[" and "]". For example, "a[0]" and "a[*]" are supported bus names and can be used as follows:</p> <pre># To match index 0 of bus "a", type: remove_all_parameters -name * -to a[0]  # To match all indices of bus "a", type: remove_all_parameters -name * -to a[*]</pre> <p>All other uses of square brackets must be escaped if you do not intend to use them as string patterns. For example, to match indices 0, 1, and 2 of the bus "a", type:</p> <pre>remove_all_parameters -name * -to "a[escape_brackets \[\]\[0-2\][escape_brackets \]]"</pre> <p>For more information about escaping square brackets, type "escape_brackets -h".</p> <p>Use the "-entity" option to remove the parameters from the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p> <p>The parameters removed by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <pre>1) export_assignments 2) project_close (unless "-dont_export_assignments" is specified)</pre> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p>
<b>Example Usage</b>	<pre>## The following 3 examples remove project-wide, ## default parameter values remove_all_parameters -name WIDTH remove_all_parameters -name *ID* remove_all_parameters -name *  ## The following 3 examples remove entity-specific ## parameter values remove_all_parameters -name inst1 -to SIZE remove_all_parameters -name inst1 -to *IZ* remove_all_parameters -name inst1 -to *</pre>

*continued...*

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: <string> parameter(s) were removed
	TCL_OK	0	INFO: Removed parameter: <string>
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Parameter does not exist and cannot be removed: <string>. Specify an existing parameter name.
	TCL_ERROR	1	ERROR: Illegal default parameter: <string>. Specify a legal default parameter name.
	TCL_ERROR	1	ERROR: Illegal parameter: <string>. Specify a legal parameter name.
	TCL_ERROR	1	ERROR: An unknown error has occurred.

### 3.1.29.33. resolve\_file\_path (::quartus::project\_ui)

The following table displays information for the resolve\_file\_path Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project_ui on page 426		
<b>Syntax</b>	resolve_file_path [-h   -help] [-long_help] <file_name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<file_name>	Option to specify the file name	
<b>Description</b>	<p>Returns the resolved full path of the specified file name. If the file does not exist, the original file name is returned.</p> <p>The Quartus Prime software resolves relative paths by searching for the file in the following directories in the following order:</p> <ol style="list-style-type: none"><li>1) Project directory, which is the directory where the Quartus Prime Settings File (.qsf) is found.</li><li>2) Project database directory, which is the "db" directory found under the project directory.</li><li>3) Project library directories, which are the directories containing the user-specified libraries that are used only by the current project.</li><li>4) User library directories, which are the directories containing the user-specified libraries that are used by all Quartus Prime projects.</li><li>5) Quartus Prime library directory, which is the directory containing Quartus Prime libraries.</li></ol>		
<b>Example Usage</b>	<pre>project_new chiptrip -overwrite  # Set one Verilog source file assignment set_global_assignment -name VERILOG_FILE chiptrip.v  # Display the resolved full path of the Verilog</pre>		

continued...

*continued...*

<pre> # source file assignment set filename [get_global_assignment -name VERILOG_FILE] set resolved_fullpath [resolve_file_path \$filename]  puts "Full Path: \$resolved_fullpath"  # Set more Verilog source file assignments set_global_assignment -name VERILOG_FILE auto_max.v set_global_assignment -name VERILOG_FILE speed_ch.v set_global_assignment -name VERILOG_FILE tick_cnt.v set_global_assignment -name VERILOG_FILE time_cnt.v  # Display the resolved full path of all the Verilog # source file assignments set file_asgns [get_all_global_assignments -name VERILOG_FILE] foreach_in_collection file_asgn \$file_asgns {      ## Each element in the collection has the following     ## format: {} {VERILOG_FILE} {&lt;file_name&gt;}      set filename [lindex \$file_asgn 2]     set resolved_fullpath [resolve_file_path \$filename]      puts "Full Path: \$resolved_fullpath" }  project_close </pre>			
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.

### 3.1.29.34. revision\_exists (::quartus::project\_ui)

The following table displays information for the revision\_exists Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::project_ui</a> on page 426	
<b>Syntax</b>	revision_exists [-h   -help] [-long_help] [-project <i>&lt;project_name&gt;</i> ] <i>&lt;revision_name&gt;</i>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-project <i>&lt;project_name&gt;</i>	Project name
	<i>&lt;revision_name&gt;</i>	Revision name
<b>Description</b>	<div>Checks whether the revision exists for the specified project or currently open project.</div> <div>Returns 1, if the revision exists; returns 0, otherwise.</div>	
<b>Example Usage</b>	<pre>## Check if the specified revision exists ## in the specified project if [revision_exists -ARG(project) chiptrip speed_ch] {     puts "Revision exists" } else {     puts "Revision does not exist" }  ## Create revision for the currently open ## project if it does not exist ## Set the current revision otherwise project_open chiptrip if [revision_exists speed_ch] {     set_current_revision speed_ch } else {</pre>	
continued...		

*continued...*

	<pre>         create_revision speed_ch     }     project_close </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Project does not exist or has illegal name characters: <i>&lt;string&gt;</i> . Specify a legal project name.
	TCL_ERROR	1	ERROR: Project name was not specified or open project does not exist. Open an existing project or specify the project name.

### 3.1.29.35. set\_current\_revision (::quartus::project\_ui)

The following table displays information for the `set_current_revision` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426		
<b>Syntax</b>	<code>set_current_revision [-h   -help] [-long_help] [-force] &lt;revision_name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-force</code>	Option to open the revision and overwrite the compilation database if the database version is incompatible.	
	<code>&lt;revision_name&gt;</code>	Revision name	
<b>Description</b>	<p>Sets the specified revision name as the current revision. All assignments created or modified during an open project will also be saved to the Quartus Prime Settings File (.qsf).</p> <p>In 8.1 or later versions of Quartus Prime software,</p> <pre>set_current_revision</pre> <p>gives an error when the compilation database version is not compatible with the current version of Quartus Prime software. You may specify the "-force" option to avoid the error and overwrite the database.</p>		
<b>Example Usage</b>	<pre>## Sets "auto_max" as the current revision set_current_revision auto_max</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	WARNING: Revision is already the current revision: <i>&lt;string&gt;</i> . No action is required.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Revision file does not exist: <i>&lt;string&gt;</i> .qsf. Use delete_revision to delete the revision from the current project. Then use create_revision to create the revision and its .qsf before setting <i>&lt;string&gt;</i> as the current revision.
	TCL_ERROR	1	ERROR: Revision is not included in the current project: <i>&lt;string&gt;</i> . Use the create_revision command to create the revision.

### 3.1.29.36. set\_global\_assignment (::quartus::project\_ui)

The following table displays information for the set\_global\_assignment Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project_ui on page 426	
<b>Syntax</b>	<pre>set_global_assignment [-h   -help] [-long_help] [-comment &lt;comment&gt; ] [-disable] [-entity &lt;entity_name&gt; ] [-fall] -name &lt;name&gt; [-remove] [-rise] [-section_id &lt;section id&gt; ] [-tag &lt;data&gt; ] [ &lt;value&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-comment <comment>	Comment
	-disable	Option to disable assignment
	-entity <entity_name>	Entity to which to add assignment
	-fall	Option applies to falling edge
	-name <name>	Assignment name
	-remove	Option to remove assignment
	-rise	Option applies to rising edge
	-section_id <section id>	Section id
	-tag <data>	Option to tag data to this assignment
	<value>	Assignment value
<b>Description</b>	<p>Sets or removes a global assignment.</p> <p>Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands (from the ::quartus::project Tcl package):</p> <ol style="list-style-type: none"> <li>1) export_assignments</li> <li>2) project_close (unless -dont_export_assignments is specified as an argument to project_close)</li> </ol> <p>You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands execute_flow and execute_module (from the ::quartus::flow Tcl package) call "export_assignments" before they run command-line executables.</p> <p>For entity-specific assignments, use the -entity option to force the assignment to specified entity. If the -entity option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p> <p>If the Quartus Prime Settings File contains a USER_LIBRARIES assignment and you call set_global_assignment to set a SEARCH_PATH or USER_LIBRARIES assignment, the existing USER_LIBRARIES assignment expands into one or more SEARCH_PATH assignments.</p> <p>Note that values that begin with a dash ("-") should be enclosed in a backslash followed by a quote. In the following example, -02 is enclosed by \" at the beginning and the end.</p> <pre>set_global_assignment -name ARM_CPP_COMMAND_LINE \"-02\"</pre>	

continued...

<b>Example Usage</b>	<pre>## Specify Stratix as the family to use when compiling set_global_assignment -name FAMILY Stratix  ## If the family name has empty spaces, use quotes set_global_assignment -name FAMILY "Stratix GX"  ## or remove any empty space set_global_assignment -name FAMILY StratixGX</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Ignored assignment: <i>&lt;string&gt;</i> . The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Assignment is not a global assignment: <i>&lt;string&gt;</i> -- it is an instance assignment. Specify a global assignment name or use the instance assignment commands.
	TCL_ERROR	1	ERROR: Can't find file(s) associated with assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find section information for assignment. Specify a different assignment name.
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <i>&lt;string&gt;</i> . Specify a legal entity name.
	TCL_ERROR	1	ERROR: File name <i>&lt;string&gt;</i> exceeds maximum of <i>&lt;string&gt;</i> characters. Specify a file name with fewer characters.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <i>&lt;string&gt;</i> . To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for the <i>-&lt;string&gt;</i> option is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Option <i>-&lt;string&gt;</i> for <i>&lt;string&gt;</i> assignment is illegal. Specify a legal option or remove the option.
	TCL_ERROR	1	ERROR: Options cannot be specified together: <i>-&lt;string&gt;</i> , <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Specify only one or two of the three options.
	TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for <i>&lt;string&gt;</i> assignment is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Found two options: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> . Choose one of the options.
	TCL_ERROR	1	ERROR: The <i>-&lt;string&gt;</i> option is not required but was specified with the value: <i>&lt;string&gt;</i> . Delete the option.
	TCL_ERROR	1	ERROR: The <i>-&lt;string&gt;</i> option is required but was not specified. Specify the required option.
	TCL_ERROR	1	ERROR: Illegal assignment name: <i>&lt;string&gt;</i> . Specify a legal assignment name. To view the list of legal assignment names, run <code>get_all_assignment_names</code> .
continued...			

TCL_ERROR	1	ERROR: An unknown error has occurred.
TCL_ERROR	1	ERROR: Assignment <i>&lt;string&gt;</i> cannot be removed -- it has multiple values. Specify one value to remove or use the <i>&lt;string&gt;</i> command to remove all values for the assignment.
TCL_ERROR	1	ERROR: Missing <i>&lt;&lt;string&gt;&gt;</i> for <i>&lt;string&gt;</i> assignment. Specify the required <i>&lt;string&gt;</i> .

### 3.1.29.37. set\_instance\_assignment (::quartus::project\_ui)

The following table displays information for the set\_instance\_assignment Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project_ui on page 426	
<b>Syntax</b>	<pre>set_instance_assignment [-h   -help] [-long_help] [-comment &lt;comment&gt; ] [-disable] [-entity &lt;entity_name&gt; ] [-fall] [-from &lt;source&gt; ] -name &lt;name&gt; [-remove] [-rise] [-section_id &lt;section id&gt; ] [-tag &lt;data&gt; ] [-to &lt;destination&gt; ] [ &lt;value&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-comment <comment>	Comment
	-disable	Option to disable assignment
	-entity <entity_name>	Entity to which to add assignment
	-fall	Option applies to falling edge
	-from <source>	Source of assignment
	-name <name>	Assignment name
	-remove	Option to remove assignment
	-rise	Option applies to rising edge
	-section_id <section id>	Section id
	-tag <data>	Option to tag data to this assignment
	-to <destination>	Destination of assignment
<b>Description</b>	<p>Sets or removes an instance assignment.</p> <p>Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <ol style="list-style-type: none"> <li>1) export_assignments</li> <li>2) project_close (unless "-dont_export_assignments" is specified)</li> </ol> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p> <p>For entity-specific assignments, use the "-entity" option to force the assignment to specified entity. If the "-entity"</p>	

continued...

	option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.		
<b>Example Usage</b>	<pre>## Specify a TSU_REQUIREMENT of 2ns from mypin to any register set_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT 2ns  ## Remove the TSU_REQUIREMENT from mypin to all registers set_instance_assignment -from "mypin" -to * -name TSU_REQUIREMENT -remove  ## Specify the entity to which the assignment is added, ## use the -entity option ## This is needed if the top-level entity name is other than ## that of the project name ## The following command generates a top_level entity set_instance_assignment -from "mypin" -to * -entity top_level -name TSU_REQUIREMENT 2ns</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Ignored assignment: <i>&lt;string&gt;</i> . The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Assignment is not an instance assignment: <i>&lt;string&gt;</i> -- it is a global assignment. Specify an instance assignment name or use the global assignment commands.

TCL_ERROR	1	ERROR: Missing <i>&lt;&lt;string&gt;&gt;</i> for <i>&lt;string&gt;</i> assignment. Specify the required <i>&lt;string&gt;</i> .

### 3.1.29.39. set\_location\_assignment (::quartus::project\_ui)

The following table displays information for the set\_location\_assignment Tcl command:

Tcl Package and Version	Belongs to ::quartus::project_ui on page 426		
Syntax	set_location_assignment [-h   -help] [-long_help] [-comment <i>&lt;comment&gt;</i> ] [-disable] [-remove] [-tag <i>&lt;data&gt;</i> ] -to <i>&lt;destination&gt;</i> [ <i>&lt;value&gt;</i> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-comment <i>&lt;comment&gt;</i>	Comment	
	-disable	Option to disable assignment	
	-remove	Option to remove assignment	
	-tag <i>&lt;data&gt;</i>	Option to tag data to this assignment	
	-to <i>&lt;destination&gt;</i>	Destination of assignment	
	<i>&lt;value&gt;</i>	Assignment value	
Description	<p>Sets or removes a location assignment.</p> <p>Assignments created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <ol style="list-style-type: none"><li>1) export_assignments</li><li>2) project_close (unless "-dont_export_assignments" is specified)</li></ol> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p>		
Example Usage	set_location_assignment -to dst LOC		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> for <i>&lt;string&gt;</i> assignment is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Missing destination for assignment. Specify the destination for the assignment.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Missing <i>&lt;&lt;string&gt;&gt;</i> for <i>&lt;string&gt;</i> assignment. Specify the required <i>&lt;string&gt;</i> .

### 3.1.29.40. set\_parameter (::quartus::project\_ui)

The following table displays information for the set\_parameter Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project_ui on page 426	
<b>Syntax</b>	<pre>set_parameter [-h   -help] [-long_help] [-comment &lt;comment&gt; ] [-disable] [-entity &lt;entity_name&gt; ] -name &lt;name&gt; [-remove] [-tag &lt;data&gt; ] [-to &lt;destination&gt; ] [ &lt;value&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-comment <comment>	Comment
	-disable	Option to disable parameter
	-entity <entity_name>	Entity to which to add parameter
	-name <name>	Parameter name
	-remove	Option to remove parameter
	-tag <data>	Option to tag data to this assignment
	-to <destination>	Destination of parameter
	<value>	Parameter value
<b>Description</b>	<p>Sets or removes the specified parameter name.</p> <p>The "-name" option is not case sensitive. The "-to" option is case sensitive.</p> <p>The parameters created or modified by using this Tcl command are not saved to the Quartus Prime Settings File (.qsf) unless you explicitly call one of the following two Tcl commands:</p> <ol style="list-style-type: none"> <li>1) export_assignments</li> <li>2) project_close (unless "-dont_export_assignments" is specified)</li> </ol> <p>These two Tcl commands reside in the ::quartus::project Tcl package. You must save assignment changes before you run Quartus Prime command-line executables. Note, however, that the Tcl commands "execute_flow" and "execute_module" (part of the ::quartus::flow Tcl package) automatically call "export_assignments" before they run command-line executables.</p> <p>Use the "-entity" option to force the parameter to the specified entity. If the "-entity" option is not specified, the value for the FOCUS_ENTITY_NAME assignment is used. If the FOCUS_ENTITY_NAME value is not found, the revision name is used.</p> <p>A parameter is an attribute of a megafunction, macrofunction, or certain primitives that determines the logic created or used to implement the function. The parameter information can be used to determine the actual primitives and other subdesigns needed to implement the logic of the function.</p> <p>The following general guidelines apply to parameters:</p> <ul style="list-style-type: none"> <li>* All logic options can be assigned as parameters for individual instances of megafunctions or macrofunctions. For a given logic OPTION the precedence for parameters is: <ol style="list-style-type: none"> <li>1) Instance specific logic option settings</li> <li>2) Instance specific parameter settings</li> <li>3) Project-wide default parameter settings</li> </ol> </li> <li>* You cannot assign a value to the predefined Intel(R) parameter DEVICE_FAMILY, which represents the device family assigned for the project. However, you can use the parameter value in comparisons.</li> <li>* The predefined Intel LPM_PIPELINE and LATENCY parameters can be assigned to an instance of a megafunction or</li> </ul>	

*continued...*

	<p>macrofunction. However, the parameter applies only to that instance, and is not inherited by the subdesigns of that instance.</p> <p>* All logic options can be assigned as parameters for individual megafunctions or macrofunctions. However, logic options cannot be assigned global, project-wide default parameter values.</p>		
<b>Example Usage</b>	<pre>## Set project-wide, default WIDTH parameter value set_parameter -name WIDTH 8  ## Set entity-specific SIZE parameter value ## to "my_ram" entity set_parameter -entity my_ram -name SIZE 16  ## Specify the same parameter to my_ram ## but inside "top_level" entity set_parameter -entity top_level -to my_ram -name SIZE 16</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Removed parameter: <string>
	TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
	TCL_ERROR	1	ERROR: Entity does not exist or uses illegal name characters: <string>. Specify a legal entity name.
	TCL_ERROR	1	ERROR: Can't run Tcl command while a process is in progress: <string>. To run the command, stop the compilation or simulation; or wait for the compilation or simulation to complete.
	TCL_ERROR	1	ERROR: Value <string> for <string> assignment is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Options are mutually exclusive: <string> and <string>. Specify only one of the two options.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: The -<string> option is not required but was specified with the value: <string>. Delete the option.
	TCL_ERROR	1	ERROR: The -<string> option is required but was not specified. Specify the required option.
	TCL_ERROR	1	ERROR: Parameter does not exist and cannot be removed: <string>. Specify an existing parameter name.
	TCL_ERROR	1	ERROR: An unknown error has occurred.
	TCL_ERROR	1	ERROR: Missing <<string>> for <string> assignment. Specify the required <string>.

### 3.1.29.41. set\_power\_file\_assignment (::quartus::project\_ui)

The following table displays information for the set\_power\_file\_assignment Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::project_ui on page 426
<b>Syntax</b>	<pre>set_power_file_assignment [-h   -help] [-long_help] [-remove] [-saf_file &lt;saf_file&gt; ] [-section_id &lt;section_id&gt; ] [-to &lt;to&gt; ] [-vcd_end_time &lt;vcd_end_time&gt; ] [-vcd_file &lt;vcd_file&gt; ] [-vcd_start_time &lt;vcd_start_time&gt; ]</pre>
<b>continued...</b>	

Arguments	-h   -help		Short help
	-long_help		Long help with examples and possible return values
	-remove		Option to remove assignment
	-saf_file <saf_file>		SAF file name
	-section_id <section_id>		Section id
	-to <to>		Entity to which to apply power input file
	-vcd_end_time <vcd_end_time>		End time for VCD file parsing
	-vcd_file <vcd_file>		VCD file name
	-vcd_start_time <vcd_start_time>		Start time for VCD file parsing
Description	<p>Sets or removes a power input file assignment. Power input file assignments are specified using multiple global assignments, and a single instance assignment as illustrated in the following example:</p> <pre>set_global_assignment -name POWER_INPUT_FILE_NAME "test.vcd" -section_id test.vcd set_global_assignment -name POWER_INPUT_FILE_TYPE VCD -section_id test.vcd set_global_assignment -name POWER_VCD_FILE_START_TIME "10 ns" -section_id test.vcd set_global_assignment -name POWER_VCD_FILE_END_TIME "1000 ns" -section_id test.vcd set_instance_assignment -name POWER_READ_INPUT_FILE test.vcd -to test_design</pre> <p>The power input file assignment serves as a wrapper for all of the above assignments. If the "-remove" setting is not set, the <code>set_power_file_assignment</code> will also make the following assignment to enable the use of input files:</p> <pre>set_global_assignment -name POWER_USE_INPUT_FILES ON</pre> <p>If you do not specify a "-section_id", a new section identifier is created for the input file assignment. If a "-section_id" is specified and it does not already exist, it is used as the new section identifier. If a "-section_id" is specified and it does exist, the existing input file assignments are removed and a new input file assignment is created using the given parameters and section identifier.</p> <p>If an entity name given by "-to" is not specified, the input file assignment applies to the top level design entity.</p> <p>If the "-remove" setting is used, the input file assignment given by the "-section_id", "-vcd_file", or "-saf_file" is removed from the project.</p> <p>Assignments created or modified by using this Tcl command are saved to the Quartus Prime Settings File (.qsf).</p>		
Example Usage	<pre>## Specify an input SAF file applied to the top level entity ## A default section will be created set_power_file_assignment -saf_file test.saf  ## Specify an input VCD file applied to design_top counter1 ## Use the given section_id to create a new section set_power_file_assignment -vcd_file test.vcd -to design_top counter1 -section_id test.vcd  ## Update the previous input VCD file assignment to specify a ## start and end time set_power_file_assignment -vcd_file test.vcd -to design_top counter1 -vcd_start_time 10ns - vcd_end_time 100ns -section_id test.vcd  ## Remove the input SAF file assignment using the file name set_power_file_assignment -saf_file test.saf -remove  ## Remove the input VCD file assignment using the section identifier set_power_file_assignment -section_id test.vcd -remove</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

continued...

TCL_ERROR	1	ERROR: Can't find active revision name. Make sure there is an open, active revision name.
TCL_ERROR	1	ERROR: Compiler database does not exist for revision name: <i>&lt;string&gt;</i> . At the minimum, run Analysis & Synthesis (quartus_map) with the specified revision name before using this Tcl command.
TCL_ERROR	1	ERROR: Exactly one of the following file name options must be specified: <i>-&lt;string&gt;</i> or <i>-&lt;string&gt;</i> .
TCL_ERROR	1	ERROR: If <i>-&lt;string&gt;</i> is set, exactly one of the following options must be specified: <i>-&lt;string&gt;</i> , <i>-&lt;string&gt;</i> or <i>-&lt;string&gt;</i> . All other options must not be set.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.
TCL_ERROR	1	ERROR: <i>-&lt;string&gt;</i> and <i>-&lt;string&gt;</i> cannot be used with <i>-&lt;string&gt;</i> option.

### 3.1.29.42. set\_user\_option (::quartus::project\_ui)

The following table displays information for the `set_user_option` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::project_ui</code> on page 426		
<b>Syntax</b>	<code>set_user_option [-h   -help] [-long_help] -name &lt;name&gt; [ &lt;value&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name &lt;name&gt;</code>	User option name	
	<code>&lt;value&gt;</code>	User option value	
<b>Description</b>	<p>Sets the user option value for the name specified by the "-name" option. The user option is written to the quartus2.ini file.</p> <p>To get a list of all available user option names, use the "get_all_user_option_names" command.</p>		
<b>Example Usage</b>	<pre>## Set TALKBACK_ENABLED to "on" set_user_option -name TALKBACK_ENABLED on</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal user option name: <string>. Specify a legal user option name. To get a list of legal names, use the get_all_user_option_names command.
	TCL_ERROR	1	ERROR: Illegal user option value: <string>. Specify a legal user option value.

### 3.1.29.43. test\_assignment\_trait (::quartus::project\_ui)

The following table displays information for the test\_assignment\_trait Tcl command:

Tcl Package and Version	Belongs to ::quartus::project_ui on page 426		
Syntax	test_assignment_trait [-h   -help] [-long_help] -name <name> -trait <trait_name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <name>	Assignment name	
	-trait <trait_name>	Trait name	
Description	Checks whether the assignment name has the specified trait. Returns 1, if the assignment name has the trait; returns 0, otherwise.		
Example Usage	<pre>## Test if the assignment name is case-sensitive if {[test_assignment_trait -name VHDL_FILE -trait CASE_SENSITIVE]} {     puts "VHDL_FILE assignment is case-sensitive." } else {     puts "VHDL_FILE assignment is not case-sensitive." }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Ignored assignment: <string>. The assignment is no longer supported.
	TCL_ERROR	1	ERROR: Value <string> for the -<string> option is illegal. Specify a legal value.
	TCL_ERROR	1	ERROR: Options cannot be specified together: -<string>, -<string> and -<string>. Specify only one or two of the three options.
	TCL_ERROR	1	ERROR: Illegal assignment name: <string>. Specify a legal assignment name. To view the list of legal assignment names, run get_all_assignment_names.
	TCL_ERROR	1	ERROR: Illegal trait: <string>. Specify a legal trait name.

### 3.1.30. ::quartus::qed

The following table displays information for the ::quartus::qed Tcl package:

<b>Tcl Package and Version</b>	::quartus::qed 1.0
<b>Description</b>	This package contains Tcl commands to work in the Quartus Exploration Dashboard. Commands perform workspace operations, create and manipulate project and project group objects, control execution of background Quartus Prime software instances, and import data from Quartus Prime projects.
<b>Availability</b>	This package is available for loading in the following executable:  quartus_sta
continued...	

<b>Tcl Commands</b>	<pre> ged::add_projects_from_archive (::quartus::ged) on page 479 ged::check_properties (::quartus::ged) on page 480 ged::check_properties_of_projects (::quartus::ged) on page 481 ged::compile (::quartus::ged) on page 482 ged::configure_local_compute_spec (::quartus::ged) on page 483 ged::configure_lsf_compute_spec (::quartus::ged) on page 483 ged::configure_max_jobs_for_compute_spec_type (::quartus::ged) on page 485 ged::configure_pbspro_compute_spec (::quartus::ged) on page 485 ged::configure_slurm_compute_spec (::quartus::ged) on page 487 ged::configure_ssh_compute_spec (::quartus::ged) on page 488 ged::create_object (::quartus::ged) on page 490 ged::delete_object (::quartus::ged) on page 491 ged::delete_object_report_panel (::quartus::ged) on page 492 ged::disconnect (::quartus::ged) on page 492 ged::find_projects_under_directory (::quartus::ged) on page 493 ged::fork_new_revision (::quartus::ged) on page 494 ged::fork_new_seeds (::quartus::ged) on page 495 ged::generate_report (::quartus::ged) on page 496 ged::get_all_properties_dict (::quartus::ged) on page 497 ged::get_default_group_id (::quartus::ged) on page 498 ged::get_object_report_panel_contents (::quartus::ged) on page 498 ged::get_object_report_panel_names (::quartus::ged) on page 499 ged::get_objects (::quartus::ged) on page 500 ged::get_project_report_panel_names (::quartus::ged) on page 501 ged::get_property (::quartus::ged) on page 502 ged::get_property_of_projects (::quartus::ged) on page 502 ged::get_return_value (::quartus::ged) on page 503 ged::get_user_data (::quartus::ged) on page 504 ged::has_property (::quartus::ged) on page 504 ged::import_report_panel (::quartus::ged) on page 505 ged::import_report_panel_names (::quartus::ged) on page 506 ged::is_connected (::quartus::ged) on page 507 ged::is_workspace_open (::quartus::ged) on page 507 ged::launch_connection (::quartus::ged) on page 508 ged::list_properties (::quartus::ged) on page 510 ged::load_db_state (::quartus::ged) on page 510 ged::open_project (::quartus::ged) on page 511 ged::pop_from_property (::quartus::ged) on page 512 ged::push_to_property (::quartus::ged) on page 513 ged::refresh_reports (::quartus::ged) on page 514 ged::run_analysis (::quartus::ged) on page 514 ged::run_command (::quartus::ged) on page 515 ged::sanitize_workspace (::quartus::ged) on page 516 ged::set_properties (::quartus::ged) on page 516 ged::set_property (::quartus::ged) on page 517 ged::set_user_data (::quartus::ged) on page 518 ged::wait_for_ready (::quartus::ged) on page 518 ged::workspace_close (::quartus::ged) on page 519 ged::workspace_new (::quartus::ged) on page 519 ged::workspace_open (::quartus::ged) on page 520 ged::write_object_reports_to_file (::quartus::ged) on page 520 </pre>
---------------------	---

### 3.1.30.1. qed::add\_projects\_from\_archive (::quartus::ged)

The following table displays information for the  
 qed::add\_projects\_from\_archive Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::ged on page 478	
<b>Syntax</b>	<pre> ged::add_projects_from_archive [-h   -help] [-long_help] [-subdir &lt;subdir&gt; ] [-num_seeds &lt;num_seeds&gt; ] [-id_pattern &lt;id_pattern&gt; ] [-group &lt;group&gt; ] &lt;archive&gt; </pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-subdir <subdir>	Directory name to create and restore the archive into. If specified, the directory must not yet exist. If unspecified, a sub-directory named after the archive will be created within the current directory.
	-num_seeds <num_seeds>	Number of new seeds to create. Each seed will have its own associated project in a separate subdirectory.
continued...		

	<code>-id_pattern &lt;id_pattern&gt;</code>		Pattern used to generate revision names. \"%BASE_ID%\" will be replaced with the ID the first project found inside the archive. \"%SEED%\" will be replaced with the seed value being assigned to the new revision.
	<code>-group &lt;group&gt;</code>		Group ID to add the restored projects to
	<code>&lt;archive&gt;</code>		Archive file to restore and add to the workspace
Description	<p>Restores a Quartus Prime Pro archive file (.gar) into a fresh directory and connects the created project to an opened workspace.</p> <p>Since this command launches remote connections before completing, the newly created projects must have access to a valid inherited compute specification, either via the workspace or a group object that is provided by "-group". See <code>qed::get_inherited_compute_spec_args</code> and <code>qed::launch_connection</code> for more details.</p> <p>The "-subdir" argument specifies the name of the fresh directory to create during the restoration process. If specified, the directory must not yet exist. If unspecified, a sub-directory named after the archive will be created within the current directory.</p> <p>The "-num_seeds" argument controls how many times the archive is restored. If the value of the "-num_seeds" argument is greater than 1, a separate directory will be created for each restored project and the SEED global assignment value will be set to a different value in each project before this command completes.</p> <p>The "-id_pattern" option controls each "id" property of the project objects which are created when this command completes. These IDs must be unique within the workspace. In order to guarantee this uniqueness, the seed value may be incorporated into the generated ID by including the substring "%SEED%" into the -id_pattern value. This substring will be replaced with the unique seed that will be set once the revision is created. For example, if the original project had a seed value of 4, -num_seeds 3 is specified, and the -id_pattern argument is set to "seed_%SEED%", the resulting projects will have IDs of "seed_5", "seed_6" and "seed_7" respectively. To derive the IDs of the new projects after the archive project's name, include the substring "%BASE_ID%" in the -id_pattern argument.</p>		
Example Usage	<pre>qed::workspace_new my_workspace qed::configure_local_compute_spec my_workspace qed::add_projects_from_archive my_archive.gar -num_seeds 3</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.2. qed::check\_properties (::quartus::qed)

The following table displays information for the qed::check\_properties Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::check_properties [-h   -help] [-long_help] [-checks <checks> ] <object>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-checks <checks>	List of Tcl expressions that evaluate to true for objects to retrieve. Expressions may use properties as variables of the same name during the check.	
	<object>	Identifier associated with the object, must be unique	
<b>Description</b>	Evaluates a series of expressions that operate on values of object properties and returns a boolean expression of the result of the evaluation.		
continued...			

	<p>The "qed::check_properties" command simplifies the process of performing a conditional check on an object for a set of parameter values. The "-checks" option requires a list of Tcl expressions, even if you specify only one expression. If you specify only one expression, make the one expression a list itself as shown in the examples below.</p> <p>Each expression uses semantics of the Tcl "expr" command. Within each expression, access object properties with variables named according to the desired properties. Accessing object properties within expressions follows semantics of the Tcl "dict with" command.</p>		
<b>Example Usage</b>	<pre> qed::create_object -type project project_A -user_data {this is some data!} qed::create_object -type group group_one -projects {project_A}  # Checks for the string "this is " appearing in the # user_data property of the project_A object. # Returns: 1 qed::check_properties project_A -checks [list {"this is " in \$user_data}] # Checks for the project group with ID "group_one" existing in # the groups property of the project_A object. # Returns: 1 qed::check_properties project_A -checks [list {group_one in \$groups}] # Checks that the project with ID project_A does not appear in # the projects property of the group_one object. # Returns: 0 qed::check_properties group_one -checks [list {project_A ni \$projects}] </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.3. qed::check\_properties\_of\_projects (::quartus::qed)

The following table displays information for the  
qed::check\_properties\_of\_projects Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	<code>qed::check_properties_of_projects [-h   -help] [-long_help] [-checks &lt;checks&gt; ] &lt;object&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-checks &lt;checks&gt;</code>	List of Tcl expressions that evaluate to true for objects to retrieve. Expressions may use properties as variables of the same name during the check.	
	<code>&lt;object&gt;</code>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>Evaluates a series of expressions that operate on values of object properties for all projects in a project group, and returns the information in a Tcl dict.</p> <p>The keys of the Tcl dict are the IDs of the projects in the group. The values are two element lists of the form { &lt;code&gt; &lt;value&gt; }. If the &lt;code&gt; value is 1, an error occurred checking the property expression. The &lt;result&gt; contains the received error message. If the &lt;code&gt; value is 0, the &lt;result&gt; value contains the boolean expression that is the result of the evaluation.</p> <p>Refer to help for "qed::check_properties" command for more information.</p>		
continued...			

<b>Example Usage</b>	<pre> ged::create_object -type project project_A -user_data {this is some data!} ged::create_object -type group group_one -projects {project_A}  # Returns: {project_A {0 1}} ged::check_properties_of_projects group_one -checks [list {"this is " in \$user_data}] </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.4. qed::compile (::quartus::qed)

The following table displays information for the `ged::compile` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qed</code> on page 478		
<b>Syntax</b>	<code>qed::compile [-h   -help] [-long_help] [-async] [-load_db_state] [-timeout &lt;timeout&gt; ] &lt;object&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-async</code>	Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to <code>qed::get_return_value</code> . By default, the return value of the remote command is reproduced (including any errors)	
	<code>-load_db_state</code>	Flag to load the necessary compilation database state for the accessor executable once the compile is complete. For example, if the accessor executable is "quartus_sta", this initializes the timing netlist	
	<code>-timeout &lt;timeout&gt;</code>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)	
	<code>&lt;object&gt;</code>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>Launches a compile on a connected project or group of connected projects.</p> <p>Use the "-load_db_state" option to prepare the project for deeper analysis after it opens. The specific operations performed will depend on the executable used to access the project. For example, if the project is accessed with "quartus_sta", timing analysis preparation follows the initialization procedure in the Quartus Prime Pro Timing Analyzer: creating the timing netlist, reading any SDC files, and updating the timing netlist.</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf -revision rev_A qed::launch_connection project_A -open_project qed::compile project_A</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.5. qed::configure\_local\_compute\_spec (::quartus::qed)

The following table displays information for the  
qed::configure\_local\_compute\_spec Tcl command:

Tcl Package and Version	Belongs to ::quartus::qed on page 478		
Syntax	qed::configure_local_compute_spec [-h   -help] [-long_help] [-exe <quartus_sta quartus_cdb quartus_sh> ] [-exe_options <exe_options> ] [-lm_license_file <lm_license_file> ] [-quartus_rootdir <quartus_rootdir> ] <object>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-exe <quartus_sta quartus_cdb quartus_sh>	Executable to open the project with. Dictates the packages and commands that will be available to run.	
	-exe_options <exe_options>	List of options to pass to executable.	
	-lm_license_file <lm_license_file>	LM_LICENSE_FILE environment setting	
	-quartus_rootdir <quartus_rootdir>	Appropriate Quartus Prime Pro installation folder to access the project	
	<object>	Identifier associated with the object, must be unique	
Description	<p>Sets properties on the specified object to cause background Quartus Prime Pro software instances to execute on the same (local) machine as the Quartus Exploration Dashboard is running on.</p> <p>The "-exe" option specifies the Quartus Prime Pro executable to run. The supported options are quartus_sta, quartus_cdb, and quartus_sh.</p> <p>The "-exe_options" option specifies any options passed to the executable that is specified with the "-exe" option.</p> <p>The "-quartus_rootdir" option specifies the directory location of the desired Quartus Prime Pro software installation. This is the root directory of the software installation, not the bin directory. If you do not specify a value, the root directory associated with the Quartus Exploration Dashboard is used.</p> <p>The "-lm_license_file" option specifies the LM_LICENSE_FILE value that will be passed to the Quartus Prime Pro software executable. If you don't know the value, look in the Tools &gt; License Setup dialog in the Quartus Prime Pro software GUI.</p>		
Example Usage	qed::configure_local_compute_spec workspace_id -exe quartus_sta -quartus_rootdir /path/to/acds/quartus		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.6. qed::configure\_lsf\_compute\_spec (::quartus::qed)

The following table displays information for the  
qed::configure\_lsf\_compute\_spec Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478
<b>Syntax</b>	<code>qed::configure_lsf_compute_spec [-h   -help] [-long_help] [-exe &lt;quartus_sta quartus_cdb quartus_sh&gt; ] [-exe_options &lt;exe_options&gt; ] [-env &lt;env&gt; ] [-error_file &lt;error_file&gt; ] [-initial_work_dir &lt;initial_work_dir&gt; ] [-lm_license_file &lt;lm_license_file&gt; ] [-local_remote_path_map &lt;local_remote_path_map&gt; ] [-output_file</code>
<i>continued...</i>	

	<code>&lt;output_file&gt; ] [-priority &lt;priority&gt; ] [-processor_limit &lt;processor_limit&gt; ] [-quartus_rootdir &lt;quartus_rootdir&gt; ] [-queue &lt;queue&gt; ] [-resource_requirements &lt;resource_requirements&gt; ] &lt;object&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-exe &lt;quartus_sta quartus_cdb quartus_sh&gt;</code>	Executable to open the project with. Dictates the packages and commands that will be available to run.
	<code>-exe_options &lt;exe_options&gt;</code>	List of options to pass to executable.
	<code>-env &lt;env&gt;</code>	Comma-separated list of environment variables to pass to job
	<code>-error_file &lt;error_file&gt;</code>	File to store standard error output. Use %J or %I to include job id or index id in the directory or filename
	<code>-initial_work_dir &lt;initial_work_dir&gt;</code>	Initial working directory on remote host. The remote host will start in this directory.
	<code>-lm_license_file &lt;lm_license_file&gt;</code>	LM_LICENSE_FILE environment setting
	<code>-local_remote_path_map &lt;local_remote_path_map&gt;</code>	The shared directory mapping between local and remote host
	<code>-output_file &lt;output_file&gt;</code>	File to store standard output. You can include Job id using %J or Index id %I in the directory or filename
	<code>-priority &lt;priority&gt;</code>	Job priority on your LSF farm. The higher the number, the higher the priority
	<code>-processor_limit &lt;processor_limit&gt;</code>	Minimum number of processors, and optionally, a maximum number of processors for the job
	<code>-quartus_rootdir &lt;quartus_rootdir&gt;</code>	Appropriate Quartus Prime Pro installation folder to access the project
	<code>-queue &lt;queue&gt;</code>	One or more comma-separated queues. Check with your administrator for a list of valid queues for your LSF farm
	<code>-resource_requirements &lt;resource_requirements&gt;</code>	Required resources. Used to restrict to machines with specific memory requirements
	<code>&lt;object&gt;</code>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Sets properties on the specified object to cause background Quartus Prime Pro software instances to execute through the LSF workload management platform.</p> <p>Use the following options to configure the LSF settings:</p> <ul style="list-style-type: none"> <li>* -resource_requirements</li> <li>* -queue</li> <li>* -initial_work_dir</li> <li>* -env</li> <li>* -local_remote_path_map</li> <li>* -priority</li> <li>* -output_file</li> <li>* -error_file</li> <li>* -processor_limit</li> </ul> <p>The "-exe" option specifies the Quartus Prime Pro executable to run. The supported options are quartus_sta, quartus_cdb, and quartus_sh.</p> <p>The "-exe_options" option specifies any options passed to the executable that is specified with the "-exe" option.</p> <p>The "-quartus_rootdir" option specifies the directory location of the desired Quartus Prime Pro software installation. This is the root directory of the software installation, not the bin directory.</p> <p>The "-lm_license_file" option specifies the LM_LICENSE_FILE value</p>	

**continued...**

	that will be passed to the Quartus Prime Pro software executable. If you don't know the value, look in the Tools > License Setup dialog in the Quartus Prime Pro software GUI.		
<b>Example Usage</b>	<code>qed::configure_lsf_compute_spec workspace_id -exe quartus_sta</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.7. qed::configure\_max\_jobs\_for\_compute\_spec\_type (::quartus::qed)

The following table displays information for the  
qed::configure\_max\_jobs\_for\_compute\_spec\_type Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::configure_max_jobs_for_compute_spec_type [-h   -help] [-long_help] -spec_type <local ssh lsf slurm pbspro arc> -max_jobs <max_jobs>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-spec_type <local ssh lsf slurm pbspro arc>	The type of compute spec that's being changed	
	-max_jobs <max_jobs>	Number of jobs that can be run simultaneously	
<b>Description</b>	<p>Sets the max_jobs_per_spec_type property for the specified compute specification type. This is a safety measure which controls the number of parallel connections that are allowed to launch simultaneously.</p> <p>The "-spec_type" option specifies the compute spec type. The supported options are local, ssh, lsf, slurm, pbspro.</p> <p>The "-max_jobs" option specifies the the number of jobs can be run concurrently. This value must be non-negative.</p> <p>If set to 0, an unlimited number of connections may be launched in parallel. For any number above 0, only that many connections may be launched in parallel. Any further connection will fail to launch until an existing connection is disconnected.</p>		
<b>Example Usage</b>	qed::configure_max_jobs_for_compute_spec_type -spec_type local -max_jobs 5		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.8. qed::configure\_pbspro\_compute\_spec (::quartus::qed)

The following table displays information for the  
qed::configure\_pbspro\_compute\_spec Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478
<b>Syntax</b>	<code>qed::configure_pbspro_compute_spec [-h   -help] [-long_help] [-exe &lt;quartus_sta quartus_cdb quartus_sh&gt; ] [-exe_options &lt;exe_options&gt; ] [-additional_args &lt;additional_args&gt; ] [-email &lt;email&gt; ] [-env &lt;env&gt; ] [-initial_work_dir &lt;initial_work_dir&gt; ] [-lm_license_file &lt;lm_license_file&gt; ] [-priority &lt;priority&gt; ] [-quartus_rootdir &lt;quartus_rootdir&gt; ] [-queue &lt;queue&gt; ] [-resources &lt;resources&gt; ] &lt;object&gt;</code>
<i>continued...</i>	

<b>Arguments</b>	-h   -help			Short help
	-long_help			Long help with examples and possible return values
	-exe <quartus_sta quartus_cdb quartus_sh>			Executable to open the project with. Dictates the packages and commands that will be available to run.
	-exe_options <exe_options>			List of options to pass to executable.
	-additional_args <additional_args>			Additional arguments to pass to the pbspro client when connecting to remote host
	-email <email>			List of email addresses to receive job status updates. Comma separated.
	-env <env>			A comma separated list of environment variables to pass to job
	-initial_work_dir <initial_work_dir>			Initial working directory on remote host. The remote host will start in this directory.
	-lm_license_file <lm_license_file>			LM_LICENSE_FILE environment setting
	-priority <priority>			Job priority. The higher the number, the higher the priority.
	-quartus_rootdir <quartus_rootdir>			Appropriate Quartus Prime Pro installation folder to access the project
	-queue <queue>			Name of the job queue to use
	-resources <resources>			Architecture, license, and/or memory requirement
	<object>			Identifier associated with the object, must be unique
<b>Description</b>	<p>Sets properties on the specified object to cause background Quartus Prime Pro software instances to execute through the PBSPro workload management platform.</p> <p>Use the following options to configure the PBSPro settings:</p> <ul style="list-style-type: none"> <li>* -queue</li> <li>* -priority</li> <li>* -resources</li> <li>* -email</li> <li>* -additional_args</li> <li>* -env</li> <li>* -initial_work_dir</li> </ul> <p>The "-exe" option specifies the Quartus Prime Pro executable to run. The supported options are quartus_sta, quartus_cdb, and quartus_sh.</p> <p>The "-exe_options" option specifies any options passed to the executable that is specified with the "-exe" option.</p> <p>The "-quartus_rootdir" option specifies the directory location of the desired Quartus Prime Pro software installation. This is the root directory of the software installation, not the bin directory.</p> <p>The "-lm_license_file" option specifies the LM_LICENSE_FILE value that will be passed to the Quartus Prime Pro software executable. If you don't know the value, look in the Tools &gt; License Setup dialog in the Quartus Prime Pro software GUI.</p>			
<b>Example Usage</b>	<pre>qed::configure_pbspro_compute_spec workspace_id -exe quartus_sta</pre>			
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>	
	TCL_OK	0	INFO: Operation successful	

### 3.1.30.9. qed::configure\_slurm\_compute\_spec (::quartus::qed)

The following table displays information for the  
qed::configure\_slurm\_compute\_spec Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::qed on page 478	
<b>Syntax</b>	<pre>qed::configure_slurm_compute_spec [-h   -help] [-long_help] [-exe &lt;quartus_sta quartus_cdb quartus_sh&gt;] [-exe_options &lt;exe_options&gt;] [-additional_args &lt;additional_args&gt;] [-cluster &lt;cluster&gt;] [-constraint &lt;constraint&gt;] [-cores_per_socket &lt;cores_per_socket&gt;] [-email &lt;email&gt;] [-env &lt;env&gt;] [-initial_work_dir &lt;initial_work_dir&gt;] [-licenses &lt;licenses&gt;] [-lm_license_file &lt;lm_license_file&gt;] [-memory &lt;memory&gt;] [-output &lt;output&gt;] [-partition &lt;partition&gt;] [-priority &lt;priority&gt;] [-quartus_rootdir &lt;quartus_rootdir&gt;] [-resources &lt;resources&gt;] [-sockets_per_node &lt;sockets_per_node&gt;] &lt;object&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-exe <quartus_sta quartus_cdb quartus_sh>	Executable to open the project with. Dictates the packages and commands that will be available to run.
	-exe_options <exe_options>	List of options to pass to executable.
	-additional_args <additional_args>	Additional arguments to pass to the slurm client when connecting to remote host
	-cluster <cluster>	Comma separated list of clusters to use
	-constraint <constraint>	Node features required as defined by Slurm administrator
	-cores_per_socket <cores_per_socket>	Number of CPU cores per socket
	-email <email>	Email address to receive job status updates. Defaults to submitting user.
	-env <env>	Comma-separated list of environment variables to pass to job
	-initial_work_dir <initial_work_dir>	Initial working directory on remote host. The remote host will start in this directory.
	-licenses <licenses>	Licenses that need to be allocated for this job
	-lm_license_file <lm_license_file>	LM_LICENSE_FILE environment setting
	-memory <memory>	Memory requirement per node. Default unit is megabytes
	-output <output>	Filename to store standard output
	-partition <partition>	Comma separated list of partitions to use
	-priority <priority>	Job priority. The higher the number, the higher the priority
	-quartus_rootdir <quartus_rootdir>	Appropriate Quartus Prime Pro installation folder to access the project
	-resources <resources>	Architecture, license, and/or memory requirement
	-sockets_per_node <sockets_per_node>	Number of CPUs per node
	<object>	Identifier associated with the object, must be unique
continued...		

<b>Description</b>	<p>Sets properties on the specified object to cause background Quartus Prime Pro software instances to execute through the SLURM workload management platform.</p> <p>Use the following options to configure the SLURM settings:</p> <ul style="list-style-type: none"> <li>* -cluster</li> <li>* -partition</li> <li>* -memory</li> <li>* -sockets_per_node</li> <li>* -cores_per_socket</li> <li>* -priority</li> <li>* -resources</li> <li>* -constraint</li> <li>* -email</li> <li>* -additional_args</li> <li>* -env</li> <li>* -initial_work_dir</li> <li>* -output</li> <li>* -licenses</li> </ul> <p>The "-exe" option specifies the Quartus Prime Pro executable to run. The supported options are quartus_sta, quartus_cdb, and quartus_sh.</p> <p>The "-exe_options" option specifies any options passed to the executable that is specified with the "-exe" option.</p> <p>The "-quartus_rootdir" option specifies the directory location of the desired Quartus Prime Pro software installation. This is the root directory of the software installation, not the bin directory.</p> <p>The "-lm_license_file" option specifies the LM_LICENSE_FILE value that will be passed to the Quartus Prime Pro software executable. If you don't know the value, look in the Tools &gt; License Setup dialog in the Quartus Prime Pro software GUI.</p>		
<b>Example Usage</b>	<pre>qed::configure_slurm_compute_spec workspace_id -exe quartus_sta</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.10. qed::configure\_ssh\_compute\_spec (::quartus::qed)

The following table displays information for the  
qed::configure\_ssh\_compute\_spec Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::qed on page 478	
<b>Syntax</b>	<pre>qed::configure_ssh_compute_spec [-h   -help] [-long_help] [-exe &lt;quartus_sta quartus_cdb quartus_sh&gt; ] [-exe_options &lt;exe_options&gt; ] [-additional_args &lt;additional_args&gt; ] [-custom_ssh_port &lt;custom_ssh_port&gt; ] [-enable_trusted_x11_forwarding &lt;enable_trusted_x11_forwarding&gt; ] [-enable_x11_forwarding &lt;enable_x11_forwarding&gt; ] -hostnames &lt;hostnames&gt; [-initial_work_dir &lt;initial_work_dir&gt; ] [-jobs_per_host &lt;jobs_per_host&gt; ] [-lm_license_file &lt;lm_license_file&gt; ] [-local_remote_path_map &lt;local_remote_path_map&gt; ] [-private_key &lt;private_key&gt; ] [-quartus_rootdir &lt;quartus_rootdir&gt; ] [-reverse_tunnel_port &lt;reverse_tunnel_port&gt; ] [-ssh_client &lt;ssh_client&gt; ] [-ssh_server &lt;ssh_server&gt; ] [-user &lt;user&gt; ] &lt;object&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-exe <quartus_sta quartus_cdb quartus_sh>	Executable to open the project with. Dictates the packages and commands that will be available to run.
	-exe_options <exe_options>	List of options to pass to executable.
	-additional_args <additional_args>	Additional arguments to pass to the SSH client when connecting to remote host
<b>continued...</b>		

	<code>-custom_ssh_port</code> <code>&lt;custom_ssh_port&gt;</code>	Custom port to use when making the SSH connection. This is only needed if the remote host(s) uses a port other than port 22 for SSH
	<code>-enable_trusted_x11_forwarding</code> <code>&lt;enable_trusted_x11_forwarding&gt;</code>	Enable trusted X11 forward. Set to on to allow linux GUI to appear on local screen. X11 forwarding is not subjected to X11 Security extension control.
	<code>-enable_x11_forwarding</code> <code>&lt;enable_x11_forwarding&gt;</code>	Enable X11 forward. Set to on to allow linux GUI to appear on local screen. X11 forwarding is subjected to X11 Security extension restrictions
	<code>-hostnames &lt;hostnames&gt;</code>	Select servers to use. Supports a comma-separated list of hostnames, or a value of file:filename, where the named file contains newline separated hostnames.
	<code>-initial_work_dir</code> <code>&lt;initial_work_dir&gt;</code>	Initial working directory on remote host. The remote host will start in this directory.
	<code>-jobs_per_host &lt;jobs_per_host&gt;</code>	Number of jobs each host should run in parallel. Default is 1
	<code>-lm_license_file</code> <code>&lt;lm_license_file&gt;</code>	LM_LICENSE_FILE environment setting
	<code>-local_remote_path_map</code> <code>&lt;local_remote_path_map&gt;</code>	Shared directory mapping between local and remote host. Format is local_path;remote_path.
	<code>-private_key &lt;private_key&gt;</code>	Private key associated with the remote host
	<code>-quartus_rootdir</code> <code>&lt;quartus_rootdir&gt;</code>	Appropriate Quartus Prime Pro installation folder to access the project
	<code>-reverse_tunnel_port</code> <code>&lt;reverse_tunnel_port&gt;</code>	Enable port forwarding and specify a port on the remote host to be forwarded to the local host. Remote host will connect to DSE server using localhost:<reverse_tunnel_port> over the secured ssh channel.
	<code>-ssh_client &lt;ssh_client&gt;</code>	Path to the ssh client used to connect to remote host
	<code>-ssh_server &lt;ssh_server&gt;</code>	Windows only. Specify SSH server used by remote host. openssh or cygwin
	<code>-user &lt;user&gt;</code>	Username to login to remote machine
	<code>&lt;object&gt;</code>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Sets properties on the specified object to cause background Quartus Prime Pro software instances to connect through the ssh protocol.</p> <p>The "-hostnames" option specifies a list of hostnames that can be connected to through the ssh protocol that will execute the background Quartus Prime Pro software instances. Entries in the list must be comma-separated and may be formatted as "file:&lt;filename&gt;", where each file contains a list of newline separated hostnames to consider alongside any other entries specified.</p> <p>The "-jobs_per_host" option limits the number of jobs a given host can be assigned.</p> <p>The "-custom_ssh_port" option overrides the port to use when making the SSH connection. Only required if the remote host(s) uses a port other than port 22 for SSH.</p> <p>The "-private_key" option specifies the private SSH key file to authenticate and log in to remote host. Use this option if the remote host prompts user for password when connecting using the ssh client. The corresponding public key should have been appended to the remote host's ~/.ssh/authorized_keys or ~/.ssh/authorized_keys2 files.</p> <p>The "-private_key" option specifies a private key that is associated with the remote host. The corresponding public key should have been appended to the remote host's ~/.ssh/authorized_keys or ~/.ssh/authorized_keys2 files.</p>	

continued...

<p>The "-user" option specifies the user or login name to use when logging in to remote host. Use this option if the user name on remote host is different from the current user.</p> <p>The "-ssh_client" option specifies the path to the SSH client to use when launching the connection. On Linux, it defaults to 'ssh'. On Windows, it defaults to Cygwin ssh. Windows also supports plink from the PuTTY package.</p> <p>The "-additional_arguments" option specifies additional commandline arguments to pass to the SSH client.</p> <p>The "-local_remote_path_map" specifies the shared directory mapping between local and remote host. Format is local_path;remote_path. Windows to Linux Example: [drive:\windows path];[linux path] s:\designs\two_reg\data\usr\designs\two_reg Linux to Windows Example: /data/usr/s:\data\usr</p> <p>The "-ssh_server" option specifies the server used by the remote host. Examples include openssh or cygwin.</p> <p>The "-initial_work_dir" option specifies the directory that the remote job should start in.</p> <p>The "-reverse_tunnel_port" option Enables port forwarding and specifies a port on the remote host to be forwarded to the local host. Use this if there is a firewall that separates the local host and the remote host. Remote host will connect to QED server using localhost:&lt;reverse_tunnel_port&gt; over the secured ssh channel. The port can be any ephemeral port that is not used by another process. Set value to 'auto' to let QED to automatically find a free network port on remote host. Omit this setting to disable port forwarding.</p> <p>The "-exe" option specifies the Quartus Prime Pro executable to run. The supported options are quartus_sta, quartus_cdb, and quartus_sh.</p> <p>The "-exe_options" option specifies any options passed to the executable that is specified with the "-exe" option.</p> <p>The "-quartus_rootdir" option specifies the directory location of the desired Quartus Prime Pro software installation. This is the root directory of the software installation, not the bin directory.</p> <p>The "-lm_license_file" option specifies the LM_LICENSE_FILE value that will be passed to the Quartus Prime software executable. If you don't know the value, look in the Tools &gt; License Setup dialog in the Quartus Prime Pro software GUI.</p>			
<b>Example Usage</b>	<pre>qed::configure_ssh_compute_spec workspace_id -exe quartus_sta -hostnames hostname - quartus_rootdir /path/to/acds/quartus qed::configure_ssh_compute_spec workspace_id -exe quartus_sta -hostnames file:/path/to/ hostnames.txt -quartus_rootdir /path/to/acds/quartus qed::configure_ssh_compute_spec workspace_id -exe quartus_sta -hostnames host1,host2 - quartus_rootdir /path/to/acds/quartus qed::configure_ssh_compute_spec workspace_id -exe quartus_sta -hostnames hostname - quartus_rootdir /path/to/acds/quartus -user username -private_key ~/.ssh/id_rsa</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.11. qed::create\_object (::quartus::qed)

The following table displays information for the qed::create\_object Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	<pre>qed::create_object [-h   -help] [-long_help] -type &lt;project group&gt; [-user_data &lt;user_data&gt; ] [-groups &lt;groups&gt; ] [-qpf_path &lt;qpf_path&gt; ] [-revision &lt;revision&gt; ] [-projects &lt;projects&gt; ] [-default_group_id &lt;default_group_id&gt; ] [ &lt;id&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
continued...		

	-type <project group>	Type of QED Workspace object	
	-user_data <user_data>	Freertext field to store any interesting metadata on the object. Use qed::set_user_data and qed::get_user_data to interact with the value as a dict instead of a string.	
	-groups <groups>	Set of group IDs this project is a member of (Valid only for type project)	
	-qpf_path <qpf_path>	Full path to a .qpf file to open (Valid only for -type project)	
	-revision <revision>	Name of the revision to open (Valid only for -type project)	
	-projects <projects>	Set of projects belonging to the group (Valid only for -type group)	
	-default_group_id <default_group_id>	Identifier used for the 'default group' that's created to house ungrouped projects during sanitize_workspace (Valid only for -type workspace)	
	<id>	Identifier associated with the object, must be unique	
Description	<p>Creates project or project group objects. The command returns the ID of the newly created object.</p> <p>The "-type" option is required, and must specify one of project or group.</p> <p>Other supported options depend on the type of object you are creating. The options correspond to property names that are valid for the type of object you are creating.</p>		
Example Usage	<pre>qed::create_object -type project project_A      -qpf_path /path/to/project_A/project.qpf - revision project_A qed::create_object -type project project_B      -qpf_path /path/to/project_B/project.qpf - revision project_B qed::create_object -type group  both_projects -projects {project_A project_B}</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.12. qed::delete\_object (::quartus::qed)

The following table displays information for the qed::delete\_object Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::qed on page 478	
<b>Syntax</b>	qed::delete_object [-h   -help] [-long_help] <object>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	<object>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Deletes project or project group objects.</p> <p>The most common reason to delete an object is if you have created it by mistake. If you added the wrong Quartus Prime Pro project to the workspace, you can edit its properties to point to the correct project, or delete the wrong one and add the right one.</p> <p>Deleting a project object also removes any and all reports you imported from the project.</p> <p>Deleting a project group object also removes any and all reports you created for that project group. Typically those reports combine or compare data from project reports.</p>	
continued...		

*continued...*

	Deleting a project group object does not delete the project objects that were part of the project group.		
<b>Example Usage</b>	<pre>set id [qed:create_object -type project] qed::delete_object \$id</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.13. qed::delete\_object\_report\_panel (::quartus::qed)

The following table displays information for the qed::delete\_object\_report\_panel Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed:: <del>delete_object_report_panel</del> [-h   -help] [-long_help] -panel_name <panel_name> <object>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-panel_name <panel_name>	Name of the report panel to delete	
	<object>	Identifier associated with the object, must be unique	
<b>Description</b>	<div>Deletes the specified report panel associated with the given object ID.</div> <div>Specify the panel name relative to the folder of the object ID.</div>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A -open_project set imported_name [qed::import_report_panel project_A -panel_name "Timing Analyzer  Setup Summary"] qed::delete_object_report_panel project_A -panel_name \$imported_name</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.14. qed::disconnect (::quartus::qed)

The following table displays information for the qed::disconnect Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	qed::disconnect [-h   -help] [-long_help] [-async] [-timeout <i>&lt;timeout&gt;</i> ] <i>&lt;object&gt;</i>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-async	Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to qed::get_return_value. By default, the return value of the remote command is reproduced (including any errors)
	-timeout <i>&lt;timeout&gt;</i>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)
continued...		

	<object>		Identifier associated with the object, must be unique
<b>Description</b>	<p>Closes background instances of the Quartus Prime Pro software associated with a project object, or projects in a project group.</p> <p>If you invoke the "qed::disconnect" command and want to extract more data from remote projects, or execute commands in them, you must use the "qed::launch_connection" command to re-initiate the connection.</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A qed::disconnect project_A</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.15. qed::find\_projects\_under\_directory (::quartus::qed)

The following table displays information for the  
qed::find\_projects\_under\_directory Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	<code>qed::find_projects_under_directory [-h   -help] [-long_help] [-project_match &lt;project_match&gt; ] [-directory_match &lt;directory_match&gt; ] [-include_all_revisions] &lt;search_dir&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-project_match &lt;project_match&gt;</code>	Pattern to match against the QPF file basenames
	<code>-directory_match &lt;directory_match&gt;</code>	Pattern to match against the QPF file directories
	<code>-include_all_revisions</code>	Flag to return all revisions of detected projects instead of the first
	<code>&lt;search_dir&gt;</code>	Directory to search
<b>Description</b>	<p>Recursively searches a directory for Quartus Prime Pro projects and returns a list of Tcl dicts, where each dict contains metadata about the projects that were found. The metadata is typically used when you add projects to the workspace.</p> <p>If no Quartus Prime Pro projects are found, the command returns an empty list.</p> <p>A Quartus Prime Pro project is considered to be a file with a .qpf extension.</p> <p>The "-project_match" and "-directory_match" options use Tcl glob-style name matching semantics. Supported wildcard characters include * and ?. The default value of the "-project_match" and "-directory_match" options is *.</p> <p>The command recursively finds all files with names matching *.qpf, starting in the directory specified with the "-search_dir" option. You must specify a directory with the "-search_dir" option, even if it is "." (the current directory); there is no default value. The command applies the directory_match wildcard to the name of each directory containing a .qpf file, and it applies the project_match wildcard to the file name of the .qpf file.</p> <p>The command extracts metadata for any Quartus Prime Pro projects that match the "-project_match" and "-directory_match" options. If you specify the "-include_all_revisions" option, metadata is extracted for</p>	
continued...		

	<p>all revisions of each project. If you do not specify the option, metadata is extracted for only the active revision of each project.</p> <p>The dict that is returned for each project includes the following properties: <code>qpf_path</code> is the absolute path of the Quartus Prime Pro project file, <code>revision</code> is the name of the project revision, <code>version</code> is the version of the Quartus Prime Pro software last used to open the project, and <code>id</code> is an automatically-generated unique name for the combination of that project and revision.</p>		
<b>Example Usage</b>	<pre>qed::find_projects_under_directory "."</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.16. qed::fork\_new\_revision (::quartus::qed)

The following table displays information for the `qed::fork_new_revision` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qed</code> on page 478	
<b>Syntax</b>	<pre>qed::fork_new_revision [-h   -help] [-long_help] [-add_to_groups &lt;add_to_groups&gt; ] [-async] [-copy_results] [-id &lt;id&gt; ] -revision &lt;revision&gt; [-timeout &lt;timeout&gt; ] &lt;object&gt;</pre>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-add_to_groups &lt;add_to_groups&gt;</code>	List of one or more groups to add the forked project object to. Defaults to the same group(s) as the source project object.
	<code>-async</code>	Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to <code>qed::get_return_value</code> . By default, the return value of the remote command is reproduced (including any errors)
	<code>-copy_results</code>	Flag to copy the source revision's compilation results into the new revision
	<code>-id &lt;id&gt;</code>	Identifier to associate with the new project object, must be unique
	<code>-revision &lt;revision&gt;</code>	Name of the new revision to create
	<code>-timeout &lt;timeout&gt;</code>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)
	<code>&lt;object&gt;</code>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Creates a new revision within a connected project and initializes a new project object that may be used to connect to that revision.</p> <p>Revisions within a Quartus Prime Pro project may be used to isolate and interact in parallel with multiple different versions of a design. These differences may include settings or assignments, which includes referencing different versions of source files to use during compilation.</p> <p>The project object returned by this utility will not yet be connected to the remote revision, and the database associated with the revision will not be complete. Run <code>"qed::launch_connection"</code> and <code>"qed::compile"</code> to generate a complete database for the new revision.</p> <p>The <code>"-revision"</code> option must specify a unique and new name for a revision to generate within the remote project. This command will return an error if</p>	

*continued...*

	<p>the revision cannot be created successfully. The new revision will be based on the revision that the connected project is accessing, which means it inherits all settings and assignments from that source revision and with no further changes will produce identical compilation results as compared to that source revision.</p> <p>The "-id" option controls the "id" property of the project object which is created when this command completes. If unspecified, a unique ID will be generated and assigned to the new project.</p> <p>The "-add_to_groups" option will initialize the new project object's "groups" property to be a list of pre-existing group(s). If unspecified, the forked project object will inherit its "groups" property from the source project object.</p> <p>The "-copy_results" option initiates a file copy of the compilation results from the source revision into the new revision. This means the new revision appears as being fully compiled and prepared for analysis but identical to the source revision until some future change is made and the revision is recompiled.</p>		
<b>Example Usage</b>	<pre> qed::create_object -type group my_group qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf -revision rev_A -groups my_group qed::launch_connection project_A -open_project qed::run project_A -cmd "set_global_assignment -name SEED 1" qed::fork_new_revision project_A -revision rev_B -id project_B -inherit_groups qed::launch_connection project_B -open_project qed::run project_B -cmd "set_global_assignment -name SEED 2"  # Returns: {project_A 1 project_B 2} qed::run my_group -cmd "get_global_assignment -name SEED" </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.17. qed::fork\_new\_seeds (::quartus::qed)

The following table displays information for the `qed::fork_new_seeds` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qed</code> on page 478	
<b>Syntax</b>	<code>qed::fork_new_seeds [-h   -help] [-long_help] [-id_pattern &lt;id_pattern&gt; ] [-launch_compiles] -num_seeds &lt;num_seeds&gt; [-revision_pattern &lt;revision_pattern&gt; ] &lt;object&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-id_pattern &lt;id_pattern&gt;</code>	Pattern used to generate revision names. <code>\"%ORIGINAL_ID %\"</code> will be replaced with the current ID of the source project. <code>\"%SEED%\"</code> will be replaced with the seed value being assigned to the new revision.
	<code>-launch_compiles</code>	Flag to compile the forked seeds after changing their SEED assignment value
	<code>-num_seeds &lt;num_seeds&gt;</code>	Number of new seeds to create
	<code>-revision_pattern &lt;revision_pattern&gt;</code>	Pattern used to generate revision names. <code>\"%ORIGINAL_REVISION%\"</code> will be replaced with the current revision of the source project. <code>\"%SEED%\"</code> will be replaced with the seed value being assigned to the new revision.
	<code>&lt;object&gt;</code>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Creates a set of new revisions within a connected project and initializes a new project object for each one. The new objects are then connected and the value of the "SEED" global assignment is modified accordingly. Each new object will inherit its "groups" property from the source project object.</p>	

continued...

<p>The "-num_seeds" argument dictates how many revisions to create and connect. The seed values will be the next in line after the value of the source project's seed. For example, if the source project used a seed of 4 and -num_seeds 3 is specified, the returned projects will have seeds 5, 6, and 7 set, respectively.</p> <p>The compilation database associated with the returned projects will not be complete. Run "qed::compile" to generate a complete database for each new revision.</p> <p>The "-revision_pattern" option must specify a unique and new name for each revision to generate within the remote project. This command will return an error if a revision cannot be created successfully. In order to guarantee this uniqueness, the seed value may be incorporated into the generated revision by including the substring "%SEED%" into the -revision_pattern value. This substring will be replaced with the unique seed that will be set once the revision is created. For example, if the original project had a seed value of 4, -num_seeds 3 is specified, and the -revision_pattern argument is set to "seed_%SEED%", the resulting revisions will be named "seed_5", "seed_6" and "seed_7" respectively. Note that the revision names are visible via the returned project objects' "revision" property. To name the new revisions after the original project's revision, include the substring "%ORIGINAL_REVISION%" in the -revision_pattern argument.</p> <p>Each new revision will be based on the revision that the connected project is accessing, which means it inherits all settings and assignments from that source revision except that it will have a different value set for the "SEED" global assignment.</p> <p>The "-id_pattern" option controls each "id" property of the project objects which are created when this command completes. These IDs must be unique within the workspace. In order to guarantee this uniqueness, the seed value may be incorporated into the generated ID by including the substring "%SEED%" into the -id_pattern value. This substring will be replaced with the unique seed that will be set once the revision is created. For example, if the original project had a seed value of 4, -num_seeds 3 is specified, and the -id_pattern argument is set to "seed_%SEED%", the resulting projects will have IDs of "seed_5", "seed_6" and "seed_7" respectively. To derive the IDs of the new projects after the original project's revision, include the substring "%ORIGINAL_ID%" in the -id_pattern argument.</p> <p>The "-launch_compiles" option will automatically launch Quartus Prime Pro compiles on just the forked seeds after their "SEED" global assignments have been updated. This is equivalent to creating a new group that just contains the new project objects and running qed::compile on that group.</p>			
<b>Example Usage</b>	<pre> qed::create_object -type group my_group qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf -revision rev_A -groups my_group qed::launch_connection project_A -open_project qed::run project_A -cmd "set_global_assignment -name SEED 1"  # Fork one new seed with a specific ID and revision name qed::fork_new_seeds project_A -num_seeds 1 -revision_pattern rev_B -id project_B - inherit_groups qed::launch_connection project_B -open_project  # Fork several new seeds and derive IDs and revision names from patterns qed::fork_new_seeds project_B -num_seeds 3 -revision_pattern rev_B_%SEED% -id project_B_seed_%SEED% -inherit_groups  # Returns: {project_A 1 project_B 2 project_B_seed_3 3 project_B_seed_4 4 project_B_seed_5 5} qed::run_command my_group -cmd "get_global_assignment -name SEED" </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.18. qed::generate\_report (::quartus::qed)

The following table displays information for the qed::generate\_report Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::generate_report [-h   -help] [-long_help] [-arguments <arguments> ] [-async] [-timeout <timeout> ] -type <type> <object>		
<b>Arguments</b>	-h   -help	Short help	
continued...			

	-long_help	Long help with examples and possible return values	
	-arguments <i>&lt;arguments&gt;</i>	Arguments that customize each report	
	-async	Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to qed::get_return_value. By default, the return value of the remote command is reproduced (including any errors)	
	-timeout <i>&lt;timeout&gt;</i>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)	
	-type <i>&lt;type&gt;</i>	Type of report to generate	
	<i>&lt;object&gt;</i>	Identifier associated with the object, must be unique	
Description	This command currently contains no help description.		
Example Usage	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A -open_project qed::generate_report project_A -type report_timing -arguments "-npaths 100 -from_clock sys_clk"</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.19. qed::get\_all\_properties\_dict (::quartus::qed)

The following table displays information for the qed::get\_all\_properties\_dict Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::qed on page 478	
<b>Syntax</b>	qed::get_all_properties_dict [-h   -help] [-long_help] [-set_only] [-writeable_only] <object>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-set_only	Flag indicating that any unset property names should be filtered out.
	-writeable_only	Flag indicating that read-only property names should be filtered out.
	<object>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Returns a Tcl dict representing the properties of the given object.</p> <p>Keys of the Tcl dict represent the property names valid for the given object, and values of the Tcl dict represent the associated values of each property.</p> <p>When you create an object, some of its properties may not be set; they may have no value and no default value.</p> <p>When you use the "-set_only" option, the list of properties returned is limited to properties that are set.</p> <p>Some object properties are read-only, and the rest are read/write. When you use the "-writeable_only" option, the list of properties returned is limited to properties that are read/write.</p>	
continued...		

<b>Example Usage</b>	<pre> ged::create_object -type project project_A -user_data {this is some data!} ged::get_all_properties_dict project_A -writeable_only  ged::create_object -type group group_one -projects {project_A} ged::get_all_properties_dict group_one -set_only </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.20. qed::get\_default\_group\_id (::quartus::qed)

The following table displays information for the `ged::get_default_group_id` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qed</code> on page 478		
<b>Syntax</b>	<code>qed::get_default_group_id [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<p>Returns the project group ID reserved for the default group.</p> <p>All projects are required to be in at least one project group. This requirement is not enforced by the project or project group objects themselves, but by the "qed::sanitize_workspace" command.</p> <p>To simplify the experience for new users, creating a project group is an optional step. However, to satisfy the requirement that all projects are in at least one project group, a project group may be automatically created by the "qed::sanitize_workspace" command if no project group exists. When a project group is created by the "qed::sanitize_workspace" command, its ID is the default group ID.</p>		
<b>Example Usage</b>	<code>qed::get_default_group_id</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.21. qed::get\_object\_report\_panel\_contents (::quartus::qed)

The following table displays information for the `ged::get_object_report_panel_contents` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qed</code> on page 478		
<b>Syntax</b>	<code>ged::get_object_report_panel_contents [-h   -help] [-long_help] -panel_name &lt;panel_name&gt; &lt;object&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-panel_name &lt;panel_name&gt;</code>	Name of the report panel to retrieve	
	<code>&lt;object&gt;</code>	Identifier associated with the object, must be unique	
<b>Description</b>	Returns the serialized content of an object panel if it exists.		
<i>continued...</i>			

<b>Example Usage</b>	<pre> qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A -open_project set imported_name [qed::import_report_panel project_A -panel_name "Timing Analyzer Setup Summary"] qed::get_object_report_panel_contents project_A -panel_name \$imported_name </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.22. qed::get\_object\_report\_panel\_names (::quartus::qed)

The following table displays information for the  
qed::get\_object\_report\_panel\_names Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::get_object_report_panel_names [-h   -help] [-long_help] [-include_generated_panels] [-regexp_match <i>&lt;regexp_match&gt;</i> ] [-string_match <i>&lt;string_match&gt;</i> ] <i>&lt;object&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-include_generated_panels	Flag to include QED-generated panels in the output	
	-regexp_match <i>&lt;regexp_match&gt;</i>	Regex to filter all panels, in the style of the \[regexp\] command	
	-string_match <i>&lt;string_match&gt;</i>	Pattern to filter all panels, in the style of the \[string match \] command	
	<i>&lt;object&gt;</i>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>Returns a Tcl list of report panel names associated with the given object.</p> <p>The "-string_match" option supports Tcl glob-style pattern matching.</p> <p>The "-regexp_match" option supports Tcl regexp pattern matching. You should enclose your regular expression in curly braces.</p> <p>The "-include_generated_panels" option control whether report panels that were generated by the Quartus Exploration Dashboard are included in the list. If you call the "qed::get_object_report_panel_names" command with the ID of a project, and do not specify the "-include_generated_panels" option, the list of names includes only report panels that were imported from the project.</p> <p>Typically, report panels associated with a project group are generated by the Quartus Exploration Dashboard, so you should use the "-include_generated_panels" option when you run the command with a project group ID.</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A -open_project qed::import_report_panel project_A -panel_name "Timing Analyzer Setup Summary" qed::import_report_panel project_A -panel_name "Timing Analyzer Hold Summary" qed::get_object_report_panel_names</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.23. qed::get\_objects (::quartus::qed)

The following table displays information for the `qed::get_objects` Tcl command:

Tcl Package and Version	Belongs to ::quartus::qed on page 478		
Syntax	qed::get_objects [-h   -help] [-long_help] [-type <project group workspace> ] [-user_data <user_data> ] [-groups <groups> ] [-qpf_path <qpf_path> ] [-revision <revision> ] [-projects <projects> ] [-default_group_id <default_group_id> ] [-checks <checks> ] [ <id> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-type <project group workspace>	Type of QED Workspace object	
	-user_data <user_data>	Freetext field to store any interesting metadata on the object. Use qed::set_user_data and qed::get_user_data to interact with the value as a dict instead of a string.	
	-groups <groups>	Set of group IDs this project is a member of (Valid only for -type project)	
	-qpf_path <qpf_path>	Full path to a .qpf file to open (Valid only for -type project)	
	-revision <revision>	Name of the revision to open (Valid only for -type project)	
	-projects <projects>	Set of projects belonging to the group (Valid only for -type group)	
	-default_group_id <default_group_id>	Identifier used for the 'default group' that's created to house ungrouped projects during sanitize_workspace (Valid only for -type workspace)	
	-checks <checks>	List of Tcl expressions that evaluate to true for objects to retrieve. Expressions may use properties as variables of the same name during the check.	
	<id>	Identifier associated with the object, must be unique	
Description	Returns a Tcl list of project or project group objects that match the options you specify.  If no objects match, the command returns an empty list.		
Example Usage	<pre>qed::get_objects -type project project_A -user_data "hello world!" -qpf_path /path/to/project_A/project.qpf -revision project_A qed::get_objects -type group my_group -user_data "hello neighbour!" -projects {project_A}  # Returns: {project_A my_group} qed::get_objects  # Returns: {project_A} qed::get_objects -type project  # Returns: {my_group} qed::get_objects -projects project_A  # Returns: {project_A my_group} qed::get_objects -checks [list {"hello" in \$user_data}]</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.24. qed::get\_project\_report\_panel\_names (::quartus::qed)

The following table displays information for the  
qed::get\_project\_report\_panel\_names Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::qed on page 478	
<b>Syntax</b>	qed::get_project_report_panel_names [-h   -help] [-long_help] [-include_generated_panels] [-regexp_match <regexp_match> ] [-string_match <string_match> ] <object>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-include_generated_panels	Flag to include QED-generated panels in the output
	-regexp_match <regexp_match>	Regex to filter all panels, in the style of the \[regexp\] command
	-string_match <string_match>	Pattern to filter all panels, in the style of the \[string match \] command
	<object>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Returns a multi-level Tcl dict of report panel names associated with the projects of the given group object. In the event that certain project report panels across the group only differ by seed-dependent values (e.g. slack values, Design Assistant violation counts, etc.) they will be grouped together in the returned dictionary based on a sanitized version of the panel names.</p> <p>The primary keys in the returned dictionary correspond to these sanitized names, and each sanitized name maps to a sub-dictionary where the key is a project that maps to the original, un-sanitized name of the panel associated with that project. If a panel was imported or generated on some of the group's projects but not others, only the projects with that panel will appear in the values associated with that panel's name.</p> <p>Each un-sanitized panel name associated with a project can be passed to the "qed::get_object_report_panel_contents" command alongside the project ID the panel name maps to.</p> <p>There are several ways to control the panel names which are returned by this command.</p> <p>The "-string_match" option supports Tcl glob-style pattern matching.</p> <p>The "-regexp_match" option supports Tcl regexp pattern matching. You should enclose your regular expression in curly braces.</p> <p>The "-include_generated_panels" option control whether report panels that were generated by the Quartus Exploration Dashboard are included in the list. If you call the "qed::get_project_report_panel_names" command, and do not specify the "-include_generated_panels" option, the dict returned includes only report panels that were imported from each project.</p>	
<b>Example Usage</b>	<pre> qed::create_object -type project project_A -qpf_path /file/path/to/A/project.qpf qed::launch_connection project_A -open_project qed::create_object -type project project_B -qpf_path /file/path/to/B/project.qpf qed::launch_connection project_B -open_project qed::create_object -type group both_projects -projects {project_A project_B} qed::import_report_panel both_projects -panel_name "Timing Analyzer  Setup Summary" qed::import_report_panel project_A -panel_name "Timing Analyzer  Hold Summary"  # Returns: # { #   "Timing Analyzer  Setup Summary" { #     project_A "Timing Analyzer  Setup Summary" #     project_B "Timing Analyzer  Setup Summary" #   } #   "Timing Analyzer  Hold Summary" { #     project_B "Timing Analyzer  Hold Summary" #   } </pre>	

continued...

	<pre># } # } qed::get_project_report_panel_names both_projects</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.25. qed::get\_property (::quartus::qed)

The following table displays information for the qed::get\_property Tcl command:

Tcl Package and Version	Belongs to ::quartus::qed on page 478		
Syntax	qed::get_property [-h   -help] [-long_help] -property <property> <object>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-property <property>	Name of the property to query	
	<object>	Identifier associated with the object, must be unique	
Description	<p>Returns the value of the given property of the object.</p> <p>If the object does not have the property (the property does not exist), the command returns a Tcl error.</p> <p>If the object has the property (the property exists) but the property is not set, the command returns a Tcl error.</p> <p>Refer to help for the "qed::has_property" command for how to check whether a property exists or is set.</p>		
Example Usage	<pre>qed::create_object -type project project_A -user_data {this is some data!} # Returns: {this is some data!} qed::get_property project_A -property user_data</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.26. qed::get\_property\_of\_projects (::quartus::qed)

The following table displays information for the qed::get\_property\_of\_projects Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::get_property_of_projects [-h   -help] [-long_help] -property <i>&lt;property&gt;</i> <i>&lt;object&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-property <i>&lt;property&gt;</i>	Name of the property to query	
	<i>&lt;object&gt;</i>	Identifier associated with the object, must be unique	
<b>Description</b>	Gets the value of the given property for all projects in the given project group and returns the information in a Tcl dict.		
continued...			

	<p>The keys of the Tcl dict are the IDs of the projects in the group. The values are two element lists of the form { &lt;code&gt; &lt;value&gt; }. If the &lt;code&gt; value is 1, an error occurred reading the property. The &lt;result&gt; contains the received error message. If the &lt;code&gt; value is 0, the &lt;result&gt; value contains the value of the property.</p> <p>Refer to help for the "qed::get_property" command for more information.</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -user_data {this is some data!} qed::create_object -type group group_one -projects {project_A}  # Returns: {project_A {0 {this is some data!}}} qed::get_property_of_projects group_one -property user_data</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.27. qed::get\_return\_value (::quartus::qed)

The following table displays information for the qed::get\_return\_value Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::get_return_value [-h   -help] [-long_help] [-return_token <return_token> ] [-timeout <timeout> ] <object>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-return_token <return_token>	Token returned by a previous asynchronous run invocation	
	-timeout <timeout>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)	
	<object>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>Returns data from a command that was run without blocking (using the "-async" option). You must specify the token returned from another command such as "qed::launch_connection" or "qed::run_command".</p> <p>Tokens are not interchangeable between objects. The "qed::get_return_value" command returns a Tcl error if the given token was not issued by the given object. The "qed::get_return_value" command blocks until the return value</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A set tok [qed::run_command project_A -cmd "after 1000; expr {100 * 100}"]  # Waits for ~1 second and returns 10000 qed::get_return_value project_A -return_token \$tok</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.28. qed::get\_user\_data (::quartus::qed)

The following table displays information for the `qed::get_user_data` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qed</code> on page 478		
<b>Syntax</b>	<code>qed::get_user_data [-h   -help] [-long_help] -key &lt;key&gt; &lt;object&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-key &lt;key&gt;</code>	Arbitrary key to look up inside the <code>user_data</code> property of the selected object	
	<code>&lt;object&gt;</code>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>Reads the "user_data" property of an object as if it is a dict, and looks up the value stored at the given key.</p> <p>It is possible to use this command in conjunction with "qed::set_property -property user_data", but whenever this method is invoked, any existing value must be a legal Tcl dictionary (which includes the empty string). "qed::get_property -property user_data" returns the entire value of the property instead of looking up a single key.</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A qed::set_property -property user_data -value [dict create key_one value_1] project_A qed::set_user_data -key key_two -value value_2 project_A  # Returns: {key_one value_1 key_two value_2} qed::get_property -property user_data project_A # Returns: value_1 qed::get_user_data -key key_one project_A # Returns: value_2 qed::get_user_data -key key_two project_A</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.29. qed::has\_property (::quartus::qed)

The following table displays information for the `qed::has_property` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	qed::has_property [-h   -help] [-long_help] -property <property> [-is_set] <object>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-property <property>	Name of the property to check
	-is_set	Flag indicating that this should only return true if the property is set to something (including a default value)
	<object>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Returns a boolean value indicating whether the given property exists on the specified object.</p> <p>A property can exist without being set. The "-is_set" option causes the command to return true only when the given property exists and is set to any value (including a default value).</p>	
continued...		

	You should check for the existence of an object's property before attempting to modify it, because getting an object property that does not exist returns a Tcl error.		
<b>Example Usage</b>	<pre> qed::create_object -type project project_A -user_data {this is some data!}  # Returns: True qed::has_property project_A -property qpf_path  # Returns: False qed::has_property project_A -property qpf_path -is_set  # Returns: True qed::has_property project_A -property user_data  # Returns: True qed::has_property project_A -property user_data -is_set </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.30. qed::import\_report\_panel (::quartus::qed)

The following table displays information for the `qed::import_report_panel` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qed</code> on page 478	
<b>Syntax</b>	<pre> qed::import_report_panel [-h   -help] [-long_help] [-async] [-panel_name &lt;panel_name&gt; ] [-regexp_match &lt;regexp_match&gt; ] [-string_match &lt;string_match&gt; ] [-timeout &lt;timeout&gt; ] &lt;object&gt; </pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-async	Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to <code>qed::get_return_value</code> . By default, the return value of the remote command is reproduced (including any errors)
	-panel_name <panel_name>	Name of the panel to retrieve
	-regexp_match <regexp_match>	Regex to match against all panels (first match is selected)
	-string_match <string_match>	Pattern to match against all panels (first match is selected)
	-timeout <timeout>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)
	<object>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Imports a report panel from a project or projects in a project group into the workspace.</p> <p>When you use the "-panel_name" option, you must specify the path to the report panel, separating report folder names with the " " separator. For example, the panel name of the RAM summary report panel is "Fitter Place Stage Fitter RAM Summary".</p> <p>The "-string_match" option supports Tcl glob-style pattern matching. When multiple report panels match the "-string_match" pattern, only the first matching report panel is imported.</p> <p>The "-regexp_match" option supports Tcl regexp pattern matching. You should enclose your regular expression in curly braces. When multiple report panels match the "-regexp_match" option, only the first matching report panel is imported.</p>	

continued...

	Before you import a report panel, you must have successfully used the "qed::launch_connection" command to initiate background instances of the Quartus Prime Pro software, and you must have opened the projects.		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A -open_project qed::import_report_panel project_A -panel_name "Timing Analyzer  Setup Summary"</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.31. qed::import\_report\_panel\_names (::quartus::qed)

The following table displays information for the  
qed::import\_report\_panel\_names Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::qed on page 478	
<b>Syntax</b>	qed::import_report_panel_names [-h   -help] [-long_help] [-async] [-folders <folders> ] [-regexp_match <regexp_match> ] [-string_match <string_match> ] [-timeout <timeout> ] <object>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-async	Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to qed::get_return_value. By default, the return value of the remote command is reproduced (including any errors)
	-folders <folders>	List of top-level folders to import panels from
	-regexp_match <regexp_match>	Regexp to match against remote panel names before returning them
	-string_match <string_match>	Pattern to match against remote panel names before returning them
	-timeout <timeout>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)
	<object>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Imports a list of report panel names from a project or projects in a project group.</p> <p>By default, all report panel names are imported.</p> <p>The "-string_match" option limits the panel names that are imported to panel names that match a Tcl glob-style pattern.</p> <p>The "-regexp_match" option limits the panel names that are imported to panel names that match the given regular expression. Enclose the regular expression in curly braces.</p> <p>The "-folders" option limits the panel names that are imported to panel names that are contained in the given top-level folder names. Top-level folder names correspond to the folder names in the compilation report, such as Synthesis, Fitter, and Timing Analyzer. Specify multiple folder names as a Tcl list, such as { Synthesis Fitter "Timing Analyzer" }.</p> <p>When you call import_report_panel_names with a project object, the command returns a list of report panel names that match the filters or folder names. Any errors that occur are returned with standard Tcl error semantics.</p>	
continued..		

*continued...*

	Before you import a report panel, you must have successfully used the "qed::launch_connection" command to initiate background instances of the Quartus Prime Pro software, and you must have opened the projects.		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A -open_project qed::import_report_panel_names project_A</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.32. qed::is\_connected (::quartus::qed)

The following table displays information for the qed::is\_connected Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed:: <b>is_connected</b> [-h   -help] [-long_help] <i>&lt;object&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<i>&lt;object&gt;</i>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>When you call the command with a project object, the return value is a boolean value indicating whether the given project is open in a background Quartus Prime Pro software instance.</p> <p>When you call the command with a project group object, the return value is a Tcl dict where the keys are IDs of the projects in the project group, and the values are the boolean values indicating whether each separate project is open in a background Quartus Prime Pro software instance. To determine whether the project group is connected, you must iterate through the Tcl dict and check each value.</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf  # Returns: false qed::is_connected project_A  qed::launch_connection project_A  # Returns: true qed::is_connected project_A</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.33. qed::is\_workspace\_open (::quartus::qed)

The following table displays information for the qed::is\_workspace\_open Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed:: <a href="#">is_workspace_open</a> [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
continued...			

<b>Description</b>	Checks whether a QED workspace is currently open. Returns 1, if a workspace is currently open; returns 0, otherwise.		
<b>Example Usage</b>	<code>qed::is_workspace_open</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.34. qed::launch\_connection (::quartus::qed)

The following table displays information for the `qed::launch_connection` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	qed::launch_connection [-h   -help] [-long_help] [-open_project] [-open_timeout <open_timeout> ] [-force_open] [-load_db_state] [-async] [-timeout <timeout> ] <object>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-open_project	Flag to open the project once the connection is established
	-open_timeout <open_timeout>	Timeout for opening the project once the connection is established (0 = no timeout)
	-force_open	Flag to use -force when running project_open on the remote side
	-load_db_state	Flag to load the necessary compilation database state for the accessor executable once the connection is established and the project is open. For example, if the accessor executable is "quartus_sta", this initializes the timing netlist
	-async	Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to qed::get_return_value. By default, the return value of the remote command is reproduced (including any errors)
	-timeout <timeout>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)
	<object>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Starts one or more instances of the Quartus Prime Pro software running in the background, to receive commands from the shell where the workspace is open.</p> <p>In most cases, you should use the "-open_project" option so that the Quartus Prime Pro project is opened automatically after the software instance has started. By default, the command does not open the Quartus Prime Pro project after starting the instance of the software.</p> <p>Use the "-timeout" option to specify the maximum time to wait for the background instance of the Quartus Prime Pro software to start. The timeout value is specified in seconds, and its default is 0, which means to wait forever. Specifying "-timeout 0" is equivalent to not using the "-timeout" option.</p> <p>Use the "-load_db_state" option to prepare the project for analysis after it opens. This option has no effect if you do not also use the "-open_project" option, or if the project has no complete compilation database. The initialization steps depend on the executable that is started.</p>	
continued...		

For example, when you use the Timing Analyzer executable (quartus\_sta), loading the compilation database follows the initialization procedure in the Quartus Prime Timing Analyzer GUI:

```
* create the timing netlist
* read SDC files
* update the timing netlist
```

The "-async" option causes the command to return a token for use with the "qed::get\_return\_value" command. By default the command will wait, or block, until the background instances of the Quartus Prime software have started, and any project opening or timing initialization options have completed.

When you call "qed::launch\_connection" with a project object without the "-async" option, the command returns the value of whatever parts of the initialization flow you have specified. Any errors that occur starting the background software instance, opening the project, and initializing timing, are returned with standard Tcl error semantics.

When you call "qed::launch\_connection" with a project group object without specifying the "-async" option, the command returns a Tcl dict where keys are IDs of the projects in the project group, and the values are two-element lists of the form { <code> <result> }. If the <code> value is 1, the "launch\_connection" command received an error starting the background software instance, opening the project, or initializing timing. When the <code> value is 1, the <result> contains the received error message. If the <code> value is 0, the "launch\_connection" command was successful for the project, and the <result> value contains the return value of whatever parts of the initialization flow you have specified.

Information needed to start the Quartus Prime Pro background software instances is set through the compute spec, which is stored in an object property called compute\_spec\_args. See qed::get\_inherited\_compute\_spec\_args for more details.

You can set the compute spec on the workspace object, on a project group object, and on individual project objects. The "qed::launch\_connection" command reads the compute specs with a defined priority to determine how to start the background software instances. First the workspace compute spec is read, then a project group compute spec, then a project compute spec. If a conflict of compute specs occurs, the compute spec of a project object overrides the compute spec of the project group it is in, and the compute spec of a project group overrides the compute spec of the workspace. This priority allows you to specify a default compute spec at the workspace level and override or customize it if necessary for project groups or projects.

Because the Quartus Exploration Dashboard supports a variety of compute farms, and each type of compute farm has unique, related requirements, you must use a command unique to each type of compute farm to configure it. Refer to help for the appropriate commands described below for details.

- \* To execute on the local machine running the Quartus Exploration Dashboard, use the "qed::configure\_local\_compute\_spec" command
- \* To execute through the LSF workload management software, use the "qed::configure\_lsf\_compute\_spec" command
- \* To execute by connecting to remote machines with the ssh command, use the "qed::configure\_ssh\_compute\_spec" command

<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.35. qed::list\_properties (::quartus::qed)

The following table displays information for the `qed::list_properties` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed:: <b>list_properties</b> [-h   -help] [-long_help] [-set_only] [-writeable_only] <i>&lt;object&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-set_only	Flag indicating that any unset property names should be filtered out.	
	-writeable_only	Flag indicating that read-only property names should be filtered out.	
	<i>&lt;object&gt;</i>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>Returns a list of valid properties for the given object.</p> <p>When you create an object, some of its properties may not be set; they may have no value and no default value.</p> <p>When you use the "-set_only" option, the list of properties returned is limited to properties that are set.</p> <p>Some object properties are read-only, and the rest are read/write. When you use the "-writeable_only" option, the list of properties returned is limited to properties that are read/write.</p> <p>This is a utility command that makes it easier to find out what properties are valid for the given object.</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -user_data {this is some data!} qed::list_properties project_A -writeable_only  qed::create_object -type group group_one -projects {project_A} qed::list_properties group_one -set_only</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.36. qed::load\_db\_state (::quartus::qed)

The following table displays information for the `qed::load_db_state` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	<code>qed::load_db_state [-h   -help] [-long_help] [-async] [-timeout <i>&lt;timeout&gt;</i> ] <i>&lt;object&gt;</i></code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-async</code>	Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to <code>qed::get_return_value</code> . By default, the return value of the remote command is reproduced (including any errors)
	<code>-timeout <i>&lt;timeout&gt;</i></code>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)
<i>continued...</i>		

	<object>			Identifier associated with the object, must be unique
<b>Description</b>	<p>Prepares an opened project for deeper analysis. The specific operations performed will depend on the executable used to access the project. For example, if the project is accessed with "quartus_sta", timing analysis preparation follows the initialization procedure in the Quartus Prime Pro Timing Analyzer: creating the timing netlist, reading any SDC files, and updating the timing netlist.</p> <p>If the opened project does not have a completed compilation database, this will return an error.</p> <p>Use the "-timeout" option to specify the maximum time to wait for the background instance of the Quartus Prime Pro software to initialize the executable state on an opened project. The timeout value is specified in seconds, and its default is 0, which means to wait forever. Specifying "-timeout 0" is equivalent to not using the "-timeout" option.</p> <p>The "-async" option causes the command to return a token for use with the "get_return_value" command. By default the command will wait, or block, until the background instances of the Quartus Prime software have started, and any project opening or timing initialization options have completed.</p> <p>When you call "qed::load_db_state" with a project group object without specifying the "-async" option, the command returns a Tcl dict where keys are IDs of the projects in the project group, and the values are two-element lists of the form { &lt;code&gt; &lt;result&gt; }. If the &lt;code&gt; value is 1, the "load_db_state" command received an error loading the compilation database state. When the &lt;code&gt; value is 1, the &lt;result&gt; contains the received error message. If the &lt;code&gt; value is 0, the "load_db_state" command was successful for the project, and the &lt;result&gt; value contains a message describing that the process succeeded.</p>			
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf  qed::launch_connection project_A qed::open_project project_A qed::load_db_state project_A</pre>			
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>	
	TCL_OK	0	INFO: Operation successful	

### 3.1.30.37. qed::open\_project (::quartus::qed)

The following table displays information for the qed::open\_project Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::qed on page 478	
<b>Syntax</b>	qed::open_project [-h   -help] [-long_help] [-force_open] [-load_db_state] [-async] [-timeout <timeout> ] <object>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-force_open	Flag to use -force when running project_open on the remote side
	-load_db_state	Flag to load the necessary compilation database state for the accessor executable once the connection is established and the project is open. For example, if the accessor executable is "quartus_sta", this initializes the timing netlist
	-async	Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to qed::get_return_value. By default, the return value of the remote command is reproduced (including any errors)
continued...		

	-timeout <timeout>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)	
	<object>	Identifier associated with the object, must be unique	
Description	<p>Use the "-timeout" option to specify the maximum time to wait for the background instance of the Quartus Prime Pro software to open the project. The timeout value is specified in seconds, and its default is 0, which means to wait forever. Specifying "-timeout 0" is equivalent to not using the "-timeout" option.</p> <p>Use the "-load_db_state" option to prepare the project for deeper analysis after it opens. The specific operations performed will depend on the executable used to access the project. For example, if the project is accessed with "quartus_sta", timing analysis preparation follows the initialization procedure in the Quartus Prime Pro Timing Analyzer: creating the timing netlist, reading any SDC files, and updating the timing netlist.</p> <p>The "-async" option causes the command to returns a token for use with the "get_return_value" command. By default the command will wait, or block, until the background instances of the Quartus Prime software have started, and any project opening or timing initialization options have completed.</p> <p>When you call "qed::open_project" with a project group object without specifying the "-async" option, the command returns a Tcl dict where keys are IDs of the projects in the project group, and the values are two-element lists of the form { &lt;code&gt; &lt;result&gt; }. If the &lt;code&gt; value is 1, the "open_project" command received an error opening the project or initializing the executable state. When the &lt;code&gt; value is 1, the &lt;result&gt; contains the received error message. If the &lt;code&gt; value is 0, the "open_project" command was successful for the project, and the &lt;result&gt; value contains the return value of whatever parts of the initialization flow you have specified.</p>		
Example Usage	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf  qed::launch_connection project_A qed::open_project project_A</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.38. qed::pop\_from\_property (::quartus::qed)

The following table displays information for the qed::pop\_from\_property Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	qed::pop_from_property [-h   -help] [-long_help] -property <i>&lt;property&gt;</i> -value <i>&lt;value&gt;</i> [-all] [-allow_missing] <i>&lt;object&gt;</i>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-property <i>&lt;property&gt;</i>	Name of the property to set
	-value <i>&lt;value&gt;</i>	Value to set the property to
	-all	Flag indicating that multiple instances of the value should all be removed (default: only the first is removed)
	-allow_missing	Flag to bypass the usual error if the value wasn't already present in the property's value
	<i>&lt;object&gt;</i>	Identifier associated with the object, must be unique
continued...		

<b>Description</b>	<p>Specialized version of the "qed::set_property" command to modify properties that have list values.</p> <p>It is equivalent to retrieving the existing property value with the "qed::get_property" command, removing the value from the returned list, then calling "qed::set_property" to update the entire list value.</p> <p>The "-all" argument removes all instances of the value from the list. Without this flag, only the first instance of a potentially repeated value will be removed.</p> <p>The "-allow_missing" argument bypasses the error which is normally thrown if the value to pop is not present in the list.</p> <p>The command returns the updated value of the property.</p> <p>The command returns a Tcl error if the given property does not exist.</p>		
<b>Example Usage</b>	<pre> qed::create_object -type group    group_one qed::create_object -type group    group_two  # Result: project_A is in groups {group_one} qed::create_object -type project project_A -groups {group_one}  # Result: project_A is in groups {group_one group_two} qed::push_to_property project_A -property groups -value group_two  # Result: project_A is in groups {group_two} qed::pop_from_property project_A -property groups -value group_one </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.39. qed::push\_to\_property (::quartus::qed)

The following table displays information for the qed::push\_to\_property Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	qed::push_to_property [-h   -help] [-long_help] -property <i>&lt;property&gt;</i> -value <i>&lt;value&gt;</i> [-unique] <i>&lt;object&gt;</i>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-property <i>&lt;property&gt;</i>	Name of the property to set
	-value <i>&lt;value&gt;</i>	Value to set the property to
	-unique	Flag indicating that the value shouldn't be appended if already present in the property
	<i>&lt;object&gt;</i>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Specialized version of the "qed::set_property" command to modify properties that have list values.</p> <p>It is equivalent to retrieving the existing property value with the "qed::get_property" command, appending the value to the returned list, then calling "qed::set_property" to update the entire list value.</p> <p>The "-unique" argument prevents the value from being added to the list if it is already present. Without this flag, the value will be added to the end of the list regardless of the other values already present.</p> <p>The command returns the updated value of the property.</p> <p>The command returns a Tcl error if the given property does not exist.</p>	
continued...		

<b>Example Usage</b>	<pre> qed::create_object -type group    group_one qed::create_object -type group    group_two  # Result: project_A is in groups {group_one} qed::create_object -type project project_A -groups {group_one}  # Result: project_A is in groups {group_one group_two} qed::push_to_property project_A -property groups -value group_two  # Result: project_A is in groups {group_two} qed::pop_from_property project_A -property groups -value group_one </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.40. qed::refresh\_reports (::quartus::qed)

The following table displays information for the `qed::refresh_reports` Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::qed</code> on page 478		
Syntax	<code>qed::refresh_reports [-h   -help] [-long_help]</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
Description	Causes the report window to update to reflect any changed project or project group reports.		
Example Usage	<code>qed::refresh_reports</code>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.41. qed::run\_analysis (::quartus::qed)

The following table displays information for the `qed::run_analysis` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	<code>qed::run_analysis [-h   -help] [-long_help] [-arguments &lt;arguments&gt; ] [-list_types] [-type &lt;type&gt; ] &lt;object&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-arguments &lt;arguments&gt;</code>	Arguments that customize each report
	<code>-list_types</code>	Bypass running any analysis and return a list of valid types to run
	<code>-type &lt;type&gt;</code>	Type of analysis to run
	<code>&lt;object&gt;</code>	Identifier associated with the object, must be unique
<b>Description</b>	This command currently contains no help description.	
continued...		

<b>Example Usage</b>	<pre># Inside an opened workspace with a compute specification configured:  qed::create_object -type project project_A -qpf_path /file/path/to/A/project.qpf qed::create_object -type project project_B -qpf_path /file/path/to/B/project.qpf qed::create_object -type group both_projects -projects {project_A project_B} qed::launch_connection group -open_project -load_db_state qed::generate_report group -type report_timing -arguments "-npaths 100 -from_clock sys_clk" qed::run_analysis group -type aggregate_report_timing_tables</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.42. qed::run\_command (::quartus::qed)

The following table displays information for the `qed::run_command` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qed</code> on page 478		
<b>Syntax</b>	<code>qed::run_command [-h   -help] [-long_help] [-async] [-timeout <i>&lt;timeout&gt;</i> ] -cmd <i>&lt;cmd&gt;</i> <i>&lt;object&gt;</i></code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-async</code>	Flag indicating not to wait for any issued remote commands to complete. With this flag, the return value is a token that can be passed to <code>qed::get_return_value</code> . By default, the return value of the remote command is reproduced (including any errors)	
	<code>-timeout <i>&lt;timeout&gt;</i></code>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)	
	<code>-cmd <i>&lt;cmd&gt;</i></code>	Command to issue to the remote executable	
	<code><i>&lt;object&gt;</i></code>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>Communicates with background instances of the Quartus Prime Pro software to run commands and receive return values.</p> <p>When you call the "qed::run_command" command with a project object, the command is evaluated by the background instance of the Quartus Prime Pro software associated with that project. When you call the "qed::run_command" command with a project group object, the command is evaluated by the background instances of the Quartus Prime Pro software for all projects that are in the project group.</p> <p>Remember Tcl evaluation and variable substitution rules when you specify the value of the "-cmd" option. Enclosing the command value in quotes ( "<code>&lt;command value&gt;</code>" ) allows the command to be interpreted by the Tcl interpreter of the workspace before it is sent to the background software instances. Enclosing the command value in curly braces ( {<code>&lt;command value&gt;</code>} ) delays interpretation until it is received by the background software instances.</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A  qed::run_command project_A -cmd "info hostname"</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.43. qed::sanitize\_workspace (::quartus::qed)

The following table displays information for the `qed::sanitize_workspace` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qed</code> on page 478		
<b>Syntax</b>	<code>qed::sanitize_workspace [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<p>Runs a variety of checks on projects and project groups to ensure they are in a "clean" state.</p> <p>After you run the "qed::sanitize_workspace" command, the following conditions will be true:</p> <ul style="list-style-type: none"><li>* Every project will be part of at least one project group. If you have not created a project group, a default project group is created.</li><li>* If any project objects exist in the workspace, at least one project group will exist. If you have not created a project group object, a default project group will be created.</li><li>* No empty project groups will exist. Any project group that does not contain any projects will be deleted.</li></ul> <p>You should use the "qed::sanitize_workspace" command after you add projects to the workspace, create a project group, edit properties of projects or project groups, or delete objects.</p>		
<b>Example Usage</b>	<code>qed::sanitize_workspace</code>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.44. qed::set\_properties (::quartus::qed)

The following table displays information for the `qed::set_properties` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	qed::set_properties [-h   -help] [-long_help] [-user_data <user_data> ] [-groups <groups> ] [-qpf_path <qpf_path> ] [-revision <revision> ] [-projects <projects> ] [-default_group_id <default_group_id> ] [-id <id> ] [-from_dict <from_dict> ] <object>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-user_data <user_data>	Freetext field to store any interesting metadata on the object. Use qed::set_user_data and qed::get_user_data to interact with the value as a dict instead of a string.
	-groups <groups>	Set of group IDs this project is a member of (Valid only for -type project)
	-qpf_path <qpf_path>	Full path to a .qpf file to open (Valid only for -type project)
	-revision <revision>	Name of the revision to open (Valid only for -type project)
	-projects <projects>	Set of projects belonging to the group (Valid only for -type group)
continued...		

	<div> <div>-default_group_id &lt;default_group_id&gt;</div> <div>Identifier used for the 'default group' that's created to house ungrouped projects during sanitize_workspace (Valid only for -type workspace)</div> </div>		
	<div> <div>-id &lt;id&gt;</div> <div>New identifier to associate with the object, must be unique</div> </div>		
	<div> <div>-from_dict &lt;from_dict&gt;</div> <div>Dictionary used to set the properties (key = property name, value = property value)</div> </div>		
	<div> <div>&lt;object&gt;</div> <div>Identifier associated with the object, must be unique</div> </div>		
<b>Description</b>	<p>Allows you to modify multiple properties of an object, with a single command, after the object has been created.</p> <p>You must specify the multiple properties and new values in a Tcl dict.</p> <p>Valid property and value strings depend on the type of object you are updating.</p> <p>Calling the "qed::set_properties" command with a dict of size 1 is equivalent to calling the "qed::set_property" command.</p> <p>The command returns a Tcl error if any of the dictionary keys do not exist as properties of the given object.</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A qed::set_properties project_a -qpf_path /path/to/project_B/project.qpf -revision project_B</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.45. qed::set\_property (::quartus::qed)

The following table displays information for the qed::set\_property Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::set_property [-h   -help] [-long_help] -property <property> -value <value> <object>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-property <property>	Name of the property to set	
	-value <value>	Value to set the property to	
	<object>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>Allows you to modify a property of an object after it is created.</p> <p>Valid property and value strings depend on the type of object you are updating.</p> <p>The "qed::set_properties" command supports setting multiple properties of one object in a single command.</p> <p>The command returns the updated value of the property.</p> <p>The command returns a Tcl error if the given property does not exist.</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A qed::set_property project_a -property qpf_path -value /path/to/project_B/project.qpf</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.46. qed::set\_user\_data (::quartus::qed)

The following table displays information for the qed::set\_user\_data Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::set_user_data [-h   -help] [-long_help] -key <key> -value <value> <object>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-key <key>	Arbitrary key to store inside the user_data property of the selected object	
	-value <value>	Arbitrary value to store inside the user_data property of the selected object	
	<object>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>Modifies the "user_data" property of an object as if it is a dict, inserting or overwriting the value stored at the given key with the given value.</p> <p>It is possible to use this command in conjunction with "qed::set_property -property user_data", but whenever this method is invoked any existing value must be a legal Tcl dictionary (which includes the empty string).</p>		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A qed::set_property -property user_data -value [dict create key_one value_1] project_A qed::set_user_data -key key_two -value value_2 project_A  # Returns: {key_one value_1 key_two value_2} qed::get_property -property user_data project_A</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.47. qed::wait\_for\_ready (::quartus::qed)

The following table displays information for the qed::wait\_for\_ready Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::wait_for_ready [-h   -help] [-long_help] [-timeout <i>&lt;timeout&gt;</i> ] <i>&lt;object&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-timeout <i>&lt;timeout&gt;</i>	Optional timeout for waiting for a return value in ms (default = 0 = no timeout)	
	<i>&lt;object&gt;</i>	Identifier associated with the object, must be unique	
<b>Description</b>	Blocks further script execution until all commands associated with the given object have completed or timed out.		
<b>Example Usage</b>	<pre>qed::create_object -type project project_A -qpf_path /file/path/to/project.qpf qed::launch_connection project_A qed::run_command project_A -cmd "after 1000; expr {100 * 100}"</pre>		
continued...			

	# Waits for ~1 second qed::wait_for_ready project_A		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.30.48. qed::workspace\_close (::quartus::qed)

The following table displays information for the `qed::workspace_close` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::workspace_close [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	<p>Closes an open QED workspace.</p> <p>Data in the workspace, such as projects, groups, and imported report panels is automatically saved in a database when the workspace closes.</p>		
<b>Example Usage</b>	qed::workspace_close		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.49. qed::workspace\_new (::quartus::qed)

The following table displays information for the `qed::workspace_new` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478	
<b>Syntax</b>	qed::workspace_new [-h   -help] [-long_help] [-directory <directory> ] [-overwrite] [ <id> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-directory <directory>	Directory to cd into before creating the workspace. This directory must exist prior to invoking this command.
	-overwrite	Overwrite any pre-existing workspace database and ensure a fresh workspace is created
	<id>	Identifier associated with the object, must be unique
<b>Description</b>	<p>Creates and opens a new QED workspace with the specified workspace name. The command returns the ID of the new QED workspace object.</p> <p>The "qed::workspace_new" command returns an error if a QED workspace with the same name exists in the directory. Use the "-overwrite" option to overwrite the existing workspace.</p>	
continued...		

	No QED workspace can be open when you create a new QED workspace; it is an error if a QED workspace is open when you use the "qed::workspace_new" command.		
<b>Example Usage</b>	<pre>if { ! [qed::is_workspace_open] } {     qed::workspace_new my_workspace }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.50. qed::workspace\_open (::quartus::qed)

The following table displays information for the qed::workspace\_open Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::workspace_open [-h   -help] [-long_help] [-force] [ <id> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-force	Overwrite any pre-existing, non-compatible workspace database and ensure the workspace opens	
	<id>	Identifier associated with the object, must be unique	
<b>Description</b>	<p>Opens an existing QED workspace. To create a new QED workspace, use the workspace_new command.</p> <p>A QED workspace is built on a Quartus Prime Pro project, so the workspace_open command gives an error when the compilation database version is not compatible with the current version of the Quartus Prime software. Use the "-force" option to overwrite the compilation database.</p> <p>If the specified workspace does not exist, the "qed::workspace_open" command returns a Tcl error.</p>		
<b>Example Usage</b>	<pre># my_workspace must exist qed::workspace_open my_workspace</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.30.51. qed::write\_object\_reports\_to\_file (::quartus::qed)

The following table displays information for the qed::write\_object\_reports\_to\_file Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qed</a> on page 478		
<b>Syntax</b>	qed::write_object_reports_to_file [-h   -help] [-long_help] [-append] -file <output file name> [-include_generated_panels] <object>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
continued...			

	-append	If output is sent to an ASCII file, this option appends the result to that file. Otherwise, the file will be overwritten.	
	-file <output file name>	Name of output file to be generated	
	-include_generated_panels	Flag to include QED-generated panels in the output	
	<object>	Identifier associated with the object, must be unique	
Description	<p>Writes all the report panels associated with the given object to an ASCII file.</p> <p>If you specify a project object, and do not use the "-include_generated_panels" option, only the report panels you imported from the project are written to the file.</p> <p>If you have created any new report panels based on any analysis in the Quartus Exploration Dashboard, you should use the "-include_generated_panels" option so those generated panels are written to the file.</p>		
Example Usage	<pre>ged::create_object -type project project_A -qpf_path /file/path/to/project.qpf ged::launch_connection project_A -open_project ged::import_report_panel project_A -panel_name "Timing Analyzer  Setup Summary" ged::write_object_reports_to_file project_A -file project_A_reports.rpt</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.31. ::quartus::qmtf

The following table displays information for the **::quartus::qmtf** Tcl package:

<b>Tcl Package and Version</b>	::quartus::qmtf 1.0
<b>Description</b>	This package contains no general description.
<b>Availability</b>	This package is not available in any Quartus Prime executable.
<b>Tcl Commands</b>	mtf::test (::quartus::qmtf) on page 521

#### 3.1.31.1. mtf::test (::quartus::qmtf)

The following table displays information for the **mtf::test** Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qmtf</code> on page 521		
<b>Syntax</b>	<code>mtf::test [-h   -help] [-long_help] -action &lt;action&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-action &lt;action&gt;</code>	Action to test	
<b>Description</b>	Test MTF functions		
<i>continued...</i>			

<b>Example Usage</b>	mtf::test -action say_hello		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.32. ::quartus::qshm

The following table displays information for the **::quartus::qshm** Tcl package:

<b>Tcl Package and Version</b>	::quartus::qshm 1.0
<b>Description</b>	This package contains no general description.
<b>Availability</b>	This package is loaded by default in the following executables:  qpro_sh quartus_sh
<b>Tcl Commands</b>	qshm_connect_to_quartus (::quartus::qshm) on page 522 qshm_disconnect_from_quartus (::quartus::qshm) on page 523 qshm_dispose_client (::quartus::qshm) on page 523 qshm_get_hub_key_prefix (::quartus::qshm) on page 523 qshm_get_parent_hub_key (::quartus::qshm) on page 524 qshm_obtain_client (::quartus::qshm) on page 524 qshm_send_request (::quartus::qshm) on page 525 qshm_send_server_state_query (::quartus::qshm) on page 525 qshm_set_context (::quartus::qshm) on page 526

#### 3.1.32.1. qshm\_connect\_to\_quartus (::quartus::qshm)

The following table displays information for the **qshm\_connect\_to\_quartus** Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qshm</a> on page 522		
<b>Syntax</b>	qshm_connect_to_quartus [-h   -help] [-long_help] -hub_key_prefix <hub_key_prefix> -name <name> [-project <project> ] [-revision <revision> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-hub_key_prefix <hub_key_prefix>	hub key prefix	
	-name <name>	client name	
	-project <project>	Quartus Prime project	
	-revision <revision>	Quartus Prime project revision	
<b>Description</b>	Connects a client with the provided name to a Quartus Prime hub and returns the key of the dedicated server created by the hub for that client.		
<b>Example Usage</b>	## Connect a client with name client1 to a Quarts Prime hub with hub key prefix hub1 qshm_connect_to_quartus -name client1 -hub_key_prefix hub1 -project <project> -revision <revision>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.32.2. qshm\_disconnect\_from\_quartus (::quartus::qshm)

The following table displays information for the `qshm_disconnect_from_quartus` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qshm</code> on page 522		
<b>Syntax</b>	<code>qshm_disconnect_from_quartus [-h   -help] [-long_help] -name &lt;name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name &lt;name&gt;</code>	client name	
<b>Description</b>	Disconnect a client with the specified name from the Quarts Prime it is connected to.		
<b>Example Usage</b>	<pre>## Disconnect a client with name client1 from the Quarts Prime qshm_disconnect_from_quartus -name client1</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.32.3. qshm\_dispose\_client (::quartus::qshm)

The following table displays information for the `qshm_dispose_client` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qshm</code> on page 522		
<b>Syntax</b>	<code>qshm_dispose_client [-h   -help] [-long_help] [-name <i>&lt;name&gt;</i> ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name <i>&lt;name&gt;</i></code>	Client name	
<b>Description</b>	Dispose and reclaim resources by the client with the specified name.		
<b>Example Usage</b>	<pre>## Dispose of a client with name client1 qshm_dispose_client -name client1</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.32.4. qshm\_get\_hub\_key\_prefix (::quartus::qshm)

The following table displays information for the `qshm_get_hub_key_prefix` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qshm</a> on page 522
<b>Syntax</b>	<code>qshm_get_hub_key_prefix [-h   -help] [-long_help] [-edition &lt;edition&gt; ] [-groot_dir &lt;groot_dir&gt; ] [-version &lt;version&gt; ]</code>
continued...	

Arguments	-h   -help		Short help
	-long_help		Long help with examples and possible return values
	-edition <edition>		Quartus Prime edition
	-groot_dir <qroot_dir>		Quartus Prime root directory
	-version <version>		Quartus Prime version
Description	Returns the key prefix for a Quartus Prime hub based on the specified configuration arguments.		
Example Usage	## Create an SHM-based server type socket with the port name "trip" qshm_get_hub_key_prefix -groot_dir /a/b/c -version 16.1 -edition "Quartus Prime Pro"		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.32.5. qshm\_get\_parent\_hub\_key (::quartus::qshm)

The following table displays information for the qshm\_get\_parent\_hub\_key Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qshm</code> on page 522		
<b>Syntax</b>	<code>qshm_get_parent_hub_key [-h   -help] [-long_help] -name &lt;name&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name &lt;name&gt;</code>	client name	
<b>Description</b>	Obtains the complete SHM key of the parent hub of the server that is connected to the client specified by the name argument		
<b>Example Usage</b>			
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.32.6. qshm\_obtain\_client (::quartus::qshm)

The following table displays information for the qshm\_obtain\_client Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::qshm</code> on page 522		
<b>Syntax</b>	<code>qshm_obtain_client [-h   -help] [-long_help] [-name <i>&lt;name&gt;</i> ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-name <i>&lt;name&gt;</i></code>	Client name	
<b>Description</b>	Creates and returns a client for the specified client name.		
continued...			

<b>Example Usage</b>	<pre>## Create an SHM-based client type socket with the name "client1" qshm_obtain_client -name client1</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.32.7. qshm\_send\_request (::quartus::qshm)

The following table displays information for the qshm\_send\_request Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qshm</a> on page 522		
<b>Syntax</b>	qshm_send_request [-h   -help] [-long_help] -cmd <i>&lt;cmd&gt;</i> -name <i>&lt;name&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-cmd <i>&lt;cmd&gt;</i>	command string	
	-name <i>&lt;name&gt;</i>	client name	
<b>Description</b>	Sends the a request to the client with the specified name and waits to receive a response from the dedicated server the client is connected to.		
<b>Example Usage</b>	## Send a Tcl command to the client with the specified name. The context should have been set to include the request_type=tcl key value pair. qshm_send_request -name client1 -cmd "set x 5"		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.32.8. qshm\_send\_server\_state\_query (::quartus::qshm)

The following table displays information for the qshm\_send\_server\_state\_query Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qshm</a> on page 522		
<b>Syntax</b>	qshm_send_server_state_query [-h   -help] [-long_help] -name <i>&lt;name&gt;</i> -state_key <i>&lt;state_key&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <i>&lt;name&gt;</i>	client name	
	-state_key <i>&lt;state_key&gt;</i>	state key string	
<b>Description</b>	<div>Sends the a server state request to the client with the specified name and waits to receive a response from the state socket of the dedicated server the client is connected to.</div>		
<b>Example Usage</b>	<div>## Send a server state command using the client with specified name. qshm_send_server_state_query -name client1 -state_key device_family</div>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.32.9. qshm\_set\_context (::quartus::qshm)

The following table displays information for the qshm\_set\_context Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::qshm</a> on page 522		
<b>Syntax</b>	qshm_set_context [-h   -help] [-long_help] -key <i>&lt;key&gt;</i> -name <i>&lt;name&gt;</i> -value <i>&lt;value&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-key <i>&lt;key&gt;</i>	A context key	
	-name <i>&lt;name&gt;</i>	client name	
	-value <i>&lt;value&gt;</i>	A context value	
<b>Description</b>	Sets the a context key value pair for the client with the specified name.		
<b>Example Usage</b>	## Set a key value pair request_type=tcl for the client with the specified name. qshm_set_context -name client1 -key request_type -value tcl		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.33. ::quartus::report

The following table displays information for the ::quartus::report Tcl package:

<b>Tcl Package and Version</b>	::quartus::report 2.1
<b>Description</b>	<p>This package contains a set of Tcl functions for accessing and updating information in the report database.</p>
<b>Availability</b>	<p>This package is loaded by default in the following executables:</p> <pre>qacv quartus_fit quartus_ipgenerate quartus_sim quartus_stp</pre> <p>This package is available for loading in the following executables:</p> <pre>qpro qpro_sh quartus quartus_cdb quartus_drc quartus_eda quartus_map quartus_sh quartus_si quartus_sta quartus_syn</pre>
<b>Tcl Commands</b>	<p><a href="#">add_row_to_table (::quartus::report)</a> on page 527 <a href="#">create_report_panel (::quartus::report)</a> on page 528 <a href="#">delete_report_panel (::quartus::report)</a> on page 530 <a href="#">get_fitter_resource_usage (::quartus::report)</a> on page 531 <a href="#">get_number_of_columns (::quartus::report)</a> on page 532 <a href="#">get_number_of_rows (::quartus::report)</a> on page 534 <a href="#">get_report_panel_column_index (::quartus::report)</a> on page 535 <a href="#">get_report_panel_data (::quartus::report)</a> on page 536 <a href="#">get_report_panel_id (::quartus::report)</a> on page 537</p>
<i>continued...</i>	

```

get_report_panel_names (::quartus::report) on page 538
get_report_panel_row (::quartus::report) on page 539
get_report_panel_row_index (::quartus::report) on page 541
load_report (::quartus::report) on page 542
read_xml_report (::quartus::report) on page 543
refresh_report_window (::quartus::report) on page 543
save_report_database (::quartus::report) on page 544
unload_report (::quartus::report) on page 544
write_report_panel (::quartus::report) on page 545
write_xml_report (::quartus::report) on page 547

```

### 3.1.33.1. add\_row\_to\_table (::quartus::report)

The following table displays information for the add\_row\_to\_table Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::report</a> on page 526		
<b>Syntax</b>	add_row_to_table [-h   -help] [-long_help] [-id <table_id> ] [-name <table_name> ] <row>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-id <table_id>	Id of table to update	
	-name <table_name>	Name of table to update	
	<row>	Tcl list of strings to add to table	
<b>Description</b>	<p>Adds the list of strings to the table as a row.</p> <p>Using the panel id provides faster data access than using the panel name.</p> <p>Panel ids that you have cached may become outdated or invalid if the report gets unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.</p> <p>Panel names support wildcards.</p> <p>The table of content portion of the UI Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the UI Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of content shows the path "Analysis &amp; Synthesis  Summary". However, the corresponding full path used by this Tcl command is "Analysis &amp; Synthesis Analysis &amp; Synthesis Summary".</p>		
<b>Example Usage</b>	<pre>load_package report project_open chiptrip load_report  # Set panel name and id set panel {Fitter Fitter Settings} set id [get_report_panel_id \$panel]  if {\$id != -1} {     # If panel exists, add a row to it     add_row_to_table -id \$id {{New Field} Yes No}     # Save the changes to the report database     save_report_database } else {     # Otherwise print an error message     puts "Error: Table \$panel does not exist." }  unload_report project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>

continued...

*continued...*

TCL_OK	0	INFO: Operation successful
TCL_ERROR	1	ERROR: Number of elements conflict. The number of elements in the added row must be <i>&lt;string&gt;</i> .
TCL_ERROR	1	ERROR: Illegal color: <i>&lt;string&gt;</i> . Specify a color that is currently supported by add_row_to_table.
TCL_ERROR	1	ERROR: You specified <i>&lt;string&gt;</i> colors for the <i>-&lt;string&gt;</i> option. However, you must specify <i>&lt;string&gt;</i> colors to match the number of elements specified for the <i>&lt;&lt;string&gt;&gt;</i> argument.
TCL_ERROR	1	ERROR: Value specified for <i>-&lt;string&gt;</i> option is not a valid Tcl list: <i>&lt;string&gt;</i> . Specify a valid Tcl list.
TCL_ERROR	1	ERROR: You must open a project before you can use this command.
TCL_ERROR	1	ERROR: Can't find panel: <i>&lt;string&gt;</i> . Specify an existing report panel name.
TCL_ERROR	1	ERROR: Report not loaded for revision name: <i>&lt;string&gt;</i> . Type load_report to load the report.
TCL_ERROR	1	ERROR: Can't access report panel. Use this command only for report panels with rows or columns.
TCL_ERROR	1	ERROR: Value specified for <i>&lt;row&gt;</i> is not a valid Tcl list: <i>&lt;string&gt;</i> . Specify <i>&lt;row&gt;</i> as a valid Tcl list.
TCL_ERROR	1	ERROR: add_row_to_table command is not allowed for this report panel. You cannot add rows to this report panel.

### 3.1.33.2. create\_report\_panel (::quartus::report)

The following table displays information for the create\_report\_panel Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::report on page 526	
<b>Syntax</b>	create_report_panel [-h   -help] [-long_help] [-folder] [-table] <panel_name>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-folder	Option to create folder
	-table	Option to create table
	<panel_name>	Name of the panel to create
<b>Description</b>	<p>Creates a new report panel with the specified name.</p> <p>If -table option is specified, a table is created.</p> <p>If -folder option is specified, a folder is created.</p> <p>The name must be the full path to the new report panel, such as "Fitter My Table". If the specified panel is created successfully, the corresponding panel id is returned.</p> <p>The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the</p>

	table of contents shows the path "Analysis & Synthesis  Summary". However, the corresponding full path used by this Tcl command is "Analysis & Synthesis  Analysis & Synthesis Summary".		
Example Usage	<pre> load_package report project_open chiptrip load_report  # Set folder name and id set folder      "My Folder" set folder_id [get_report_panel_id \$folder]  # Check if specified folder exists. If not, create it. if {\$folder_id == -1} {     set folder_id [create_report_panel -folder \$folder] }  # Set table name and id set table      "\$folder  My Table" set table_id [get_report_panel_id \$table]  # Check if specified table exists. If so, delete it. if {\$table_id != -1} {     delete_report_panel -id \$table_id }  # Create the specified table and get its id set table_id [create_report_panel -table \$table]  # Add Timing Analyzer Summary to the table add_row_to_table -id \$table_id {{Name} {Value}} add_row_to_table -id \$table_id {{Number of Registers} {100}}  # Save the changes to the report database save_report_database  unload_report project_close </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The database file was not found at: <string>.
	TCL_ERROR	1	ERROR: Report folder <string> already exists -- specify a different report folder name.
	TCL_ERROR	1	ERROR: Can't find folder: <string>. Specify an existing report folder name.
	TCL_ERROR	1	ERROR: Illegal color: <string>. Specify a color that is currently supported by add_row_to_table.
	TCL_ERROR	1	ERROR: The input report object is not a table to be the master table of master details object
	TCL_ERROR	1	ERROR: The parent folder is not master details type <string>.
	TCL_ERROR	1	ERROR: The master details object already has the master table
	TCL_ERROR	1	ERROR: The -orientation option is only supported for -master_folder panels.
	TCL_ERROR	1	ERROR: Options -table, -tcl_table, -sql_table and -folder are mutually exclusive -- specify only one of the options.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Report object is not a folder: <string>. Specify an existing report folder name.
continued...			

	TCL_ERROR	1	ERROR: Specify one of the options: -<string> or -<string>.
	TCL_ERROR	1	ERROR: Report not loaded for revision name: <string>. Type load_report to load the report.
	TCL_ERROR	1	ERROR: Report panel already exists: <string>. Specify a different report panel name.

### 3.1.33.3. delete\_report\_panel (::quartus::report)

The following table displays information for the delete\_report\_panel Tcl command:

Tcl Package and Version	Belongs to ::quartus::report on page 526		
Syntax	delete_report_panel [-h   -help] [-long_help] [-id <panel_id> ] [-name <panel_name> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-id <panel_id>	Id of panel to delete	
	-name <panel_name>	Name of panel to delete	
Description	<p>Deletes the report panel with the specified id or name. The panel can either be a report table or report folder.</p> <p>Using the panel id provides faster data access than using the panel name.</p> <p>Panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.</p> <p>Panel names support wildcards.</p> <p>The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis &amp; Synthesis Summary". However, the corresponding full path used by this Tcl command is "Analysis &amp; Synthesis Analysis &amp; Synthesis Summary".</p>		
Example Usage	<pre>load_package report project_open chiptrip load_report  # Set table name and id set table    "Fitter  My Table" set table_id [get_report_panel_id \$table]  # Delete the table if the it already exists if {\$table_id != -1} {     delete_report_panel -id \$table_id }  # Re-create the table create_report_panel -table \$table add_row_to_table -name \$table {{Name} {Value}} add_row_to_table -name \$table {{Number of Registers} {100}}  # This time, use table name instead of table id to delete it. delete_report_panel -name \$table  # Now, delete a folder set folder    "My Folder" set folder_id [get_report_panel_id \$folder]  # Delete it if the specified folder already exists</pre>		

continued...

*continued...*

	<pre> if {\$folder_id != -1} {     delete_report_panel -id \$folder_id }  # Save the changes to the report database save_report_database  unload_report project_close </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Found conflicting panel options <string> and <string>. Specify only one of the options: -name or -id. If the panel name was not specified, then an unknown option was detected.
	TCL_ERROR	1	ERROR: The delete_report_panel command is not allowed for this report panel. You cannot delete a report panel folder.
	TCL_ERROR	1	ERROR: Illegal panel id: <string>. Specify a legal panel id.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: The option specified <string> , is unknown. Recheck the command options.
	TCL_ERROR	1	ERROR: Specify one of the options: -name or -id.
	TCL_ERROR	1	ERROR: Can't find panel: <string>. Specify an existing report panel name.
	TCL_ERROR	1	ERROR: Report not loaded for revision name: <string>. Type load_report to load the report.

#### 3.1.33.4. get\_fitter\_resource\_usage (::quartus::report)

The following table displays information for the `get_fitter_resource_usage` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::report</a> on page 526	
Syntax	<code>get_fitter_resource_usage [-h   -help] [-long_help] [-alm] [-alut] [-available] [-io_pin] [-lab] [-le] [-mem_bit] [-percentage] [-reg] [-used] [-utilization]</code>	
Arguments	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-alm</code>	Get total adaptive logic modules
	<code>-alut</code>	Get total Combinational ALUTs
	<code>-available</code>	Get available resource summary
	<code>-io_pin</code>	Get total I/O pins
	<code>-lab</code>	Get total logic array blocks
	<code>-le</code>	Get total logic elements
	<code>-mem_bit</code>	Get total memory bits
	<code>-percentage</code>	Get used resource summary in percentage
continued...		

	-reg	Get total registers	
	-used	Get used resource summary	
	-utilization	Get total logic utilization	
Description			
	<p>Gets the Fitter resource usage results.</p> <p>You must use one of the following options: "-alut", "-reg", "-le", "-alm", "-lab", "-io_pin", "-mem_bit" or "-resource".</p> <p>If the above option is not "-resource", you may also optionally use one of the following options: "-used", "-available" or "-percentage".</p> <p>Option "-resource" takes resource name as parameter, which supports wildcards.</p>		
Example Usage			
	<pre>load_package report project_open chiptrip load_report  # Shortcut of get_fitter_resource_usage command set cmd      get_fitter_resource_usage  # Get total registers, logic elements, and DSP block 9-bit elements. set registers [\$cmd -reg] set alms      [\$cmd -alm] set io_pin    [\$cmd -io_pin -available] set mem_bit   [\$cmd -mem_bit -percentage] set dsp       [\$cmd -resource "DSP block 9*"] puts "Registers usage: \$registers" puts "Total used ALMs: \$alms" puts "Total available I/O pins: \$io_pin" puts "Total used memory bits in percentage: \${mem_bit}%" puts "DSP block 9-bit elements: \$dsp"  unload_report project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Command requires one of the following options: -alut, -reg, -le, -alm, -lab, -io_pin, mem_bit or -resource. Specify one of the options.
	TCL_ERROR	1	ERROR: Options -used, -available and -percentage can't be used together. Specify either one or none of the options.
	TCL_ERROR	1	ERROR: Option -resource was used with option -used, -available or -percentage. Use option -resource only.
	TCL_ERROR	1	ERROR: Can't find panel: <string>. Make sure the project was compiled by quartus_fit and the panel was not deleted.

### 3.1.33.5. get\_number\_of\_columns (::quartus::report)

The following table displays information for the get\_number\_of\_columns Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::report on page 526	
<b>Syntax</b>	get_number_of_columns [-h   -help] [-long_help] [-id <table_id> ] [-name <table_name> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-id <table_id>	Id of panel from which to get data
continued...		

	-name <table_name>		Name of panel from which to get data
<b>Description</b>	<p>Returns the number of columns for the specified panel.</p> <p>Using the panel id provides faster data access than using the panel name.</p> <p>Panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.</p> <p>Panel names support wildcards.</p> <p>The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis &amp; Synthesis Summary". However, the corresponding full path used by this Tcl command is "Analysis &amp; Synthesis Analysis &amp; Synthesis Summary".</p>		
<b>Example Usage</b>	<pre>## Loop through a panel row and print out all its element information  load_package report project_open chiptrip load_report  # Set panel name and id set panel {*Input Pins} set id [get_report_panel_id \$panel] if {\$id == -1} {     error( "Panel not found") }  # Get the number of columns set col_cnt [get_number_of_columns -id \$id]  # Set row name and get row index set rname {*clk1*} set rindex [get_report_panel_row_index -id \$id \$rname] set rname [get_report_panel_data -row \$rindex -col 0 -id \$id]  puts "\[Input Pins - \$rname\]" for {set i 1} {\$i &lt; \$col_cnt} {incr i} {     set result [get_report_panel_data -row 0 -col \$i -id \$id]: "     append result [get_report_panel_data -row \$rindex -col \$i -id \$id]     puts \$result }  unload_report project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Report automatically reloaded because it was not up-to-date after use of Tcl command execute_flow or execute_module (which belong to ::quartus::flow package). No action is required.
	TCL_ERROR	1	ERROR: Can't find the top-level panel. Make sure the loaded report is not empty. You can run a successful compilation to rebuild the report.
	TCL_ERROR	1	ERROR: Can't find panel: <string>. Specify an existing report panel name.
	TCL_ERROR	1	ERROR: Report not loaded for revision name: <string>. Type load_report to load the report.
	TCL_ERROR	1	ERROR: Can't access report panel. Use this command only for report panels with rows or columns.

### 3.1.33.6. get\_number\_of\_rows (::quartus::report)

The following table displays information for the get\_number\_of\_rows Tcl command:

Tcl Package and Version	Belongs to ::quartus::report on page 526		
Syntax	get_number_of_rows [-h   -help] [-long_help] [-id <table_id> ] [-name <table_name> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-id <table_id>	Id of panel from which to get data	
	-name <table_name>	Name of panel from which to get data	
Description	<p>Returns the number of rows for the specified panel.</p> <p>Using the panel id provides faster data access than using the panel name.</p> <p>Panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.</p> <p>Panel names support wildcards.</p> <p>The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis &amp; Synthesis  Summary". However, the corresponding full path used by this Tcl command is "Analysis &amp; Synthesis  Analysis &amp; Synthesis Summary".</p>		
Example Usage	<pre>## Loop through a panel and print out all its row information  load_package report project_open chiptrip load_report  # Set panel name and id set panel    {*Fitter Settings} set id       [get_report_panel_id \$panel]  # Get the number of rows set row_cnt [get_number_of_rows -id \$id]  for {set i 0} {\$i &lt; \$row_cnt} {incr i} {     puts [get_report_panel_row -row \$i -id \$id] }  unload_report project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Report automatically reloaded because it was not up-to-date after use of Tcl command execute_flow or execute_module (which belong to ::quartus::flow package). No action is required.
	TCL_ERROR	1	ERROR: Can't find the top-level panel. Make sure the loaded report is not empty. You can run a successful compilation to rebuild the report.
continued...			

TCL_ERROR	1	ERROR: Can't find panel: <string>. Specify an existing report panel name.
TCL_ERROR	1	ERROR: Report not loaded for revision name: <string>. Type load_report to load the report.
TCL_ERROR	1	ERROR: Can't access report panel. Use this command only for report panels with rows or columns.

### 3.1.33.7. get\_report\_panel\_column\_index (::quartus::report)

The following table displays information for the `get_report_panel_column_index` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::report</code> on page 526	
<b>Syntax</b>	<code>get_report_panel_column_index [-h   -help] [-long_help] [-id &lt;table_id&gt; ] [-name &lt;table_name&gt; ] &lt;col_name&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-id &lt;table_id&gt;</code>	Id of panel from which to get column index
	<code>-name &lt;table_name&gt;</code>	Name of panel from which to get column index
	<code>&lt;col_name&gt;</code>	Column name
<b>Description</b>	<p>Gets the column index of the specified panel column name.</p> <p>Column name refers to the specified name in the header row. The column index is a non-negative integer for an existing column. The column index is -1 if the column name is not found in the panel.</p> <p>Using the column index and panel id provides faster data access than using column name and panel name.</p> <p>Column indices and panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.</p> <p>Column and panel names support wildcards.</p> <p>The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of content shows the path "Analysis &amp; Synthesis Summary". However, the corresponding full path used by this Tcl command is "Analysis &amp; Synthesis Analysis &amp; Synthesis Summary".</p>	
<b>Example Usage</b>	<pre>load_package report project_open chiptrip load_report  # Set panel name and id set panel {*Input Pins} set id [get_report_panel_id \$panel]  # Set column name and index set cname {Pin #} set cindex [get_report_panel_column_index -id \$id \$cname]  # Get data out of the specified panel set clock [get_report_panel_data -id \$id -row_name clk1 -col \$cindex] set enable [get_report_panel_data -id \$id -row_name enable -col \$cindex]  # Output results puts "\$cname of clock: \$clock" puts "\$cname of enable: \$enable"</pre>	

continued...

	unload_report project_close		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.33.8. get\_report\_panel\_data (::quartus::report)

The following table displays information for the get\_report\_panel\_data Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::report on page 526	
<b>Syntax</b>	get_report_panel_data [-h   -help] [-long_help] [-col <column> ] [-col_name <column_name> ] [-id <table_id> ] [-name <table_name> ] [-row <row> ] [-row_name <row_name> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-col <column>	column (or X) coordinate
	-col_name <column_name>	column (or X) name
	-id <table_id>	id of panel from which to get data
	-name <table_name>	Name of panel from which to get data
	-row <row>	row (or Y) coordinate
	-row_name <row_name>	row (or Y) name
<b>Description</b>	<p>Returns non-empty data for the specified row and column of the specified panel. If the data is empty or if the row, column, or panel do not exist, an error will be generated. To properly handle the error, make sure to catch the result as in the following example:</p> <pre>if [catch {set data [get_report_panel_data ...]} result] {     puts "No data found" } else {     puts "Got \$data" }</pre> <p>Using the panel id and row and column indices provides faster data access than using panel, row, and column names.</p> <p>Panel ids and row and column indices that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.</p> <p>Panel, row, and panel names support wildcards.</p> <p>The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis &amp; Synthesis Summary". However, the corresponding full path used by this Tcl command is "Analysis &amp; Synthesis Analysis &amp; Synthesis Summary".</p>	
<b>Example Usage</b>	<pre>load_package report project_open chiptrip load_report  # Set panel name and id set panel {Flow Settings}</pre>	

*continued...*

	<pre> set id      [get_report_panel_id \$panel] # Set row name set rname {Revision Name}  # Get row 2 - column 1 data get_report_panel_data -row 2 -col 1 -id \$id # Get row {Revision Name} - column 1 data get_report_panel_data -row_name \$rname -col 1 -id \$id # Get row {Revision Name} - column {Setting} data get_report_panel_data -row_name \$rname -col_name Setting -id \$id # If unsure the case of a row or column name, use glob-style pattern get_report_panel_data -row_name {[Rr]evision*} -col_name {[Ss]etting} -id \$id  unload_report project_close </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Report automatically reloaded because it was not up-to-date after use of Tcl command <code>execute_flow</code> or <code>execute_module</code> (which belong to <code>::quartus::flow</code> package). No action is required.
	TCL_ERROR	1	ERROR: Found conflicting column options. Specify either the <code>-col</code> or <code>-col_name</code> option.
	TCL_ERROR	1	ERROR: Found conflicting row options. Specify either the <code>-row</code> or <code>-row_name</code> option.
	TCL_ERROR	1	ERROR: Table is empty. Add rows to the table before accessing its data.
	TCL_ERROR	1	ERROR: Illegal column name: <code>&lt;string&gt;</code> .
	TCL_ERROR	1	ERROR: Illegal column number: <code>&lt;string&gt;</code> . Specify a legal column number from <code>&lt;string&gt;</code> to <code>&lt;string&gt;</code> .
	TCL_ERROR	1	ERROR: Illegal row name: <code>&lt;string&gt;</code> .
	TCL_ERROR	1	ERROR: Illegal row number: <code>&lt;string&gt;</code> . Specify a legal row number from <code>&lt;string&gt;</code> to <code>&lt;string&gt;</code> .
	TCL_ERROR	1	ERROR: No column option specified.
	TCL_ERROR	1	ERROR: Can't retrieve data for row and column number. Specify a legal row and column number for the command <code>get_report_panel_data</code> .
	TCL_ERROR	1	ERROR: No row option specified.
	TCL_ERROR	1	ERROR: Can't access report panel. Use this command only for report panels with rows or columns.

### 3.1.33.9. get\_report\_panel\_id (::quartus::report)

The following table displays information for the `get_report_panel_id` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::report</a> on page 526	
<b>Syntax</b>	<code>get_report_panel_id [-h   -help] [-long_help] &lt;name&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>&lt;name&gt;</code>	Name of panel for which to get id
<b>continued...</b>		

<b>Description</b>	<p>Gets the id of a panel with the specified name.</p> <p>The panel id is a non-negative integer for an existing panel. If the specified panel cannot be found, the id is -1.</p> <p>Using the panel id provides faster data access than using the panel name.</p> <p>You can use the "get_report_panel_id" command to check for the existence of a panel. (Refer to the example under the "get_report_panel_id" command.)</p> <p>Panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.</p> <p>Panel names support wildcards.</p> <p>The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis &amp; Synthesis Summary". However, the corresponding full path used by this Tcl command is "Analysis &amp; Synthesis Analysis &amp; Synthesis Summary".</p>		
<b>Example Usage</b>	<pre>load_package report project_open chiptrip load_report  # Set panel name set panel {Fitter Fitter Settings} # Get the panel id set id [get_report_panel_id \$panel]  if {\$id != -1} {     # If panel exists, add a row to it     add_row_to_table -id \$id {{New Field} Yes No}     # Save the changes to the report database     save_report_database } else {     # Otherwise print an error message     puts "Error: Table \$panel does not exist." }  unload_report project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.33.10. get\_report\_panel\_names (::quartus::report)

The following table displays information for the get\_report\_panel\_names Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::report</a> on page 526		
<b>Syntax</b>	get_report_panel_names [-h   -help] [-long_help] [-filter_name <filter_name> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-filter_name <filter_name>	filter the returned list to match the specified panel names	
<b>Description</b>	<div>Returns a list of panel names for the current report.</div> <div>The table of contents portion of the Compilation Report window shows short panel names for better readability.</div>		
continued...			

*continued...*

	<p>However, each panel name returned by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis &amp; Synthesis Summary". However, the corresponding full path returned by this Tcl command is "Analysis &amp; Synthesis Analysis &amp; Synthesis Summary".</p>		
<b>Example Usage</b>	<pre>## Load report database and write Timing Analyzer Summary ## panel to file in HTML format  load_package report project_open chiptrip load_report  # Set panel name set fmax_panel "Timing Analyzer Summary"  # Iterate through all the accessible panels foreach panel [get_report_panel_names] {     # If find the panel '*Timing Analyzer Summary',     # write its content to file fmax.htm     if {[string match "\$fmax_panel" \$panel] == 1} {         write_report_panel -file fmax.htm -html \$panel         break     } }  unload_report project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Report automatically reloaded because it was not up-to-date after use of Tcl command execute_flow or execute_module (which belong to ::quartus::flow package). No action is required.
	TCL_ERROR	1	ERROR: Illegal report panel type.
	TCL_ERROR	1	ERROR: Can't find panel: <string>. Specify an existing report panel name.
	TCL_ERROR	1	ERROR: Report not loaded for revision name: <string>. Type load_report to load the report.

### 3.1.33.11. get\_report\_panel\_row (::quartus::report)

The following table displays information for the get\_report\_panel\_row Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::report on page 526	
<b>Syntax</b>	<pre>get_report_panel_row [-h   -help] [-long_help] [-id &lt;table_id&gt; ] [-name &lt;table_name&gt; ] [-row &lt;row&gt; ] [-row_name &lt;row_name&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-id <table_id>	Id of panel from which to get data
	-name <table_name>	Name of panel from which to get data
	-row <row>	Row (or Y) coordinate
	-row_name <row_name>	Row (or Y) name
continued...		

<b>Description</b>	<p>Reports data of the specified panel row.</p> <p>Using the panel id and row index provides faster data access than using panel name and row name, respectively.</p> <p>Panel ids and row indices that you have cached may become outdated or invalid if the report gets unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.</p> <p>Panel and row names support wildcards.</p> <p>The table of content portion of the UI Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the UI Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of content shows the path "Analysis &amp; Synthesis Summary". However, the corresponding full path used by this Tcl command is "Analysis &amp; Synthesis Analysis &amp; Synthesis Summary".</p>		
<b>Example Usage</b>	<pre>load_package report project_open chiptrip load_report  # Set panel name and id set panel {Flow Settings} set id [get_report_panel_id \$panel] # Set row name set rname {Revision Name}  # Get row {Revision Name} data (use panel id) get_report_panel_row -row_name \$rname -id \$id # Get row 2 data (use panel id) get_report_panel_row -row 2 -id \$id # Get row 3 data (use panel name) get_report_panel_row -row 3 -name \$panel  ## Get the last row data set row_cnt [get_number_of_rows -id \$id] set last_rindex [expr \$row_cnt - 1] get_report_panel_row -row \$last_rindex -id \$id  unload_report project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Report automatically reloaded because it was not up-to-date after use of Tcl command execute_flow or execute_module (which belong to ::quartus::flow package). No action is required.
	TCL_ERROR	1	ERROR: Found conflicting row options. Specify either the -row or -row_name option.
	TCL_ERROR	1	ERROR: Table is empty. Add rows to the table before accessing its data.
	TCL_ERROR	1	ERROR: Illegal row name: <string>.
	TCL_ERROR	1	ERROR: Illegal row number: <string>. Specify a legal row number from <string> to <string>.
	TCL_ERROR	1	ERROR: No row option specified.
	TCL_ERROR	1	ERROR: The option specified <string>, is unknown. Recheck the command options.
	TCL_ERROR	1	ERROR: Can't access report panel. Use this command only for report panels with rows or columns.

### 3.1.33.12. get\_report\_panel\_row\_index (::quartus::report)

The following table displays information for the `get_report_panel_row_index` Tcl command:

Tcl Package and Version	Belongs to ::quartus::report on page 526		
Syntax	get_report_panel_row_index [-h   -help] [-long_help] [-id <table_id> ] [-name <table_name> ] <row_name>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-id <table_id>	Id of panel from which to get row index	
	-name <table_name>	Name of panel from which to get row index	
	<row_name>	Row name	
Description	<p>Gets the row index of the specified panel row name.</p> <p>Row name refers to the first element content of the specified row. The row index is a non-negative integer for an existing row. Row index is -1 if the row name is not found in the panel.</p> <p>Using the row index and panel id provides faster data access than using row name and panel name.</p> <p>Row indices and panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.</p> <p>Row and panel names support wildcards.</p> <p>The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis &amp; Synthesis Summary". However, the corresponding full path used by this Tcl command is "Analysis &amp; Synthesis Analysis &amp; Synthesis Summary".</p>		
Example Usage	<pre>load_package report project_open chiptrip load_report  # Set panel name and id set panel    {*Input Pins} set id       [get_report_panel_id \$panel]  # Set row name and index set rname    {[Cc]lk1} set rindex   [get_report_panel_row_index -id \$id \$rname]  # Get data out of the specified panel set pc_str   [get_report_panel_data -id \$id -row 0 -col 1] set pin_cnt  [get_report_panel_data -id \$id -row \$rindex -col 1] set iob_str  [get_report_panel_data -id \$id -row 0 -col 2] set io_bank  [get_report_panel_data -id \$id -row \$rindex -col 2]  # Output results puts "\$pc_str: \$pin_cnt" puts "\$iob_str: \$io_bank"  unload_report project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.33.13. load\_report (::quartus::report)

The following table displays information for the load\_report Tcl command:

Tcl Package and Version	Belongs to ::quartus::report on page 526		
Syntax	load_report [-h   -help] [-long_help] [-simulator]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-simulator	Option to load the Simulation Report. If this option isn't specified, the Compilation Report is loaded instead.	
Description	<p>By default, loads the Compilation Report for the current revision or the specified revision name. If the -simulator option is specified, loads the Simulation Report instead.</p> <p>After the report is loaded or reloaded, the cached panel ids, and row and column indices may become outdated or invalid. Intel recommends that you update them before using them.</p>		
Example Usage	<pre># Load report package load_package report # Open chiptrip project project_open chiptrip # Load the current revision report load_report  # Set panel name and id set panel {Fitter  Fitter Summary} set id [get_report_panel_id \$panel]  # Get total registers set rname {Total [Rr]registers} set rindex [get_report_panel_row_index -id \$id \$rname] set rname [get_report_panel_data -id \$id -row \$rindex -col 0] set data [get_report_panel_data -id \$id -row \$rindex -col 1] puts "\$rname: \$data"  # Get total pins set rname {Total [Pp]ins} set rindex [get_report_panel_row_index -id \$id \$rname] set rname [get_report_panel_data -id \$id -row \$rindex -col 0] set data [get_report_panel_data -id \$id -row \$rindex -col 1] puts "\$rname: \$data"  # Unload the report unload_report # Close the project project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't load report for revision: <string>. A different, active revision already exists: <string>. To specify another active revision name, type set_current_revision <string>.
	TCL_ERROR	1	ERROR: Can't find active revision. Specify an active revision name using set_current_revision <string>.
	TCL_ERROR	1	ERROR: Can't find active revision. Specify an active revision name using set_current_revision <revision name>.
	TCL_ERROR	1	ERROR: Revision name does not exist: <string>. Run Analysis & Synthesis (quartus_map) with the specified revision name before using this Tcl command.
	TCL_ERROR	1	ERROR: Compilation database is newer than the last call to create_timing_netlist. Use the delete_timing_netlist Tcl command before using <string>.
continued...			

	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Can't load report data for revision name: <i>&lt;string&gt;</i> . Make sure the report database exists for the specified revision name.
	TCL_ERROR	1	ERROR: Existing report was not unloaded. Ensure that your load_report commands have matching unload_report commands.

### 3.1.33.14. read\_xml\_report (::quartus::report)

The following table displays information for the read\_xml\_report Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::report</a> on page 526		
<b>Syntax</b>	read_xml_report [-h   -help] [-long_help] <filename>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<filename>	Name of XML Report Database File from which to read	
<b>Description</b>	Creates the current Compilation Report from the specified XML Report Database File (.xml).		
<b>Example Usage</b>	<pre># Set project name set project_name "chiptrip"  load_package report project_open \$project_name  # Read XML Report Database File (.xml) read_xml_report \$project_name.xml  load_report  # Get all the panel names puts {All Report Panel Names:} puts [get_report_panel_names]  unload_report project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Report read from XML Report Database File: <string>. No action is required.
	TCL_ERROR	1	ERROR: Can't read XML Report Database File: <string> . Make sure that the file exists and does not contain syntax errors.

### 3.1.33.15. refresh\_report\_window (::quartus::report)

The following table displays information for the refresh\_report\_window Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::report</a> on page 526
<b>Syntax</b>	refresh_report_window [-h   -help] [-long_help]
<i>continued...</i>	

<b>Arguments</b>	-h   -help		Short help
	-long_help		Long help with examples and possible return values
<b>Description</b>	Refresh the Report Window.		
<b>Example Usage</b>	refresh_report_window		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.33.16. save\_report\_database (::quartus::report)

The following table displays information for the save\_report\_database Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::report on page 526		
<b>Syntax</b>	save_report_database [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help		Short help
	-long_help		Long help with examples and possible return values
<b>Description</b>	Saves the report database, including any new report panel.		
<b>Example Usage</b>	<pre>load_package report project_open chiptrip load_report  # Set panel name and id set panel {Fitter Fitter Settings} set id [get_report_panel_id \$panel]  # If panel exists, add a row to it. Otherwise, print an error message. if {\$id != -1} {     add_row_to_table -id \$id {{New Field} Yes No}     # Save the changes to the report database     save_report_database } else {     puts "Error: Table \$panel does not exist." }  unload_report project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Report not loaded for revision name: <string>. Type load_report to load the report.

### 3.1.33.17. unload\_report (::quartus::report)

The following table displays information for the unload\_report Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::report</a> on page 526
<b>Syntax</b>	unload_report [-h   -help] [-long_help]
continued...	

<b>Arguments</b>	-h   -help			Short help
	-long_help			Long help with examples and possible return values
<b>Description</b>	<p>Unloads the report for the current revision or the specified revision name.</p> <p>After the report is loaded or reloaded, the cached panel ids, and row and column indices, may become outdated or invalid. Intel recommends that you update them before using them.</p>			
<b>Example Usage</b>	<pre># Load report package load_package report # Open chiptrip project project_open chiptrip # Load the current revision report load_report  # Set panel name and id set panel {Fitter Fitter Summary} set id [get_report_panel_id \$panel]  # Get total registers set rname {Total [Rr]egisters} set rindex [get_report_panel_row_index -id \$id \$rname] set rname [get_report_panel_data -id \$id -row \$rindex -col 0] set data [get_report_panel_data -id \$id -row \$rindex -col 1] puts "\$rname: \$data"  # Get total pins set rname {Total [Pp]ins} set rindex [get_report_panel_row_index -id \$id \$rname] set rname [get_report_panel_data -id \$id -row \$rindex -col 0] set data [get_report_panel_data -id \$id -row \$rindex -col 1] puts "\$rname: \$data"  # Unload the report unload_report # Close the project project_close</pre>			
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>	
	TCL_OK	0	INFO: Operation successful	
	TCL_ERROR	1	ERROR: Can't load report for revision: <string>. A different, active revision already exists: <string>. To specify another active revision name, type set_current_revision <string>.	
	TCL_ERROR	1	ERROR: Can't find active revision. Specify an active revision name using set_current_revision <string>.	
	TCL_ERROR	1	ERROR: Can't find active revision. Specify an active revision name using set_current_revision <revision name>.	
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.	

### 3.1.33.18. write\_report\_panel (::quartus::report)

The following table displays information for the write\_report\_panel Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::report on page 526		
<b>Syntax</b>	write_report_panel [-h   -help] [-long_help] [-append] -file <output file name> [-html] [-id <table_id> ] [-name <table_name> ] [-xml] [ <name> ]		
<b>Arguments</b>	-h   -help		Short help
	-long_help		Long help with examples and possible return values

**continued...**

	-append	If output is sent to an ASCII file, this option appends the result to that file. Otherwise, the file will be overwritten. This option is not supported for HTML or XML files.	
	-file <output file name>	Name of output file to be generated	
	-html	Option to generate output file in HTML format	
	-id <table_id>	id of panel from which to get data	
	-name <table_name>	Name of panel from which to get data	
	-xml	Option to generate output file in XML format	
	<name>	Name of panel from which to get data	
Description	<p>Writes data from the specified report panel to the specified output file. If the "-html" option is specified, the output file is generated in HTML format. If the "-xml" option is specified, the output file is generated in XML format. Otherwise, the output file is generated in ASCII format.</p> <p>For ASCII formatted files, "-append" preserves the existing file and adds the panel to the end. Otherwise, the file is overwritten. HTML and XML files are always overwritten.</p> <p>Using the panel id provides faster data access than using the panel name.</p> <p>Panel ids that you have cached may become outdated or invalid if the report is unloaded or reloaded. This error occurs after compilation or with calls to the "project_close", "unload_report", and "load_report" commands.</p> <p>Panel names support wildcards.</p> <p>The table of contents portion of the Compilation Report window shows short panel names for better readability. However, the panel name used by this command is the full panel name as shown in the right-hand side frame of the Compilation Report window or the .rpt file of the corresponding command-line executable. For example, the table of contents shows the path "Analysis &amp; Synthesis  Summary". However, the corresponding full path used by this Tcl command is "Analysis &amp; Synthesis  Analysis &amp; Synthesis Summary".</p>		
Example Usage	<pre>## Load report database and write Timing Analyzer Summary ## panel to file in HTML format  load_package report project_open chiptrip load_report  # Set panel name and id set panel "**Timing Analyzer Summary" set id [get_report_panel_id \$panel]  # If the specified panel exists, write it to # fmax.htm and fmax.xml. # Otherwise, print out an error message if {\$id != -1} {     write_report_panel -file fmax.htm -html -id \$id     write_report_panel -file fmax.xml -xml -id \$id } else {     puts "Error: report panel could not be found." }  unload_report project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Successfully generated HTML-Format Report File: <string>
	TCL_OK	0	INFO: Successfully generated output file: <string>
continued...			

TCL_OK	0	INFO: Successfully generated XML-Format Report File: <i>&lt;string&gt;</i>
TCL_OK	0	INFO: Report automatically reloaded because it was not up-to-date after use of Tcl command <code>execute_flow</code> or <code>execute_module</code> (which belong to <code>::quartus::flow</code> package). No action is required.
TCL_ERROR	1	ERROR: Can't create or overwrite file: <i>&lt;string&gt;</i> . Specify a file name that has write permission.
TCL_ERROR	1	ERROR: Can't find the top-level panel. Make sure the loaded report is not empty. You can run a successful compilation to rebuild the report.
TCL_ERROR	1	ERROR: Can't find panel: <i>&lt;string&gt;</i> . Specify an existing report panel name.
TCL_ERROR	1	ERROR: Report not loaded for revision name: <i>&lt;string&gt;</i> . Type <code>load_report</code> to load the report.

### 3.1.33.19. `write_xml_report` (`::quartus::report`)

The following table displays information for the `write_xml_report` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::report</a> on page 526		
<b>Syntax</b>	write_xml_report [-h   -help] [-long_help] <filename>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<filename>	Name of XML Report Database File to which to write	
<b>Description</b>	Writes the current Compilation Report or Simulation Report to the specified XML Report Database File (.xml).		
<b>Example Usage</b>	<pre>load_package report  set project_name "chiptrip" project_open \$project_name  ## Create XML Report Database File (.xml) load_report file delete -force report.xml puts [write_xml_report report.xml] unload_report  # Close project project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Report written to XML Report Database File: <string>. No action is required.
	TCL_ERROR	1	ERROR: Can't write XML Report Database File: <string> -- report does not exist. Make sure that an existing report is loaded. Type load_report -h for more information.

### 3.1.34. ::quartus::sdc

The following table displays information for the **::quartus::sdc** Tcl package:

<b>Tcl Package and Version</b>	::quartus::sdc 1.5
<b>Description</b>	<p>Synopsys Design Constraint (SDC) format is used to specify the design intent, including the timing and area constraints of the design. The Timing Analyzer only implements the set of SDC commands required to specify the timing constraints of the design. For area constraints, the QSF file should be used.</p> <p>This package implements the SDC Spec Version 1.5 (June 2005).</p> <p>Any command in this package can be specified in a Timing Analyzer SDC file.</p>
<b>Availability</b>	<p>This package is loaded by default in the following executable:</p> <p style="text-align: center;">quartus_sta</p> <p>This package is available for loading in the following executable:</p> <p style="text-align: center;">quartus_fit</p>
<b>Tcl Commands</b>	<p>all_clocks (::quartus::sdc) on page 548</p> <p>all_inputs (::quartus::sdc) on page 549</p> <p>all_outputs (::quartus::sdc) on page 549</p> <p>all_registers (::quartus::sdc) on page 550</p> <p>create_clock (::quartus::sdc) on page 550</p> <p>create_generated_clock (::quartus::sdc) on page 551</p> <p>derive_clocks (::quartus::sdc) on page 553</p> <p>get_cells (::quartus::sdc) on page 554</p> <p>get_clocks (::quartus::sdc) on page 555</p> <p>get_nets (::quartus::sdc) on page 556</p> <p>get_pins (::quartus::sdc) on page 557</p> <p>get_ports (::quartus::sdc) on page 558</p> <p>remove_clock_groups (::quartus::sdc) on page 559</p> <p>remove_clock_latency (::quartus::sdc) on page 560</p> <p>remove_clock_uncertainty (::quartus::sdc) on page 561</p> <p>remove_disable_timing (::quartus::sdc) on page 561</p> <p>remove_input_delay (::quartus::sdc) on page 562</p> <p>remove_output_delay (::quartus::sdc) on page 563</p> <p>reset_design (::quartus::sdc) on page 563</p> <p>set_clock_groups (::quartus::sdc) on page 564</p> <p>set_clock_latency (::quartus::sdc) on page 565</p> <p>set_clock_uncertainty (::quartus::sdc) on page 566</p> <p>set_disable_timing (::quartus::sdc) on page 567</p> <p>set_false_path (::quartus::sdc) on page 568</p> <p>set_input_delay (::quartus::sdc) on page 570</p> <p>set_input_transition (::quartus::sdc) on page 572</p> <p>set_max_delay (::quartus::sdc) on page 572</p> <p>set_max_time_borrow (::quartus::sdc) on page 574</p> <p>set_min_delay (::quartus::sdc) on page 575</p> <p>set_multicycle_path (::quartus::sdc) on page 576</p> <p>set_output_delay (::quartus::sdc) on page 578</p>

#### 3.1.34.1. all\_clocks (::quartus::sdc)

The following table displays information for the **all\_clocks** Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc</a> on page 548	
<b>Syntax</b>	all_clocks [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<b>Description</b>	Returns a collection of all previously defined clocks in the design.	
continued...		

<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist foreach_in_collection clk [all_clocks] {     puts [get_clock_info -name \$clk] } delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.2. all\_inputs (::quartus::sdc)

The following table displays information for the all\_inputs Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc</a> on page 548		
<b>Syntax</b>	all_inputs [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Returns a collection of all input ports in the design.		
<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist foreach_in_collection in [all_inputs] {     puts [get_port_info -name \$in] } set_input_delay -clock clock1 2.0 [all_inputs] delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.3. all\_outputs (::quartus::sdc)

The following table displays information for the all\_outputs Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc</a> on page 548	
<b>Syntax</b>	all_outputs [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<b>Description</b>	Returns a collection of all output ports in the design.	
<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist foreach_in_collection out [all_outputs] {     puts [get_port_info -name \$out] }</pre>	
continued...		

	<pre>set_output_delay -clock clock1 2.0 [all_outputs] delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.4. all\_registers (::quartus::sdci)

The following table displays information for the all\_registers Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdci</a> on page 548		
<b>Syntax</b>	all_registers [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Returns a collection of all registers in the design.		
<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist foreach_in_collection reg [all_registers] {     puts [get_register_info -name \$reg] } report_timing -from [all_registers] -to [all_registers] delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.5. create\_clock (::quartus::sdci)

The following table displays information for the create\_clock Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc</a> on page 548	
<b>Syntax</b>	create_clock [-h   -help] [-long_help] [-add] [-name <i>&lt;clock_name&gt;</i> ] -period <i>&lt;value&gt;</i> [-waveform <i>&lt;edge_list&gt;</i> ] [ <i>&lt;targets&gt;</i> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-add	Adds clock to a node with an existing clock
	-name <i>&lt;clock_name&gt;</i>	Clock name of the created clock
	-period <i>&lt;value&gt;</i>	Speed of the clock in terms of clock period
	-waveform <i>&lt;edge_list&gt;</i>	List of edge values
	<i>&lt;targets&gt;</i>	List or collection of targets
continued...		

<b>Description</b>	<p>Defines a clock. If the -name option is not used, the clock name is the same as the first target in the list or collection. The clock name is used to refer to the clock in other commands.</p> <p>The -period option specifies the clock period. It is also possible to use this option to specify a frequency to define the clock period. This can be done by using -period option followed by either &lt;frequency&gt;MHz or "&lt;frequency&gt; MHz". However, this is a Timing Analyzer-only extension and makes the SDC syntax non-standard.</p> <p>The -waveform option specifies the rising and falling edges (duty cycle) of the clock, and is specified as a list of two time values: the first rising edge and the next falling edge. The rising edge must be within the range [0, period]. The falling edge must be within one clock period of the rising edge. The waveform defaults to (0, period/2).</p> <p>If a clock with the same name is already assigned to a given target, the create_clock command will overwrite the existing clock. If a clock with a different name exists on the given target, the create_clock command will be ignored unless the -add option is used. The -add option can be used to assign multiple clocks to a pin or port.</p> <p>If the target of the clock is internal (i.e. not an input port), the source latency is zero by default.</p> <p>If a clock is on a path after another clock, then it blocks or overwrites the previous clock from that point forward.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>		
<b>Example Usage</b>	<pre># Create a simple 10ns with clock with a 60% duty cycle create_clock -period 10 -waveform {0 6} -name clk [get_ports clk]  # Create a clock with a falling edge at 2ns, rising edge at 8ns, # falling at 12ns, etc. create_clock -period 10 -waveform {8 12} -name clk [get_ports clk]  # Assign two clocks to an input port that are switched externally create_clock -period 10 -name clk100Mhz [get_ports clk] create_clock -period 6.667 -name clk150Mhz -add [get_ports clk]  # Two ways to use MHz to define clock period (Timing Analyzer only) create_clock -period 250MHz -name clk250MHz [get_ports clk] create_clock -period "250 MHz" -name clk250MHz [get_ports clk]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.6. create\_generated\_clock (::quartus::sdc)

The following table displays information for the create\_generated\_clock Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc</a> on page 548		
<b>Syntax</b>	<pre>create_generated_clock [-h   -help] [-long_help] [-add] [-divide_by &lt;factor&gt; ] [-duty_cycle &lt;percent&gt; ] [-edge_shift &lt;shift_list&gt; ] [-edges &lt;edge_list&gt; ] [-invert] [-master_clock &lt;clock&gt; ] [-multiply_by &lt;factor&gt; ] [-name &lt;clock_name&gt; ] [-offset &lt;time&gt; ] [-phase &lt;degrees&gt; ] [-source &lt;clock_source&gt; ] [ &lt;targets&gt; ]</pre>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-add</code>	Add clock to existing clock node	
<i>continued...</i>			

	<table> <tr> <td>-divide_by &lt;factor&gt;</td><td>Division factor</td></tr> <tr> <td>-duty_cycle &lt;percent&gt;</td><td>Specifies the duty cycle as a percentage of the clock period--accepts floating point values</td></tr> <tr> <td>-edge_shift &lt;shift_list&gt;</td><td>List of edge shifts</td></tr> <tr> <td>-edges &lt;edge_list&gt;</td><td>List of edge values</td></tr> <tr> <td>-invert</td><td>Invert the clock waveform</td></tr> <tr> <td>-master_clock &lt;clock&gt;</td><td>Specifies clock of the source node</td></tr> <tr> <td>-multiply_by &lt;factor&gt;</td><td>Multiplication factor</td></tr> <tr> <td>-name &lt;clock_name&gt;</td><td>Name of generated clock</td></tr> <tr> <td>-offset &lt;time&gt;</td><td>Specifies the offset as an absolute time shift</td></tr> <tr> <td>-phase &lt;degrees&gt;</td><td>Specifies the phase shift in degrees</td></tr> <tr> <td>-source &lt;clock_source&gt;</td><td>Source node for the generated clock</td></tr> <tr> <td>&lt;targets&gt;</td><td>List or collection of targets</td></tr> </table>	-divide_by <factor>	Division factor	-duty_cycle <percent>	Specifies the duty cycle as a percentage of the clock period--accepts floating point values	-edge_shift <shift_list>	List of edge shifts	-edges <edge_list>	List of edge values	-invert	Invert the clock waveform	-master_clock <clock>	Specifies clock of the source node	-multiply_by <factor>	Multiplication factor	-name <clock_name>	Name of generated clock	-offset <time>	Specifies the offset as an absolute time shift	-phase <degrees>	Specifies the phase shift in degrees	-source <clock_source>	Source node for the generated clock	<targets>	List or collection of targets
-divide_by <factor>	Division factor																								
-duty_cycle <percent>	Specifies the duty cycle as a percentage of the clock period--accepts floating point values																								
-edge_shift <shift_list>	List of edge shifts																								
-edges <edge_list>	List of edge values																								
-invert	Invert the clock waveform																								
-master_clock <clock>	Specifies clock of the source node																								
-multiply_by <factor>	Multiplication factor																								
-name <clock_name>	Name of generated clock																								
-offset <time>	Specifies the offset as an absolute time shift																								
-phase <degrees>	Specifies the phase shift in degrees																								
-source <clock_source>	Source node for the generated clock																								
<targets>	List or collection of targets																								
<b>Description</b>	<p>Defines an internally generated clock. If -name is not specified, the clock name is the same as the first target in the list or collection. The clock name is used to refer to the clock in other commands.</p> <p>If a clock with the same name is already assigned to a given target, the create_generated_clock command overwrites the existing clock. If a clock with a different name exists on the given target, the create_generated_clock command is ignored unless the -add option is used. The -add option can be used to assign multiple clocks to a pin or port, and is recommended be used with -master_clock option.</p> <p>The source of the generated clock, specified by -source, is a port, pin, register, or net in the design. All waveform modifications are relative to this point. If more than one clock feeds the source node, the -master_clock option must be used to specify which clock to modify.</p> <p>The source latency of the generated clock is based on the clock network of the generated clock, and not the clock network of the node specified using -source. This latency is added to any source latency of the master clock.</p> <p>If no target is specified, the clock is treated as a virtual clock. In that case, the source latency of the generated clock will be equal to the source latency of the master clock, plus any added latency specified with set_clock_latency.</p> <p>The -divide_by, -multiply_by, -invert, -duty_cycle, -edges, and -edge_shift options modify the waveform relative to the waveform at the source node.</p> <p>Clock division and multiplication, using -divide_by and -multiply_by, is performed relative to the first rising edge. Clock division is based on edges in the master clock waveform, and scaled if the division is an odd number. Use the -duty_cycle option to specify the new duty cycle for clock multiplication. Use the -phase option to specify any phase shift relative to the new clock period. Use the -offset option to specify an arbitrary offset or time shift. Use the -invert option to invert the generated waveform. The -phase and -duty_cycle options may be specified as a decimal value (e.g. 22.5) or as a ratio of two numbers (e.g. 45/2). The latter form may improve Timing Analyzer accuracy when detecting relationships between related clocks.</p> <p>Clock generation can also be specified with the -edges and -edge_shift options. The -edges option accepts a list of three numbers specifying the master clock edges to use for the first rising edge, the next falling edge, and next rising edge. Edges of the master clock are labeled according to the first rising edge (1), next falling edge (2), next rising edge (3), etc. For example, a basic clock divider can be specified equivalently with -divide_by 2 or -edges {1 3 5}. The -edge_shift option accepts a list of three time values, the amount to shift each of</p>																								

continued...

	<p>the three edges.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for <code>use_timing_analyzer_style_escaping</code> for details.</p>		
<b>Example Usage</b>	<pre># Create a clock and a divide-by-2 generated clock create_clock -period 10 [get_ports clk] create_generated_clock -divide_by 2 -source [get_ports clk] -name clkdiv [get_registers clkdiv]  # An equivalent generated clock create_generated_clock -edges {1 3 5} -source [get_ports clk] -name clkdiv [get_registers clkdiv]  # Specify a clock multiplier with a 60% duty cycle create_generated_clock -multiply_by 2 -source [get_ports clk] -duty_cycle 60 [get_pins clkmult combout]  # Specify an inverted divide-by-2 clock relative to the output of the source clock create_generated_clock -divide_by 2 -invert -source [get_ports clk] -name nclkdiv [get_registers clkdiv]  # Specify a divide-by-2 clock with a 90-degree phase shift create_generated_clock -divide_by 2 -phase 90 -source [get_ports clk] -name clkdiv [get_registers clkdiv]  # Create a divide-by-2 generated clock generated off the falling edge of the source clock create_generated_clock -edges {2 4 6} -source [get_ports clk] -name clkfall_div [get_registers clkfall_div]  # Assign two clocks to an input port that are switched externally, # along with an internal clock divider. create_clock -period 10 -name clk100Mhz [get_ports clk] create_clock -period 6.667 -name clk150Mhz -add [get_ports clk] create_generated_clock -divide_by 2 -name clk50Mhz -source [get_ports clk] -master_clock clk100Mhz -add [get_registers clkdiv] create_generated_clock -divide_by 2 -name clk75Mhz -source [get_ports clk] -master_clock clk150Mhz -add [get_registers clkdiv]  # Create a virtual clock, and two generated clocks that derive from it. # This makes the generated clocks related, so crossings between them are not asynchronous. create_clock -period 10 -name virtual_base create_generated_clock -master_clock virtual_base -divide_by 2 [get_ports clka] create_generated_clock -master_clock virtual_base -divide_by 4 [get_ports clkb]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use <code>create_timing_netlist</code> to create a timing netlist.

### 3.1.34.7. derive\_clocks (::quartus::sdc)

The following table displays information for the `derive_clocks` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sdc</code> on page 548	
<b>Syntax</b>	<code>derive_clocks [-h   -help] [-long_help] [-no_black_box_sources] -period &lt;period_value&gt; [-suffix &lt;suffix_string&gt; ] [-waveform &lt;edge_list&gt; ]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-no_black_box_sources</code>	Option to disable considering periphery nodes of black box atoms as possible clock sources when deriving clocks
	<code>-period &lt;period_value&gt;</code>	Speed of the default clock in terms of clock period
	<code>-suffix &lt;suffix_string&gt;</code>	Suffix of derived clock names
	<code>-waveform &lt;edge_list&gt;</code>	List of edge values
continued...		

<b>Description</b>	<p>Creates a clock on sources of clock pins in the design that do not already have at least one clock sourcing the clock pin. This command is equivalent to calling create_clock on each clock source in the design that does not already have a clock assigned to it.</p> <p>See the help for create_clock for more information.</p> <p>Intel does not recommend using this command during final sign-off analysis of a design. derive_clocks should only be used early in the design phase when the clocks are not completely known. When possible, create_clock and create_generated_clock should be used instead.</p>		
<b>Example Usage</b>	<pre># Automatically create a 10ns, 60% duty cycle clock on all # unconstrained clock sources. derive_clocks -period 10 -waveform {0 6}  # Append a suffix to all derived clock names using the "-suffix" option. # All derived clock names will end with "-my_suffix". derive_clocks -period 10 -suffix "my_suffix"</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.34.8. get\_cells (::quartus::sdc)

The following table displays information for the get\_cells Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc on page 548	
<b>Syntax</b>	get_cells [-h   -help] [-long_help] [-compatibility_mode] [-hierarchical] [-no_duplicates] [-nocase] [-nowarn] [ <filter> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-compatibility_mode	Use simple Tcl matching
	-hierarchical	Specifies use of a hierarchical searching method
	-no_duplicates	Do not match duplicated cell names
	-nocase	Specifies case insensitive node name matching
	-nowarn	Do not issue warning messages about unmatched patterns
	<filter>	Valid destinations (string patterns are matched using Tcl string matching)
<b>Description</b>	<p>Returns a collection of cells in the design. All cell names in the collection match the specified pattern. Wildcards can be used to select multiple cells at once.</p> <p>There are three Tcl string matching schemes available with this command: the default method, the -hierarchical option, and the -compatibility_mode option.</p> <p>When you use the default matching scheme, use pipe characters to separate one hierarchy level from the next. They are treated as special characters and are taken into account when string matching with wildcards is performed. When this matching scheme is enabled, the specified pattern is matched against absolute cell names: the names that include the entire hierarchical path. A full cell name can contain multiple pipe characters in it to reflect the hierarchy. All hierarchy levels in the pattern are matched level by level. Any included wildcards refer to only one hierarchical level. For example, "*" and "** " produce different collections since they refer to the highest hierarchical level and second highest hierarchical level respectively.</p> <p>When using the -hierarchical matching scheme, pipe characters are</p>	

*continued...*

	<p>treated as special characters and are taken into account when string matching with wildcards is performed. This matching scheme forces the search to proceed recursively down the hierarchy. The specified pattern is matched against the relative cell names: the immediate names that do not include any of the hierarchy information. Note that a short cell name cannot contain pipe characters in it. Any included wildcards are expanded to match the relative cell names.</p> <p>The -compatibility_mode matching scheme uses simple Tcl string matching on full, absolute cell names. Pipe characters are not treated as special characters when used with wildcards.</p> <p>The default matching scheme returns cells whose names match the specified filter and also cells automatically generated by the Quartus II software from these cells). Use -no_duplicates option to not include duplicated cells.</p> <p>The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p>		
<b>Example Usage</b>	<pre># Find a cell called "reg" using case insensitive search get_cells -nocase reg # Create a collection of all cells whose names start with "reg" get_cells reg* # Create a collection of all cells on the highest hierarchical level set mycollection [get_cells *] # Create a collection of all cells in the design # Output cell names. foreach_in_collection cell \$mycollection {     puts [get_cell_info -name \$cell] } set fullcollection [get_cells -hierarchical *] # Output cell IDs and names. foreach_in_collection cell \$fullcollection {     puts -nonewline \$cell     puts -nonewline ": "     puts [get_cell_info -name \$cell] }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.9. get\_clocks (::quartus::sdc)

The following table displays information for the get\_clocks Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc on page 548	
<b>Syntax</b>	get_clocks [-h   -help] [-long_help] [-include_generated_clocks] [-nocase] [-nowarn] [-of_objects <object_collection> ] [ <filter> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-include_generated_clocks	Includes generated clocks derived from the matched clocks
	-nocase	Specifies the matching of node names to be case-insensitive
	-nowarn	Do not issue warning messages when querying for clocks
	-of_objects <object_collection>	Returns all clocks that target (defined on) or drive (determine data frequency of) the nodes in the collection.
	<filter>	Valid destinations (string patterns are matched using Tcl string matching)
<i>continued...</i>		

Description	<p>Returns a collection of previously defined clocks in the design. Use a clock collection as the -from/to argument of a command (such as set_multicycle_path) to refer to all nodes driven by the clocks in the collection.</p> <pre># The following multicycle constraint applies to all paths ending at registers # driven by clk set_multicycle_path -to [get_clocks clk] 2</pre> <p>If a filter, which is a Tcl list of wildcards and must follow standard Tcl or Timing Analyzer-extension substitution rules, is specified, then get_clocks returns all previously defined clocks whose names match the filter. See the help for use_timing_analyzer_style_escaping for filter rules.</p> <p>If you use the -of_objects option, you must provide a collection of registers, ports, pins, or cells. The get_clocks command returns a collection of all the previously defined clocks that target these nodes, or if these nodes are not clock targets, all the previously defined clocks that drive these nodes. You cannot use the -of_objects option with the clock name filter. Refer to the long help for examples of using the -of_objects option.</p> <p>Tip: the get_clocks command can be used as part of SDC commands, as well as for reporting. When it is used as part of SDC commands and includes the -include_generated_clocks option, the Timing Analyzer needs to analyze the design and may issue warnings about missing clocks. The missing clocks might still be created later on in the SDC file and are not necessarily indicative of a problem. Use the -nowarn option in this case to suppress those warnings. When you use the -nowarn option, pass a node collection generated by another get_* collection command as the filter. This way, warnings directly related to the filter resolution are still posted.</p>		
Example Usage	<pre># get clocks that begin with 'c' or 'C', and print out their names and periods: set clocks [get_clocks c* -nocase] foreach_in_collection clk \$clocks {     set name [get_clock_info -name \$clk]     set period [get_clock_info -period \$clk]     puts "\$name: \$period" }  # getting the clock that targets a port, and its generated clock: create_clock -name my_clock -period 10.000 [get_ports CLK_100] create_generated_clock -name my_gen_clock -divide_by 2 -source [get_ports CLK_100] [get_registers clk_div_reg] get_clocks -nowarn -of_objects [get_ports CLK_100] -include_generated_clocks  # display the name of the clocks that drive registers beginning with 'reg_*': foreach_in_collection clk_id [get_clocks -nowarn -of_objects [get_registers reg_*]] {     puts [get_clock_info -name \$clk_id] }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Use the -clock_networks_only option only with the -of_objects option.
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.10. get\_nets (::quartus::sdc)

The following table displays information for the get\_nets Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sdc</code> on page 548		
<b>Syntax</b>	get_nets [-h   -help] [-long_help] [-no_duplicates] [-nocase] [-nowarn] [ <filter> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-no_duplicates	Do not match duplicated net names	
continued...			

	-nocase	Specifies case-insensitive node name matching	
	-nowarn	Do not issue warning messages about unmatched patterns	
	<filter>	Valid destinations (string patterns are matched using Tcl string matching)	
Description	<p>Returns a collection of nets in the design. All net names in the collection match the specified pattern. Wildcards can be used to select multiple nets at once.</p> <p>The default matching scheme returns nets whose names match the specified filter and nets that are automatically generated by the Quartus Prime software from these nets. Use the -no_duplicates option to exclude duplicated nets.</p> <p>The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p>		
Example Usage	<pre># Find a net called "reg" using case insensitive search get_nets -nocase reg # Create a collection of all nets whose names start with "reg" get_nets reg* # Create a collection of all nets in the design set mycollection [get_nets *] # Output net names. foreach_in_collection net \$mycollection {     puts [get_net_info -name \$net] }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.11. get\_pins (::quartus::sdc)

The following table displays information for the get\_pins Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc on page 548	
<b>Syntax</b>	get_pins [-h   -help] [-long_help] [-compatibility_mode] [-hierarchical] [-no_duplicates] [-nocase] [-nowarn] [ <filter> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-compatibility_mode	Use simple Tcl matching
	-hierarchical	Specifies use of a hierarchical searching method
	-no_duplicates	Do not match duplicated pin names
	-nocase	Specifies case-insensitive node name matching
	-nowarn	Do not issue warning messages about unmatched patterns
	<filter>	Valid destinations (string patterns are matched using Tcl string matching)
<b>Description</b>	<p>Returns a collection of pins in the design. All pin names in the collection match the specified pattern. Wildcards can be used to select multiple pins at once.</p> <p>There are three Tcl string matching schemes available with this</p>	
continued...		

	<p>command: the default method, the -hierarchical option, and the -compatibility_mode option.</p> <p>By default, pipe characters are used to separate one hierarchy level from the next. They are treated as special characters and are taken into account when string matching with wildcards is performed. When the default matching scheme is enabled, the specified pattern is matched against absolute pin names: the names that include the entire hierarchical path. All hierarchy levels in the pattern are matched level by level. Pin names of the form &lt;absolute full cell name&gt; &lt;pin suffix&gt; are used for matching. Note that a full cell name can contain multiple pipe characters in it to reflect the hierarchy. Any included wildcards refer to only one hierarchical level. For example, "** *" and "** * " produce different collections since they refer to the highest hierarchical level and second highest hierarchical level respectively.</p> <p>When using the -hierarchical matching scheme, pipe characters are treated as special characters and are taken into account when string matching with wildcards is performed. This matching scheme forces the search to proceed recursively through the hierarchy. The specified pattern is matched against the relative pin names: the immediate names that do not include any of the hierarchy information. Pin names of the form &lt;relative short cell name&gt; &lt;pin suffix&gt; are used for matching. Note that a short cell name cannot contain pipe characters. Any included wildcards are expanded to match the relative pin names. For example, "*" and "** *" match exactly the same pins since the former is expanded into the latter.</p> <p>The -compatibility_mode matching scheme uses simple Tcl string matching on full, absolute cell names. Pipe characters are not treated as special characters when used with wildcards.</p> <p>The default matching scheme returns not only pins whose names match the specified filter, but also pins duplicated from these pins (refers to pins are automatically generated by Quartus from the pins). Use -no_duplicates option to not include duplicated pins.</p> <p>The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p>		
<b>Example Usage</b>	<pre># Get regout pin of "reg" cell get_pins -nocase reg regout # Create a collection of all pins of "reg" cell get_pins reg * # Create a collection of all pins on the highest hierararchical level set mycollection [get_pins *] # Output pin names. foreach_in_collection pin \$mycollection {     puts [get_pin_info -name \$pin] } # Create a collection of all pins in the design set fullcollection [get_pins -hierarchical *] # Output pin IDs and names. foreach_in_collection pin \$fullcollection {     puts -nonewline \$pin     puts -nonewline ": "     puts [get_pin_info -name \$pin] }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.12. get\_ports (::quartus::sdc)

The following table displays information for the get\_ports Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sdc</code> on page 548		
<b>Syntax</b>	<code>get_ports [-h   -help] [-long_help] [-nocase] [-nowarn] [ &lt;filter&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
<i>continued...</i>			

	-long_help	Long help with examples and possible return values	
	-nocase	Specifies case-insensitive node name matching	
	-nowarn	Do not issue warning messages about unmatched patterns	
	<filter>	Valid destinations (string patterns are matched using Tcl string matching)	
Description	Returns a collection of ports (design inputs and outputs) in the design.  The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.		
Example Usage	<pre>project_open chiptrip create_timing_netlist  # Get all ports starting with "In". set ports [get_ports In*] foreach_in_collection port \$ports {     puts [get_port_info -name \$port] }  delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.13. remove\_clock\_groups (::quartus::sdc)

The following table displays information for the remove\_clock\_groups Tcl command:

Tcl Package and Version	Belongs to ::quartus::sdc on page 548		
Syntax	remove_clock_groups [-h   -help] [-long_help] -all		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-all	Specify remove all clock group settings	
Description	Remove all clock group assignments. This command removes any clock groups that have been previously set. There is no way to remove specific groups.		
Example Usage	<pre>project_open top create_timing_netlist create_clock -period 10.000 -name clkA [get_ports sysclk[0]] create_clock -period 10.000 -name clkB [get_ports sysclk[1]]  # Set clkA and clkB to be mutually exclusive clocks. set_clock_groups -exclusive -group {clkA} -group {clkB} set_clock_groups -exclusive -group {clkC} -group {clkD}  # Remove clock groups A, B, C, and D. Result is that there # are no longer any mutually exclusive clocks. remove_clock_groups -all</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.34.14. remove\_clock\_latency (::quartus::sdc)

The following table displays information for the remove\_clock\_latency Tcl command:

Tcl Package and Version	Belongs to ::quartus::sdc on page 548		
Syntax	remove_clock_latency [-h   -help] [-long_help] -source <targets>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-source	Specifies the source clock latency	
	<targets>	Valid destinations (string patterns are matched using Tcl string matching)	
Description	<p>Removes clock latency for a given clock or clock target.</p> <p>There are two types of latency: network and source. Network latency is the clock network delay between the clock and register clock pins. Source latency is the clock network delay between the clock and its source (e.g., a system clock or a base clock of a generated clock).</p> <p>The Timing Analyzer automatically computes network latencies for all register and generated clocks. Overriding clock network latencies is not supported by the Timing Analyzer. Therefore, the -source option must always be specified. Remove_clock_latency requires this option as well.</p> <p>You can apply clock latency to a clock, which affects all targets of the clock, or to a specific clock target. Therefore, you can remove clock latency from a collection of clocks, or from a collection of target nodes. remove_clock_latency removes all latencies from a clock or node, so removing a node's clock latency with respect to a particular clock, or removing only latencies with particular conditions is not supported.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>		
Example Usage	<pre>create_clock -name SYSCLK -period 10.000 [get_ports inclk] create_generated_clock -name OUTCLK -divide_by 1 -source [get_ports inclk] [get_ports outclk] create_generated_clock -name FDBKCLK -divide_by 1 -source [get_ports outclk] [get_ports fdbkclk]  # Apply a simple 2.000 ns source latency to the system clock. set_clock_latency -source 2.000 [get_clocks SYSCLK]  # Specify feedback clock latencies between output port outclk # and the output port fdbkclk. set_clock_latency -source -late -rise 0.800 [get_clocks FDBKCLK] set_clock_latency -source -late -fall 0.750 [get_clocks FDBKCLK] set_clock_latency -source -early -rise 0.500 [get_clocks FDBKCLK] set_clock_latency -source -early -fall 0.460 [get_clocks FDBKCLK]  # Remove all clock latency from FDBKCLK remove_clock_latency -source [get_clocks FDBKCLK]</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.15. remove\_clock\_uncertainty (::quartus::sdci)

The following table displays information for the `remove_clock_uncertainty` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdci</a> on page 548		
<b>Syntax</b>	remove_clock_uncertainty [-h   -help] [-long_help] -from <i>&lt;from_clock&gt;</i> -to <i>&lt;to_clock&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-from <i>&lt;from_clock&gt;</i>	Valid destinations (string patterns are matched using Tcl string matching)	
	-to <i>&lt;to_clock&gt;</i>	Valid destinations (string patterns are matched using Tcl string matching)	
<b>Description</b>	<p>Removes clock uncertainty from a collection of clocks to a collection of clocks. The source and destination clocks can be any arbitrary collection of clocks. This command removes all uncertainty between two clocks. If there does not exist uncertainty between two clocks specified in remove_clock_uncertainty, the command does nothing for those two clocks but continues to attempt to remove uncertainty between other clocks specified.</p> <p>The values of the -from and -to options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>		
<b>Example Usage</b>	<pre>set_clock_uncertainty -setup -rise_from {clk1 clk2} -fall_to {clk3 clk4} 200ps set_clock_uncertainty -from {clk5 clk6} -to {clk7 clk8} 300ps remove_clock_uncertainty -from {clk3 clk5} -to {clk4 clk7}</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.34.16. remove\_disable\_timing (::quartus::sdci)

The following table displays information for the `remove_disable_timing` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sdc</code> on page 548	
<b>Syntax</b>	<code>remove_disable_timing [-h   -help] [-long_help] [-from &lt;name&gt; ] [-to &lt;name&gt; ] &lt;cells&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-from &lt;name&gt;</code>	Valid source pin suffix
	<code>-to &lt;name&gt;</code>	Valid destination pin suffix
	<code>&lt;cells&gt;</code>	List of cells
<b>Description</b>	<p>Adds a previously disabled edge (arc) back to a given cell(s). If no -from/-to value is specified, the missing value is substituted by a "".</p> <p>***</p>	
continued...		

	The values of the -from and -to are valid pin suffixes. The values must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.		
<b>Example Usage</b>	<pre>remove_disable_timing -from datain -to combout A B remove_disable_timing -from carryin *</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.17. remove\_input\_delay (::quartus::sdc)

The following table displays information for the remove\_input\_delay Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc</a> on page 548		
<b>Syntax</b>	remove_input_delay [-h   -help] [-long_help] [-blackbox] <i>&lt;targets&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-blackbox	Removes an input delay that was assigned to a partition boundary port.	
	<i>&lt;targets&gt;</i>	Collection or list of input ports	
<b>Description</b>	<p>Removes input delay from a port. For each input port specified, removes all input delays for that port. This means that rise, fall, max, and min delays for each clock and reference pin on the input port are all removed.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p>		
<b>Example Usage</b>	<pre># Simple input delay with the same value for min/max and rise/fall set_input_delay -clock clk 1.5 [get_ports {in1 in2}] set_input_delay -clock clk2 1.5 [get_ports {in1 in2}] set_input_delay -clock clk 1.6 [get_ports {in3 in4}]  # Remove input delay on ports in1 and in4, # for all flags and reference ports and flags remove_input_delay [get_ports {in1 in4}]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Incorrect collection type. Expected a collection of type <i>&lt;string&gt;</i> .
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.18. remove\_output\_delay (::quartus::sdcc)

The following table displays information for the `remove_output_delay` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sdc</code> on page 548		
<b>Syntax</b>	<code>remove_output_delay [-h   -help] [-long_help] [-blackbox] &lt;targets&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-blackbox</code>	Removes an output delay that was assigned to a partition boundary port.	
	<code>&lt;targets&gt;</code>	Collection or list of output ports	
<b>Description</b>	<p>Removes output delay from a port. For each output port specified, removes all output delays for that port. Rise, fall, max, and min delays for each clock and reference pin on the output port are all removed.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the <code>use_timing_analyzer_style_escaping</code> command for details.</p>		
<b>Example Usage</b>	<pre># Simple output delay with the same value for min/max and rise/fall set_output_delay -clock clk 1.5 [get_ports {out1 out2}] set_output_delay -clock clk2 1.5 [get_ports {out1 out2}] set_output_delay -clock clk 1.6 [get_ports {out3 out4}]  # Remove input delay on ports out1 and out4, # for all flags and reference ports and flags remove_output_delay [get_ports {out1 out4}]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Incorrect collection type. Expected a collection of type <code>&lt;string&gt;</code> .
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use <code>create_timing_netlist</code> to create a timing netlist.

### 3.1.34.19. reset\_design (::quartus::sdcc)

The following table displays information for the `reset_design` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdcc</a> on page 548		
<b>Syntax</b>	reset_design [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Removes all assignments from the design. This includes clocks, generated clocks, derived clocks, input delays, output delays, clock latency, clock uncertainty, clock groups, false paths, multicycle paths, min delays, and max delays. After reset_design is called, the design should be in the same state as it would be if create_timing_netlist was just called.		
continued...			

<b>Example Usage</b>	<pre># Constrain design create_clock -name clk -period 4.000 -waveform { 0.000 2.000 } [get_ports clk] set_input_delay -clock clk2 1.5 [get_ports in*] set_output_delay -clock clk 1.6 [get_ports out*] set_false_path -from [get_keepers in] -through [get_nets r1] -to [get_keepers out]  # Reset the design to the state that it was in before any constraints were entered reset_design</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.20. set\_clock\_groups (::quartus::sdc)

The following table displays information for the set\_clock\_groups Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc on page 548	
<b>Syntax</b>	set_clock_groups [-h   -help] [-long_help] [-asynchronous] [-exclusive] -group <names> [-logically_exclusive] [-physically_exclusive]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-asynchronous	Specify mutually exclusive clocks (such as groups of primary clocks)
	-exclusive	Specify mutually exclusive clocks (an alias for the -logically_exclusive option). Exists for backwards compatibility.
	-group <names>	Valid destinations (string patterns are matched using Tcl string matching)
	-logically_exclusive	Specify logically exclusive clocks (meaning they are not actively used at the same time)
	-physically_exclusive	Specify physically exclusive clocks (meaning they are not physically present at the same time)
<b>Description</b>	<p>Clock groups provide a quick and convenient way to specify which clocks are not related. Asynchronous clocks are those that are completely unrelated (e.g., have different ideal clock sources). Logically exclusive clocks are not actively used in the design at the same time (e.g., multiplexed clocks), but the clock signals may physically exist on-chip at the same time and therefore may still influence each other through crosstalk effects. Physically exclusive clocks, in contrast, cannot be physically present in the device at the same time (e.g., multiple clocks defined on the same clock pin).</p> <p>The Timing Analyzer does not currently analyze crosstalk explicitly. Instead, the timing models use extra guard bands to account for any potential crosstalk-induced delays. As a result, the Timing Analyzer currently treats logically_exclusive and physically_exclusive clock groups the same. However, different parts of the Timing Analyzer may treat asynchronous and exclusive groups differently.</p> <p>The result of set_clock_groups is that all clocks in any group are cut from all clocks in every other group. The use of a single -group option tells the Timing Analyzer to cut this group of clocks from all other clocks in the design, including clocks that are created in the future. This command is similar to calling set_false_path from each clock in every group to each clock in every other group and vice versa, making set_clock_groups easier to specify for cutting clock domains. However, cutting clocks with set_clock_groups also affects the results of some other commands. Any commands that are affected by clock groups will say so in their help text.</p>	
continued...		

<b>Example Usage</b>	<pre>project_open top create_timing_netlist create_clock -period 10.000 -name clkA [get_ports sysclk[0]] create_clock -period 10.000 -name clkB [get_ports sysclk[1]]  # Set clkA and clkB to be mutually exclusive clocks. set_clock_groups -logically_exclusive -group {clkA} -group {clkB}  # The previous line is equivalent to the following two commands. set_false_path -from [get_clocks clkA] -to [get_clocks clkB] set_false_path -from [get_clocks clkB] -to [get_clocks clkA]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.34.21. set\_clock\_latency (::quartus::sdc)

The following table displays information for the set\_clock\_latency Tcl command:

Tcl Package and Version	Belongs to ::quartus::sdc on page 548	
Syntax	set_clock_latency [-h   -help] [-long_help] [-clock <clock_list> ] [-early] [-fall] [-late] [-rise] -source <delay> <targets>	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-clock <clock_list>	Valid clock destinations (string patterns are matched using Tcl string matching)
	-early	Specifies the early clock latency
	-fall	Specifies the falling transition clock latency
	-late	Specifies the late clock latency
	-rise	Specifies the rising transition clock latency
	-source	Specifies the source clock latency
	<delay>	Latency delay value
	<targets>	Valid destinations (string patterns are matched using Tcl string matching)
Description	<p>Specifies clock latency for a given clock or clock target.</p> <p>There are two types of latency: network and source. Network latency is the clock network delay between the clock and register clock pins. Source latency is the clock network delay between the clock and its source (e.g., the system clock or base clock of a generated clock).</p> <p>The Timing Analyzer automatically computes network latencies for all register and generated clocks. Overriding clock network latencies is not supported by the Timing Analyzer. Therefore, the -source option must always be specified.</p> <p>You can apply clock latency to a clock, which affects all targets of the clock, or to a specific clock target. If you specify a specific clock target that is driven by more than one clock, use the -clock option to specify which clock to use. Latencies assigned to a clock target override any latencies assigned to a clock.</p> <p>Different clock latencies can be specified for early (-early) and late (-late) latencies, as well as for</p>	
continued...		

*continued...*

	<p>rising edges (-rise) and falling edges (-fall). If only some combinations are specified, the other combinations are used by default. For example, if only a -rise -early latency and a -fall -early latency are specified, then the -rise -late latency is assumed to be the same as the -rise -early latency and the -fall -late latency is assumed to be the same as the -fall -early latency. If neither -rise nor -fall are used or neither -early nor -late are used, then the latency applies to both conditions.</p> <p>Source latency can also be assigned to generated clocks. This may be useful for specifying board level delays from a clock output port to a clock input port when the clock input port is acting as a feedback clock.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p>		
<b>Example Usage</b>	<pre>create_clock -name SYSCLK -period 10.000 [get_ports inclk] create_generated_clock -name OUTCLK -divide_by 1 -source [get_ports inclk] [get_ports outclk] create_generated_clock -name FDBKCLK -divide_by 1 -source [get_ports outclk] [get_ports fdbkclk]  # Apply a simple 2.000 ns source latency to the system clock. set_clock_latency -source 2.000 [get_clocks SYSCLK]  # Specify feedback clock latencies between output port outclk # and the input port fdbkclk. set_clock_latency -source -late -rise 0.800 [get_clocks FDBKCLK] set_clock_latency -source -late -fall 0.750 [get_clocks FDBKCLK] set_clock_latency -source -early -rise 0.500 [get_clocks FDBKCLK] set_clock_latency -source -early -fall 0.460 [get_clocks FDBKCLK]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.22. set\_clock\_uncertainty (::quartus::sdc)

The following table displays information for the set\_clock\_uncertainty Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc on page 548	
<b>Syntax</b>	<pre>set_clock_uncertainty [-h   -help] [-long_help] [-add] [-enable_same_physical_edge] [-fall_from &lt;fall_from_clock&gt; ] [-fall_to &lt;fall_to_clock&gt; ] [-from &lt;from_clock&gt; ] [-hold] [-rise_from &lt;rise_from_clock&gt; ] [-rise_to &lt;rise_to_clock&gt; ] [-setup] [-to &lt;to_clock&gt; ] &lt;uncertainty&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-add	Specifies that this assignment is an addition to the clock uncertainty derived by derive_clock_uncertainty call
	-enable_same_physical_edge	Enable setting uncertainty value for same physical clock edge
	-fall_from <fall_from_clock>	Valid destinations (string patterns are matched using Tcl string matching)
	-fall_to <fall_to_clock>	Valid destinations (string patterns are matched using Tcl string matching)
continued...		

	-from <from_clock>	Valid destinations (string patterns are matched using Tcl string matching)	
	-hold	Only apply the uncertainty value to hold and removal checks	
	-rise_from <rise_from_clock>	Valid destinations (string patterns are matched using Tcl string matching)	
	-rise_to <rise_to_clock>	Valid destinations (string patterns are matched using Tcl string matching)	
	-setup	Only apply the uncertainty value to setup and recovery checks	
	-to <to_clock>	Valid destinations (string patterns are matched using Tcl string matching)	
	<uncertainty>	Uncertainty	
Description	<p>Specifies clock uncertainty or skew for clocks for clock-to-clock transfers. You can specify uncertainty separately for setup and hold, and you can specify separate rising and falling clock transitions. If you omit to specify -setup or -hold, the uncertainty value will be applied to both analysis types. Similarly, if you omit to specify rising or falling clock transitions, the uncertainty value will be applied to both transitions.</p> <p>The setup uncertainty is subtracted from the data required time for each applicable path, and the hold uncertainty is added to the data required time for each applicable path.</p> <p>Intel Quartus Prime software computes clock uncertainty for every clock transfer. For particular transfers, you can use the set_clock_uncertainty assignment to override the automatically derived value, or you can specify the -add option to add to the automatically derived value. Note that the -add option is only relative to the automatically derived value. If multiple set_clock_uncertainty assignments apply to the same clock transfer, the later value overrides the earlier ones, regardless of whether the -add option was used.</p> <p>Note: The Timing Analyzer does not apply clock uncertainty to transfers involving the same physical launch and latch edge (that is, the latch and launch edges are the same edge of a clock source and occur at the same time) by default. Such transfers typically occur in hold analysis, but may also occur in setup analysis with a multicycle value of 0. You can use the -enable_same_physical_edge option to override this behavior.</p> <p>The values for -from, -to, and similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>		
Example Usage	set_clock_uncertainty -setup -rise_from clk1 -fall_to clk2 200ps		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.34.23. set\_disable\_timing (::quartus::sdc)

The following table displays information for the set\_disable\_timing Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc on page 548
<b>Syntax</b>	set_disable_timing [-h   -help] [-long_help] [-from <name> ] [-to <name> ] <cells>
continued...	

Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-from <name>	Valid source pin suffix	
	-to <name>	Valid destination pin suffix	
	<cells>	List of cells	
Description	<p>Disables a timing edge (arc) from inside a given cell or cells. Disabling a timing edge prevents timing analysis through that edge. If either -from or -to (or both) are unspecified, the missing value or values are replaced by a "*" character.</p> <p>The values of the -from and -to are valid pin suffixes. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>		
Example Usage	<pre>set_disable_timing -from datain -to combout A B set_disable_timing -from carryin *</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.24. set\_false\_path (::quartus::sdc)

The following table displays information for the set\_false\_path Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc</a> on page 548	
<b>Syntax</b>	set_false_path [-h   -help] [-long_help] [-fall_from <names> ] [-fall_to <names> ] [-from <names> ] [-hold] [-latency_insensitive] [-no_synchronizer] [-rise_from <names> ] [-rise_to <names> ] [-setup] [-through <names> ] [-to <names> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-fall_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-hold	Specifies the false_path value (applies only to clock hold or removal checks)
	-latency_insensitive	Mark this false path as one that should still be optimized
	-no_synchronizer	Prevent this false path from triggering a synchronizer
	-rise_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-rise_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
continued...		

	<div>-setup</div> <div>Specifies the false_path value (applies only to clock setup or recovery checks)</div>
	<div>-through &lt;names&gt;</div> <div>Valid through nodes (string patterns are matched using Tcl string matching)</div>
	<div>-to &lt;names&gt;</div> <div>Valid destinations (string patterns are matched using Tcl string matching)</div>
<b>Description</b>	<p>Specifies a false-path exception, removing (or cutting) paths from timing analysis.</p> <p>The -from and -to values are collections of clocks, registers, ports, pins, or cells in the design. If the -from or -to values are not specified, the collection is converted automatically into {get_keepers *}. It is worth noting that if the counterpart of the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection only if the clock collection also generates the desired assignment.</p> <p>Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.</p> <p>If the -latency_insensitive flag is set, the Fitter will be allowed to freely insert additional pipelining stages on any paths that are cut by the exception. These pipelined stages will be retimed to improve performance, but the timing requirements of the paths will still be ignored, just like for ordinary false paths. Without this flag, the Fitter will not perform any optimizations on the cut paths.</p> <p>If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.</p> <p>The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node.</p> <p>The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points.</p> <p>For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.</p> <p>The -rise_from and -fall_from options can be used in place of the -from destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node, taking into consideration any logical inversions along the clock path. The -from option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.</p> <p>The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value, taking into consideration any logical inversions that are along the clock path.</p> <p>The -setup and -hold options allow the false path to only be applied to the corresponding setup/recovery or hold/removal checks. The default if neither value is specified is to apply the false path to both -setup and -hold.</p> <p>The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p> <p>See help for the set_clock_groups command for information.</p>
<b>Example Usage</b>	<pre># Set a false-path between two unrelated clocks # See also set_clock_groups set_false_path -from [get_clocks clkA] -to [get_clocks clkB]  # Set a false-path for a specific path set_false_path -from [get_pins regA clk] -to [get_pins regB aclr]</pre>

continued...

	# Set a false-path from a node to a falling clock set_false_path -from [get_pins regA clk] -fall_to [get_clocks clkB]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.34.25. set\_input\_delay (::quartus::sdc)

The following table displays information for the set\_input\_delay Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc on page 548	
<b>Syntax</b>	set_input_delay [-h   -help] [-long_help] [-add_delay] [-blackbox] -clock <name> [-clock_fall] [-fall] [-max] [-min] [-reference_pin <name> ] [-rise] [-source_latency_included] <delay> <targets>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-add_delay	Create additional delay constraint instead of overriding previous constraints
	-blackbox	Create an assignment for a partition boundary port causing it to be treated as a port
	-clock <name>	Clock name
	-clock_fall	Specifies that input delay is relative to the falling edge of the clock
	-fall	Specifies the falling input delay at the port
	-max	Applies value as maximum data arrival time
	-min	Applies value as minimum data arrival time
	-reference_pin <name>	Specifies a pin or port in the design to which the input delay is relative
	-rise	Specifies the rising input delay at the port
	-source_latency_included	Specifies that input delay includes added source latency
	<delay>	Time value
	<targets>	List of input port type objects
<b>Description</b>	<p>Specifies the data arrival times at the specified input ports relative the clock specified by the -clock option. The clock must refer to a clock name in the design.</p> <p>Input delays can be specified relative to the rising edge (default) or falling edge (-clock_fall) of the clock.</p> <p>Input delays can be specified relative to a pin or a port (-reference_pin) in the clock network. Clock arrival times to the reference pin or port are added to data arrival times.</p> <p>If no -reference_pin is specified, if the input delay is specified relative to a generated clock with a single target, the clock arrival times to the generated clock are added to the data arrival time. If the generated clock has multiple targets, the worst case arrival time to those targets will be used.</p> <p>Input delays can already include clock source latency. By default the clock source latency of the related clock is added to the input delay value, but when the -source_latency_included option is specified, the clock source latency is not added because it was factored into the</p>	

continued...

	<p>input delay value.</p> <p>The maximum input delay (-max) is used for clock setup checks or recovery checks and the minimum input delay (-min) is used for clock hold checks or removal checks. If only -min or -max (or neither) is specified for a given port, the same value is used for both.</p> <p>Separate rising (-rise) and falling (-fall) arrival times at the port can be specified. If only one of -rise and -fall are specified for a given port, the same value is used for both.</p> <p>By default, set_input_delay removes any other input delays to the port except for those with the same -clock, -clock_fall, and -reference_pin combination. Multiple input delays relative to different clocks, clock edges, or reference pins can be specified using the -add_delay option. Future input delays relative to different clocks, clock edges, or reference pins that do not specify the -add_delay option will still remove previous input delays that specified the -add_delay option.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p>		
Example Usage	<pre># Simple input delay with the same value for min/max and rise/fall: # 1) set on ports with names of the form myin* set_input_delay -clock clk 1.5 [get_ports myin*] # 2) set on all input ports set_input_delay -clock clk 1.5 [all_inputs]  # Input delay with respect to the falling edge of clock set_input_delay -clock clk -clock_fall 1.5 [get_ports myin*]  # Input delays for different min/max and rise/fall combinations set_input_delay -clock clk -max -rise 1.4 [get_ports myin*] set_input_delay -clock clk -max -fall 1.5 [get_ports myin*] set_input_delay -clock clk -min -rise 0.7 [get_ports myin*] set_input_delay -clock clk -min -fall 0.8 [get_ports myin*]  # Adding multiple input delays with respect to more than one clock set_input_delay -clock clkA -min 1.2 [get_ports myin*] set_input_delay -clock clkA -max 1.8 [get_ports myin*] set_input_delay -clock clkA -clock_fall 1.6 [get_ports myin*] -add_delay set_input_delay -clock clkB -min 2.1 [get_ports myin*] -add_delay set_input_delay -clock clkB -max 2.5 [get_ports myin*] -add_delay  # This is a common mistake where input delays are accidentally removed set_input_delay -clock clkA -min 0.2 [get_ports myout*] set_input_delay -clock clkB -min 1.1 [get_ports myout*] -add_delay # The following removes the clkB entry. You need to always use -add_delay # when more than one clock, clock_fall or reference_pin exists set_input_delay -clock clkA -max 0.8 [get_ports myout*] # The following removes the clkA entry. You need to always use -add_delay # when more than one clock, clock_fall or reference_pin exists set_input_delay -clock clkB -max 1.5 [get_ports myout*]  # Specifying an input delay relative to an external clock output port set_input_delay -clock clk -reference_pin [get_ports clkout] 0.8 [get_ports myin*]  # Specifying an input delay relative to the clock pin of a register set_input_delay -clock clk -reference_pin [get_pins regA clk] 0.8 [get_ports myin*]</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Incorrect collection type. Expected a collection of type <string>.
	TCL_ERROR	1	ERROR: Options -<string> and -<string> are mutually exclusive. Specify only one of the two options.
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.26. set\_input\_transition (::quartus::sdc)

The following table displays information for the set\_input\_transition Tcl command:

Tcl Package and Version	Belongs to ::quartus::sdc on page 548		
Syntax	set_input_transition [-h   -help] [-long_help] [-clock <name> ] [-clock_fall] [-fall] [-max] [-min] [-rise] <transition> <ports>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-clock <name>	Clock name	
	-clock_fall	Specifies that input delay is relative to the falling edge of the clock	
	-fall	Specifies the falling output delay at the port	
	-max	Applies value as maximum data required time	
	-min	Applies value as minimum data required time	
	-rise	Specifies the rising output delay at the port	
	<transition>	Time value	
	<ports>	Collection or list of input or bidir ports	
Description	<div>This constraint does not affect calculations performed by the Timing Analyzer. It only affects PrimeTime analysis. If you set this constraint in the Timing Analyzer the constraint is written out to the SDC file when you call write_sdc.</div>		
Example Usage	set_input_transition 50 [all_inputs]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Incorrect collection type. Expected a collection of type <string>.
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.34.27. set\_max\_delay (::quartus::sdc)

The following table displays information for the set\_max\_delay Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc</a> on page 548		
<b>Syntax</b>	set_max_delay [-h   -help] [-long_help] [-fall_from <names> ] [-fall_to <names> ] [-from <names> ] [-no_synchronizer] [-rise_from <names> ] [-rise_to <names> ] [-through <names> ] [-to <names> ] <value>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-fall_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)	
<i>continued...</i>			

	<table> <tr> <td>-fall_to &lt;names&gt;</td><td>Valid destination clocks (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-from &lt;names&gt;</td><td>Valid sources (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-no_synchronizer</td><td>Prevent this max delay from triggering a synchronizer</td></tr> <tr> <td>-rise_from &lt;names&gt;</td><td>Valid source clocks (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-rise_to &lt;names&gt;</td><td>Valid destination clocks (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-through &lt;names&gt;</td><td>Valid through nodes (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-to &lt;names&gt;</td><td>Valid destinations (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>&lt;value&gt;</td><td>Time Value</td></tr> </table>	-fall_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)	-from <names>	Valid sources (string patterns are matched using Tcl string matching)	-no_synchronizer	Prevent this max delay from triggering a synchronizer	-rise_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)	-rise_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)	-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)	-to <names>	Valid destinations (string patterns are matched using Tcl string matching)	<value>	Time Value
-fall_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)																
-from <names>	Valid sources (string patterns are matched using Tcl string matching)																
-no_synchronizer	Prevent this max delay from triggering a synchronizer																
-rise_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)																
-rise_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)																
-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)																
-to <names>	Valid destinations (string patterns are matched using Tcl string matching)																
<value>	Time Value																
<b>Description</b>	<p>Specifies a maximum delay exception for a given path.</p> <p>The maximum delay is similar to changing the setup relationship (latching clock edge - launching clock edge), except that it can be applied to input or output ports without input or output delays assigned to them. Maximum delays are always relative to any clock network delays (if the source or destination is a register) or any input or output delays (if the source or destination is a port). Therefore, input delays and clock latencies are added to the data arrival times. Clock latencies also added to data required times and output delays are subtracted from data required times.</p> <p>The -from and -to values are collections of clocks, registers, ports, pins, or cells in the design. If the -from or -to values are not specified, the collection is converted automatically into [get_keepers *]. It is worth noting that if the counterpart to the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection but only if the clock collection also generates the desired assignment.</p> <p>Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.</p> <p>If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.</p> <p>The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node.</p> <p>The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points. For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.</p> <p>The -rise_from and -fall_from options can be used in place of the -from destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The "-from" option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.</p> <p>The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.</p> <p>The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p>

	TCL_OK	0	INFO: Operation successful

### 3.1.34.28. set\_max\_time\_borrow (::quartus::sdc)

The following table displays information for the set\_max\_time\_borrow Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc on page 548	
<b>Syntax</b>	set_max_time_borrow [-h   -help] [-long_help] [-exact] <value> <targets>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-exact	Forces the time borrowed to be the exact value provided (if physically possible)
	<value>	Time Value
	<targets>	Collection or list of latches
<b>Description</b>	<p>Specifies the maximum borrowed time for level-sensitive latches. The actual borrowed time will be determined automatically, but will never exceed the amount you specify. For any latches without a set_max_time_borrow constraint, no limit will apply (except for the physical limit of what is possible on the device, as described below).</p> <p>By using the -exact option, you can bypass the automatic algorithm and specify the exact amount of borrowing at a given latch. For optimum results, using the automatic algorithm is recommended (ideally, without any set_max_time_borrow constraints).</p> <p>Time borrowing is specified with respect to the earliest possible time a signal can be clocked into the latch node. For example, for a positive latch, if the earliest possible arrival time of the rising clock edge is 1.025ns, then a signal that has an arrival time of 1.035ns (where this arrival time already includes the micro-setup time of the latch) will require at least 0.010ns of time borrowing.</p> <p>Regardless of how the borrowed time is determined (automatically without a limit, automatically with a set_max_time_borrow constraint, or manually with a set_max_time_borrow -exact constraint), the borrowed time can never exceed what is physically possible to borrow on the device. The maximum amount that can be borrowed is the period of time when the latch is open (e.g. half the clock period if the clock has a 50% duty cycle), but this time is reduced by clock propagation time spread and clock uncertainty between the latch-opening and latch-closing clock edges, and is further reduced by the closing-edge setup time of the latch. Some of these factors vary from corner to corner, as well as from clock to clock (if multiple clocks drive the latch).</p> <p>Time borrowing analysis will only occur in the Timing Analysis (Signoff) stage, or when manually running the Timing Analyzer. The Fitter will not utilize time borrowing information and will assume zero time borrowed. Thus, the use of level-sensitive latches with high-speed clocks is not recommended, unless other constraints (such as set_max_delay) are manually set to ensure optimal Fitter behavior.</p> <p>The targets of this command must be level-sensitive latches (all other targets will be ignored).</p> <p>The targets can be specified as either a collections or a Tcl list of wildcards</p>

	used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the <code>use_timing_analyzer_style_escaping</code> command for details.		
<b>Example Usage</b>	<pre># Borrow at most 3ns at all "lat*" latches: set_max_time_borrow 3 [get_registers lat*]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Option <string> has illegal value: <string>. Specify a legal option value.

### 3.1.34.29. set\_min\_delay (::quartus::sdc)

The following table displays information for the `set_min_delay` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sdc</code> on page 548	
<b>Syntax</b>	<pre>set_min_delay [-h   -help] [-long_help] [-fall_from &lt;names&gt; ] [-fall_to &lt;names&gt; ] [-from &lt;names&gt; ] [-rise_from &lt;names&gt; ] [-rise_to &lt;names&gt; ] [-through &lt;names&gt; ] [-to &lt;names&gt; ] &lt;value&gt;</pre>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-fall_from &lt;names&gt;</code>	Valid source clocks (string patterns are matched using Tcl string matching)
	<code>-fall_to &lt;names&gt;</code>	Valid destination clocks (string patterns are matched using Tcl string matching)
	<code>-from &lt;names&gt;</code>	Valid sources (string patterns are matched using Tcl string matching)
	<code>-rise_from &lt;names&gt;</code>	Valid source clocks (string patterns are matched using Tcl string matching)
	<code>-rise_to &lt;names&gt;</code>	Valid destination clocks (string patterns are matched using Tcl string matching)
	<code>-through &lt;names&gt;</code>	Valid through nodes (string patterns are matched using Tcl string matching)
	<code>-to &lt;names&gt;</code>	Valid destinations (string patterns are matched using Tcl string matching)
	<code>&lt;value&gt;</code>	Time Value
<b>Description</b>	<p>Specifies a minimum delay exception for a given path.</p> <p>The minimum delay is similar to changing the hold relationship (launching clock edge - latching clock edge), except that it can be applied to input or output ports without input or output delays assigned to them. Minimum delays are always relative to any clock network delays (if the source or destination is register) or any input or output delays (if the source or destination is a port). Therefore, input delays and clock latencies are added to the data arrival times. Clock latencies also added to data required times and output delays are subtracted from data required times.</p> <p>The <code>-from</code> and <code>-to</code> values are collections of clocks, registers, ports, pins, or cells in the design. If the <code>-from</code> or <code>-to</code> values are not specified, the collection is converted automatically into <code>[get_keepers *]</code>. It is worth noting that if the counterpart of the unspecified collection is a clock collection, it is more efficient to explicitly specify this collection as a clock collection, but only if the clock collection also generates the desired assignment.</p>	

*continued...*

	<p>Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock. Also, applying exceptions between a pair of clocks is more efficient than for specific node to node or node to clock paths.</p> <p>If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.</p> <p>The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node.</p> <p>The Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points.</p> <p>For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.</p> <p>The -rise_from and -fall_from options can be used in place of the destination nodes specified using the -from option. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The -from option is the combination of both rising and falling "from" nodes. If the -from collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.</p> <p>The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.</p> <p>The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p>		
<b>Example Usage</b>	<pre># Apply a 0ns min delay between two unrelated clocks set_min_delay -from [get_clocks clkA] -to [get_clocks clkB] 0.000  # Apply a 0ns min delay for an input port (TH) set_min_delay -from [get_ports in[*]] -to [get_registers *] -.000  # Apply a 0.5ns min delay for an output port (MIN_TCO) set_min_delay -from [get_registers *] -to [get_ports out[*]] 0.500  # Apply a 0.5ns min delay for an input port to an output port (MIN_TPD) set_min_delay -from [get_ports in[*]] -to [get_ports out[*]] 0.500  # Apply a 0.5ns min delay for an input port only to nodes driven by # the falling edge of clock CLK set_max_delay -from [get_ports in[*]] -fall_to [get_clocks CLK] 0.500</pre>

### 3.1.34.31. set\_output\_delay (::quartus::sdc)

The following table displays information for the set\_output\_delay Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc on page 548	
<b>Syntax</b>	<pre>set_output_delay [-h   -help] [-long_help] [-add_delay] [-blackbox] -clock &lt;name&gt; [-clock_fall] [-fall] [-max] [-min] [-reference_pin &lt;name&gt; ] [-rise] [- source_latency_included] &lt;delay&gt; &lt;targets&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-add_delay	Create additional delay constraint instead of overriding previous constraints
	-blackbox	Create an assignment for a partition boundary port causing it to be treated as a port
	-clock <name>	Clock name
	-clock_fall	Specifies output delay relative to the falling edge of the clock
	-fall	Specifies the falling output delay at the port
continued...		

	<table> <tr> <td>-max</td><td>Applies value as maximum data required time</td></tr> <tr> <td>-min</td><td>Applies value as minimum data required time</td></tr> <tr> <td>-reference_pin &lt;name&gt;</td><td>Specifies a pin or port in the design to which the output delay is relative</td></tr> <tr> <td>-rise</td><td>Specifies the rising output delay at the port</td></tr> <tr> <td>-source_latency_included</td><td>Specifies input delay already includes added source latency</td></tr> <tr> <td>&lt;delay&gt;</td><td>Time value</td></tr> <tr> <td>&lt;targets&gt;</td><td>Collection or list of output ports</td></tr> </table>	-max	Applies value as maximum data required time	-min	Applies value as minimum data required time	-reference_pin <name>	Specifies a pin or port in the design to which the output delay is relative	-rise	Specifies the rising output delay at the port	-source_latency_included	Specifies input delay already includes added source latency	<delay>	Time value	<targets>	Collection or list of output ports
-max	Applies value as maximum data required time														
-min	Applies value as minimum data required time														
-reference_pin <name>	Specifies a pin or port in the design to which the output delay is relative														
-rise	Specifies the rising output delay at the port														
-source_latency_included	Specifies input delay already includes added source latency														
<delay>	Time value														
<targets>	Collection or list of output ports														
<b>Description</b>	<p>Specifies the data required times at the specified output ports relative the clock specified by the -clock option. The clock must refer to a clock name in the design.</p> <p>Output delays can be specified relative to the rising edge (default) or falling edge (-clock_fall) of the clock.</p> <p>Output delays can be specified relative to a pin or a port (-reference_pin) in the clock network. Clock arrival times to the reference pin or port are added to the data required time.</p> <p>If no -reference_pin is specified, if the output delay is specified relative to a generated clock with a single target, the clock arrival times to the generated clock are added to the data required time. If the generated clock has multiple targets, the worst case arrival time to those targets will be used.</p> <p>Output delays can include clock source latency. By default the clock source latency of the related clock is added to the output delay value, but when the -source_latency_included option is specified, the clock source latency is not added because it was factored into the output delay value.</p> <p>The maximum output delay (-max) is used for clock setup checks or recovery checks and the minimum output delay (-min) is used for clock hold checks or removal checks. If only one of -min and -max (or neither) is specified for a given port, the same value is used for both.</p> <p>Separate rising (-rise) and falling (-fall) required times at the port can be specified. If only one of -rise and -fall are specified for a given port, the same value is used for both.</p> <p>By default, set_output_delay removes any other output delays to the port except for those with the same -clock, -clock_fall, and -reference_pin combination. Multiple output delays relative to different clocks, clock edges, or reference pins can be specified using the -add_delay option. Future output delays relative to different clocks, clock edges, or reference pins that do not specify the -add_delay option will still remove previous output delays that specified the -add_delay option.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p>														
<b>Example Usage</b>	<pre># Simple output delay with the same value for min/max and rise/fall: # 1) set on ports with names of the form myout* set_output_delay -clock clk 0.5 [get_ports myout*] # 2) set on all output ports set_output_delay -clock clk 0.5 [all_outputs]  # Output delay with respect to the falling edge of clock set_output_delay -clock clk -clock_fall 0.5 [get_ports myout*]  # Output delays for different min/max and rise/fall combinations set_output_delay -clock clk -max -rise 0.5 [get_ports myout*] set_output_delay -clock clk -max -fall 0.4 [get_ports myout*] set_output_delay -clock clk -min -rise 0.4 [get_ports myout*] set_output_delay -clock clk -min -fall 0.3 [get_ports myout*]  # Adding multiple output delays with respect to more than one clock set_output_delay -clock clkA -min 0.2 [get_ports myout*] set_output_delay -clock clkA -max 0.8 [get_ports myout*] set_output_delay -clock clkA -clock_fall 0.6 [get_ports myout*] -add_delay set_output_delay -clock clkB -min 1.1 [get_ports myout*] -add_delay</pre>

### 3.1.35.1. derive\_clock\_uncertainty (::quartus::sdc\_ext)

The following table displays information for the `derive_clock_uncertainty` Tcl command:

Tcl Package and Version	Belongs to ::quartus::sdc_ext on page 580		
Syntax	derive_clock_uncertainty [-h   -help] [-long_help] [-add] [-overwrite]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-add	Adds results to user-defined clock uncertainty assignments	
	-overwrite	Overwrites user-defined clock uncertainty assignments	
Description	<p>Applies inter-clock, intra-clock and I/O interface uncertainties based on timing model characterization. This command calculates and applies setup and hold clock uncertainties for each clock-to-clock transfer found in the design. The calculation of the uncertainties is delayed until the next update_timing_netlist call.</p> <p>To get I/O interface uncertainty in addition to inter-clock and intra-clock uncertainties, create a virtual clock to represent an off-chip clock for input or output delay specification and assign delays to input/output ports with set_input_delay and set_output_delay commands that specify the virtual clock.</p> <p>If set_input_delay and set_output_delay commands specifying a non-virtual clock are called, derive_clock_uncertainty applies either inter-clock or intra-clock uncertainty for that clock transfer since those transfers represent a clock-to-clock domain rather than an I/O-to-register clock domain.</p> <p>The set_clock_uncertainty calls will override the derived values for a source clock and destination clock pair unless either the set_clock_uncertainty command or the derive_clock_uncertainty command specified the -add option, in which case the values are added. Specifying the -overwrite option will instead cause all set_clock_uncertainty commands to be ignored. Previous set_clock_uncertainty assignments can also be manually removed by using the remove_clock_uncertainty command.</p> <p>Note that this command is called automatically and the user only needs to manually call it to specify the -add or -overwrite options.</p>		
Example Usage	<pre># create a virtual clock create_clock -name virtual -period 1  # apply input/output delays with the virtual clock to get # I/O interface uncertainties set_input_delay -clock virtual -add_delay 0 [all_inputs] set_output_delay -clock virtual -add_delay 0 [all_outputs]  # call derive_clock_uncertainty. results will be calculated # at the next update_timing_netlist call derive_clock_uncertainty  update_timing_netlist</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.35.2. derive\_pll\_clocks (::quartus::sdc\_ext)

The following table displays information for the derive\_pll\_clocks Tcl command:

Tcl Package and Version	Belongs to ::quartus::sdc_ext on page 580		
Syntax	derive_pll_clocks [-h   -help] [-long_help] [-create_base_clocks] [-use_net_name]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-create_base_clocks	Creates base clocks on input clock ports of the design that are feeding the PLL	
	-use_net_name	Use net names as clock names	
Description	<p>NOTE: This command is no longer supported for Stratix 10 and later families.</p> <p>Identifies PLLs or similar resources in the design and creates generated clocks for their output clock pins. Multiple generated clocks may be created for each output clock pin if the PLL is using clock switchover, one for the inclk[0] input clock pin and one for the inclk[1] input clock pin.</p> <p>By default this command does not create base clocks on input clock ports that are driving the PLL. When you use the create_base_clocks option, derive_pll_clocks also creates the base clock on an input clock port deriving the PLL. This option does not overwrite an existing clock.</p> <p>By default the clock name is the same as the output clock pin name. To use the net name, use the -use_net_name option.</p> <p>Note that this command is not supported for Stratix 10 and later device families. The only families that still have support for this command are Arria 10 and Cyclone 10GX. The reason why this command has been deprecated is because all PLL clocks are now automatically generated by the SDC files generated alongside the PLL IP. No user action is required.</p>		
Example Usage	<pre>project_open top create_timing_netlist  # Create the base clock for the input clock port driving the PLL create_clock -period 10.0 [get_ports sysclk]  # Create the generated clocks for the PLL. derive_pll_clocks  update_timing_netlist  # Other user actions report_timing  delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.35.3. disable\_min\_pulse\_width (::quartus::sdc\_ext)

The following table displays information for the `disable_min_pulse_width` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sdc_ext</code> on page 580		
<b>Syntax</b>	<code>disable_min_pulse_width [-h   -help] [-long_help] &lt;targets&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>&lt;targets&gt;</code>	Elements to disable MPW checks for	
<b>Description</b>	<p>Allows you to disable minimum pulse width checks for specified targets.</p> <p>If the target is a clock collection, all MPW checks along that clock path will be disabled. Otherwise, MPW checks for the elements in the passed target collection will be disabled.</p>		
<b>Example Usage</b>	<pre>disable_min_pulse_width -targets reg[*] disable_min_pulse_width -targets [get_clocks {clkA}]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.35.4. get\_active\_clocks (::quartus::sdc\_ext)

The following table displays information for the `get_active_clocks` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc_ext</a> on page 580		
<b>Syntax</b>	get_active_clocks [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Returns the collection of active clocks for timing analysis. The active clocks are the clocks specified in the most recent call to set_active_clocks, or all clocks if set_active_clocks has not been called.		
<b>Example Usage</b>	# Set some active clocks set_active_clocks [get_clocks {clk1 clk2 sysclk*}]  # Update the active clocks to exclude clk1 set_active_clocks [remove_from_collection [get_active_clocks] [get_clocks clk1]]		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.35.5. get\_fanins (::quartus::sdc\_ext)

The following table displays information for the get\_fanins Tcl command:

Tcl Package and Version	Belongs to ::quartus::sdc_ext on page 580	
Syntax	get_fanins [-h   -help] [-long_help] [-asynch] [-clock] [-inverting_paths] [-no_logic] [-non_inverting_paths] [-stop_at_clocks] [-synch] [-through <names> ] <filter>	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-asynch	Traverse through asynch edges
	-clock	Traverse through clock edges
	-inverting_paths	Only follow inverting combinational paths
	-no_logic	Do not follow combinational paths
	-non_inverting_paths	Only follow non-inverting combinational paths
	-stop_at_clocks	Return clock targets as fanin/fanouts rather than traversing through them
	-synch	Traverse through synch edges
	-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	<filter>	Valid starting nodes (string patterns are matched using Tcl string matching or collection)
Description	<p>Returns a collection of fanin ports, registers (and optionally clock targets) reachable from the &lt;filter&gt; in the design. When you supply the -no_logic option, get_fanins ignores paths that pass through combinational logic elements other than buffers and inverters.</p> <p>NOTE: the -no_logic option does not consider logic absorbed into the cells of the &lt;filter&gt; nor the cells of fanin registers, ports or clock targets.</p> <p>When you use -synch, -asynch, or -clock options, get_fanins traverses the netlist through corresponding edges. You can specify more than one of these options. If you do not specify any of these three options, the command does not ignore any paths.</p> <p>When the -non_inverting_paths option is used, no_logic does not follow any paths that includes odd number of inverters. Similarly, when the -inverting_paths option is used, no_logic does not follow any paths that includes even number of inverters. Both the -non_inverting_paths and -inverting_paths options require the -no_logic option and are mutually exclusive.</p> <p>When the -through option is used, only the fanins that can be reached by going through those nodes are returned.</p> <p>When -stop_at_clocks is used, combinational clock targets may be returned (in addition to clock or non-clock registers and ports), and registers or ports that can only be reached by traversing through a clock target will not be returned.</p> <p>The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for the use_timing_analyzer_style_escaping command for details.</p>	
continued...		

<b>Example Usage</b>	<pre> set fanins [get_fanins \$item -synch -clock] foreach_in_collection fanin_keeper \$fanins {     lappend fanin_keeper_list [get_node_info \$fanin_keeper -name] }  set fanins_no_logic [get_fanins \$item -no_logic -asynch] foreach_in_collection fanin_keeper \$fanins_no_logic {     lappend fanin_keeper_list_no_logic [get_node_info \$fanin_keeper -name] }  #-through example get_fanins inst18 -through inst11 </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.35.6. get\_fanouts (::quartus::sdc\_ext)

The following table displays information for the get\_fanouts Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc_ext</a> on page 580	
<b>Syntax</b>	get_fanouts [-h   -help] [-long_help] [-asynch] [-clock] [-inverting_paths] [-no_logic] [-non_inverting_paths] [-stop_at_clocks] [-synch] [-through <names> ] <filter>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-asynch	Traverse through asynchronous edges
	-clock	Traverse through clock edges
	-inverting_paths	Only follow inverting combinational paths
	-no_logic	Do not follow combinational paths
	-non_inverting_paths	Only follow non-inverting combinational paths
	-stop_at_clocks	Return clock targets as fanin/fanouts rather than traversing through them
	-synch	Traverse through synchronous edges
	-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	<filter>	Valid starting nodes (string patterns are matched using Tcl string matching or collection)
<b>Description</b>	<p>Returns a collection of fanout ports, registers (and optionally clock targets) reachable from the &lt;filter&gt; in the design. When the -no_logic option is used, get_fanouts ignores the paths that pass through combinational logic elements other than buffers and inverters.</p> <p>When you use the -synch, -asynch, or -clock options, get_fanouts traverses the netlist through corresponding edges. You can specify more than one of these options. If you do not specify any of these three options, the command does not ignore any paths.</p> <p>When the -non_inverting_paths option is used in conjunction with the -no_logic option, get_fanouts does not follow paths that include an odd number of inverters. Similarly, when the -inverting_paths option is used in conjunction with the -no_logic option, get_fanouts does not follow any paths that include an even number of inverters. Both the</p>	
continued...		

	<p>-non_inverting_paths and -inverting_paths options require the -no_logic option and are mutually exclusive.</p> <p>NOTE: The -no_logic option does not consider logic absorbed into the cells of the &lt;filter&gt; nor the cells of fanout registers, ports or clock targets. The -no_inversion option does not consider inversions absorbed into synchronous inputs of fanout registers, as the Intel Quartus Prime software register timing model always considers these edges as being positive unate.</p> <p>When the -through option is used, only the fanouts that can be reached by going through those nodes are returned.</p> <p>When -stop_at_clocks is used, combinational clock targets may be returned (in addition to clock or non-clock registers and ports), and registers or ports that can only be reached by traversing through a clock target will not be returned.</p> <p>The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>		
<b>Example Usage</b>	<pre>set fanouts [get_fanouts \$item] foreach_in_collection fanout_keeper \$fanouts {     lappend fanout_keeper_list [get_node_info \$fanout_keeper -name] }  set fanouts_no_logic [get_fanouts \$item -no_logic] foreach_in_collection fanout_keeper \$fanouts_no_logic {     lappend fanout_keeper_list_no_logic [get_node_info \$fanout_keeper -name] }  # Using through option to find the fanout registers whose enable input is # connected to the signal while ignoring the inverting paths. get_fanouts inst1 -no_logic -non_inverting_paths -through [get_pins -hierarchical * ena]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.35.7. get\_keepers (::quartus::sdc\_ext)

The following table displays information for the get\_keepers Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc_ext</a> on page 580	
<b>Syntax</b>	get_keepers [-h   -help] [-long_help] [-no_duplicates] [-nocase] [-nowarn] [ <filter> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-no_duplicates	Do not match duplicated keeper names
	-nocase	Specifies the matching of node names to be case-insensitive
	-nowarn	Do not issue warning messages about unmatched patterns
	<filter>	Valid destinations (string patterns are matched using Tcl string matching)
<b>Description</b>	<p>Returns a collection of non-combinational or "keeper" nodes in the design.</p> <p>The default matching scheme returns not only non-combinational nodes whose names match the specified filter, but also non-combinational nodes</p>	
continued...		

	<p>duplicated from these keepers (refers to cells are automatically generated by Quartus from these keepers). Use the <code>-no_duplicates</code> option to exclude duplicated keepers.</p> <p>The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the <code>use_timing_analyzer_style_escaping</code> command for details.</p>		
<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist  set kprs [get_keepers *reg*] foreach_in_collection kpr \$kprs {     puts [get_object_info -name \$kpr] }  delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use <code>create_timing_netlist</code> to create a timing netlist.

### 3.1.35.8. get\_nodes (::quartus::sdc\_ext)

The following table displays information for the `get_nodes` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sdc_ext</code> on page 580	
<b>Syntax</b>	<code>get_nodes [-h   -help] [-long_help] [-include_generated_clocks] [-no_duplicates] [-nocase] [-nowarn] [-of_clocks] [ &lt;filter&gt; ]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-include_generated_clocks</code>	Includes generated clocks derived from the matched clocks. This option can only be used in conjunction with the <code>-of_clocks</code> option.
	<code>-no_duplicates</code>	Do not match duplicated node names
	<code>-nocase</code>	Specifies the matching of node names (or clock names if the <code>-of_clocks</code> option is used) to be case-insensitive
	<code>-nowarn</code>	Do not issue warning messages about unmatched patterns
	<code>-of_clocks</code>	Returns nodes that are on the clock domains of the specified clock names
	<code>&lt;filter&gt;</code>	Valid destinations (string patterns are matched using Tcl string matching)
<b>Description</b>	<p>Returns a collection of nodes in the design.</p> <p>The default matching scheme returns not only nodes whose names match the specified filter, but also nodes duplicated from these nodes (refers to cells are automatically generated by Quartus from these nodes). Use the <code>-no_duplicates</code> option to not include duplicated nodes. If the <code>-of_clocks</code> option is used, the nodes returned are limited to those on the clock domains of clocks whose names match the specified filter.</p> <p>The filter for the collection is a Tcl list of</p>	

*continued...*

	wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.		
<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist  set nodes [get_nodes *name*] foreach_in_collection node \$nodes {     puts [get_object_info -name \$node] }  delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The -include_generated_clocks option can only be used when the -of_clocks option is used as well
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.35.9. get\_partitions (::quartus::sdc\_ext)

The following table displays information for the get\_partitions Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc_ext on page 580	
<b>Syntax</b>	get_partitions [-h   -help] [-long_help] [-cell] [-hierarchical] [-nocase] [ <filter> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-cell	Returns a cell collection inside the partitions matching the <filter>
	-hierarchical	Specifies if hierarchical searching method should be used
	-nocase	Specifies the matching of node names to be case-insensitive
	<filter>	Valid partitions (string patterns are matched using Tcl string matching)
<b>Description</b>	<p>Returns a collection of partitions matching the filter by default. All partition names in the collection match the specified pattern. Wildcards can be used to select multiple partitions at once.</p> <p>The -cell option creates and returns the collection of cells found inside the partitions matching the &lt;filter&gt; instead of returning a partition collection.</p> <p>There are three Tcl string matching schemes available with this command: default, -hierarchical, and -no_case.</p> <p>When using the default matching scheme, pipe characters separate one hierarchy level from the next. They are treated as special characters and are taken into account when string matching with wildcards is performed. The default matching scheme does not force the search to proceed recursively down the hierarchy.</p> <p>Using the hierarchical matching scheme forces the search to proceed recursively down the hierarchy.</p>	
continued...		

	<p>The -nocase matching scheme uses case-insensitive matching behavior.</p> <p>The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>		
<b>Example Usage</b>	<pre>#Get the partitions matching the filter get_partitions *  #Get the collection of cells inside partitions matching the filter get_partitions * -cell</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: This command is not supported in this version of the software.

### 3.1.35.10. get\_registers (::quartus::sdc\_ext)

The following table displays information for the get\_registers Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc_ext on page 580	
<b>Syntax</b>	get_registers [-h   -help] [-long_help] [-latches] [-no_duplicates] [-nocase] [-nowarn] [ <filter> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-latches	Get only latches that match the filter
	-no_duplicates	Do not match duplicated register names
	-nocase	Specifies the matching of node names to be case-insensitive
	-nowarn	Do not issue warning messages about unmatched patterns
	<filter>	Valid destinations (string patterns are matched using Tcl string matching)
<b>Description</b>	<p>Returns a collection of registers in the design.</p> <p>The default matching scheme returns not only registers whose names match the specified filter, but also returns registers duplicated from these registers (cells automatically generated from these registers by the Quartus Prime software). Use the -no_duplicates option to exclude duplicated registers.</p> <p>The filter for the collection is a Tcl list of wildcards, and must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p>	
<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist  set regs [get_registers *reg*] foreach_in_collection reg \$regs {     puts [get_object_info -name \$reg] }  delete_timing_netlist project_close</pre>	
continued...		

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.35.11. remove\_annotated\_delay (::quartus::sdc\_ext)

The following table displays information for the `remove_annotated_delay` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sdc_ext</code> on page 580		
<b>Syntax</b>	<code>remove_annotated_delay [-h   -help] [-long_help] -all</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-all</code>	Specifies removal of all annotated delays	
<b>Description</b>	Removes annotated delays from the design.		
<b>Example Usage</b>	<pre># annotate delay set_annotated_delay -net -from [get_pins clk] 0.1 update_timing_netlist  # remove all annotated delays remove_annotated_delay -all update_timing_netlist</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use <code>create_timing_netlist</code> to create a timing netlist.

### 3.1.35.12. remove\_clock (::quartus::sdc\_ext)

The following table displays information for the `remove_clock` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc_ext</a> on page 580		
<b>Syntax</b>	remove_clock [-h   -help] [-long_help] [-all] [ <clock_list> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-all	Removes all clocks from the design	
	<clock_list>	Clock(s) to be removed	
<b>Description</b>	Removes the specified clock(s) from the design.		
continued...			

<b>Example Usage</b>	<pre># Create a clock and then remove it. create_clock -period 10 -name CLK [get_ports clk] remove_clock CLK</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.35.13. reset\_timing\_derate (::quartus::sdc\_ext)

The following table displays information for the `reset_timing_derate` Tcl command:

Tcl Package and Version	Belongs to ::quartus::sdc_ext on page 580		
Syntax	reset_timing_derate [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Resets all derate factors set on the design.		
Example Usage	# set timing derate set_timing_derate -late 0.2 [get_cells *] update_timing_netlist  # reset all derate factors reset_timing_derate update_timing_netlist		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.35.14. set\_active\_clocks (::quartus::sdc\_ext)

The following table displays information for the `set_active_clocks` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc_ext</a> on page 580		
<b>Syntax</b>	set_active_clocks [-h   -help] [-long_help] <clocks>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<clocks>	List or collection of clocks	
<b>Description</b>	<p>Sets the list of active clocks for timing analysis. All other clocks not in the list or collection are considered inactive.</p> <p>Timing analysis is only performed on active clocks. All clocks are active by default. Generated clocks that are generated from inactive clocks are considered inactive. Therefore, to make a generated clock active, specify both the parent and generated clock when calling set_active_clocks.</p> <p>To reset all clocks to active, call "set_active_clocks **" or "set_active_clocks [all_clocks]".</p>		
continued...			

*continued...*

	The set_active_clocks command does not affect all reports. For example, inactive clocks are still reported by report_clocks, report_clock_transfers, and similar commands.		
<b>Example Usage</b>	<pre># Only analyze clk1 set_active_clocks [get_clocks clk1]  # Only analyze clk2 set_active_clocks [get_clocks clk2]  # Analyze all clocks set_active_clocks [all_clocks]</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.35.15. set\_annotated\_delay (::quartus::sdc\_ext)

The following table displays information for the set\_annotated\_delay Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc_ext on page 580	
<b>Syntax</b>	set_annotated_delay [-h   -help] [-long_help] [-cell] [-ff] [-fr] [-from <names> ] [-max] [-min] [-net] [-operating_conditions <operating_conditions> ] [-rf] [-rr] [-to <names> ] <delay>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-cell	Specifies that cell delay must be set
	-ff	Specifies that FF delay must be set
	-fr	Specifies that FR delay must be set
	-from <names>	Valid source pins or ports (string patterns are matched using Tcl string matching)
	-max	Specifies that only max delay should be set
	-min	Specifies that only min delay should be set
	-net	Specifies that net delay must be set
	-operating_conditions <operating_conditions>	Operating conditions Tcl object
	-rf	Specifies that RF delay must be set
	-rr	Specifies that RR delay must be set
	-to <names>	Valid destination pins or ports (string patterns are matched using Tcl string matching)
	<delay>	The delay value in default time units
<b>Description</b>	Annotates the cell delay between two or more pins/nodes on a cell, or the interconnect delay between two or more pins on the same net, in the	
continued...		

	<p>current design. Multiple transition edges (rr, fr, rf, ff) can be specified. If no transition is specified, then the given delay is assigned to all four values. If either -from or -to (or both) values are left unspecified, the missing value or values are substituted by an "*" character. Options -max and -min allow users to specify max or only min delay. If neither -max or -min is specified, both delays are set. Using this command to reduce delay pessimism might lead to optimistic results from timing analysis.</p> <p>The values for -from and -to are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p> <p>Delay annotation is deferred until the next time update_timing_netlist is called. To remove annotated delays, use remove_annotated_delay command.</p> <p>This assignment is for timing analysis only, and is not considered during timing-driven compilation.</p>		
<b>Example Usage</b>	<pre>set_annotated_delay -cell 100 -from A B C datain -to A B C combout -rr -ff set_annotated_delay -net 100 -to A carryin update_timing_netlist  # To clear all net delays set_annotated_delay -net 0 update_timing_netlist  # To remove all annotated delay assignments remove_annotated_delay -all update_timing_netlist</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.35.16. set\_data\_delay (::quartus::sdc\_ext)

The following table displays information for the set\_data\_delay Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc_ext on page 580	
<b>Syntax</b>	<pre>set_data_delay [-h   -help] [-long_help] [-add_latch_clock] [-add_launch_clock] [-allow_destination_borrowing] [-fall_from &lt;names&gt; ] [-fall_to &lt;names&gt; ] [-from &lt;names&gt; ] [-get_value_from_clock_period &lt;src_clock_period dst_clock_period min_clock_period max_clock_period&gt; ] [-no_synchronizer] [-override] [-rise_from &lt;names&gt; ] [-rise_to &lt;names&gt; ] [-through &lt;names&gt; ] [-to &lt;names&gt; ] [-value_multiplier &lt;multiplier&gt; ] [ &lt;value&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-add_latch_clock	Include the latch clock path in timing analysis
	-add_launch_clock	Include the launch clock path in timing analysis
	-allow_destination_borrowing	Allow time borrowing at the destination
	-fall_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
<b>continued...</b>		

	-from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-get_value_from_clock_period <src_clock_period dst_clock_period  min_clock_period max_clock_period>	Compute constraint as a multiple of the clock period
	-no_synchronizer	Prevent this data delay from triggering a synchronizer
	-override	Make this constraint override non-datapath-only setup constraints, instead of applying it in addition to them (equivalent to set_data_delay & set_false_path -setup -no_synchronizer, unless -add_launch_clock is used as well)
	-rise_from <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-rise_to <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	-to <names>	Valid destinations (string patterns are matched using Tcl string matching)
	-value_multiplier <multiplier>	Value by which the clock period should be multiplied to compute requirement
	<value>	Time Value
<b>Description</b>	<p>Specifies a maximum datapath delay exception for a given path.</p> <p>The maximum delay analysis includes Tco of the launching register, and Tsu of the latching register. By default, it does not include clock arrival times at the launching or latching register. To include launch clock arrival times, use the -add_launch_clock option. To include latch clock arrival times, use the -add_latch_clock option. If the path starts or ends at a port, the analysis does not include delays due to set_input_delay or set_output_delay.</p> <p>Use -get_value_from_clock_period to set the delay requirement for each path to be equal to the launching or latching clock period, or whichever of the two has a smaller or larger period. If -value_multiplier is used, the requirement will be multiplied by that value. If there are no clocks clocking the endpoints of the path (such as if the path begins or ends at an unconstrained I/O), the constraint will be ignored.</p> <p>The datapath delay constraint is applied in addition to other constraints on the given path, including the default constraint. Furthermore, the datapath delay constraint is analyzed independently from other SDC constraints, including set_false_path and set_clock_groups, and cannot be overridden by other SDC constraints. For example, you can use set_data_delay to specify an upper limit on logic and routing delay for paths cut by set_false_path.</p> <p>To both cut a path for (clock-aware) timing and constrain its datapath delay, the path must be constrained with both set_false_path and set_data_delay.</p> <p>The -from and -to values are collections of clocks, registers, ports, pins, or cells in the design.</p> <p>Applying exceptions between clocks applies the exception from all register or ports driven by the -from clock to all registers or ports driven by the -to clock.</p> <p>If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells applies to all registers in the cell or driven by the clock pin.</p> <p>The -through values are collections of pins or nets in the design. An exception applied through a node in the design applies only to paths through the specified node.</p> <p>the Timing Analyzer allows you to specify the -through argument multiple times to describe paths that go through multiple points.</p> <p>For instance, users can select all paths that go through node X, and then go through node Y. This helps you narrow down and select the specific paths that you are interested in.</p> <p>The -rise_from and -fall_from options can be used in place of the</p>	

*continued...*

	<p>-from destination nodes. The rise or fall value of the option indicates that the "from" nodes are driven by the rising or falling edge of the clock that feeds this node taking into consideration any logical inversions along the clock path. The "-from" option is the combination of both rising and falling "from" nodes. If the "from" collection is a clock collection, the assignment applies to those nodes that are driven by the respective rising or falling clock edge.</p> <p>The -rise_to and -fall_to options behave similarly to the "from" options described previously. These assignments restrict the given assignment to only those nodes or clocks that correspond to the specified rise or fall value taking into consideration any logical inversions that are along the clock path.</p> <p>The values of the -from, -to, -through, and other similar options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See help for the use_timing_analyzer_style_escaping command for details.</p> <p>If the source of a path with a set_data_delay constraint has any time borrowed, the delay budget will be reduced by the time borrowed.</p> <p>By default, the delay budget will not be increased by time borrowed at the destination of a path constrained by a set_data_delay constraint, and negative slack on a set_data_delay constraint will not cause time borrowing to happen. To change this behavior, use the -allow_destination_borrowing option.</p>		
<b>Example Usage</b>	<pre># Apply a 10ns max data delay on paths between two unrelated clocks set_data_delay -from [get_clocks clkA] -to [get_clocks clkB] 10.000  # Apply a 2ns max data delay from an input port to any register set_data_delay -from [get_ports in[*]] -to [get_registers *] 2.000  # Require net delay to be at most 90% of the period of the clock driving the inst9 register set_data_delay -get_value_from_clock_period dst_clock_period -value_multiplier 0.9 -from [get_clocks clk] -to [get_keepers inst9]  # Apply a 2ns max data delay for an input port only to nodes driven by # the rising edge of clock CLK set_data_delay -from [get_ports in[*]] -rise_to [get_clocks CLK] 2.000</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.35.17. set\_max\_skew (::quartus::sdc\_ext)

The following table displays information for the set\_max\_skew Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc_ext on page 580	
<b>Syntax</b>	<pre>set_max_skew [-h   -help] [-long_help] [-fall_from_clock &lt;names&gt; ] [-fall_to_clock &lt;names&gt; ] [-from &lt;names&gt; ] [-from_clock &lt;names&gt; ] [-get_skew_value_from_clock_period &lt;src_clock_period dst_clock_period min_clock_period&gt; ] [-rise_from_clock &lt;names&gt; ] [-rise_to_clock &lt;names&gt; ] [-skew_value_multiplier &lt;multiplier&gt; ] [-to &lt;names&gt; ] [-to_clock &lt;names&gt; ] [ &lt;skew&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-fall_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-from <names>	Valid sources (string patterns are matched using Tcl string matching)
<i>continued...</i>		

	-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-get_skew_value_from_clock_period <src_clock_period dst_clock_period min_clock_period>	Compute skew constraint as a multiple of the clock period
	-rise_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-rise_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-skew_value_multiplier <multiplier>	Value by which the clock period should be multiplied to compute skew requirement
	-to <names>	Valid destinations (string patterns are matched using Tcl string matching)
	-to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	<skew>	Required skew
<b>Description</b>	<p>Use the set_max_skew constraint to perform maximum allowable skew analysis between sets of registers or ports. In order to constrain skew across multiple paths, all such paths must be defined within a single set_max_skew constraint. The set_max_skew timing constraint is not affected by the set_max_delay, set_min_delay, set_multicycle_path, and set_false_path constraints but is affected by the set_clock_groups -exclusive constraint. Paths between exclusive clocks are not analyzed for skew, and no two paths are compared for skew if their clocks are exclusive to each other. However, paths whose clocks are asynchronous are still analyzed for skew.</p> <p>Legal values for the -from and -to options are collections of clocks, registers, ports, pins, cells or partitions in a design.</p> <p>Applying maximum skew constraints between clocks applies the constraint from all register or ports driven by the clock specified with the -from option to all registers or ports driven by the clock specified with the -to option.</p> <p>If pin names or collections are used, the -from value must be a clock pin and the -to value must be any non-clock input pin to a register. Assignments from clock pins or to and from cells apply to all registers contained in the cell or driven by the clock pin. Similarly, -to and -from partition specifications apply to all registers in the specified partition.</p> <p>Max skew analysis includes data arrival times, clock arrival times, register micro parameters, clock uncertainty, on-die variation and ccpp removal.</p> <p>Use -get_skew_value_from_clock_period to set the skew requirement to be equal to the launching or latching clock period, or whichever of the two has a smaller period. If -skew_value_multiplier is used, the requirement is multiplied by that value. If this option is used, then the positional skew option may not be set. If the set of skew paths is clocked by more than one clock, the Timing Analyzer will use the one with smallest period to compute the skew constraint.</p> <p>When this constraint is used, results of max skew analysis are displayed in the Report Max Skew (report_max_skew) report from the Timing Analyzer. Since skew is defined between two or more paths, no results are displayed if the -from/-from_clock and -to/-to_clock filters satisfy less than two paths.</p>	

*continued...*

<b>Example Usage</b>	<pre># Constrain the skew on an input port to all registers it feeds set_max_skew -from [get_ports din] 0.200  # Constrain the skew on output bus dout[*] set_max_skew -to [get_ports dout\[*\]] 0.200  # Constrain skew to be less than 90% of the period of any clock in the source # register set set_max_skew -to [get_keepers inst1 *] -get_skew_value_from_clock_period src_clock_period - skew_value_multiplier 0.900  # Report the results of max skew assignments report_max_skew -panel_name "Report Max Skew" -npaths 10 -detail path_only</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: <string> is not a valid argument for option -exclude. Available argument is to_clock

### 3.1.35.18. set\_net\_delay (::quartus::sdc\_ext)

The following table displays information for the set\_net\_delay Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sdc_ext on page 580	
<b>Syntax</b>	set_net_delay [-h   -help] [-long_help] -from <names> [-get_value_from_clock_period <src_clock_period dst_clock_period min_clock_period max_clock_period> ] [-max] [-min] [-to <names> ] [-value_multiplier <multiplier> ] [ <delay> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-from <names>	Valid source pins, ports, registers or nets (string patterns are matched using Tcl string matching)
	-get_value_from_clock_period <src_clock_period dst_clock_period min_clock_period max_clock_period>	Compute net delay constraint as a multiple of the clock period
	-max	Specifies maximum delay
	-min	Specifies minimum delay
	-to <names>	Valid destination pins, ports, registers or nets (string patterns are matched using Tcl string matching)
	-value_multiplier <multiplier>	Value by which the clock period should be multiplied to compute net delay requirement
	<delay>	Net delay
<b>Description</b>	<p>Use the set_net_delay command to query the net delays and perform minimum or maximum timing analysis across nets. The -from and -to options can be string patterns or pin, port, register, or net collections. When pin or net collection is used, the collection should include output pins or nets.</p> <p>If the -to option is unused or if the -to filter is an "*" character, all the output pins and registers on timing netlist become valid destination points.</p> <p>When you use the -min option, slack is calculated by looking at the minimum delay on the edge. If you use</p>	
continued...		

	<p>-max option, slack is calculated with the maximum edge delay.</p> <p>Use -get_value_from_clock_period to set the net delay requirement to be equal to the launching or latching clock period, or whichever of the two has a smaller or larger period. If -value_multiplier is used, the requirement will be multiplied by that value. If the set of nets is clocked by more than one clock, the Timing Analyzer will use the one with smallest period to compute the constraint for a -max constraint, and the largest period for a -min constraint. If there are no clocks clocking the endpoints of the net (e.g. if the endpoints of the nets are not registers or constrained ports), then the net delay constraint will be ignored.</p>		
<b>Example Usage</b>	<pre>project_open my_project create_timing_netlist read_sdc update_timing_netlist  # add min delay constraint set_net_delay -min 0.160 -from [get_pins inst9 combout] -to [get_pins * dataf]  # add max delay constraint set_net_delay -max 0.500 -from inst8 combout  # this is same as the previous call set_net_delay -max 0.500 -from inst8 combout -to *  # Require net delay to be at most 90% of the period of the clock driving the inst9 register set_net_delay -max -get_value_from_clock_period dst_clock_period -value_multiplier 0.9 -from inst8 combout -to [get_keepers inst9]  update_timing_netlist report_net_delay -panel "Net Delay"</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: <string> is not a valid delay value
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: The option -value_multiplier must be a non-zero floating point number
	TCL_ERROR	1	ERROR: The option -value_multiplier may only be used if -get_value_from_clock_period is used

### 3.1.35.19. set\_scc\_mode (::quartus::sdc\_ext)

The following table displays information for the set\_scc\_mode Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc_ext</a> on page 580	
<b>Syntax</b>	set_scc_mode [-h   -help] [-long_help] [-size <size> ] [-use_heuristic]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-size <size>	Maximum SCC loop size
	-use_heuristic	Always use heuristic for SCC processing
<b>Description</b>	<p>Allows you to set maximum Strongly Connected Components (SCC) loop size or force the Timing Analyzer to always estimate delays through SCCs.</p> <p>When the Timing Analyzer encounters a loop of size greater than the specified maximum SCC loop size,</p>	
continued...		

	it uses a heuristic which only estimates delays through the loop.  If the loop is smaller than the maximum SCC loop size, a full processing of loops is performed unless the <code>-use_heuristic</code> option is used.		
<b>Example Usage</b>	<pre># Make the Timing Analyzer use normal processing for all loops # the size of which is less than or equal to 100. For loops of size # greater than 100, a runtime-saving heuristic will be used set_scc_mode -size 100  # Force the Timing Analyzer to use heuristic for all SCCs # disregarding their size set_scc_mode -use_heuristic</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.35.20. set\_time\_format (::quartus::sdc\_ext)

The following table displays information for the `set_time_format` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sdc_ext</a> on page 580		
<b>Syntax</b>	set_time_format [-h   -help] [-long_help] [-decimal_places <decimal_places> ] [-unit <unit> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-decimal_places <decimal_places>	Number of decimal places to use	
	-unit <unit>	Default time unit to use	
<b>Description</b>	<p>Sets time format, including time unit and decimal places.</p> <p>Time units are assumed to be nanoseconds (ns) by default. The "-unit" option overrides the default time units. Legal time unit values are: ps, ns, us, ms.</p> <p>Time units are displayed with three decimal places by default. The "-decimal_places" option overrides the default number of decimal places to show.</p> <p>The smallest resolution of all times units is one picosecond (ps). Any additional specified precision will be truncated.</p>		
<b>Example Usage</b>	<pre># Create two clocks with a clock period of 8 nanoseconds. create_clock -period 8.000 clk1  set_time_format -unit ps -decimal_places 0 create_clock -period 8000 clk2</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The default time unit can be set to ms, us, ns, or ps. Please specify one of these units instead.

### 3.1.35.21. set\_timing\_derate (::quartus::sdc\_ext)

The following table displays information for the set\_timing\_derate Tcl command:

Tcl Package and Version	Belongs to ::quartus::sdc_ext on page 580		
Syntax	set_timing_derate [-h   -help] [-long_help] [-cell_delay] [-early] [-late] [-net_delay] [-operating_conditions <operating_conditions> ] <derate_value> [ <cells> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-cell_delay	Specifies that derating factors are only to apply to cell delays	
	-early	Specifies the minimum derating factor. This factor specifies how early the signal can arrive	
	-late	Specifies the maximum derating factor. This factor specifies how late the signal can arrive	
	-net_delay	Specifies that derating factors are only to apply to net delays	
	-operating_conditions <operating_conditions>	Operating conditions Tcl object	
	<derate_value>	Timing derate value	
	<cells>	List of cell type objects	
Description	<p>Sets the global derate factors for the current design. The maximum and minimum delays of all timing arcs in the design are multiplied by the factors specified with the -late and -early options respectively. Only positive derate factors are allowed. If neither the -cell_delay nor -net_delay option is used, the derating factors apply to both cell and net delays. For net delay derates, the derate factor is applied to nets driven by matching cells.</p> <p>Specifying a derate value of less than 1.0 for the -late option or a derate value of greater than 1.0 for the -early option reduces delay pessimism, which might lead to optimistic results from timing analysis.</p> <p>The effect of set_timing_derate command is deferred until the next time update_timing_netlist is called. To reset derate factors to original values, use the reset_timing_derate command.</p> <p>This assignment is for timing analysis only, and is not considered during timing-driven compilation.</p>		
Example Usage	set_timing_derate -early 0.9 [get_cells *] set_timing_derate -late 1.1 [get_cells *]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Option -<string> has illegal value: <string>. Specify a legal option value.
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36. ::quartus::sta

The following table displays information for the **::quartus::sta** Tcl package:

<b>Tcl Package and Version</b>	::quartus::sta 1.0
<b>Description</b>	This package contains the set of Tcl functions for obtaining information from the Timing Analyzer.
<b>Availability</b>	This package is loaded by default in the following executables:  quartus_fit quartus_sta
<b>Tcl Commands</b>	add_to_collection (::quartus::sta) on page 602 check_timing (::quartus::sta) on page 603 compute_synchronizer_protection_length (::quartus::sta) on page 605 create_report_histogram (::quartus::sta) on page 606 create_slack_histogram (::quartus::sta) on page 607 create_timing_netlist (::quartus::sta) on page 609 create_timing_summary (::quartus::sta) on page 612 delete_sta_collection (::quartus::sta) on page 614 delete_timing_netlist (::quartus::sta) on page 614 enable_ccpp_removal (::quartus::sta) on page 615 enable_sdc_extension_collections (::quartus::sta) on page 616 get_available_operating_conditions (::quartus::sta) on page 617 get_cell_info (::quartus::sta) on page 617 get_clock_domain_info (::quartus::sta) on page 618 get_clock_fmax_info (::quartus::sta) on page 620 get_clock_info (::quartus::sta) on page 621 get_clock_pair_info (::quartus::sta) on page 622 get_datasheet (::quartus::sta) on page 623 get_default_sdc_file_names (::quartus::sta) on page 625 get_edge_info (::quartus::sta) on page 626 get_entity_instances (::quartus::sta) on page 627 get_min_pulse_width (::quartus::sta) on page 628 get_net_info (::quartus::sta) on page 629 get_node_info (::quartus::sta) on page 630 get_object_info (::quartus::sta) on page 631 get_operating_conditions (::quartus::sta) on page 632 get_operating_conditions_info (::quartus::sta) on page 633 get_partition_info (::quartus::sta) on page 633 get_path (::quartus::sta) on page 634 get_path_info (::quartus::sta) on page 636 get_pin_info (::quartus::sta) on page 639 get_point_info (::quartus::sta) on page 640 get_port_info (::quartus::sta) on page 642 get_register_info (::quartus::sta) on page 643 get_timing_paths (::quartus::sta) on page 644 import_sdc (::quartus::sta) on page 647 is_post_syn_sta (::quartus::sta) on page 647 locate (::quartus::sta) on page 648 print_total_sdc_processing_time (::quartus::sta) on page 650 query_collection (::quartus::sta) on page 650 read_sdc (::quartus::sta) on page 651 register_delete_timing_netlist_callback (::quartus::sta) on page 652 remove_from_collection (::quartus::sta) on page 652 report_advanced_io_timing (::quartus::sta) on page 653 report_asynch_cdc (::quartus::sta) on page 654 report_bottleneck (::quartus::sta) on page 656 report_cdc_viewer (::quartus::sta) on page 657 report_clock_fmax_summary (::quartus::sta) on page 659 report_clock_network (::quartus::sta) on page 660 report_clock_transfers (::quartus::sta) on page 662 report_clocks (::quartus::sta) on page 663 report_datasheet (::quartus::sta) on page 664 report_ddr (::quartus::sta) on page 665 report_exceptions (::quartus::sta) on page 665 report_ini_usage (::quartus::sta) on page 670 report_logic_depth (::quartus::sta) on page 670 report_max_clock_skew (::quartus::sta) on page 673 report_max_skew (::quartus::sta) on page 674 report_metastability (::quartus::sta) on page 676 report_min_pulse_width (::quartus::sta) on page 678 report_neighbor_paths (::quartus::sta) on page 680 report_net_delay (::quartus::sta) on page 683 report_net_timing (::quartus::sta) on page 684 report_partitions (::quartus::sta) on page 685 report_path (::quartus::sta) on page 686 report_pipelining_info (::quartus::sta) on page 689 report_register_spread (::quartus::sta) on page 690 report_register_statistics (::quartus::sta) on page 691

### 3.1.36.1. add\_to\_collection (::quartus::sta)

The following table displays information for the add\_to\_collection Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601		
Syntax	add_to_collection [-h   -help] [-long_help] <collection_obj_1> <collection_obj_2>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<collection_obj_1>	First object collection	
	<collection_obj_2>	Second object collection	
Description	<p>This command takes two collections and returns a new collection that is a union of the two. The second collection is allowed to be a string, whereas the first has to be previously-created collection, either by passing any of the "get_" functions directly, or by passing a variable that contains a collection (see code examples for this command). If a collection is used for the second argument, the types in the second collection must be the same as or a subset of the types in the first collection.</p> <p>If the first collection consists of keepers, the second collection can only consist of keepers, registers or ports. If the first collection consists of partitions, the second collection can only consist of partitions or cells. If the first collection consists of nodes, the second collection can only consist of nodes, keepers, registers, ports, pins, nets or combinational nodes.</p>		
Example Usage	<pre>set kprsl [get_keepers b*] set regsl [get_registers a*]  set regs_union [add_to_collection \$kprsl \$regsl]  #or: set regs_union [add_to_collection [get_keepers b*] \$regsl]  #or even: set regs_union [add_to_collection \$kprsl a*]  # - note that the last statement will actually add all keepers with name a* #   not only registers! (will add IOs with name a*, if any)  # Get the first 100 nodes in the collection. query_collection \$regs_union -limit 100</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Cannot find specified collection. Specify an existing collection.

### 3.1.36.2. check\_timing (::quartus::sta)

The following table displays information for the check\_timing Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	check_timing [-h   -help] [-long_help] [-append] [-file <name> ] [-include <check_list> ] [-panel_name <name> ] [-stdout]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-include <check_list>	Checks to perform
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
<b>Description</b>	<p>Checks for problems in the design or problems with design constraints. The check_timing command performs a series of different checks based on user-specified variables and options. There is no default list of checks. Use the -include option to specify which checks to perform. You must precede check_timing with update_timing_netlist.</p> <p>The no_clock check reports whether registers have at least one clock at their clock pin, and that ports determined to be clocks have a clock assigned to them, and also checks that PLLs have a clock assignment.</p> <p>The multiple_clock check verifies that registers have at most one clock at their clock pin. (When multiple clocks reach a register clock pin, it is undefined which clock is used for analysis.</p> <p>The generated_clock check verifies that generated clocks are valid. Generated clocks must have a source that is triggered by a valid clock.</p> <p>The no_input_delay check verifies that every input port that is not determined to be a clock has an input delay assignment.</p> <p>The no_output_delay check verifies that every output port has an output delay constraint.</p> <p>The partial_input_delay check verifies that input delays are complete, and ensures that input delays have a rise-min, fall-min, rise-max, and fall-max portion set.</p> <p>The partial_output_delay check verifies that output delays are complete, and makes sure that output delays have a rise-min, fall-min, rise-max, and fall-max portion set.</p> <p>The io_min_max_delay_consistency check verifies that min delay values specified by set_input_delay or set_output_delay assignments are less than max delay values.</p> <p>The reference_pin check verifies that reference pins specified in set_input_delay and set_output_delay using the -reference_pin option are valid. A reference_pin is valid if the -clock option specified in the same set_input_delay/set_output_delay command</p>	

*continued...*

	<p>matches the clock that is in the direct fanin of the reference_pin. Being in the direct fanin of the reference_pin means that there must be no keepers between the clock and the reference_pin.</p> <p>The latency_override check reports whether the clock latency set on a port or pin overrides the more generic clock latency set on a clock. Clock latency can be set on a clock, where the latency applies to all keepers clocked by the clock, whereas clock latency can also be set on a port or pin, where the latency applies to registers in the fanout of the port or pin.</p> <p>The loops check verifies that there are no strongly connected components in the netlist. These loops prevent a design from being properly analyzed. The loops check also reports if loops exist but were marked so that they would not be traversed.</p> <p>The latches check reports latches in the design and warns that latches may not be analyzed properly. For best results, change your design to remove latches whenever possible.</p> <p>The pos_neg_clock_domain check determines if any register is clocked by both the rising and falling edges of the same clock. If this scenario is necessary such as in a clock multiplexer, create two separate clocks that have similar settings and are assigned to the same node.</p> <p>The pll_cross_check checks the clocks that are assigned to a PLL against the PLL settings defined in design files. Inconsistent settings or an unmatched number of clocks associated with the PLL are reported to the user.</p> <p>The uncertainty check reports each clock-to-clock transfer that does not have a clock uncertainty assignment set between the two clocks. When a device family has derive_clock_uncertainty support, this report also checks if a user-defined set_clock_uncertainty assignment has a less than recommended clock uncertainty value.</p> <p>The virtual_clock check reports all unreferenced virtual clocks. It also reports if design does not have any virtual clock assignment.</p> <p>The partial_multicycle check ensures that each setup multicycle assignment has a corresponding hold multicycle assignment, and each hold multicycle assignment has a corresponding setup multicycle assignment.</p> <p>The multicycle_consistency check reports all the multicycle cases where a setup multicycle does not equal one greater than the hold multicycle. Hold multicycle assignments are usually one cycle less than setup multicycle assignments.</p> <p>The partial_min_max_delay check verifies that each minimum delay assignment has a corresponding maximum delay assignment, and vice versa.</p> <p>The clock_assignments_on_output_ports check reports all the clock assignments that have been applied to output ports.</p> <p>The input_delay_assigned_to_clock check verifies that no input delay value is set for a clock. Input delays set on clock ports are ignored because clock-as-data analysis takes precedence.</p> <p>The internal_io_delay check reports all the IO delays that have no specifications for -reference_pin and -source_latency_included, and -clock is a clock that is not assigned to a top level input or output port.</p>
<b>Example Usage</b>	<pre># Constrain design create_clock -name clk -period 4.000 -waveform { 0.000 2.000 } [get_ports clk] set_input_delay -clock clk2 1.5 [get_ports in*] set_output_delay -clock clk 1.6 [get_ports out*] set_false_path -from [get_keepers in] -through [get_nets r1] -to [get_keepers out]</pre>

*continued...*

	# Check if there were any problems check_timing -include {loops latches no_input_delay partial_input_delay}		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.36.3. compute\_synchronizer\_protection\_length (::quartus::sta)

The following table displays information for the  
compute\_synchronizer\_protection\_length Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601		
<b>Syntax</b>	compute_synchronizer_protection_length [-h   -help] [-long_help] [-slack_percentage <slack_percentage> ] -source_clk_freq <source_clk_freq> -synchronizer_clk_freq <synchronizer_clk_freq> [-toggle_rate_percentage <toggle_rate_percentage> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-slack_percentage <slack_percentage>	The percentage of the synchronizer clock period to use as slack	
	-source_clk_freq <source_clk_freq>	Source clock frequency	
	-synchronizer_clk_freq <synchronizer_clk_freq>	Synchronizer clock frequency	
	-toggle_rate_percentage <toggle_rate_percentage>	Source data toggle rate, set as 12.5% of source clock frequency by default	
<b>Description</b>	<p>This command computes the synchronizer protection length using the given source clock frequency and synchronizer clock frequency.</p> <p>The values should be specified as &lt;frequency&gt;&lt;unit&gt; or "&lt;frequency&gt; &lt;unit&gt;", for example 10MHz or "10 MHz".</p> <p>The values can also be specified as a period instead of a frequency. For example, 100ns.</p> <p>By default, the source data toggle rate used in the computation is 12.5% of the source clock frequency.</p> <p>This percentage can be changed by specifying the -toggle_rate_percentage option. For example, -toggle_rate_percentage 12.5.</p> <p>By default, the slack of synchronizer registers used in the computation is 80% of the synchronizer clock period.</p> <p>This percentage can be changed by specifying the -slack_percentage option. For example, -slack_percentage 80.</p> <p>This command returns the computed protection length, or -1 if an acceptable length cannot be found.</p>		
<b>Example Usage</b>	compute_synchronizer_protection_length -source_clk_freq 80MHz -synchronizer_clk_freq "50 MHz" -slack_percentage 80 compute_synchronizer_protection_length -source_clk_freq 12.5ns -toggle_rate_percentage 12.5 -synchronizer_clk_freq "500 ns"		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.36.4. create\_report\_histogram (::quartus::sta)

The following table displays information for the create\_report\_histogram Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre>create_report_histogram [-h   -help] [-long_help] [-append] [-color_div &lt;color_div&gt; ] [-color_list &lt;color_list&gt; ] [-file &lt;name&gt; ] [-max_data &lt;max_data&gt; ] [- min_data &lt;min_data&gt; ] [-num_bins &lt;num_bins&gt; ] [-panel_name &lt;name&gt; ] [-stdout] [- x_label &lt;x_label&gt; ] [-x_unit &lt;x_unit&gt; ] [-y_label &lt;y_label&gt; ] &lt;data&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-color_div <color_div>	Color divisions for the created histogram
	-color_list <color_list>	List of colors for painting the created histogram
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-max_data <max_data>	Maximum data value of the created histogram
	-min_data <min_data>	Minimum data value of the created histogram
	-num_bins <num_bins>	Number of bins
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
	-x_label <x_label>	Text label on x-axis
	-x_unit <x_unit>	Unit to be displayed on x-axis
	-y_label <y_label>	Text label on y-axis
	<data>	List of data to be analyzed
<b>Description</b>	<p>Create a user defined histogram.</p> <p>Use &lt;data&gt; to specify the data entries to be displayed on the histogram. It can be a tcl list of either one of the following two formats or a mix of the two: {time_integer} or {time_integer number_count}, where time_integer is an integer possibly with a unit representing time (default unit is second), and number_count is a positive integer specifying number of entries (y value) of the corresponding time_integer.</p> <p>Use -num_bins to specify the number of bins, or the number of bars to be displayed on the histogram.</p> <p>Use -color_div and -color_list to specify the color of each bin. -color_div takes a tcl list of time_integers (see &lt;data&gt; above). Each entry in the list specifies the upper bound of each color division and therefore is forced to be a boundary of bins. -color_list takes a tcl list of colors. Each color in the list is used in the order specified and if less color is given than color divisions, the list is re-used. For example, if specified "-color_div {-1 0</p>	

*continued...*

	<pre> 1) -color_list {red green}", then bins below -1 are red, bins between -1 and 0 are green, bins between 0 and 1 are red again, and bins larger than 1 are blue again. Possible choices of colors: black, blue, brown, green, grey, light_grey, orange, purple, red, white. Default -color_div is {0} and default -color_list is {red blue}.  Use -max_data to specify the upper bound, i.e. largest number to be included in the histogram.  Use -min_data to specify the lower bound, i.e. smallest number to be included in the histogram.  Use -panel_name to specify the path and panel name of the created histogram. e.g. "-panel_name {Folder 1 Histogram 1} creates a histogram named "Histogram 1" and put it in a folder with the name "Folder 1".  Use -x_label to specify the text label on x_axis.  Use -y_label to specify the text label on y_axis.  Use -x_unit to specify a text unit to be attached to x_axis. </pre>		
Example Usage	<pre> # create a path-based slack histogram project_open my_project create_timing_netlist read_sdc update_timing_netlist  # get path-based slack data in the format of a tcl list set data [list] set paths [get_timing_paths -setup -npaths 1000] foreach_in_collection path \$paths {     lappend data [get_path_info \$path -slack] }  # output data to histogram create_report_histogram \$data -panel_name {Path-based Slack Histogram} -num_bins 20  delete_timing_netlist project_close </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Option <string> has illegal value: <string>. Specify a legal option value.

### 3.1.36.5. create\_slack\_histogram (::quartus::sta)

The following table displays information for the create\_slack\_histogram Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601	
Syntax	<pre> create_slack_histogram [-h   -help] [-long_help] [-all_edges] [-append] [- clock_name &lt;name&gt; ] [-data_delay] [-file &lt;name&gt; ] [-hold] [-max_slack &lt;max_slack&gt; ] [-min_slack &lt;min_slack&gt; ] [-num_bins &lt;num_bins&gt; ] [-panel_name &lt;name&gt; ] [-partition] [-recovery] [-removal] [-setup] [-stdout] </pre>	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-all_edges	Consider slacks at all edges, not just at the endpoint nodes (results in increased memory consumption)
continued...		

	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-clock_name <name>	Name of the Clock Domain	
	-data_delay	Data Delay Analysis (only applicable for setup and recovery analysis)	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-hold	Hold Analysis	
	-max_slack <max_slack>	Maximum slack value of the created histogram	
	-min_slack <min_slack>	Minimum slack value of the created histogram	
	-num_bins <num_bins>	Number of bins	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-partition	Show slack count for each of the partition	
	-recovery	Recovery Analysis	
	-removal	Removal Analysis	
	-setup	Setup Analysis	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
Description	<p>Creates a slack histogram in the timing report for the specified clock domain "-clock_name," showing the number of timing edges within various ranges of slacks for a clock setup analysis. The histogram can be named using the "-panel_name" option.</p> <p>By default, only slack at the endpoint nodes of the timing netlist are considered. To include slack at all edges in the histogram, use the "-all_edges" option. This option results in increased memory consumption.</p> <p>Use the "-setup", "-hold", "-recovery", or "-removal" options to specify which kind of analysis should be performed. If none is specified, setup analysis is used by default.</p> <p>Reports can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical interface ("-panel_name"), or any combination of the three.</p> <p>The range of reported slack values can be controlled by specifying the "-min_slack" and "-max_slack" options. The number of bins (histogram bars) can also be specified using the "-num_bins" option.</p> <p>Use the "-partition" to show more information about each partition. A path is in a partition if it's starting point is in the partition. This option only works for "-panel".</p>		
Example Usage	<pre>project_open top create_timing_netlist read_sdc update_timing_netlist  # Create a slack histogram for clk1, defaulting to # the name "Slack Histogram (clk1)" create_slack_histogram -clock_name clk1  # Create a slack histogram for clk2 named "MyHistogram" create_slack_histogram -clock_name clk2 -panel_name MyHistogram  delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
continued...			

TCL_OK	0	INFO: Operation successful
TCL_ERROR	1	ERROR: Clock node not found or specified. Check valid clocks
TCL_ERROR	1	ERROR: Value <i>&lt;string&gt;</i> of option <i>&lt;string&gt;</i> is an invalid slack. Specify a valid slack value.
TCL_ERROR	1	ERROR: The max_slack value is less than or equal to the min_slack value. Specify a max_slack value that is greater than the min_slack value.
TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
TCL_ERROR	1	ERROR: Number of bins is 0. Specify a number greater than 0.

### 3.1.36.6. create\_timing\_netlist (::quartus::sta)

The following table displays information for the create\_timing\_netlist Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	create_timing_netlist [-h   -help] [-long_help] [-force_dat] [-grade <c i m e a> ] [-model <fast slow> ] [-no_latch] [-post_map] [-post_syn] [-snapshot <snapshot> ] [-speed <speed> ] [-temperature <value_in_C> ] [-voltage <value_in_mV> ] [-zero_ic_delays] [ <operating_conditions> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-force_dat	Option to force delay annotation
	-grade <c i m e a>	Option to specify temperature grade
	-model <fast slow>	Option to specify timing model
	-no_latch	Option to disable the analysis of latches as synchronous elements
	-post_map	Option to perform timing analysis on the post-synthesis netlist
	-post_syn	Option to perform timing analysis on the post-synthesis netlist
	-snapshot <snapshot>	Snapshot of the design to load
	-speed <speed>	Speed grade
	-temperature <value_in_C>	Operating temperature
	-voltage <value_in_mV>	Operating voltage
	-zero_ic_delays	Option to set all IC delays to zero
	<operating_conditions>	Operating conditions Tcl object name string
<b>Description</b>	<p>Creates the timing netlist by annotating the atom netlist with delay information using post-fitting results.</p> <p>Use the -post_syn option to obtain post-synthesis results.</p>	

continued...

	<p>In Quartus Prime Pro edition, you can use the <code>-snapshot</code> option to specify which netlist you want to perform timing analysis on.</p> <p>The <code>create_timing_netlist</code> command skips delay annotation by default. Use <code>-force_dat</code> to rerun delay annotation. This is required if any delay annotation setting is changed in the Quartus Prime project revision (e.g. <code>OUTPUT_PIN_LOAD</code>).</p> <p>Use <code>"-model fast"</code> to run the analysis using the fast corner delay models first. The <code>-temperature</code>, <code>-voltage</code>, and <code>-speed</code>, options are also available. See help for <code>set_operating_conditions</code> for details on these options.</p> <p>You can use <code>model</code>, <code>temperature</code> and <code>voltage</code> options to specify operating conditions while creating timing netlist (<code>temperature</code> and <code>voltage</code> options are not supported by all families). You can also set operating conditions by passing an operating conditions object name as a positional argument to <code>create_timing_netlist</code> command. After the timing netlist has been created, you can use <code>set_operating_conditions</code> command to change timing models without deleting and re-creating the timing netlist.</p> <p>Use the <code>-grade</code> option to analyze the design at a different temperature grade. This option is provided to support what-if analysis and is not recommended for final sign-off analysis.</p> <p>Use the <code>-no_latch</code> option to analyze latches as combinational loops instead of synchronous elements.</p> <p>Use the <code>-zero_ic_delays</code> option to set all IC delays in the netlist to zero.</p>
<b>Example Usage</b>	<pre> project_open my_top  # Create timing netlist before calling # any report functions create_timing_netlist  # Read SDC and update timing read_sdc update_timing_netlist  # Ready to call report functions report_timing -npaths 1 -clock_setup  # The following command is optional delete_timing_netlist  project_close  project_open my_top  # Report worst case period for -9 speed grade create_timing_netlist -speed 9  # Read SDC and update timing read_sdc update_timing_netlist  report_timing -clock_setup -clock_filter clk delete_timing_netlist  # Report hold violation for fastest corner # Use set_operating_conditions instead create_timing_netlist -model fast  # Read SDC and update timing read_sdc update_timing_netlist  report_timing -clock_hold -clock_filter clk delete_timing_netlist  # If Delay Annotation has been run for the fast corner # Force Delay Annotation create_timing_netlist -model fast -force_dat  # Read SDC and update timing read_sdc update_timing_netlist </pre>
	<i>continued...</i>

	<pre> report_timing -clock_hold -clock_filter clk delete_timing_netlist  # Report worst case period for post-technology mapping netlist create_timing_netlist -post_map  # Read SDC and update timing read_sdc update_timing_netlist  report_timing -clock_setup -clock_filter clk delete_timing_netlist  project_close </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The TCL command <string> is not supported in quartus_fit. It is only supported in quartus_sta. Please use quartus_sta instead of quartus_fit if you want to use this TCL command.
	TCL_ERROR	1	ERROR: Can't create timing netlist for device family <string>. Run Analysis and Synthesis (quartus_syn) using this device family as a value for the --family option before running the Timing Analyzer (create_timing_netlist).
	TCL_ERROR	1	ERROR: The Fast Forward snapshot cannot be used for sign-off timing analysis. Please see the Fast Forward Timing Closure Recommendations report for performance estimates.
	TCL_ERROR	1	ERROR: Can't run the Timing Analyzer (quartus_sta) --Periphery placement (quartus_fit --plan) failed or was not run. Run I/O Assignment Analysis (quartus_fit --plan) successfully before running the Timing Analyzer (create_timing_netlist -post_map).

### 3.1.36.7. create\_timing\_summary (::quartus::sta)

The following table displays information for the create\_timing\_summary Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus:sta on page 601	
<b>Syntax</b>	create_timing_summary [-h   -help] [-long_help] [-append] [-data_delay] [-file <i>&lt;name&gt;</i> ] [-hold] [-mpw] [-panel_name <i>&lt;name&gt;</i> ] [-recovery] [-removal] [-setup] [-split_by_corner] [-stdout]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<b>continued...</b>		

	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-data_delay	Data Delay Analysis (only applicable for setup and recovery analysis)	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-hold	Hold Analysis	
	-mpw	Minimum Pulse Width Analysis	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-recovery	Recovery Analysis	
	-removal	Removal Analysis	
	-setup	Setup Analysis (Default)	
	-split_by_corner	When set, running this command with the -panel option creates a folder containing versions of this report for selected multiple operating conditions. This option has no effect when used with the -stdout or -file options.	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
Description	<p>Reports the worst-case Clock Setup and Clock Hold slacks and endpoint TNS (total negative slack) per clock domain. Total negative slack is the sum of all slacks less than zero for either destination registers or ports in the clock domain. The number of endpoints in the domain with negative slack is also shown.</p> <p>This command shows the worst-case slack for each clock domain. You right click in these reports to run more detailed reports like Histograms and Report Timing.</p> <p>By default, this command creates a Setup Summary. This command can also generate a Hold Summary (-hold), Recovery Summary (-recovery), Removal Summary (-removal), or Minimum Pulse Width Summary (-mpw).</p> <p>The report can be directed to the Tcl console (-stdout, default), a file (-file), the Timing Analyzer graphical interface (-panel_name), or any combination of the three.</p>		
Example Usage	<pre>project_open my_project  # Always create the netlist first and process constraints create_timing_netlist read_sdc my_project.sdc update_timing_netlist  # Create Clock Domain Summary create_timing_summary -panel_name "Setup Summary" create_timing_summary -hold -panel_name "Hold Summary"  # The following command is optional delete_timing_netlist  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Panel name cannot contain repeated pipe characters. ( ).
continued...			

	TCL_ERROR	1	ERROR: Option <string> has illegal value: <string>. Specify a legal option value.
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.8. delete\_sta\_collection (::quartus::sta)

The following table displays information for the delete\_sta\_collection Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601		
<b>Syntax</b>	delete_sta_collection [-h   -help] [-long_help] <collection>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<collection>	The collection to delete	
<b>Description</b>	<div>This function is deprecated since sta cleans up the memory once the collection is out of scope. If you want to force a collection to go out of scope, use built-in tcl command 'unset'. Otherwise this function can remove the collection in cache.</div>		
<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist  set nodes [get_nodes Reg*]  # ... # do some work with the \$nodes collection # ...  # Delete the collection. delete_sta_collection \$nodes  # ... # do more work # ...  delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Cannot find specified collection. Specify an existing collection.

### 3.1.36.9. delete\_timing\_netlist (::quartus::sta)

The following table displays information for the delete\_timing\_netlist Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601		
<b>Syntax</b>	delete_timing_netlist [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
continued...			

	-long_help		Long help with examples and possible return values
Description	<p>Use this command to delete a timing netlist previously created using create_timing_netlist. This should be done at the end of a script or before calling create_timing_netlist again using different options or after recompiling the design.</p> <p>Use the set_operating_conditions command instead of delete_timing_netlist and create_timing_netlist to change timing models. This avoids the cost of deleting and re-creating the timing netlist, and also preserves current timing assignments.</p>		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.10. enable\_ccpp\_removal (::quartus::sta)

The following table displays information for the enable\_ccpp\_removal Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	enable_ccpp_removal [-h   -help] [-long_help] [-depth <depth> ] [-off] [-on]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-depth <depth>	maximum clock tree depth for ccpp removal
	-off	Disable this setting.
	-on	Enable this setting.
<b>Description</b>	<p>Enables (or disables) common clock path pessimism (CCPP) removal during slack computation. CCPP removal can improve timing results by removing min/max delay differences from common portions of clock paths. Enabling CCPP removal increases the time required to perform timing analysis.</p> <p>When specified, the optional depth parameter limits the clock tree depth used for CCPP removal. This is generally not applicable to FPGA compilations where the clock tree is fixed, but for large designs with potentially deep synthesized clock trees this can reduce outlier run time.</p> <p>When not specified, or when specified with a value of 0, the complete clock tree is used for CCPP removal (i.e. full clock-tree depth).</p>	
<b>Example Usage</b>	<pre>project_open top create_timing_netlist read_sdc  # Report timing without CCPP removal report_timing  # Enable CCPP removal and re-report timing. enable_ccpp_removal report_timing</pre>	

continued...

*continued...*

	delete_timing_netlist project_close		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.11. enable\_sdc\_extension\_collections (::quartus::sta)

The following table displays information for the enable\_sdc\_extension\_collections Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601		
<b>Syntax</b>	enable_sdc_extension_collections [-h   -help] [-long_help] [-off] [-on]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-off	Disable this setting.	
	-on	Enable this setting.	
<b>Description</b>	Enable the support of SDC extension collections, such as keeper, register and node collections. When enable_sdc_extension_collections is not used, using these collections causes an error. Default to -on option.		
<b>Example Usage</b>	<pre>project_open top enable_sdc_extension_collections -on create_timing_netlist read_sdc  report_timing -to_clock clk1  delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Found an SDC extension Tcl collection creation command: <i>&lt;string&gt;</i> . Either switch to an SDC Tcl collection creation command or turn on enable_sdc_extension_collections.
	TCL_ERROR	1	ERROR: Found an SDC extension collection type: <i>&lt;string&gt;</i> . Either switch to an SDC collection type or turn on enable_sdc_extension_collections.
	TCL_ERROR	1	ERROR: Found timing netlist in memory. Delete timing netlist before use this command.

### 3.1.36.12. get\_available\_operating\_conditions (::quartus::sta)

The following table displays information for the `get_available_operating_conditions` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601		
<b>Syntax</b>	get_available_operating_conditions [-h   -help] [-long_help] [-all] [-compile]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-all	Returns all available operating conditions	
	-compile	Returns only the operating conditions that are critical to analyze in the inner loop compilation	
<b>Description</b>	Returns a Tcl collection of available operating conditions for the current device. The Tcl collection contains the most extreme operating conditions within a user-specified junction temperature range. Use the -all option to return all available operating conditions.		
<b>Example Usage</b>	<pre>#do report timing for different operating conditions foreach_in_collection op [get_available_operating_conditions] {     set_operating_conditions \$op     update_timing_netlist     report_timing }  #see detailed information about operating conditions foreach_in_collection op [get_available_operating_conditions] {     puts "Delay Model: [get_operating_conditions_info \$op -model]" }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: VID mode is not supported by part <string>.

### 3.1.36.13. get\_cell\_info (::quartus::sta)

The following table displays information for the `get_cell_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	<code>get_cell_info [-h   -help] [-long_help] [-buried_nodes] [-buried_regs] [-in_pin_names] [-in_pins] [-location] [-name] [-out_pin_names] [-out_pins] [-pin_names] [-pins] [-type] [-wysiwyg_type] &lt;cell_object&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-buried_nodes</code>	Return a collection of buried node IDs
	<code>-buried_regs</code>	Return a collection of buried register IDs
	<code>-in_pin_names</code>	Return a list of input pin names
	<code>-in_pins</code>	Return a collection of input pin IDs
<b>continued...</b>		

	-location	Return the atom location in device	
	-name	Return the cell name	
	-out_pin_names	Return a list of output pin names	
	-out_pins	Return a collection of output pin IDs	
	-pin_names	Return a list of input and output pin names	
	-pins	Return a collection of input and output pin IDs	
	-type	Return the cell type	
	-wysiwyg_type	Return the WYSIWYG type of the cell	
	<cell_object>	Cell object	
Description			
	<p>Gets information about the specified cell (referenced by cell ID). You can obtain cell using the get_cells Tcl command.</p> <p>The "-type" option returns "cell".</p> <p>Options "-name", "-type", "-pin_name", "-in_pin_names", "-out_pin_names", "-pins", "-clock_pins", "-in_pins", "-out_pins", "-buried_nodes", "-buried_regs", "-location", and "-wysiwyg_type" are mutually exclusive.</p>		
Example Usage	<pre>project_open chiptrip create_timing_netlist set cells [get_cells] foreach_in_collection cell \$cells {     puts "[get_cell_info \$cell -name]: [get_cell_info \$cell -type]" } delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Options are mutually exclusive: <string>. Specify only one of the these options.
	TCL_ERROR	1	ERROR: Object with ID <string> is not an object of type <string>. Specify the ID of an object with the correct type.
	TCL_ERROR	1	ERROR: Cannot find object of ID <string>. Specify an existing object ID.
	TCL_ERROR	1	ERROR: Unsupported object type: <string>. Specify a supported object type.

### 3.1.36.14. get\_clock\_domain\_info (::quartus::sta)

The following table displays information for the get\_clock\_domain\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	get_clock_domain_info [-h   -help] [-long_help] [-data_delay] [-edge_slack] [-hold] [-mpw] [-recovery] [-removal] [-setup]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
continued...		

	-data_delay	Data Delay Analysis (only applicable for setup and recovery analysis)	
	-edge_slack	Compute edge TNS (this option may significantly increase memory consumption)	
	-hold	Hold Analysis	
	-mpw	Minimum Pulse Width Analysis	
	-recovery	Recovery Analysis	
	-removal	Removal Analysis	
	-setup	Setup Analysis (Default)	
Description	<p>Similar to create_timing_summary, the get_clock_domain_info command returns a Tcl list of information about each active clock domain: the clock name, worst-case slack, endpoint TNS, number of endpoints in the domain with negative slack, and the timing model for which the worst-case slack is most critical.</p> <p>If the edge_slack option is specified, an extra entry for the edge TNS will be present, placed after the endpoint TNS. Computing the edge TNS may result in a significant increase in memory consumption.</p> <p>TNS is total negative slack, and it is the sum of all slacks less than zero for either destination registers or ports in the clock domain (endpoint TNS) or for all edges affecting the clock domain (edge TNS).</p> <p>By default, this command creates a Setup Summary. This command can also generate a Hold Summary (-hold), Recovery Summary (-recovery), Removal Summary (-removal), or Minimum Pulse Width Summary (-mpw).</p>		
Example Usage	<pre>project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist  # Get domain summary object set domain_list [get_clock_domain_info -setup] foreach domain \$domain_list {     set name [lindex \$domain 0]     set slack [lindex \$domain 1]     set keeper_tns [lindex \$domain 2]      puts "Clock \$name : Slack = \$slack , TNS = \$keeper_tns" }  # The following command is optional delete_timing_netlist  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.15. get\_clock\_fmax\_info (::quartus::sta)

The following table displays information for the get\_clock\_fmax\_info Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601		
Syntax	get_clock_fmax_info [-h   -help] [-long_help]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	<p>Reports potential Fmax for every clock in the design, regardless of the user-specified clock periods. Fmax is only computed for paths where the source and destination registers or ports are driven by the same clock. Paths of different clocks, including generated clocks, are ignored. For paths between a clock and its inversion, Fmax is computed as if the rising and falling edges of the clock are scaled along with fmax, such that the duty cycle (in terms of a percentage) is maintained.</p> <p>Restricted Fmax considers hold timing in addition to setup timing, as well as minimum pulse and minimum period restrictions. Similar to unrestricted Fmax, the restricted Fmax is computed as if the rising and falling edges of the clock are scaled along with Fmax, such that the duty cycle (in terms of a percentage) is maintained. Refer to hold timing reports (e.g., report_timing with the -hold option) or minimum pulse width reports (report_min_pulse_width) for details about specific paths, registers, or ports.</p> <p>This command is similar to report_clock_fmax_summary, except that it returns the results as a Tcl list for use in Tcl scripts. Each entry in the list represents one clock domain. Each entry is a Tcl list of the clock name, fmax (MHz), and restricted Fmax (MHz).</p>		
Example Usage	<pre>project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist  # Get domain summary object set domain_list [get_clock_fmax_info] foreach domain \$domain_list {     set name [lindex \$domain 0]     set fmax [lindex \$domain 1]     set restricted_fmax [lindex \$domain 2]      puts "Clock \$name : Fmax = \$fmax (Restricted Fmax = \$restricted_fmax)" }  # The following command is optional delete_timing_netlist  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

## 3.1.36.16. get\_clock\_info (::quartus::sta)

The following table displays information for the get\_clock\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre>get_clock_info [-h   -help] [-long_help] [-child_clocks] [-divide_by] [-duty_cycle] [-edge_shifts] [-edges] [-fall] [-is_inverted] [-latency] [-master_clock] [-master_clock_pin] [-max] [-min] [-multiply_by] [-name] [-nreg_neg] [-nreg_pos] [-offset] [-period] [-phase] [-rise] [-targets] [-type] [-waveform] &lt;clk_object&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-child_clocks	Returns a list of child clock names
	-divide_by	Return the frequency divider (to the base clock)
	-duty_cycle	Return the duty cycle
	-edge_shifts	Return a list of edge shifts that the specified edges are to undergo to yield the final generated clock waveform
	-edges	Return a list of integer representing edges from the source clock that are to form edges of the generated clock
	-fall	Return clock fall latency
	-is_inverted	Return a boolean value to indicate if the generated clock is inverted
	-latency	Return clock latency
	-master_clock	Return the master clock name
	-master_clock_pin	Return the master clock source pin
	-max	Return max clock latency
	-min	Return min clock latency
	-multiply_by	Return the frequency multiplier (to the base clock)
	-name	Return the clock name
	-nreg_neg	Return number of registers negatively clocked by clock
	-nreg_pos	Return number of registers positively clocked by clock
	-offset	Return the clock offset
	-period	Return the clock period
	-phase	Return the clock phase
	-rise	Return clock rise latency
	-targets	Return the clock targets collection
	-type	Return the clock type
	-waveform	Return the waveform (rise time and fall time)
	<clk_object>	Clock object
continued...		

<b>Description</b>	<p>Returns information about the specified clock (referenced by clock ID). Clock IDs can be obtained by Tcl commands such as <code>get_clocks</code>.</p> <p>The "-type" option returns one of "base", "virtual_base", "generated", "virtual_generated".</p> <p>Options "-name", "-type", "-period", "-duty_cycle", "-waveform", "-edges", "-edge_shifts", "-multiply_by", "-divide_by", "-is_inverted", "-latency", "-master_clock", and "-targets" are mutually exclusive. The "-latency" option requires a specified "-max" or "-min" option as well as a "-rise" or "-fall" option.</p>		
<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist set_clocks [get_clocks] foreach_in_collection clk \$clocks {     puts "[get_clock_info \$clk -name]: [get_clock_info \$clk -period]" } delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Options are mutually exclusive: <string>. Specify only one of the these options.
	TCL_ERROR	1	ERROR: Object with ID <string> is not an object of type <string>. Specify the ID of an object with the correct type.
	TCL_ERROR	1	ERROR: Cannot find object of ID <string>. Specify an existing object ID.
	TCL_ERROR	1	ERROR: Unsupported object type: <string>. Specify a supported object type.

### 3.1.36.17. get\_clock\_pair\_info (::quartus::sta)

The following table displays information for the `get_clock_pair_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	<code>get_clock_pair_info [-h   -help] [-long_help] [-fall_from &lt;clk_object&gt; ] [-fall_to &lt;clk_object&gt; ] [-false_path] [-from &lt;clk_object&gt; ] [-hierarchy] [-hold] [-rise_from &lt;clk_object&gt; ] [-rise_to &lt;clk_object&gt; ] [-setup] [-to &lt;clk_object&gt; ]</code>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-fall_from <clk_object>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_to <clk_object>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-false_path	Return a description of the satisfied false-path-type assignment applied between the "from" and "to" clocks, if any
	-from <clk_object>	Valid source clocks (string patterns are matched using Tcl string matching)
	-hierarchy	Return a description the hierarchical relationship between the "from" and "to" clocks
<b>continued...</b>		

	-hold	Return the hold analysis information if you use the "-false_path" option	
	-rise_from <clk_object>	Valid source clocks (string patterns are matched using Tcl string matching)	
	-rise_to <clk_object>	Valid destination clocks (string patterns are matched using Tcl string matching)	
	-setup	Return the setup analysis information if you use the "-false_path" option. The setup analysis relationship is returned by default	
	-to <clk_object>	Valid destination clocks (string patterns are matched using Tcl string matching)	
Description	<p>The get_clock_pair_info command returns various clock information between two given clocks.</p> <p>If you specify the "-false_path" option, the command returns a description of the satisfied false path assignment between the "from" and "to" clocks, which includes clock groups.</p> <p>If you specify the "-hierarchy" option, the command returns a description of the clock hierarchy relationship between the two clocks, such as whether the "from" clock is a parent of the "to" clock.</p> <p>Use the "-from" option to specify the source clock that you want to query, and use the "-to" option to specify the destination clock that you want to query.</p> <p>When using the "-false_path" option, you can use the "-rise_from" option to specify a source clock's rising edge to report on, or use the "-fall_from" option to specify a source clock's falling edge to report on. Likewise, you can use the "-rise_to" option to specify a destination clock's rising edge, or use the "-fall_to" option to specify a destination clock's falling edge. You can also specify to retrieve either the setup or hold false path relationship using the "-setup" or "-hold" option respectively. By default, the setup relationship is reported.</p>		
Example Usage	<pre>create_clock clkA -period 10 create_generated_clock clkB -source clkA -divide_by 2 create_generated_clock clkC -source clkB -divide_by 2  set_false_path -from clkA -to clkB -latency_insensitive set_clock_groups -group clkA -group clkC -asynchronous  get_clock_pair_info -from clkA -to clkB -false_path      -&gt; "false_path_latency_insensitive" get_clock_pair_info -from clkA -to clkC -false_path      -&gt;   "clock_group_asynchronous" get_clock_pair_info -from clkA -to clkB -hierarchy       -&gt;   "parent_child" get_clock_pair_info -from clkC -to clkA -hierarchy       -&gt;   "descendant_ancestor"</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.36.18. get\_datasheet (::quartus::sta)

The following table displays information for the get\_datasheet Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sta</code> on page 601		
<b>Syntax</b>	<code>get_datasheet [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	<div>This function returns a tcl collection which contains the datasheet report. Its format is as follows:</div>		
<div>continued...</div>			

```
{
  { tsu
    { <tsu rise time>
      <tsu fall time>
      <input port>
      <clock port>
      <clock edge>
      <clock reference>
    }
  }

  { th
    { <th rise time>

    }
  }
}
```

*continued...*

	<pre>     }   }   { mintxz     { &lt;mintlz time&gt;       &lt;minthz time&gt;       &lt;output port&gt;       &lt;clock port&gt;       &lt;clock edge&gt;       &lt;clock reference&gt;     }   } } </pre> <p>There are no options for this command, and the data returned is the same as from the report_datasheet command.</p>		
<b>Example Usage</b>	<pre> project_open proj1 create_timing_netlist read_sdc update_timing_netlist  # get the datasheet collection set datasheet [get_datasheet]  # loop through contents of datasheet collection foreach i \$datasheet {   foreach j \$i {     foreach k \$j {       #       # extract individual items or       # manipulate as necessary       #     }   } } </pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.19. get\_default\_sdc\_file\_names (::quartus::sta)

The following table displays information for the get\_default\_sdc\_file\_names Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	get_default_sdc_file_names [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<b>Description</b>	<p>Returns the default SDC file name(s) used by the Quartus Prime Compiler when doing timing-driven optimizations.</p> <p>Returns the value for the QSF variable SDC_FILE. If multiple assignments are found, return them as a list. If not specified, return &lt;revision_name&gt;.sdc.</p>	
<b>Example Usage</b>	<pre>project_new test create_timing_netlist foreach file [get_default_sdc_file_names] {     read_sdc \$file } update_timing_netlist</pre>	
continued...		

	report_timing delete_timing_netlist project_close		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.36.20. get\_edge\_info (::quartus::sta)

The following table displays information for the get\_edge\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	get_edge_info [-h   -help] [-long_help] [-delay] [-delay_type] [-dst] [-ff] [-fr] [-hslp] [-is_disabled] [-max] [-min] [-name] [-rf] [-rr] [-src] [-type] [-unateness] <edge_object>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-delay	Return the delay.
	-delay_type	Return the type of the delay (ic/cell/loop/user).
	-dst	Return the destination node ID.
	-ff	Return the fall-to-fall delay
	-fr	Return the fall-to-rise delay
	-hslp	Return the HS/LP setting
	-is_disabled	Return whether the edge has been disabled, so should not be traversed through
	-max	Max delay
	-min	Min delay
	-name	Return the edge name
	-rf	Return the rise-to-fall delay
	-rr	Return the rise-to-rise delay
	-src	Return the source node ID
	-type	Return the edge type.
	-unateness	Return the unateness.
	<edge_object>	Edge object
<b>Description</b>	<p>Returns information about the specified edge (referenced by edge ID). Edge IDs can be obtained by Tcl commands such as get_node_info &lt;node_id&gt; -synch_edges.</p> <p>The "-type" and "-name" options exist only to keep the interface compliant with the get_object_info command. The "-type" option returns specific edge type as "synchronous", "asynchronous", "clock", or "combinational", while the "-name" option always returns an empty string.</p> <p>The "-delay" option returns the delay associated to the edge. Use -max, -min and -rr, -rf, -fr, -ff options to specify the type of returned delay. One of the -max, -min options must be specified. One of the -rr, -rf, -fr, -ff options must be specified.</p>	

*continued...*

	<p>The <code>-hslp</code> option returns the HS/LP setting associated to the edge.</p> <p>The <code>-unateness</code> option returns the unateness associated to the edge.</p> <p>The <code>-is_disabled</code> option returns 1 if the edge should not be traversed through, and 0 if the edge can be traversed through. Disabled edges include edges in SCC loops and edges that the user has manually cut with the <code>set_disable_timing</code> command.</p>		
<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist set nodes [get_pins] foreach_in_collection node \$nodes {     set node_name [get_node_info -name \$node]     set edges [get_node_info \$node -fanout_edges]     foreach edge \$edges {         # Traverse to the fanout node         set dst_node [get_edge_info -dst \$edge]         set dst_name [get_node_info -name \$dst_node]         set delay_type [get_edge_info -delay_type \$edge]          set rr_delay [get_edge_info \$edge -max -delay -rr]         set rf_delay [get_edge_info \$edge -max -delay -rf]         set fr_delay [get_edge_info \$edge -max -delay -fr]         set ff_delay [get_edge_info \$edge -max -delay -ff]         puts "Max \$delay_type delay of edge \$edge, from \$node_name to \$dst_name: (RR:\$rr_delay RF:\$rf_delay FR:\$fr_delay FF:\$ff_delay)"     } } delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Option <code>&lt;string&gt;</code> is not allowed to be specified with option <code>-&lt;string&gt;</code> . Remove the disallowed option.
	TCL_ERROR	1	ERROR: Options <code>&lt;string&gt;</code> are exclusively allowed to be specified with option <code>-&lt;string&gt;</code> . Specify one of the allowed options.
	TCL_ERROR	1	ERROR: Options are mutually exclusive: <code>&lt;string&gt;</code> . Specify only one of the these options.
	TCL_ERROR	1	ERROR: Object with ID <code>&lt;string&gt;</code> is not an object of type <code>&lt;string&gt;</code> . Specify the ID of an object with the correct type.
	TCL_ERROR	1	ERROR: Cannot find object of ID <code>&lt;string&gt;</code> . Specify an existing object ID.
	TCL_ERROR	1	ERROR: Option <code>&lt;string&gt;</code> is required to be specified with option <code>-&lt;string&gt;</code> . Specify a required option.
	TCL_ERROR	1	ERROR: Unsupported object type: <code>&lt;string&gt;</code> . Specify a supported object type.

### 3.1.36.21. get\_entity\_instances (::quartus::sta)

The following table displays information for the `get_entity_instances` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sta</code> on page 601	
<b>Syntax</b>	<code>get_entity_instances [-h   -help] [-long_help] [-nowarn] &lt;entity_name&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
<i>continued...</i>		

	-nowarn		Do not issue warning messages about missing entities
	<entity_name>		entity name
Description	Returns a tcl list of all hierarchical instance paths to a named given entity/module. This can be useful in SDC files which need to be applied to all instances of a module automatically.		
Example Usage	get_entity_instances entity_name		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.36.22. get\_min\_pulse\_width (::quartus::sta)

The following table displays information for the get\_min\_pulse\_width Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601		
<b>Syntax</b>	get_min_pulse_width [-h   -help] [-long_help] [-nworst <number> ] [-type <all min_period clock_pulse> ] [ <targets> ]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-nworst <number>	Specifies the number of pulse width checks to report (default=1)	
	-type <all min_period clock_pulse>	Option to determine the minimum pulse width analysis type	
	<targets>	Registers or ports	
<b>Description</b>	<p>This command returns a Tcl list which contains the minimum pulse width report. Its format is as follows:</p> <pre>{   {     &lt;slack&gt;,     &lt;actual width&gt;,     &lt;required width&gt;,     &lt;pulse&gt;,     &lt;clock&gt;,     &lt;clock edge&gt;,     &lt;target&gt;   } }</pre> <p>Refer to help for the report_min_pulse_width command for help on the -nworst and -targets options.</p>		
<b>Example Usage</b>	get_min_pulse_width		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.23. get\_net\_info (::quartus::sta)

The following table displays information for the get\_net\_info Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601		
Syntax	get_net_info [-h   -help] [-long_help] [-name] [-pin] [-type] <net_object>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name	Return the net name	
	-pin	Return the pin ID of this net	
	-type	Return the net type.	
	<net_object>	Net object	
Description	<div>Returns information about the specified net (referenced by net ID). Net ID's can be obtained by Tcl commands such as get_nets.  The "-type" option returns "net".  The options "-name", "-type", and "-pin" are mutually exclusive.</div>		
Example Usage	<pre>project_open chiptrip create_timing_netlist  set nets [get_nets] foreach_in_collection net \$nets {     puts [get_net_info \$net -name] }  delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Option <string> is not allowed to be specified with option -<string>. Remove the disallowed option.
	TCL_ERROR	1	ERROR: Options <string> are exclusively allowed to be specified with option -<string>. Specify one of the allowed options.
	TCL_ERROR	1	ERROR: Options are mutually exclusive: <string>. Specify only one of the these options.
	TCL_ERROR	1	ERROR: Object with ID <string> is not an object of type <string>. Specify the ID of an object with the correct type.
	TCL_ERROR	1	ERROR: Cannot find object of ID <string>. Specify an existing object ID.
	TCL_ERROR	1	ERROR: Option <string> is required to be specified with option -<string>. Specify a required option.
	TCL_ERROR	1	ERROR: Unsupported object type: <string>. Specify a supported object type.

### 3.1.36.24. get\_node\_info (::quartus::sta)

The following table displays information for the get\_node\_info Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601		
Syntax	get_node_info [-h   -help] [-long_help] [-asynch_edges] [-cell] [-clock_edges] [-fanout_asynch_edges] [-fanout_clock_edges] [-fanout_edges] [-fanout_synch_edges] [-location] [-name] [-synch_edges] [-type] <node_object>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-asynch_edges	Return a list of asynchronous edge IDs	
	-cell	Return the host cell	
	-clock_edges	Return a list of clock edge IDs	
	-fanout_asynch_edges	Return a list of asynchronous fanout edge IDs	
	-fanout_clock_edges	Return a list of clock fanout edge IDs	
	-fanout_edges	Return a list of fanout edge IDs	
	-fanout_synch_edges	Return a list of synchronous fanout edge IDs	
	-location	Return the atom location in device	
	-name	Return the node name	
	-synch_edges	Return a list of synchronous edge IDs	
	-type	Return the node type	
	<node_object>	Node object	
Description	Gets information about the specified node (referenced by node ID). Use Tcl commands such as get_nodes to obtain node IDs. The -type option returns "reg", "port", "pin", "net", or "comb". The -name, -type, -clock_edges, -synch_edges, -asynch_edges, -fanout_edges, -fanout_clock_edges, -fanout_synch_edges, -fanout_asynch_edges, -cell and -location options are mutually exclusive.		
Example Usage	<pre>project_open chiptrip create_timing_netlist set_registers [get_registers] foreach_in_collection reg \$registers {     puts "[get_node_info \$reg -name]: [get_node_info \$reg -type]" } delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Object with ID <string> is not an object of type <string>. Specify the ID of an object with the correct type.
	TCL_ERROR	1	ERROR: Cannot find object of ID <string>. Specify an existing object ID.
	TCL_ERROR	1	ERROR: Unsupported object type: <string>. Specify a supported object type.

### 3.1.36.25. get\_object\_info (::quartus::sta)

The following table displays information for the get\_object\_info Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601		
Syntax	get_object_info [-h   -help] [-long_help] [-name] [-type] <object>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name	Return the object name	
	-type	Return the object type	
	<object>	Object	
Description	Gets information about the specified object (referenced by object ID). Object IDs can be obtained by Tcl commands such as get_clocks, get_ports, get_cells, and others. The -type option returns "clk", "reg", "port", "cell", "pin", "comb", "net", or "edge". The -name and -type options are mutually exclusive.		
Example Usage	<pre>project_open chiptrip create_timing_netlist set_ports [get_ports] foreach_in_collection port \$ports {     puts [get_object_info \$port -name] } delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Argument <string> is a collection ID that does not link to any collection. Specify a legal collection ID.
	TCL_ERROR	1	ERROR: Argument <string> is an object ID that does not link to any object. Specify a valid object ID.
	TCL_ERROR	1	ERROR: Argument <string> is an empty collection. Specify one that is a non-empty collection.
	TCL_ERROR	1	ERROR: Argument <string> is not a valid object. Specify a valid object.
	TCL_ERROR	1	ERROR: Argument <string> gives an empty collection. Specify one that gives a non-empty collection.
	TCL_ERROR	1	ERROR: Argument <string> gives a collection with more than one object. Specify one that gives a collection with one object.
	TCL_ERROR	1	ERROR: Argument <string> gives a collection that is not of <string> type. Specify one that gives a collection of required type.
	TCL_ERROR	1	ERROR: Argument <string> gives an object that is not of <string> type. Specify one that gives an object of required type.
	TCL_ERROR	1	ERROR: Argument <string> is a collection with more than one object. Specify a collection with one object.
	TCL_ERROR	1	ERROR: Argument <string> is not a collection ID. Specify a legal collection ID.

continued...

TCL_ERROR	1	ERROR: Argument <i>&lt;string&gt;</i> is not an object ID. Specify a valid object ID.
TCL_ERROR	1	ERROR: Argument <i>&lt;string&gt;</i> is an object filter that matches more than one object. Specify a filter that matches only one object.
TCL_ERROR	1	ERROR: Argument <i>&lt;string&gt;</i> is an object filter that matches no objects. Specify one matches only one object.
TCL_ERROR	1	ERROR: Object with ID <i>&lt;string&gt;</i> is not an object of type <i>&lt;string&gt;</i> . Specify the ID of an object with the correct type.
TCL_ERROR	1	ERROR: Cannot find object of ID <i>&lt;string&gt;</i> . Specify an existing object ID.
TCL_ERROR	1	ERROR: Unsupported object type: <i>&lt;string&gt;</i> . Specify a supported object type.
TCL_ERROR	1	ERROR: Argument <i>&lt;string&gt;</i> is a collection that is not of <i>&lt;string&gt;</i> type. Specify a collection of required type.
TCL_ERROR	1	ERROR: Argument <i>&lt;string&gt;</i> is an object that is not of <i>&lt;string&gt;</i> type. Specify an object of required type.
TCL_ERROR	1	ERROR: Argument <i>&lt;string&gt;</i> is not <i>&lt;string&gt;</i> <i>&lt;string&gt;</i> . Specify an argument of the correct type.

### 3.1.36.26. get\_operating\_conditions (::quartus::sta)

The following table displays information for the `get_operating_conditions` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601		
<b>Syntax</b>	get_operating_conditions [-h   -help] [-long_help] [-for_analysis]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-for_analysis	Get the set of analysis corners instead of the set of reporting corners	
<b>Description</b>	Returns a list of the current operating conditions Tcl objects.		
<b>Example Usage</b>	puts "Delay Model : [get_operating_conditions_info [get_operating_conditions] -model]"		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.27. get\_operating\_conditions\_info (::quartus::sta)

The following table displays information for the `get_operating_conditions_info` Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601		
Syntax	get_operating_conditions_info [-h   -help] [-long_help] [-display_name] [-grade] [-is_hold_only] [-model] [-name] [-speed] [-temperature] [-voltage] <operating_condition>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-display_name	Returns the operating conditions display name	
	-grade	Returns the temperature grade of the current device	
	-is_hold_only	Returns whether the operating conditions only support short-path analysis	
	-model	Returns the operating corner	
	-name	Returns the operating conditions Tcl_Obj name	
	-speed	Returns the speed grade of the current device	
	-temperature	Returns the operating temperature	
	-voltage	Returns the operating voltage	
	<operating_condition>	Operating condition object	
Description	Returns information about the operating_conditions Tcl object.		
Example Usage	<pre>#see detailed information about operating conditions foreach_in_collection op [get_available_operating_conditions] {     puts "Delay Model: [get_operating_conditions_info \$op -model]" }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.36.28. get\_partition\_info (::quartus::sta)

The following table displays information for the `get_partition_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sta</code> on page 601	
<b>Syntax</b>	<code>get_partition_info [-h   -help] [-long_help] [-child] [-name] [-parent] [-type] &lt;partition_object&gt;</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-child</code>	Return child partition name(s)
	<code>-name</code>	Return the partition name
	<code>-parent</code>	Return parent partition name
<i>continued...</i>		

	-type		Return the partition type
	<partition_object>		Partition object
Description	<p>Gets information about the specified partition (referenced by partition ID). Partition ID's can be obtained by Tcl commands such as get_partitions.</p> <p>The -name, -type, -parent, and -child options are mutually exclusive.</p>		
Example Usage	<pre>project_open chiptrip create_timing_netlist set_partitions [get_partitions *] foreach_in_collection partition \$partitions {     puts "[get_partition_info \$partition -name]" } delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Object with ID <string> is not an object of type <string>. Specify the ID of an object with the correct type.
	TCL_ERROR	1	ERROR: Cannot find object of ID <string>. Specify an existing object ID.
	TCL_ERROR	1	ERROR: Unsupported object type: <string>. Specify a supported object type.

### 3.1.36.29. get\_path (::quartus::sta)

The following table displays information for the get\_path Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre>get_path [-h   -help] [-long_help] [-fall_from &lt;names&gt; ] [-fall_through &lt;names&gt; ] [-fall_to &lt;names&gt; ] [-from &lt;names&gt; ] [-logic_depth] [-min_path] [-npaths &lt;number&gt; ] [-nworst &lt;number&gt; ] [-pairs_only] [-rise_from &lt;names&gt; ] [-rise_through &lt;names&gt; ] [-rise_to &lt;names&gt; ] [-show_routing] [-through &lt;names&gt; ] [-to &lt;names&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-fall_from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-fall_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	-fall_to <names>	Valid destinations (string patterns are matched using Tcl string matching)
	-from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-logic_depth	Option to display the logic depth instead of path delay
	-min_path	Find the minimum delay path(s)
	-npaths <number>	Specifies the number of paths to report. The default value is 1 or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported (be wary that this may be slow)
continued...		

	<div>-nworst &lt;number&gt;</div> <div>Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst</div>
	<div>-pairs_only</div> <div>When set, paths with the same start and end points are considered equivalent. Only the longest delay path for each unique combination is displayed.</div>
	<div>-rise_from &lt;names&gt;</div> <div>Valid sources (string patterns are matched using Tcl string matching)</div>
	<div>-rise_through &lt;names&gt;</div> <div>Valid through nodes (string patterns are matched using Tcl string matching)</div>
	<div>-rise_to &lt;names&gt;</div> <div>Valid destinations (string patterns are matched using Tcl string matching)</div>
	<div>-show_routing</div> <div>Option to display detailed routing in the path</div>
	<div>-through &lt;names&gt;</div> <div>Valid through nodes (string patterns are matched using Tcl string matching)</div>
	<div>-to &lt;names&gt;</div> <div>Valid destinations (string patterns are matched using Tcl string matching)</div>
<b>Description</b>	<p>Returns a collection of path objects for the longest delay paths between arbitrary points in the netlist.</p> <p>This command behaves the same as the report_path command. However, instead of reporting the paths, it returns a Tcl collection of path objects. You can retrieve path object data using the get_path_info and get_point_info commands.</p> <p>Note that get_path_info does not provide any clock-related information, required points, or meaningful slack values, for paths represented by the path objects returned by this function.</p> <p>For help on the options shared with report_path, see help for the report_path command.</p>
<b>Example Usage</b>	<pre># Define a few helper procedures to print out points # on a path, and the path itself  proc print_point { point } {     set total [ get_point_info \$point -total ]     set incr [ get_point_info \$point -incr ]     set node_id [ get_point_info \$point -node ]     set type [ get_point_info \$point -type ]     set rf [ get_point_info \$point -rise_fall ]     set node_name ""      if { \$node_id ne "" } {         set node_name [ get_node_info \$node_id -name ]     }      puts [format "%10s %8s %2s %-6s %s" \$total \$incr \$rf \$type \$node_name ] }  proc print_path { path } {     puts "Delay : [ get_path_info \$path -arrival_time]"     puts ""     puts [format "%10s %8s %-2s %-6s %s" "Total" "Incr" "RF" "Type" "Name"]     puts "===== "      foreach_in_collection pt [ get_path_info \$path -arrival_points ] {         print_point \$pt     } }  project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist  # And now simply iterate over the 10 longest delay paths, # printing each as we go.</pre>

continued...

	<pre>foreach_in_collection path [get_path -nworst 10] {     print_path \$path     puts "" }  delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Option <string> has illegal value: <string>. Specify a legal option value.
	TCL_ERROR	1	ERROR: Collection type '<string>' is not a valid type for a through collection. Valid collection types are 'pin' and 'net'
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.30. get\_path\_info (::quartus::sta)

The following table displays information for the get\_path\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre>get_path_info [-h   -help] [-long_help] [-advanced] [-arrival_points] [-arrival_time] [-borrow_dst] [-borrow_src] [-clock_relationship] [-clock_skew] [-corner] [-data_delay] [-from] [-from_clock] [-from_clock_is_inverted] [-hold_end_multicycle] [-hold_start_multicycle] [-latch_time] [-launch_time] [-num_logic_levels] [-operating_conditions] [-required_points] [-required_time] [-setup_end_multicycle] [-setup_start_multicycle] [-slack] [-to] [-to_clock] [-to_clock_is_inverted] [-type] &lt;path_ref&gt;</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-advanced	Return clock pessimism due to advanced effects
	-arrival_points	Return a collection of point objects for the arrival path
	-arrival_time	Return the data arrival time for the path
	-borrow_dst	Return the time borrowed at destination (when the path ends at a level-sensitive latch)
	-borrow_src	Return the time borrowed at source (when the path starts at a level-sensitive latch)
	-clock_relationship	Return the clock relationship for the path
	-clock_skew	Return the clock skew for the path
	-corner	Returns a string indicating the operating conditions at which the path's delay values are found
	-data_delay	Return the data delay for the path
	-from	Return the source node ID
	-from_clock	Return the source clock ID
	-from_clock_is_inverted	Return 1 if the source clock is inverted, 0 otherwise

<path_ref>	Path object																																
<b>Description</b>	<p>Returns information about the referenced timing path object.</p> <p>You can generate references to path objects with the <code>get_timing_paths</code> and <code>get_path</code> functions.</p> <p>The <code>-type</code> option returns one of the following types: "setup", "hold", "recovery", "removal", "max_path", or "min_path".</p> <p>The <code>-from</code> and <code>-to</code> options return the ID of the nodes at the start and end, respectively, of the arrival path. If there is no node, an empty string is returned. The <code>-from</code> node remains the same, regardless of the level of clock detail provided. It is always the first node clocked by the <code>-from</code> clock in the data arrival path. You can use the node ID with the <code>get_node_info</code> function to obtain additional information about the node.</p> <p>The <code>-from_clock</code> and <code>-to_clock</code> options return the ID of the launching and latching clocks, respectively. If there is no clock, an empty string is returned. You can obtain additional information about the clocks using the <code>get_clock_info</code> function.</p> <p>Path objects generated by <code>get_path</code> do not have clock information, required points, or meaningful slack values.</p> <p>The <code>-arrival_points</code> and <code>-required_points</code> options return a collection of point objects for the arrival and required paths, respectively. By iterating over the collection, and using the <code>get_point_info</code> function, you can obtain specific details about each portion of the path.</p> <p>If a path was created with additional clock detail, the elements of the clock path are included in each collection of points.</p> <p>The values for the <code>-from</code>, <code>-to</code>, and other options are</p>																																

*continued...*

	<p>either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for <code>use_timing_analyzer_style_escaping</code> for details.</p> <p>When the path starts at a level-sensitive latch, the <code>-borrow_src</code> option may be used to get the time borrowed at the source. Similarly, when the path ends at a level-sensitive latch, <code>-borrow_dst</code> may be used to get the time borrowed at the destination. When these options are used with anything other than level-sensitive latches, zero is returned.</p> <p>For level-sensitive latches, when you use the <code>-launch_time</code> or <code>-latch_time</code> options, the times reported do not include time borrowed.</p> <p>The operating condition corresponding to all of a path's delay and time values can be found using the <code>-corner</code> option.</p>
<b>Example Usage</b>	<pre># Define a few helper procedures to print out points # on a path, and the path itself proc get_clock_string { path clk } {     set clk_str ""     set clk_id [ get_path_info \$path -\${clk}_clock ]      if { \$clk_id ne "" } {         set clk_str [ get_clock_info \$clk_id -name ]          if { [ get_path_info \$path -\${clk}_clock_is_inverted ] } {             append clk_str " (INVERTED)"         }     }      return \$clk_str }  proc print_point { point } {     set total [ get_point_info \$point -total ]     set incr [ get_point_info \$point -incr ]     set node_id [ get_point_info \$point -node ]     set type [ get_point_info \$point -type ]     set rf [ get_point_info \$point -rise_fall ]     set node_name ""      if { \$node_id ne "" } {         set node_name [ get_node_info \$node_id -name ]     }      puts [format "%10s %8s %2s %-6s %s" \$total \$incr \$rf \$type \$node_name ] }  proc print_path { path } {     puts "Slack      : [ get_path_info \$path -slack]"     puts "To Clock   : [ get_clock_string \$path to ]"     puts "From Clock  : [ get_clock_string \$path from]"     puts ""     puts [format "%10s %8s %-2s %-6s %s" "Total" "Incr" "RF" "Type" "Name"]     puts "===== "      foreach_in_collection pt [ get_path_info \$path -arrival_points ] {         print_point \$pt     } }  project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist  # And now simply iterate over the 10 worst setup paths, printing each path foreach_in_collection path [ get_timing_paths -npaths 10 -setup ] {     print_path \$path     puts "" }  delete_timing_netlist project_close</pre>

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Object with ID <i>&lt;string&gt;</i> is not an object of type <i>&lt;string&gt;</i> . Specify the ID of an object with the correct type.

### 3.1.36.31. get\_pin\_info (::quartus::sta)

The following table displays information for the `get_pin_info` Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601		
Syntax	get_pin_info [-h   -help] [-long_help] [-is_clock_pin] [-is_in_pin] [-is_out_pin] [-name] [-net] [-parent_cell] [-suffix] [-type] <pin_object>		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-is_clock_pin	Return true if it is a clock pin, or false otherwise	
	-is_in_pin	Return true if it is an input pin, or false otherwise	
	-is_out_pin	Return true if it is an output pin, or false otherwise	
	-name	Return the pin name	
	-net	Return the net ID if this is an output pin	
	-parent_cell	Return the parent cell ID	
	-suffix	Return the suffix of the pin	
	-type	Return the pin type	
	<pin_object>	Pin object	
Description	<p>Gets information about the specified pin (referenced by pin ID). Pin ID's can be obtained by Tcl commands such as get_pins.</p> <p>The -type option returns "pin".</p> <p>Options -name, -type, -parent_cell, -net, -suffix, -is_clock_pin, -is_in_pin and -is_out_pin are mutually exclusive.</p>		
Example Usage	<pre>project_open chiptrip create_timing_netlist set pins [get_pins] foreach_in_collection pin \$pins {     set pin_name [get_pin_info \$pin -name]     set parent_cell [get_pin_info \$pin -parent_cell]     puts "Pin \$pin_name belongs to cell [get_cell_info -name \$parent_cell]" } delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Options are mutually exclusive: <string>. Specify only one of the these options.

*continued...*

	TCL_ERROR	1	ERROR: Object with ID <string> is not an object of type <string>. Specify the ID of an object with the correct type.
	TCL_ERROR	1	ERROR: Cannot find object of ID <string>. Specify an existing object ID.
	TCL_ERROR	1	ERROR: Unsupported object type: <string>. Specify a supported object type.

### 3.1.36.32. get\_point\_info (::quartus::sta)

The following table displays information for the get\_point\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	get_point_info [-h   -help] [-long_help] [-edge] [-incremental_delay] [-location] [-node] [-number_of_fanout] [-rise_fall] [-total_delay] [-type] <point_ref>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-edge	Return the edge ID for the edge associated with this point. If the point has no edge, this returns an empty string
	-incremental_delay	Return the incremental delay through this point
	-location	Return a string indicating the location of the point's node, if there is one, else an empty string
	-node	Return the node ID for the node associated with this point. If the point has no node, this returns an empty string
	-number_of_fanout	Return the number of fanout that this point has in the netlist
	-rise_fall	Return a string indicating the rise_fall type of this point. Return values are r, f, rr, rf, fr, ff, or an empty string for undefined
	-total_delay	Return the total delay of the path at this point. This includes the incremental delay for the point itself
	-type	Return a string indicating the type of the point
	<point_ref>	Point object
<b>Description</b>	<p>Returns information about the referenced timing point object. References to path objects can be generated using the get_path_info function.</p> <p>A point object is the equivalent of a row in a path in the output from report_timing.</p> <p>The -node option returns a node ID for the corresponding node in the path. For points that do not have a corresponding node (such as points for the lumped clock network delay, launch time, latch time, individual routing elements, etc.), the node ID is an empty string. A non-empty node ID can be used in conjunction with the get_node_info function to obtain additional information about the node.</p> <p>The -edge option returns an edge ID for the corresponding edge in the path. Only points of type "ic", "cell", and "comp" may have edges. For other point types, an empty string is returned. A non-empty edge ID can be used in conjunction with the get_edge_info function to obtain additional information about the edge.</p> <p>The -total_delay option returns the total delay along the path, up to and including the current point. The -incremental_delay option returns the delay incurred by going through this point in the path.</p>	

*continued...*

Both delays are formatted in terms of the current time units, excluding the unit string.

The `-number_of_fanout` option returns the number of fanouts that the corresponding node has in the timing netlist. If there is no node for this point, the return value is 0.

The `-location` option returns a string indicating the location of the corresponding node in the part. If there is no corresponding node, this returns an empty string.

The `-rise_fall` option returns the transition type of this point.

Possible values for `-rise_fall` are:

Value	Description
(empty)	Unknown transition
r	Rising output
f	Falling output
rr	Rising input, rising output
rf	Rising input, falling output
fr	Falling input, rising output
ff	Falling input, falling output

The `-type` option returns a string indicating the type of delay that this point represents in the path.

Possible return values for `-type` are:

Value	Description
borrow	Time borrowed (for level-sensitive latches)
cell	Cell delay
clknet	Lumped clock network delay
clksrc	Clock source. Used to ensure that the end-point of a clock segment is marked in the path when source latency is specified, or when the actual path cannot be found.
comp	PLL clock network compensation delay
ic	Interconnect delay
iext	External input delay
latch	Clock latch time
launch	Clock launch time
loop	Lumped combinational loop delay
oext	External output delay
re	Routing element (only for paths generated with the <code>-show_routing</code> option)
srclat	Source latency for a clock segment. This appears if latency was specified between two clocks, or if a path could not be found between them.
unc	Clock uncertainty
utco	Register micro-Tco time
utsu	Register micro-Tsu time
uth	Register micro-Th time

#### Example Usage

```
# Define a few helper procedures to print out points
# on a path, and the path itself
proc get_clock_string { path clk } {
    set clk_str ""
    set clk_id [ get_path_info $path -${clk}_clock ]

    if { $clk_id ne "" } {
        set clk_str [ get_clock_info $clk_id -name ]

        if { [ get_path_info $path -${clk}_clock_is_inverted ] } {
            append clk_str " (INVERTED)"
        }
    }

    return $clk_str
}

proc print_point { point } {
    set total [ get_point_info $point -total ]
    set incr [ get_point_info $point -incr ]
    set node_id [ get_point_info $point -node ]
    set type [ get_point_info $point -type ]
    set rf [ get_point_info $point -rise_fall ]
    set node_name ""

    if { $node_id ne "" } {
        set node_name [ get_node_info $node_id -name ]
    }

    puts [format "%10s %8s %2s %-6s %s" $total $incr $rf $type $node_name ]
}
```

*continued...*

	<pre> proc print_path { path } {     puts "Slack      : [ get_path_info \$path -slack]"     puts "To Clock   : [ get_clock_string \$path to ]"     puts "From Clock : [ get_clock_string \$path from]"     puts ""     puts [format "%10s %8s %-2s %-6s %s" "Total" "Incr" "RF" "Type" "Name"]     puts "===== "      foreach_in_collection pt [ get_path_info \$path -arrival_points ] {         print_point \$pt     } }  project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist  # And now simply iterate over the 10 worst setup paths, printing each path foreach_in_collection path [ get_timing_paths -npaths 10 -setup ] {     print_path \$path     puts "" }  delete_timing_netlist project_close </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Object with ID <string> is not an object of type <string>. Specify the ID of an object with the correct type.

### 3.1.36.33. get\_port\_info (::quartus::sta)

The following table displays information for the get\_port\_info Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601	
Syntax	get_port_info [-h   -help] [-long_help] [-edge_rate] [-is_inout_port] [-is_input_port] [-is_output_port] [-name] [-type] <port_object>	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-edge_rate	Return the edge_rate value
	-is_inout_port	Return true if it is an inout port, or false otherwise
	-is_input_port	Return true if it is an input port, or false otherwise
	-is_output_port	Return true if it is an output port, or false otherwise
	-name	Return the port name
	-type	Return the port type
	<port_object>	Port object
Description	Returns information about the specified port (referenced by port ID). Port ID's can be obtained by Tcl commands such as get_ports. The -type option returns "port". The -name, -type, -edge_rate, -is_input_port, -is_output_port and is_inout_port options are mutually exclusive.	
Example Usage	project_open chiptrip create_timing_netlist set_ports [get_ports]	
continued...		

	<pre> foreach_in_collection port \$ports {     set port_type ""     if [get_port_info \$port -is_inout_port] {         set port_type "bidir"     } elseif [get_port_info \$port -is_input_port] {         set port_type "in"     } else {         set port_type "out"     }     puts "[get_port_info \$port -name]: \$port_type" } delete_timing_netlist project_close </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Options are mutually exclusive: <string>. Specify only one of the these options.
	TCL_ERROR	1	ERROR: Object with ID <string> is not an object of type <string>. Specify the ID of an object with the correct type.
	TCL_ERROR	1	ERROR: Cannot find object of ID <string>. Specify an existing object ID.
	TCL_ERROR	1	ERROR: Unsupported object type: <string>. Specify a supported object type.

### 3.1.36.34. get\_register\_info (::quartus::sta)

The following table displays information for the get\_register\_info Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre> get_register_info [-h   -help] [-long_help] [-asynch_edges] [-clock_edges] [- delay_type &lt;max_rise max_fall min_rise min_fall&gt; ] [-fanout_edges] [-is_latch] [- is_synchronizer] [-name] [-related_pin &lt;related_pin_value&gt; ] [-synch_edges] [-tch] [-tcl] [-tco] [-th] [-tmin] [-tsu] [-type] &lt;reg_object&gt; </pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-asynch_edges	Return a list of asynchronous edge IDs
	-clock_edges	Return a list of clock edge IDs
	-delay_type <max_rise max_fall min_rise min_fall>	Specify which type of micro delay to query
	-fanout_edges	Return a list of fanout edge IDs
	-is_latch	Return "1" if this is a latch node, or "0" otherwise
	-is_synchronizer	Return which stage of a synchronizer chain this register is part of, or "0" if it is not part of a synchronizer chain
	-name	Return the object name
	-related_pin <related_pin_value>	Specify which register port you want the tsu/th/tco for
	-synch_edges	Return a list of synchronous edge IDs
	-tch	Return the Tch value
	-tcl	Return the Tcl value
	-tco	Return the Tco value
continued...		

	-th	Return the Th value	
	-tmin	Return the Tmin value	
	-tsu	Return the Tsu value	
	-type	Return the object type	
	<reg_object>	Register object	
Description	<p>Gets information about the specified register (referenced by register ID). Register IDs can be obtained by Tcl commands such as get_registers.</p> <p>The -type option returns "reg". The -name, -type, -tco, -tsu, -th, -tch, -tcl, -tmin, -clock_edges, -synch_edges, -asynch_edges, -fanout_edges and -is_latch options are mutually exclusive.</p>		
Example Usage	<pre>project_open chiptrip create_timing_netlist set registers [get_registers] foreach_in_collection reg \$registers {     set name [get_register_info \$reg -name]     set tco [get_register_info \$reg -tco]     puts "Tco of \$name is \$tco" } delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: delay_type is used without specifying the related_pin. These two options must be used together.
	TCL_ERROR	1	ERROR: related_pin is used without specifying the delay_type. These two options must be used together.
	TCL_ERROR	1	ERROR: Object with ID <string> is not an object of type <string>. Specify the ID of an object with the correct type.
	TCL_ERROR	1	ERROR: Cannot find object of ID <string>. Specify an existing object ID.
	TCL_ERROR	1	ERROR: Unsupported object type: <string>. Specify a supported object type.

### 3.1.36.35. get\_timing\_paths (::quartus::sta)

The following table displays information for the get\_timing\_paths Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre>get_timing_paths [-h   -help] [-long_help] [-asynch_clock] [-data_delay] [-detail &lt;summary path_only path_and_clock full_path&gt;] [-fall_from &lt;names&gt;] [-fall_from_clock &lt;names&gt;] [-fall_through &lt;names&gt;] [-fall_to &lt;names&gt;] [-fall_to_clock &lt;names&gt;] [-false_path] [-from &lt;names&gt;] [-from_clock &lt;names&gt;] [-hold] [-inter_clock] [-intra_clock] [-less_than_slack &lt;slack_limit&gt;] [-npaths &lt;number&gt;] [-nworst &lt;number&gt;] [-pairs_only] [-recovery] [-removal] [-rise_from &lt;names&gt;] [-rise_from_clock &lt;names&gt;] [-rise_through &lt;names&gt;] [-rise_to &lt;names&gt;] [-rise_to_clock &lt;names&gt;] [-setup] [-show_routing] [-through &lt;names&gt;] [-to &lt;names&gt;] [-to_clock &lt;names&gt;]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
continued...		

-asynch_clock	Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups
-data_delay	Report only paths that are covered by a data delay assignment
-detail <summary path_only path_and_clock full_path>	Option to determine how much detail should be shown in the path report
-fall_from <names>	Valid sources (string patterns are matched using Tcl string matching)
-fall_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-fall_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
-fall_to <names>	Valid destinations (string patterns are matched using Tcl string matching)
-fall_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
-false_path	Report only paths that are cut by a false path assignment
-from <names>	Valid sources (string patterns are matched using Tcl string matching)
-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-hold	Option to report clock hold paths
-inter_clock	Only report paths whose launch and latch clock are different
-intra_clock	Only report paths whose launch and latch clock are the same
-less_than_slack <slack limit>	Limit the paths reported to those with slack values less than the specified limit.
-npaths <number>	Specifies the number of paths to report (default=1, or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported but be wary that this may be slow)
-nworst <number>	Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst
-pairs_only	When set, paths with the same start and end points are considered equivalent. Only the worst case path for each unique combination is displayed.
-recovery	Option to report recovery paths
-removal	Option to report removal paths
-rise_from <names>	Valid sources (string patterns are matched using Tcl string matching)
-rise_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-rise_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)

*continued...*

	<table> <tr> <td>-rise_to &lt;names&gt;</td><td>Valid destinations (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-rise_to_clock &lt;names&gt;</td><td>Valid destination clocks (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-setup</td><td>Option to report clock setup paths</td></tr> <tr> <td>-show_routing</td><td>Option to display detailed routing in the path</td></tr> <tr> <td>-through &lt;names&gt;</td><td>Valid through nodes (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-to &lt;names&gt;</td><td>Valid destinations (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-to_clock &lt;names&gt;</td><td>Valid destination clocks (string patterns are matched using Tcl string matching)</td></tr> </table>	-rise_to <names>	Valid destinations (string patterns are matched using Tcl string matching)	-rise_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)	-setup	Option to report clock setup paths	-show_routing	Option to display detailed routing in the path	-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)	-to <names>	Valid destinations (string patterns are matched using Tcl string matching)	-to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
-rise_to <names>	Valid destinations (string patterns are matched using Tcl string matching)														
-rise_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)														
-setup	Option to report clock setup paths														
-show_routing	Option to display detailed routing in the path														
-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)														
-to <names>	Valid destinations (string patterns are matched using Tcl string matching)														
-to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)														
<b>Description</b>	<p>Get a collection of path objects for the worst-case paths.</p> <p>This command behaves the same as the report_timing command. However, instead of reporting the paths, it returns a Tcl collection of path objects. You can retrieve path object data using the get_path_info and get_point_info commands.</p> <p>For help on the options shared with report_timing, see the report_timing help page.</p>														
<b>Example Usage</b>	<pre># Define a few helper procedures to print out points # on a path, and the path itself proc get_clock_string { path clk } {     set clk_str ""     set clk_id [ get_path_info \$path -\${clk}_clock ]      if { \$clk_id ne "" } {         set clk_str [ get_clock_info \$clk_id -name ]          if { [ get_path_info \$path -\${clk}_clock_is_inverted ] } {             append clk_str " (INVERTED)"         }     }      return \$clk_str }  proc print_point { point } {     set total [ get_point_info \$point -total ]     set incr [ get_point_info \$point -incr ]     set node_id [ get_point_info \$point -node ]     set type [ get_point_info \$point -type ]     set rf [ get_point_info \$point -rise_fall ]     set node_name ""      if { \$node_id ne "" } {         set node_name [ get_node_info \$node_id -name ]     }      puts [format "%10s %8s %2s %-6s %s" \$total \$incr \$rf \$type \$node_name ] }  proc print_path { path } {     puts "Slack : [ get_path_info \$path -slack]"     puts "To Clock : [ get_clock_string \$path to ]"     puts "From Clock : [ get_clock_string \$path from]"     puts ""     puts [format "%10s %8s %-2s %-6s %s" "Total" "Incr" "RF" "Type" "Name"]     puts "===== "      foreach_in_collection pt [ get_path_info \$path -arrival_points ] {         print_point \$pt     } }  project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist</pre>														

*continued...*

	<pre># And now simply iterate over the 10 worst setup paths, printing each path foreach_in_collection path [ get_timing_paths -npaths 10 -setup ] {     print_path \$path     puts "" }  delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Option <string> has illegal value: <string>. Specify a legal option value.
	TCL_ERROR	1	ERROR: Collection type '<string>' is not a valid type for a through collection. Valid collection types are 'pin' and 'net'
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.36. import\_sdc (::quartus::sta)

The following table displays information for the `import_sdc` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601		
<b>Syntax</b>	import_sdc [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Reads SDCs from synthesized database directly.		
<b>Example Usage</b>	<pre>project_new test create_timing_netlist  # Read SDC commands import_sdc  update_timing_netlist  report_timing  delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.37. is\_post\_syn\_sta (::quartus::sta)

The following table displays information for the `is_post_syn_sta` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601
<b>Syntax</b>	<code>is_post_syn_sta [-h   -help] [-long_help]</code>
<i>continued...</i>	

Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
Description	Returns 1 when post synthesis delays are annotated on the timing netlist		
Example Usage	<pre>if {[is_post_syn_stal]} {     create_clock ... }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.38. locate (::quartus::sta)

The following table displays information for the locate Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601					
<b>Syntax</b>	locate [-h   -help] [-long_help] [-chip] [-classic_tmv] [-color <black blue brown green grey light_grey orange purple red white> ] [-dpp] [-label <label> ] [-no_duplicates] [-rpe] [-rtm] [-tmv] <items>					
<b>Arguments</b>	-h   -help	Short help				
	-long_help	Long help with examples and possible return values				
	-chip	Locate the object in the Chip Planner				
	-classic_tmv	Locate the object in the Classic Technology Map Viewer				
	-color <black blue brown green grey light_grey orange purple red white>	Specify the color to be used to identify the objects you are locating				
	-dpp	Locate in the Design Partition Planner				
	-label <label>	Specify a label used to identify the objects you are locating				
	-no_duplicates	Do not locate duplicate objects				
	-rpe	Locate in the Resource Property Editor				
	-rtm	Locate in the Hyper-Retiming Viewer				
	-tmv	Locate the object in the Technology Map Viewer				
	<items>	Items to locate. Any collection or object (such as paths, points, nodes, nets, keepers, registers, etc) may be located by passing a reference to the corresponding collection or object.				
<b>Description</b>	<p>Locate an object from the Timing Analyzer in another Quartus Prime tool.</p> <p>With this command, one or more objects, or collections of objects, can be located in a supported Quartus tool from the Timing Analyzer.</p> <p>The destination must be specified with one of the following options:</p> <table><tr><td>Option</td><td>Destination Tool</td></tr><tr><td>=====</td><td>=====</td></tr></table>		Option	Destination Tool	=====	=====
Option	Destination Tool					
=====	=====					

continued..

*continued...*

	<pre> -chip      Chip Planner -rpe      Resource Property Editor -rtl      RTL Viewer -classic_rtl  Classic RTL Viewer -tmv      Technology Map Viewer -classic_tmv  Classic Technology Map Viewer -rtm      Hyper-Retiming Viewer -dpp      Design Partition Planner  The -label option can be used to specify a label for the located objects. The -color command can be used to specify a color to be used to identify the located objects in the destination tool. </pre>		
Example Usage	<pre> proc prepare_design { } {     set sleep_for 2000      create_timing_netlist -risefall      post_message -type info "Give the GUI some time to catch up to the new netlist. Sleep for \$sleep_for ms"     after \$sleep_for      read_sdc     update_timing_netlist }  prepare_design  # Locate all of the nodes in the longest ten paths # into the Resource Property Editor locate [get_path -npaths 10] -rpe  # Locate ten paths into the chip planner, labelling # each one individually. set path_col [get_timing_paths -npaths 10] set path_id 0  foreach_in_collection path \$path_col {     incr path_id      locate -label "Path #\$path_id" \$path -chip }  # locate all keepers that begin with the letter t # to the Tech Map Viewer locate [get_keepers t*] -tmv  # locate all nodes that begin with the letter a # # The Timing Analyzer GUI will prompt the user for the # tool to which the nodes should be located. # # Pause first to allow the previous locations to # appear, as the dialog that pops up, to ask # the user for a location, will block the rest # of the GUI until cleared.  after 5000  post_message -type info "Interactive locate" locate a* </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Illegal color: <string>. Specify a color that is currently supported by the locate command.
	TCL_ERROR	1	ERROR: An object or collection matching <string> could not be found, or was of a type not supported by the locate command.
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.39. print\_total\_sdc\_processing\_time (::quartus::sta)

The following table displays information for the `print_total_sdc_processing_time` Tcl command:

Tcl Package and Version	Belongs to <code>::quartus::sta</code> on page 601		
Syntax	<code>print_total_sdc_processing_time [-h   -help] [-long_help]</code>		
Arguments	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
Description	Returns the total processing time as a formatted string.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.36.40. query\_collection (::quartus::sta)

The following table displays information for the `query_collection` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	query_collection [-h   -help] [-long_help] [-all] [-limit <limit_value> ] [-list_format] [-report_format] <collection>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-all	Return all the collection objects.
	-limit <limit_value>	Set number of collection objects to return.
	-list_format	Return collection objects in a list format.
	-report_format	Return collection objects in a format of one element per line.
	<collection>	Object collection
<b>Description</b>	<p>Query collection objects.</p> <p>Collections can be obtained by Tcl commands such as get_clocks, get_ports, get_cells. If neither the -limit nor the -all option is specified, then first 20 objects (if the collection has more than 20 objects) or all objects (if the collection has less than or equal to 20 objects) are returned.</p>	
<b>Example Usage</b>	<pre>project_open chiptrip create_timing_netlist  set nodes [get_nodes Reg*] # Get the first 100 nodes in the collection. query_collection \$nodes -limit 100  delete_timing_netlist project_close</pre>	
continued...		

Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Cannot find specified collection. Specify an existing collection.

### 3.1.36.41. read\_sdc (::quartus::sta)

The following table displays information for the `read_sdc` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sta</code> on page 601		
<b>Syntax</b>	<code>read_sdc [-h   -help] [-long_help] [-hdl] [-instance &lt;instance_name&gt; ] [-no_import] [-no_sdc_promotion] [-post_fit] [-post_syn] [-project_relative] [ &lt;file_name&gt; ]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
	<code>-hdl</code>	Read SDC commands embedded in HDL	
	<code>-instance &lt;instance_name&gt;</code>	Name of the block for which we are reading the SDC file	
	<code>-no_import</code>	Do not automatically import RTL SDCs from the netlist	
	<code>-no_sdc_promotion</code>	Disable instance-bound scoping of constraints	
	<code>-post_fit</code>	For post_syn STA. Load SDCs as if in post_fit (Includes SDC_FILE, HDL Embedded, Entity)	
	<code>-post_syn</code>	For use with STA on fitter snapshots. Load SDCs as if in post_syn mode	
	<code>-project_relative</code>	If passing in a relative path to a file, interpret that path relative to the current project's directory instead of STA's current directory	
	<code>&lt;file_name&gt;</code>	Name of the SDC file	
<b>Description</b>	<p>Reads an SDC file with all current constraints and exceptions.</p> <p>If an SDC file is specified, <code>read_sdc</code> only reads that SDC file. If the <code>-hdl</code> option is specified, <code>read_sdc</code> only reads SDC commands that were embedded in HDL.</p> <p>If no arguments are specified, <code>read_sdc</code> reads the default SDC files along with any SDC commands that were embedded in HDL. If one or more SDC_FILE assignments exists in the QSF, <code>read_sdc</code> reads all of them in order. Otherwise, <code>read_sdc</code> reads the file <code>&lt;revision&gt;.sdc</code> if it exists.</p>		
<b>Example Usage</b>	<pre>project_new test create_timing_netlist  # Read SDC commands from test_constraints.sdc read_sdc test_constraints.sdc  # Read SDC commands embedded in HDL read_sdc -hdl  update_timing_netlist  report_timing  delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>

continued...

	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Can't find file <string>
	TCL_ERROR	1	ERROR: The provided instance name does not exist in the current design.
	TCL_ERROR	1	ERROR: instance_name must be specified when using no_sdc_promotion.
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.42. register\_delete\_timing\_netlist\_callback (::quartus::sta)

The following table displays information for the register\_delete\_timing\_netlist\_callback Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601		
<b>Syntax</b>	register_delete_timing_netlist_callback [-h   -help] [-long_help] <i>&lt;body&gt;</i>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	<i>&lt;body&gt;</i>	Body of the callback to run	
<b>Description</b>	<p>Use this command to specify a TCL procedure that runs before the timing netlist is deleted.</p> <p>This command can be used to specify a procedure to run, like so:</p> <pre>proc mycallback {     # This is the body of the delete_timing_netlist callback.     ... } register_delete_timing_netlist_callback mycallback</pre> <p>Or, you may specify the procedure directly:</p> <pre>register_delete_timing_netlist_callback {     # This is the body of the delete_timing_netlist callback.     ... }</pre>		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.36.43. remove\_from\_collection (::quartus::sta)

The following table displays information for the remove\_from\_collection Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sta</code> on page 601		
<b>Syntax</b>	<code>remove_from_collection [-h   -help] [-long_help] &lt;base_collection&gt; &lt;items_to_remove&gt;</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
<i>continued...</i>			

	-long_help	Long help with examples and possible return values	
	<base_collection>	Collection to remove items from	
	<items_to_remove>	Items to be removed from base_collection	
Description	<p>This command takes two collections and returns a new collection that is the difference of the two, effectively the second collection subtracted from the first collection. The second collection can be a string, but the first has to be previously-created collection: either by passing any of the "get_" functions directly, or by passing a variable that contains a collection (see code examples for this command). If a collection is used for the second argument, the types in the second collection must be the same as or a subset of the types in the first collection.</p> <p>If the first collection consists of keepers, the second collection can only consist of keepers, registers or ports. If the first collection consists of partitions, the second collection can only consist of partitions or cells. If the first collection consists of nodes, the second collection can only consist of nodes, keepers, registers, ports, pins, nets or combinational nodes.</p>		
Example Usage	<pre>set a_keepers [get_keepers a*] set al_regs [get_registers al*]  set keepers_without_al [remove_from_collection \$a_keepers \$al_regs]  #or: set keepers_without_al [remove_from_collection \$a_keepers [get_registers al*]]  #or even: set keepers_without_al [remove_from_collection \$a_keepers al*]  # - note that the last statement will actually remove all keepers with name al* #   not only registers! (will remove IOs with name al*, if any)  # Get the first 100 nodes in the collection. query_collection \$keepers_without_al -limit 100</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Cannot find specified collection. Specify an existing collection.

### 3.1.36.44. report\_advanced\_io\_timing (::quartus::sta)

The following table displays information for the `report_advanced_io_timing` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sta</code> on page 601	
<b>Syntax</b>	<code>report_advanced_io_timing [-h   -help] [-long_help] [-append] [-file &lt;name&gt; ] [-panel_name &lt;name&gt; ] [-stdout]</code>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
continued...		

	-panel_name <name>		Sends the results to the panel and specifies the name of the new panel
	-stdout		Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
Description	<p>This command creates a report containing all of the relevant signal integrity measurements computed during I/O buffer simulation.</p> <p>You must perform delay annotation with Advanced I/O Timing enabled before using this command. This option can be enabled from the Timing Analyzer Page of the Settings dialog box.</p>		
Example Usage	<pre>project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist  # Create "Advanced I/O Timing" report panel report_advanced_io_timing -panel_name "Advanced I/O Timing"  # The following command is optional delete_timing_netlist  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.45. report\_asynch\_cdc (::quartus::sta)

The following table displays information for the report\_asynch\_cdc Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre>report_asynch_cdc [-h   -help] [-long_help] [-append] [-asynch_clock] [-detail &lt;summary full&gt;] [-fall_from_clock &lt;names&gt;] [-fall_to_clock &lt;names&gt;] [-file &lt;name&gt;] [-from &lt;names&gt;] [-from_clock &lt;names&gt;] [-inter_clock] [-intra_clock] [-multi_bit_cdc] [-nentries &lt;number&gt;] [-panel_name &lt;name&gt;] [-reset_cdc] [-rise_from_clock &lt;names&gt;] [-rise_to_clock &lt;names&gt;] [-single_bit_cdc] [-stdout] [-to &lt;names&gt;] [-to_clock &lt;names&gt;]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-asynch_clock	Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups
	-detail <summary full>	Option to specify how much detail should be shown in the CDC report
	-fall_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
continued...		

	<div>-file &lt;name&gt;</div> <div>Sends the results to an ASCII or HTML file. Depending on the extension</div>
	<div>-from &lt;names&gt;</div> <div>Valid sources (string patterns are matched using Tcl string matching)</div>
	<div>-from_clock &lt;names&gt;</div> <div>Valid source clocks (string patterns are matched using Tcl string matching)</div>
	<div>-inter_clock</div> <div>Only report paths whose launch and latch clock are different</div>
	<div>-intra_clock</div> <div>Only report paths whose launch and latch clock are the same</div>
	<div>-multi_bit_cdc</div> <div>Report multi-bit CDC topologies found in the design</div>
	<div>-nentries &lt;number&gt;</div> <div>Display up to this number of entries per CDC topology. Only applicable in full detail mode</div>
	<div>-panel_name &lt;name&gt;</div> <div>Sends the results to the panel and specifies the name of the new panel</div>
	<div>-reset_cdc</div> <div>Report reset CDC topologies found in the design</div>
	<div>-rise_from_clock &lt;names&gt;</div> <div>Valid source clocks (string patterns are matched using Tcl string matching)</div>
	<div>-rise_to_clock &lt;names&gt;</div> <div>Valid destination clocks (string patterns are matched using Tcl string matching)</div>
	<div>-single_bit_cdc</div> <div>Report single-bit CDC topologies found in the design</div>
	<div>-stdout</div> <div>Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.</div>
	<div>-to &lt;names&gt;</div> <div>Valid destinations (string patterns are matched using Tcl string matching)</div>
	<div>-to_clock &lt;names&gt;</div> <div>Valid destination clocks (string patterns are matched using Tcl string matching)</div>
<b>Description</b>	<p>This report displays all Clock-Domain-Crossings (CDC) between asynchronous clocks in a design.</p> <p>The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.</p> <p>By default, this command reports all CDC's in a design. You can limit the analysis performed by this command to specific CDC source and destination nodes, using the "-from" and "-to" options. The analysis can also be limited using clocks. Specify the CDC's source and destination clocks using the "-from_clock" and "-to_clock" options. Alternatively, specify edges of the clock using "-rise_from_clock", "-fall_from_clock", "-rise_to_clock", and "-fall_to_clock" options.</p> <p>To limit the report to only display specific categories of CDC's, use "-multi_bit_cdc" to report multi-bit CDC buses, "-single_bit_cdc" to report single-bit CDC synchronizers, and "-reset_cdc" to report asynchronous reset topologies. By default, all three CDC categories are reported.</p> <p>Use the "-nentries" option to limit the number of CDC's displayed per CDC topology type. The topology types fall into one of the three categories above. Run the report to see all the topology types that are supported.</p> <p>Use the "-detail" option to specify the desired level of reporting detail. "summary" generates a table listing only the number of CDC topologies recognized per category and the total number of crossings for that category. "full" reports every recognized CDC under each topology type, and is the default behaviour. In the full report, you can click on each individual CDC in the Timing Analyzer graphical user interface to view its statistics.</p>
<b>Example Usage</b>	<pre># Report all bus CDC's, up to 10 buses per CDC topology type report_asynch_cdc -buses -nentries 10</pre>

*continued...*

	<pre># Report all CDC's from clkA to clkB report_asynch_cdc -from_clock clkA -to_clock clkB  # Report all synchronizer chains whose source node contains "transfer" report_asynch_cdc -from *transfer* -synch_chains</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: The current report cannot be run in XML mode. Use create_timing_netlist to create a non-XML timing netlist.

### 3.1.36.46. report\_bottleneck (::quartus::sta)

The following table displays information for the report\_bottleneck Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre>report_bottleneck [-h   -help] [-long_help] [-cmetric &lt;cmetric_name&gt; ] [- details] [-metric &lt;default tns num_paths num_fpaths num_fanins num_fanouts&gt; ] [-nworst &lt;number&gt; ] [-panel_name &lt;panel_name&gt; ] [-stdout] [ &lt;paths&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-cmetric <cmetric_name>	Custom metric function to evaluate individual nodes
	-details	Show the detailed information (number of failing edges, number of fanins, etc)
	-metric <default tns num_paths num_fpaths num_fanins num_fanouts>	Indicate the metric to use to rate individual nodes
	-nworst <number>	Specifies the maximum number of nodes to report. If unspecified, there is no limit
	-panel_name <panel_name>	Sends the results to the panel and specifies the name of the new panel
	-stdout	Output the result onto stdout
	<paths>	Paths to be analyzed
<b>Description</b>	<p>Reports bottleneck nodes in a design based on user-specified criteria for rating each node.</p> <p>The following considerations are pre-defined</p> <pre>num_fpaths: (default) returns the number of paths that fail timing through the node.  num_fanins: returns the number of fanin edges from the node.  num_fanouts: returns the number of fanout edges from the node.  num_paths: returns the number of paths through the node.  tns: returns the total negative slack of all the paths through the node.</pre> <p>The paths to be analyzed can be specified by passing the result of any get_timing_paths call as the last argument to report_bottleneck. If no paths are specified, report_bottleneck analyzes the worst 1000 setup paths in the design.</p> <p>You can also create your own custom criteria for evaluating nodes based on the combination of the number of fanouts, fanins, failing</p>	

*continued...*

	<p>paths, and total paths.</p> <p>To use custom criteria, do the following:</p> <ol style="list-style-type: none"> <li>1. Create a Tcl procedure that takes one argument, "arg", for example.</li> <li>2. Use "upvar \$arg metric" in the procedure.</li> <li>3. Calculate the rating based on \$metric(tns), \$metric(num_fanouts), \$metric(num_fanins), and \$metric(num_fpaths).</li> <li>4. Return the rating with "return \$rating".</li> <li>5. Pass the name of your custom criteria procedure to report_bottleneck using the -cmetric option.</li> </ol> <p>Reports can be directed to the Tcl console (-stdout), the Timing Analyzer graphical interface (-panel), or a combination of the two.</p>		
<b>Example Usage</b>	<pre>project_open my_project create_timing_netlist read_sdc update_timing_netlist  # use the worst 500 hold paths set paths [ get_timing_paths -npaths 500 -hold ] report_bottleneck -metric default -panel "Timing Analysis Bottleneck Report - Default Metric" \$paths report_bottleneck -metric tns -panel "Timing Analysis Bottleneck Report - TNS" \$paths report_bottleneck -metric num_paths -panel "Timing Analysis Bottleneck Report - Number of Paths" \$paths report_bottleneck -metric num_fpaths -panel "Timing Analysis Bottleneck Report - Number of Failing Paths" \$paths report_bottleneck -metric num_fanouts -panel "Timing Analysis Bottleneck Report - Number of Fanouts" \$paths  # create custom metric and use the worst 2000 setup paths proc report_bottleneck_custom_metric {arg} {     # Description: use the number of fanins as the custom metric.     upvar \$arg metric     set rating \$metric(num_fanins)     return \$rating }  set paths [ get_timing_paths -npaths 2000 -setup ] report_bottleneck -cmetric report_bottleneck_custom_metric -panel "Timing Analysis Bottleneck Report - Custom" \$paths</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.36.47. report\_cdc\_viewer (::quartus::sta)

The following table displays information for the report\_cdc\_viewer Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre>report_cdc_viewer [-h   -help] [-long_help] [-append] [-clock_groups] [-file &lt;name&gt;] [-from_clock &lt;names&gt;] [-fully_cut] [-hierarchy] [-hold] [-inactive] [-less_than_slack &lt;slack limit&gt;] [-list] [-panel_name &lt;name&gt;] [-recovery] [-removal] [-setup] [-show_empty] [-show_non_crossing] [-stdout] [-summary] [-timed] [-to_clock &lt;names&gt;] [-tree]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-clock_groups	Show transfers cut by clock groups
<b>continued...</b>		

	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fully_cut	Include transfers where all paths are cut by false path assignments
	-hierarchy	When writing to a panel or a non-list file, show child clocks as nested within their parent clocks
	-hold	Option to report clock hold paths
	-inactive	Show transfers between inactive clocks
	-less_than_slack <slack limit>	Ignore paths with slack values greater or equal to the specified limit
	-list	When writing to file, output all clock transfers in a list instead of a grid
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
	-recovery	Option to report recovery paths
	-removal	Option to report removal paths
	-setup	Option to report clock setup paths
	-show_empty	Include all clocks in the report, even ones that launch/latch no paths
	-show_non_crossing	Include transfers that do not cross a clock domain (i.e. transfers to/from the same clock)
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
	-summary	Do not display slack information
	-timed	Include all timed transfers (i.e. those not fully cut by false paths or clock groups)
	-to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-tree	Alias for the -hierarchy option
<b>Description</b>	<p>Generates a Clock Domain Crossing Viewer (CDC Viewer) report. It displays all clock transfers (i.e., data paths between one clock domain and another clock domain) in a design, as well as data on each transfer: the number of uncut &amp; cut paths in the transfer, the worst-case and total-negative slack of the transfer, and the tightest setup/hold/removal/recovery relationship between the clocks in the transfer.</p> <p>The report indicates what clock transfers are cut ("false paths") by set_clock_groups or clock-to-clock set_false_path commands, and which clock transfers are ignored due to clocks marked as inactive by set_active_clocks.</p> <p>The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three. When directed to a panel or a file without the -list option, the CDC Viewer report will be a grid, where each cell represents paths transferring between a source and destination clock. When directed to a panel or an HTML file, the grid is color-coded to highlight passing, failing, cut, and inactive transfers, as well as clock groups. When directed to the Tcl console or a file with the -list option, a list of clock transfers are reported.</p> <p>The -setup, -hold, -recovery, and -removal options determine the</p>	

*continued...*

	<p>analysis type of the report, particularly the reporting of false_paths that apply to only one analysis type. If you do not specify any of these options, a report is generated for each analysis.</p> <p>By default, the only transfers that are shown in the report are ones that participate in clock domain crossings. This means that transfers to/from the same clock are not shown, even if they fail timing. To show all transfers, use the -show_all option.</p> <p>The generated report can be customized by a variety of options. Refer to the help text of those options for more information.</p>		
<b>Example Usage</b>	<pre>project_open top create_timing_netlist -skip_dat report_cdc_viewer -panel_name delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Netlist must be updated. Run update_timing_netlist

### 3.1.36.48. report\_clock\_fmax\_summary (::quartus::sta)

The following table displays information for the report\_clock\_fmax\_summary Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601	
Syntax	report_clock_fmax_summary [-h   -help] [-long_help] [-append] [-file <name> ] [-panel_name <name> ] [-split_by_corner] [-stdout]	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
	-split_by_corner	When set, running this command with the -panel option creates a folder containing versions of this report for selected multiple operating conditions. This option has no effect when used with the -stdout or -file options.
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
Description	<p>Reports potential fmax for every clock in the design, regardless of the user-specified clock periods. Fmax is only computed for paths where the source and destination registers or ports are driven by the same clock. Paths of different clocks, including generated clocks, are ignored. For paths between a clock and its inversion, fmax is computed as if the rising and falling edges of the clock are scaled along with fmax, such that the duty cycle (in terms of a percentage) is maintained.</p>	
continued...		

	Restricted fmax considers hold timing in addition to setup timing, as well as minimum pulse and minimum period restrictions. Similar to unrestricted fmax, the restricted fmax is computed as if the rising and falling edges of the clock are scaled along with fmax, such that the duty cycle (in terms of a percentage) is maintained. The "Note" column reports which analyses restricted fmax. Refer to hold timing reports (e.g., report_timing with the -hold option) or minimum pulse width reports generated by the report_min_pulse_width command for details of specific paths, registers, or ports.		
<b>Example Usage</b>	<pre>project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist  # Output results in the form of messages report_clock_fmax_summary # Create "Fmax" report panel report_clock_fmax_summary -panel_name Fmax # Report both with report panel and messages report_clock_fmax_summary -panel_name Fmax -stdout  # The following command is optional delete_timing_netlist  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.49. report\_clock\_network (::quartus::sta)

The following table displays information for the report\_clock\_network Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	report_clock_network [-h   -help] [-long_help] [-append] [-file <name> ] [-include_non_clock_paths] [-initial_depth <number> ] [-locate_with_routing] [-panel_name <name> ] [-show_full_paths] [-stdout] [-target <names> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-include_non_clock_paths	Show paths that are potentially in the clock network. These paths terminate at a register's clock pin but do not start at a clock source.
	-initial_depth <number>	Initial clock network depth to report.
	-locate_with_routing	When locating to a path, also show detailed routing. This is only shown in Chip Planner.
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
<b>continued...</b>		

	-show_full_paths			Show the full clock paths - do not reduce the table size by condensing multiple trivial nodes into one row.
	-stdout			Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
	-target <names>			Valid nodes in the clock network or clocks (string patterns are matched using Tcl string matching).
<b>Description</b>	<p>The clock network report shows the netlist topology of clock paths that make up the clock network in a design. It allows the user to track a clock signal from its source, through transformations such as PLL's, to the loads that the clock drives. It also reveals clock relationships by indicating nodes where generated clocks are defined.</p> <p>The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.</p> <p>Use the "-target" option to specify report targets. These can be clocks in the design or nodes on the clock network, for example PLL outputs. If you specify clocks as targets, the clock network report uses the clock's target nodes as report targets. The clock network report then displays all nodes in the clock network that are in the fanin and fanout cones of the report targets. If no report target is specified, all clock target nodes in the design are used by default.</p> <p>Each row in the report may include one node or multiple trivial nodes with singular fanin and fanout edge. To disable the behaviour of collapsing down trivial nodes into one row, use the "-show_full_paths" option.</p> <p>When running the clock network report in the Timing Analyzer GUI, rows in the main table corresponding to report target nodes are highlighted in light blue. You may click on each row of the table to view information such as clock frequencies, relationships, and why this node belongs in the clock network. You may right-click on any row to locate the node in other Quartus tools such as RTL Viewer. You may also right-click on specific rows to locate the shortest clock path from the clock source to that node in tools such as RTL Viewer.</p> <p>Use the "-initial_depth" option to reduce the height of the report table in the Timing Analyzer GUI. Rows in the main table that are deeper than the set initial depth are collapsed by default, but can be manually expanded. If this option is not set, the report determines an appropriate initial depth to use.</p> <p>Use the "-include_non_clock_paths" option if a node that you expect to be in the clock network cannot be found. This option shows nodes that lead into a register's clock pin, but are not downstream of any known clock source. Furthermore, registers that are not clocked by any clocks will be shown using this option.</p> <p>Use the "-locate_with_routing" option to show the routing elements that make up a path when locating a path to Chip Planner. Only use this option if you use the "-target" option to specify reporting targets, otherwise the report may be slow to generate.</p>			
<b>Example Usage</b>	<pre># Report the clock network that feeds into register regA report_clock_network -panel {Report} -target [get_registers regA]  # Report the clock network starting from clk_100 clock, but show only the first 10 levels report_clock_network -panel {Report} -target [get_clocks clk_100] -initial_depth 10  # Report the clock network passing through the combinational node clk_mux combout. # In the report, include paths that end at a register's clock pin but do not start # at a clock source. report_clock_network -panel {Report} -target [get_nodes clk_mux combout] - include_non_clock_paths</pre>			
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>	
	TCL_OK	0	INFO: Operation successful	

### 3.1.36.50. report\_clock\_transfers (::quartus::sta)

The following table displays information for the report\_clock\_transfers Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601		
Syntax	report_clock_transfers [-h   -help] [-long_help] [-append] [-file <name> ] [-hold] [-panel_name <name> ] [-recovery] [-removal] [-setup] [-stdout]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-hold	Creates a clock transfer summary for hold analysis	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-recovery	Creates a clock transfer summary for recovery analysis	
	-removal	Creates a clock transfer summary for removal analysis	
	-setup	Creates a clock transfer summary for setup analysis	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
Description	<p>Generates a timing report table showing all clock transfers (i.e., data paths between one clock domain and another clock domain). The from and to clocks are shown as well as the number of paths for each transfer: RR, RF, FR, FF. An RF transfer, for example, occurs when the source register of path is clocked by the rising edge of its clock and the destination register is clocked by the falling edge of its clock.</p> <p>The report also indicates what clock transfers are cut ("false paths") by set_clock_groups or clock-to-clock set_false_path commands. For transfers that are not cut, the number of paths reported does not take into account paths cut by path-specific set_false_path commands. Actual path counts may be lower than reported.</p> <p>The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.</p> <p>The -setup, -hold, -recovery, and -removal options determine the analysis type of the report, particularly the reporting of false_paths that apply to only one analysis type. If you do not specify any of these options, a report is generated for each analysis.</p>		
Example Usage	<pre>project_open top create_timing_netlist -skip_dat report_clock_transfers -panel_name delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return

continued...

TCL_OK	0	INFO: Operation successful
TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
TCL_ERROR	1	ERROR: Netlist must be updated. Run update_timing_netlist

### 3.1.36.51. report\_clocks (::quartus::sta)

The following table displays information for the report\_clocks Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601		
Syntax	report_clocks [-h   -help] [-long_help] [-append] [-desc] [-file <name> ] [-hierarchy] [-panel_name <name> ] [-stdout] [-summary] [-tree] [-waveform]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-desc	Sort the clocks by name in descending order (ascending order is default)	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-hierarchy	Display a tree view of the clocks	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
	-summary	Create a single table with a summary of each clock	
	-tree	alias for hierarchy	
	-waveform	Display the clocks graphically as waveforms	
Description	<p>Report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical interface ("-panel_name"), or any combination of the three.</p> <p>For stdout/file output, the clock details are reported in two sections. The first section shows all clocks, their period, and their waveform. This includes generated clocks after an update_timing_netlist. The second section shows details for all generated clocks. For the panel report, both sections are combined into a single report.</p>		
Example Usage	<pre>project_open top create_timing_netlist read_sdc update_timing_netlist  report_clocks  delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.36.52. report\_datasheet (::quartus::sta)

The following table displays information for the report\_datasheet Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601		
Syntax	report_datasheet [-h   -help] [-long_help] [-append] [-expand_bus] [-file <name> ] [-panel_name <name> ] [-stdout]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-expand_bus	If set, bus is reported as individual ports	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
Description	<p>This function creates a datasheet report which summarizes the timing characteristics of the design as a whole. It reports setup (tsu), hold (th), clock-to-output (tco), minimum clock-to-output (mintco), output enable (txz), minimum output enable (mintzx), output disable (txz), minimum output disable (mintxz), propagation delay (tpd), and minimum propagation delay (mintpd) times. These delays are reported for each clock or port for which they are relevant. If there is a case where there are multiple paths for a clock (for example if there are multiplexed clocks), then the maximum delay is reported for the tsu, th, tco, txz, txz and tpd, and the minimum delay is reported for mintco, mintzx, mintxz and mintpd.</p> <p>The datasheet can be outputted to the Tcl console ("-stdout", default), a file ("-file"), or a report panel ("-panel_name"). Additionally if the "-file" option is used then the "-append" option can be used to specify that new data should be written to the end of the specified file.</p>		
Example Usage	<pre>project_open proj1 create_timing_netlist read_sdc update_timing_netlist  # Report the datasheet to a report panel report_datasheet -panel_name Datasheet  # Report the datasheet to a file report_datasheet -file file1.txt</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.53. report\_dds (::quartus::sta)

The following table displays information for the `report_dds` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::sta</a> on page 601		
Syntax	report_dds [-h   -help] [-long_help] [-append] [-file <name> ] [-panel_name <name> ] [-stdout]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
Description	This command generates custom timing reports for EMIF instantiations.		
Example Usage	<pre>project_new test create_timing_netlist read_sdc update_timing_netlist  report_dds -panel "Report DDR"  delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.54. report\_exceptions (::quartus::sta)

The following table displays information for the `report_exceptions` Tcl command:

Tcl Package and Version	Belongs to <a href="#">::quartus::sta</a> on page 601
Syntax	<pre>report_exceptions [-h   -help] [-long_help] [-append] [-asynch_clock] [-clock_groups] [-detail &lt;summary path_summary path_only path_and_clock full_path&gt; ] [-fall_from_clock &lt;names&gt; ] [-fall_to_clock &lt;names&gt; ] [-false_path] [-file &lt;name&gt; ] [-from &lt;names&gt; ] [-from_clock &lt;names&gt; ] [-hold] [-ignored] [-inter_clock] [-intra_clock] [-less_than_slack &lt;slack limit&gt; ] [-max_delay] [-min_delay] [-multicycle_path] [-npaths &lt;number&gt; ] [-num_exceptions &lt;number&gt; ] [-nworst &lt;number&gt; ] [-pairs_only] [-panel_name &lt;name&gt; ] [-reachability] [-recovery] [-removal] [-report_clock_groups] [-rise_from_clock &lt;names&gt; ] [-rise_to_clock &lt;names&gt; ] [-setup] [-split_by_corner] [-stdout] [-through &lt;names&gt; ] [-to &lt;names&gt; ] [-to_clock &lt;names&gt; ] [-valid]</pre>
continued...	

<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-asynch_clock	Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups
	-clock_groups	Option to show clock groups in reports. This option also treats clock groups as timing exceptions
	-detail <summary path_summary path_only path_and_clock full_path>	Option to determine how much detail should be shown in the path report
	-fall_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-false_path	Option to report false path exceptions
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-hold	Option to report clock hold paths
	-ignored	Option to report only exceptions that are partially or fully ignored
	-inter_clock	Only report paths whose launch and latch clock are different
	-intra_clock	Only report paths whose launch and latch clock are the same
	-less_than_slack <slack limit>	Limit the paths reported to those with slack values less than the specified limit.
	-max_delay	Option to report maximum delay exceptions
	-min_delay	Option to report minimum delay exceptions
	-multicycle_path	Option to report multicycle path exceptions
	-npaths <number>	Specifies the number of paths to report (default=1, or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported but be wary that this may be slow)
	-num_exceptions <number>	Option to only show a certain number of exceptions in the report
	-nworst <number>	Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst
	-pairs_only	When set, paths with the same start and end points are considered equivalent. Only the worst case path for each unique combination is displayed.
continued...		

	<table> <tr> <td>-panel_name &lt;name&gt;</td><td>Sends the results to the panel and specifies the name of the new panel</td></tr> <tr> <td>-reachability</td><td>Option to report a percent value of how many nodes in an exception's targets are satisfied by the exception</td></tr> <tr> <td>-recovery</td><td>Option to report recovery paths</td></tr> <tr> <td>-removal</td><td>Option to report removal paths</td></tr> <tr> <td>-report_clock_groups</td><td>Option to treat clock groups as exceptions</td></tr> <tr> <td>-rise_from_clock &lt;names&gt;</td><td>Valid source clocks (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-rise_to_clock &lt;names&gt;</td><td>Valid destination clocks (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-setup</td><td>Option to report clock setup paths</td></tr> <tr> <td>-split_by_corner</td><td>When set, running this command with the -panel option creates a folder containing versions of this report for selected multiple operating conditions. -to <names>	Valid destinations (string patterns are matched using Tcl string matching)																												
-to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)																												
-valid	Option to report only exceptions that cover valid paths and have been successfully applied																												
<b>Description</b>	<p>Reports status and timing analysis results for each timing exception in your design. A timing exception is one of: set_false_path, set_multicycle_path, set_min_delay, or set_max_delay.</p> <p>The status is relative to the paths covered by the -from, -to, and other options. A complete timing exception relative to the values specified for the -from and -to options may not actually be complete with respect to the full design.</p> <p>Complete: The exception has not been overridden and is valid. There are paths affected by this exception.</p> <p>Partially overridden: The exception includes some paths that have been overridden by one or more higher-precedence exceptions.</p> <p>Fully overridden: All paths affected by this exception have been overridden by one or more higher-precedence exceptions.</p> <p>Invalid: No paths are affected by this exception. This occurs when a timing exception has valid -from, -to, or -through collections, but there are no actual paths from the -from nodes to the -to nodes.</p> <p>Paths will not be analyzed: This exception has no paths for the given analysis type (setup/hold/recovery/removal). This occurs when a timing exception has paths, but only for analysis types other than the type used for the current report.</p> <p>Use the -valid option to show only exceptions that have the status of "Complete" or "Partially overridden". These exceptions cover valid paths and have been successfully applied.</p> <p>Use the -ignored option to show only exceptions that are partially or fully ignored. This includes exceptions with the status "Partially</p>																												

*continued...*

Overridden", "Fully Overridden", "Invalid", as well as any exceptions that have errors and were not included in the analysis.

Use the `-setup` (default), `-hold`, `-recovery`, or `-removal` options to further filter the exceptions reported.

The report can be directed to the Tcl console using `-stdout` (default), a file using `-file`, the Timing Analyzer graphical user interface using `-panel_name`, or any combination of those three options.

You can limit the reporting by this command to specific start and end points, using the `-from` and `-to` options. You can further limit reporting to clocks using the `-from_clock` and `-to_clock` options, or to specific edges of the clock using the `-rise_from_clock`, `-fall_from_clock`, `-rise_to_clock`, and `-fall_to_clock` options. Additionally, the `-through` option can be used to restrict reporting to paths which go through specified pins or nets.

To determine which timing exceptions override other timing exceptions, use the same `-from` and `-to` options that were used with the overridden timing exception.

Use the `-npaths` option to limit the number of paths to report per timing exception. If you do not specify this option, only the single worst-case path per timing exception is provided. Use the `-less_than_slack` option to limit output to all paths with slack less than the specified value, up to the number specified by `-npaths`.

Use the `-nworst` option to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the `-npaths` option. If this option is used, but `-npaths` is not specified, `-npaths` defaults to the same value specified for `-nworst`.

Use the `"-pairs_only"` option to filter the output further, restricting the results to only unique combinations of start and end points.

Use the `"-num_exceptions"` option to limit the report to only show a certain number of exceptions. If the limit is not set or set too high, the report may need to run for extended durations.

Use the `"-reachability"` option to determine a percentage of how many start and endpoint pairs given by an exception's `-from` and `-to` filters are satisfied by the exception. If an exception does not have a `-from` target, the reachability ratio measures how many of the `-to` targets are satisfied by the exception, and vice versa for exceptions without a `-to` target. Exceptions without both `-from` and `-to` targets are not calculated for reachability. An exception that targets clocks or uses wildcards that match many nodes likely has a lower reachability than an exception that targets specific nodes. To avoid overly-broad exception constraints, you should use exceptions with a higher reachability value.

Reachability is calculated differently depending on whether the exception is bus-type. A bus-type exception has both `-from` and `-to` options declared, and they target the same number of nodes. As well, all nodes in the `-from` option must be declared together, and all nodes in the `-to` option must be declared together. Otherwise, the exception is non-bus type. Bus-type reachability ratio assumes that each node in the `-from` target connects with one node in the `-to` target. Non-bus type reachability ratio is typically more pessimistic because it assumes that each node in the `-from` target connects with every node in the `-to` target.

Use the `-detail` option to specify the desired level of report detail. Specifying `"summary"` generates a single table listing only the highlights of each timing exception (status and worst-case slack). Specifying `"path_summary"` generates a table, per timing exception, listing only the highlights of each path. Specifying `"path_only"` reports the path from the source to the destination without any detail about the clock path. Instead, the clock network delay is shown as a single number. This is the default behavior. Specifying `"path_and_clock"` extends the arrival and required paths back to the launch and latch clocks. Specifying `"full_path"` causes continued tracing back through generated clocks to the underlying base clock.

To treat clock groups as timing exceptions (meaning that they override exceptions with a lower priority), use the `"-report_clock_groups"` option.

By default, all exception types are reported, and clock groups are reported only if the `"-report_clock_groups"` option is used. Use a combination of `"-false_path"`, `"-multicycle_path"`, `"-max_delay"`, `"-min_delay"`, and `"-clock_groups"` to limit the analysis to specific

*continued...*

	<p>exception types. Note that "-clock_groups" option also treats clock groups as timing exceptions.</p> <p>False path exceptions (set_false_path) are reported as if the false path was not applied, similar to the -false_path option for report_timing.</p> <p>The values of the "-from", "-to", and "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p> <p>*****</p> <p>Clock-Domains-Crossing Verification:</p> <p>To view the effects of clock groups on your design, run "report_exceptions -report_clock_groups". If any pair of clocks in your design are cut by a set_clock_groups command and NOT cut by a set_false_path command, the Report shows paths between that pair of clocks as a clock-to-clock exception.</p> <p>Example:</p> <pre>set_clock_groups -logically_exclusive -group {clkA clkB} -group {clkC clkD} report_exceptions -report_clock_groups -npaths 0 -detail path_only</pre> <p>You might want to run "report_exceptions -report_clock_groups" if:</p> <ol style="list-style-type: none"> <li>1. You want to check which paths are cut by a set_clock_groups SDC command.</li> <li>2. You want to cut clock paths, but don't want to add set_clock_groups because you're concerned that you might cut a path incorrectly. With the "report_exceptions -report_clock_groups" command, you can add set_clock_groups to split clocks that are truly asynchronous, then add set_false_path commands to manually cut what you want, and then verify (in the Report) that no paths were found (since false paths have priority). If a path is found by the report, you can correct that without wasting a compilation concentrating on some unrelated false paths.</li> <li>3. If you use the set_clock_groups command and have some logic that is behaving badly and think it's timing related, run the "report_exceptions -report_clock_groups" command on that hierarchy to verify whether the correct paths have been cut.</li> </ol> <p>*****</p>		
<b>Example Usage</b>	<pre># Reports all timing exceptions for a setup analysis. report_exceptions  # Reports all timing exceptions for a hold analysis. report_exceptions -hold  # Reports all timing exceptions affecting input paths for # recovery analysis, reporting the 10 worst paths per exception. report_exceptions -from [all_inputs] -to [all_registers] \ -recovery -npaths 10 -detail full_path  # Reports all paths affected by timing exceptions, including # all clock-to-clock-paths cut by clock groups. report_exceptions -report_clock_groups -npaths 0 -detail path_only  # Reports false path exceptions to determine which ones were overridden by clock groups report_exceptions -false_path -report_clock_groups -npaths 20  # Reports only clock groups, multicycle paths, and min delays report_exceptions -clock_groups -multicycle_path -min_delay  # Generate a reachability report that shows 10 exceptions report_exceptions -reachability -num_exceptions 10</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.36.55. report\_ini\_usage (::quartus::sta)

The following table displays information for the report\_ini\_usage Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601		
<b>Syntax</b>	report_ini_usage [-h   -help] [-long_help] [-append] [-file <name> ] [-panel_name <name> ] [-stdout]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
<b>Description</b>	Reports the list of .ini files and variables used during timing analysis.		
<b>Example Usage</b>	<pre>project_open top create_timing_netlist read_sdc update_timing_netlist  report_ini_usage -panel "INI Usage"</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.56. report\_logic\_depth (::quartus::sta)

The following table displays information for the report\_logic\_depth Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	report_logic_depth [-h   -help] [-long_help] [-append] [-asynch_clock] [-detail <histogram path> ] [-fall_from <names> ] [-fall_from_clock <names> ] [-fall_through <names> ] [-fall_to <names> ] [-fall_to_clock <names> ] [-file <name> ] [-from <names> ] [-from_clock <names> ] [-hold] [-inter_clock] [-intra_clock] [-less_than_slack <slack limit> ] [-npaths <number> ] [-nworst <number> ] [-pairs_only] [-panel_name <name> ] [-recovery] [-removal] [-rise_from <names> ] [-rise_from_clock <names> ] [-rise_through <names> ] [-rise_to <names> ] [-rise_to_clock <names> ] [-setup] [-stdout] [-through <names> ] [-to <names> ] [-to_clock <names> ] [-topology]	
<b>Arguments</b>	-h   -help	Short help
continued...		

-long_help	Long help with examples and possible return values
-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
-asynch_clock	Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups
-detail <histogram path>	Option to determine how much detail should be shown in the report
-fall_from <names>	Valid sources (string patterns are matched using Tcl string matching)
-fall_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-fall_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
-fall_to <names>	Valid destinations (string patterns are matched using Tcl string matching)
-fall_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
-from <names>	Valid sources (string patterns are matched using Tcl string matching)
-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-hold	Option to report clock hold paths
-inter_clock	Only report paths whose launch and latch clock are different
-intra_clock	Only report paths whose launch and latch clock are the same
-less_than_slack <slack limit>	Limit the paths reported to those with slack values less than the specified limit.
-npaths <number>	Specifies the number of paths to report (default=1, or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported but be wary that this may be slow)
-nworst <number>	Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst
-pairs_only	When set, paths with the same start and end points are considered equivalent. Only the worst case path for each unique combination is displayed.
-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
-recovery	Option to report recovery paths
-removal	Option to report removal paths
-rise_from <names>	Valid sources (string patterns are matched using Tcl string matching)

	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
continued...		

Description	<p>Reports max skew analysis results for all <code>set_max_skew</code> commands in a single report. For each valid <code>set_max_skew</code> constraint, this command computes skew with respect to the latest and the earliest arrival of each path.</p> <p>By default, "Skew for the Latest Arrival" is computed by comparing the latest arrival of each path with the earliest arrival of the path that has the smallest value for early arrival of all other paths included in the constraint. Similarly, "Skew for the Earliest Arrival" is computed by comparing the earliest arrival of each path with the latest arrival of the path that has the largest value for late arrival of all other paths included in the constraint. No path is compared with itself.</p> <p>Use the <code>-stdout</code> option to direct the report to the Tcl console (default), the <code>-file</code> option to write the report to a file or the <code>-panel_name</code> option to direct the report to the Timing Analyzer graphical user interface. You can use these options in any combination.</p> <p>Use the <code>-npaths</code> option to limit the number of path result pairs reported for each <code>set_max_skew</code> constraint. If you do not specify this option, <code>report_max_skew</code> only reports the result pair for the single worst-case path. Use the <code>-less_than_slack</code> option to limit output to all paths with slack less than the specified value, up to the number specified with <code>-npaths</code>.</p> <p>Use the <code>-detail</code> option to specify the desired level of report detail. The <code>-detail summary</code> option generates a single table listing only the highlights of each path (and is the same as <code>-summary</code> option, which this replaces. <code>-detail path_only</code> (default) reports the path from the source to the destination without any detail about the clock path. Instead, the clock network delay is shown as a single number. <code>-detail path_and_clock</code> extends the arrival and required paths back to the launch and latch clocks. <code>-detail full_path</code> continues tracing back through generated clocks to the underlying base clock.</p> <p>The <code>-show_routing</code> option displays detailed routing information in the path. Lines marked "IC" without the option are shown, but only as a placeholder. The routing elements for that line are broken out individually and listed before the line.</p> <p>The return value of this command is a two-element list. The first number is the number of paths found in the analysis. The second is the worst-case slack, in terms of the current default time unit.</p> <p>The "RF" column in the report output uses a two-letter symbol to indicate the rise/fall transition that occurs at that point in the path.</p> <p>Possible "RF" values are:</p> <table data-bbox="487 1396 901 1564"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>(empty)</td><td>Unknown transition</td></tr> <tr> <td>R</td><td>Rising output</td></tr> <tr> <td>F</td><td>Falling output</td></tr> <tr> <td>RR</td><td>Rising input, rising output</td></tr> <tr> <td>RF</td><td>Rising input, falling output</td></tr> <tr> <td>FR</td><td>Falling input, rising output</td></tr> <tr> <td>FF</td><td>Falling input, falling output</td></tr> </tbody> </table> <p>The "Type" column in the report uses a symbol to indicate what type of delay occurs at that point in the path.</p> <p>Possible "Type" values are:</p> <table data-bbox="487 1669 1136 1816"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>CELL</td><td>Cell delay</td></tr> <tr> <td>COMP</td><td>PLL clock network compensation delay</td></tr> <tr> <td>IC</td><td>Interconnect delay</td></tr> <tr> <td>iExt</td><td>External input delay</td></tr> <tr> <td>LOOP</td><td>Lumped combinational loop delay</td></tr> <tr> <td>oExt</td><td>External output delay</td></tr> </tbody> </table>	Value	Description	(empty)	Unknown transition	R	Rising output	F	Falling output	RR	Rising input, rising output	RF	Rising input, falling output	FR	Falling input, rising output	FF	Falling input, falling output	Value	Description	CELL	Cell delay	COMP	PLL clock network compensation delay	IC	Interconnect delay	iExt	External input delay	LOOP	Lumped combinational loop delay	oExt	External output delay

### 3.1.36.59. report\_metastability (::quartus::sta)

The following table displays information for the report\_metastability Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	report_metastability [-h   -help] [-long_help] [-append] [-file <name> ] [-length <number> ] [-max_length <number> ] [-min_length <number> ] [-nchains <number> ] [-panel_name <name> ] [-stdout]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-length <number>	Reports only the synchronizer chains of an exact length
	-max_length <number>	Specifies the maximum length of a chain that appears in the report (default=no limit)
	-min_length <number>	Specifies the minimum length of a chain that appears in the report (default=0)
	-nchains <number>	Specifies the number of chains to report (default=1)
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
continued...		

Description	<p>Report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical interface ("-panel_name"), or any combination of the three.</p> <p>The report_metastability function can be used to estimate the robustness of asynchronous transfers in your design.</p> <p>----- Background -----</p> <p>Synchronization register chains should be used when transferring data between unrelated clock domains to greatly reduce the probability of the captured data signal becoming metastable. A synchronization register chain is a sequence of registers with the same clock, that is driven by a pin, or logic from an unrelated clock domain. The output of all but the last register in the chain must connect only to the next register, either directly or indirectly through logic.</p> <p>When a register is metastable, its output hovers at a voltage between high and low for a length of time beyond the normal Tco for the register. The design can fail if subsequent registers that use this metastable signal latch different values. Therefore, it is important to properly synchronize data signals to prevent such occurrences.</p> <p>----- Output -----</p> <p>The report_metastability function generates a list of synchronization register chains found in the design, and can provide estimates of the Mean Time Between Failures (MTBF) of each chain. The design MTBF is an estimate of the overall robustness of the design, computed from the MTBF results from all synchronization chains with calculated MTBFs. The design MTBF metric is reported only when the design meets timing. Therefore, it is important to fully timing constrain your design.</p> <p>The typical MTBF result assumes typical silicon characteristics for the selected device speed grade, with nominal operating conditions.</p> <p>The worst case MTBF result uses the worst case silicon characteristics for the selected device speed grade, with worst case operating conditions.</p> <p>----- Settings -----</p> <p>To get a list of possible synchronization chains, set "Synchronizer Identification" to AUTO in the Timing Analyzer Page in the Settings dialog box. This sets the "Synchronizer Identification" QSF assignment in your QSF file. The Timing Analyzer uses timing constraints to automatically detect synchronization chains in the design. Metastability analysis checks for signal transfers between circuitry in unrelated or asynchronous clock domains, so clock domains must be related correctly with the timing constraints.</p> <p>Set the maximum number of registers to consider as part of one synchronization chain, via the "Synchronization Register Chain Length" setting under Analysis and Synthesis Page in the Settings dialog box. The default length is 2. All the registers in a chain (up to this length) are protected from optimizations that can decrease MTBF.</p> <p>Note that if you change the "Synchronizer Identification" setting, you should rerun the Fitter, as this setting can impact some optimization algorithms.</p> <p>Use the -nchains option to limit the number of chains to report. If you do not specify this option, only the single worst-case chain is reported.</p> <p>To filter the synchronizer chains by their lengths, use the -min_length option to set the minimum chain length to be reported, and use the -max_length option to set the maximum chain length to be reported. Alternatively, use the -length option to report only chains with a specific length.</p> <p>----- Report Panels -----</p> <p>The MTBF Summary report provides the estimated mean time between failure for the design. This is an estimate for the overall robustness of the design in terms of metastability, and it is computed from all available synchronization chain MTBFs present in the design.</p> <p>The MTBF metric of automatically identified synchronization chains is not computed. To compute the MTBF of a synchronization chain, set "Synchronizer Identification" to "Forced If Asynchronous" or "Forced" for all registers of the synchronization chain. By explicitly specifying</p>
-------------	--

*continued...*

	<p>that this synchronization chain is valid, this chain will then be optimized during the Fitter, and its MTBF will be computed. Its MTBF will then be included in the computation of the design MTBF.</p> <p>The Synchronizer Summary table lists all the synchronization chains found in your design. It is possible that the analysis performed might erroneously interpret certain structures, such as shift registers, as synchronization chains. If some synchronization chains are misidentified and you wish to remove them from the report, you can turn off analysis of these paths by making node-based assignments via the Assignment Editor, set "Synchronizer Identification" to "Off" for the first register in these synchronization chains. Conversely, if there are synchronization chains in your design that were not detected, you can set "Synchronizer Identification" assignment to "Forced If Asynchronous" for all registers in this chain through the Assignment Editor, and this chain will be reported if it meets the criteria for being a synchronization chain. This can often occur if there is logic present between the registers of the synchronization chain. In the automatic mode of synchronizer identification, these structures are not considered to be synchronizers. If you want to force a register to be identified as the head of a synchronizer, set the "Synchronizer Identification" assignment to "Forced" to the register, and it will always be identified as the first of a synchronization chain. This setting should not be applied to the entire design, since this identifies every register in the design as a synchronizer.</p> <p>The MTBF estimates assume the data being synchronized is switching at a toggle rate of 12.5% of the source clock frequency. That is, the estimates assume that the arriving data signal switches once every 8 source clock cycles. If multiple clocks apply, the highest frequency is used. If no source clocks can be determined, then the data rate is taken as 12.5% of the synchronization clock frequency.</p> <p>If you know the approximate rate at which the data changes, and would like to obtain a more accurate MTBF, use the "Synchronizer Toggle Rate" assignment in the Assignment Editor. Set the data toggle rate, in number of transitions per second, on the first register of a synchronization chain. The Timing Analyzer then takes the specified rate into account when computing the MTBF of that particular chain. You can also apply this assignment to an entity or the entire design. Since a "Synchronizer Toggle Rate" assignment of 0 indicates that the data signal never toggles, the affected synchronization chain will not be reported since it does not affect the reliability of the design.</p>		
<b>Example Usage</b>	<pre>project_open top create_timing_netlist read_sdc update_timing_netlist  report_metastability  # Reports only 10 chains that are between 2 and 4 registers long report_metastability -min_length 2 -max_length 4 -nchains 10  delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.36.60. report\_min\_pulse\_width (::quartus::sta)

The following table displays information for the report\_min\_pulse\_width Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre>report_min_pulse_width [-h   -help] [-long_help] [-append] [-detail &lt;summary full_path&gt; ] [-file &lt;name&gt; ] [-nworst &lt;number&gt; ] [-panel_name &lt;name&gt; ] [-show_routing] [-split_by_corner] [-stdout] [-type &lt;all min_period clock_pulse&gt; ] [ &lt;targets&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<b>continued...</b>		

	<div>-append</div> <div>-detail &lt;summary full_path&gt;</div> <div>-file &lt;name&gt;</div> <div>-nworst &lt;number&gt;</div> <div>-panel_name &lt;name&gt;</div> <div>-show_routing</div> <div>-split_by_corner</div> <div>-stdout</div> <div>-type &lt;all min_period clock_pulse&gt;</div> <div>&lt;targets&gt;</div>	<div>If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.</div> <div>Option to determine how much detail should be shown in the report</div> <div>Sends the results to an ASCII or HTML file. Depending on the extension</div> <div>Specifies the number of pulse width checks to report (default=1)</div> <div>Sends the results to the panel and specifies the name of the new panel</div> <div>Option to display detailed routing in the path report</div> <div>When set, running this command with the -panel option creates a folder containing versions of this report for selected multiple operating conditions. This option has no effect when used with the -stdout or -file options.</div> <div>Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.</div> <div>Option to determine the minimum pulse width analysis type</div> <div>Either clocks or nodes such as ports and registers.</div>
<b>Description</b>	<p>Reports the results of minimum pulse width and minimum period checks.</p> <p>A minimum pulse width check verifies that a clock high ("High") or low ("Low") pulse sustains long enough to qualify as a recognizable change in the clock signal at a register or latch clock pin. A failed minimum pulse width check indicates that the register or latch may not recognize the clock transition. Each node in the design is reported twice per clock for minimum pulse width checks: once for the high pulse and once for the low pulse. While registers and latches may have a pulse width requirement greater than zero, other nodes are checked to ensure the pulse does not collapse entirely.</p> <p>A minimum period check verifies that the clock period ("Period") is large enough for the device to operate. Minimum period checks apply to registers and latches.</p> <p>The results of the minimum pulse width checks can be output to the Tcl console ("-stdout," the default), a report panel ("-panel"), a file ("-file"), or a combination of the three.</p> <p>Results are sorted from worst-case slack to best-case slack. To limit the number of checks reported, use the "-nworst" option.</p> <p>Results can be shown in summary ("-detail summary") or in detail ("-detail full_path," the default), showing the path details for the clock arrival times and how they affect the actual pulse width.</p> <p>The value of the targets is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>	
<b>Example Usage</b>	<pre>project_open top create_timing_netlist read_sdc update_timing_netlist  # Report the worst 100 minimum pulse width checks report_min_pulse_width -nworst 100  # Report minimum pulse width checks for the register test_reg[*] report_min_pulse_width test_reg[*]  # Output the previous results to a report panel and a file. report_min_pulse_width -panel_name "Min Pulse (test_reg)" test_reg[*]</pre>	

*continued...*

	# Output the previous results to a file. report_min_pulse_width -file min_pulse_test_reg.txt test_reg[*]		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.61. report\_neighbor\_paths (::quartus::sta)

The following table displays information for the report\_neighbor\_paths Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601	
Syntax	report_neighbor_paths [-h   -help] [-long_help] [-append] [-asynch_clock] [-enable_complementary] [-extra_info <basic all none> ] [-fall_from <names> ] [-fall_from_clock <names> ] [-fall_through <names> ] [-fall_to <names> ] [-fall_to_clock <names> ] [-file <name> ] [-from <names> ] [-from_clock <names> ] [-hold] [-inter_clock] [-intra_clock] [-less_than_slack <slack limit> ] [-neighbor_path_num <number> ] [-npaths <number> ] [-nworst <number> ] [-pairs_only] [-panel_name <name> ] [-recovery] [-removal] [-rise_from <names> ] [-rise_from_clock <names> ] [-rise_through <names> ] [-rise_to <names> ] [-rise_to_clock <names> ] [-setup] [-stdout] [-through <names> ] [-to <names> ] [-to_clock <names> ]	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-asynch_clock	Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups
	-enable_complementary	Option to enable complementary analysis for the neighbor paths report
	-extra_info <basic all none>	Option to determine how much detail should be shown in the Extra Info report
	-fall_from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-fall_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	-fall_to <names>	Valid destinations (string patterns are matched using Tcl string matching)
	-fall_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	continued...	

-from <names>	Valid sources (string patterns are matched using Tcl string matching)
-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-hold	Option to report clock hold paths
-inter_clock	Only report paths whose launch and latch clock are different
-intra_clock	Only report paths whose launch and latch clock are the same
-less_than_slack <slack limit>	Limit the paths reported to those with slack values less than the specified limit.
-neighbor_path_num <number>	Specifies the number of before and after paths for the neighbor paths report (default=1)
-npaths <number>	Specifies the number of paths to report (default=1, or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported but be wary that this may be slow)
-nworst <number>	Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst
-pairs_only	When set, paths with the same start and end points are considered equivalent. Only the worst case path for each unique combination is displayed.
-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
-recovery	Option to report recovery paths
-removal	Option to report removal paths
-rise_from <names>	Valid sources (string patterns are matched using Tcl string matching)
-rise_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-rise_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
-rise_to <names>	Valid destinations (string patterns are matched using Tcl string matching)
-rise_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
-setup	Option to report clock setup paths
-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
-to <names>	Valid destinations (string patterns are matched using Tcl string matching)
-to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)

*continued...*

Description	
	<p>Reports the most timing-critical paths in the design, including associated slack and additional path summary information, including path bounding boxes. Additionally, for each path, shows its most timing-critical neighbor paths: the path with the worst slack that fans into the source of the current path (shown on the report as "Critical Path Before") and the path with the worst slack that fans out of the destination of the current path (shown as "Critical Path After"). Note that if a register's output is connected to its own input, one or both of the neighbor paths may be identical to the current path. When looking for neighbor paths with the worst slack, all operating conditions are considered, not just the operating conditions of the main path itself.</p> <p>Use the "-setup", "-hold", "-recovery", or "-removal" options to specify which kind of analysis should be performed.</p> <p>The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.</p> <p>You can limit the analysis performed by this command to specific start and end points, using the "-from" and "-to" options. Use the "-rise_from" and "-fall_from" options to limit the analysis to endpoints with established high or low starting states. Use the "rise_to" and "fall_to" options to limit the analysis to destination points with high or low ending states.</p> <p>The analysis can be further limited to clocks using the "-from_clock" and "-to_clock" options, or to specific edges of the clock using the "-rise_from_clock", "-fall_from_clock", "-rise_to_clock", and "-fall_to_clock" options.</p> <p>Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Use the "rise_through" and "fall_through" options to limit the analysis to intermediate points with high or low ending states.</p> <p>Use "-npaths" to limit the number of paths to report. If you do not specify this option, only the single worst-case path is provided. Use the "-less_than_slack" option to limit output to all paths with slack less than the specified value, up to the number specified by "-npaths".</p> <p>Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. If this option is used, but "-npaths" is not specified, then "-npaths" defaults to the same value specified for "-nworst".</p> <p>Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.</p> <p>The values of the "-from", "-to", and "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p> <p>The following options are not supported for this command: --ccpp, --summary_view, --show_routing, --show_xtalk, --false_path</p> <p>Ideally you should use -panel_name or -file option to get the best view of the report.</p> <p>Here is description of each of the rows displayed for each path:</p> <p>From: Source node in the path To: Destination node in the path Launch Clock: Source node clock Latch Clock: Destination node clock Relationship: Clock relationship Slack: Slack on the path Complement Analysis Slack: Slack of the same path via complement analysis Number of Paths: Number of paths with the same source and destination nodes Clock Skew: Clock Skew on the path Data Delay: Data delay on the path ( ~ cell delay + interconnect delay + misc. delay ) uTCO Delay: input delay Cell Delay: Cell delay Interconnect Delay: Wire Delay Misc. Delay: Other kinds of delay Uncertainty Delay: Clock uncertainty delay uTSU Delay: Data stability delay - setup uTH Delay: Data stability delay - hold Logic Levels: Logic levels in the path Max Fanout: Maximum fanout for any node on the path I/O Crossings: Number of I/O crossings in the path</p>

	Number of wires: number of wires encountered on the path Source/Destination Bounding Box: Co-ordinates covered by source destination blocks Cell Bounding Box: Co-ordinates covered by cell blocks Interconnect Bounding Box: Co-ordinates covered by wires Source/Destination Relative Area: Normalized to 1.0 Cell Relative Area: Ratio of cell area against src/dst bounding area Interconnect Relative Area: Ration of wire area against src/dst bounding area Elements on Path: Displays the element type that make up that path TDB Names Along Path: All the TDB elements that make up the path (only available with developer license) Corner: Describes the corner the path is found in Complement Analysis Corner: Corner of the complement analysis path found		
<b>Example Usage</b>	<pre>project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist  report_neighbor_paths -npaths 10 -file "neighbor_path_analysis.txt"  # The following command is optional delete_timing_netlist  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Option <string> has illegal value: <string>. Specify a legal option value.
	TCL_ERROR	1	ERROR: Collection type '<string>' is not a valid type for a through collection. Valid collection types are 'pin' and 'net'
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.62. report\_net\_delay (::quartus::sta)

The following table displays information for the report\_net\_delay Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	report_net_delay [-h   -help] [-long_help] [-append] [-file <name> ] [-nworst <number> ] [-panel_name <name> ] [-split_by_corner] [-stdout]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-nworst <number>	Specifies the maximum number of paths to report for each analysis. If unspecified, there is no limit.
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
<b>continued...</b>		

	-split_by_corner	When set, running this command with the -panel option creates a folder containing versions of this report for selected multiple operating conditions. This option has no effect when used with the -stdout or -file options.	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
Description	<p>Reports net delay analysis results based on set_net_delay commands. Each set_net_delay command is treated as a separate analysis and report_net_delay reports the results of all set_net_delay commands in a single report.</p> <p>The report contains each set_net_delay command with the worst case slack result followed by the results of each edge matching the criteria set by that set_net_delay command. These results are ordered based on the slack value.</p> <p>Use -nworst option to limit the number of lines reported for a set_net_delay command.</p>		
Example Usage	<pre>project_open my_project create_timing_netlist read_sdc update_timing_netlist  set_net_delay -min 0.160 -from [get_pins inst9 combout] -to [get_pins * dataf] set_net_delay -max 0.500 -from inst8 combout  report_net_delay -panel "Net Delay"</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.63. report\_net\_timing (::quartus::sta)

The following table displays information for the report\_net\_timing Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	report_net_timing [-h   -help] [-long_help] [-append] [-file <name> ] [-nworst_delay <number> ] [-nworst_fanout <number> ] [-panel_name <name> ] [-stdout] [ <name> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-nworst_delay <number>	Report worst net delays
	-nworst_fanout <number>	Report worst fanout nets
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
continued...		

	-stdout		Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
	<name>		Signal or collection name
Description	<p>Reports delay and fanout information about a net in the design. A net corresponds to a cell output pin.</p> <p>Report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical interface ("-panel_name"), or any combination of the three.</p> <p>The value of the name is either a collection or a Tcl list of wildcards used to create a collection of the appropriate type. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>		
Example Usage	<pre>project_open &lt;design&gt; create_timing_netlist  # Show delay and fanout information for all nets # that match "abc*" report_net_timing [get_nets abc*]  # Report delay and fanout information for the 10 # nets showing higher delays report_net_timing -nworst_delay 10  # Report delay and fanout information for the 10 # nets showing higher fanout report_net_timing -nworst_fanout 10  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Options -<string> and -<string> are mutually exclusive. Specify only one of the two options.
	TCL_ERROR	1	ERROR: You must open a project before you can use this command.
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Neither of options -<string> or -<string> is specified. Specify one of the two options.

### 3.1.36.64. report\_partitions (::quartus::sta)

The following table displays information for the report\_partitions Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	report_partitions [-h   -help] [-long_help] [-append] [-file <name> ] [-from_clock <names> ] [-nworst <number> ] [-panel_name <name> ] [-stdout] [-to_clock <names> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
<b>continued...</b>		

	<code>-file &lt;name&gt;</code>		Sends the results to an ASCII or HTML file. Depending on the extension
	<code>-from_clock &lt;names&gt;</code>		Valid source clocks (string patterns are matched using Tcl string matching)
	<code>-nworst &lt;number&gt;</code>		Specifies the maximum number of paths to report between partitions. If unspecified, the limit defaults to 1000
	<code>-panel_name &lt;name&gt;</code>		Sends the results to the panel and specifies the name of the new panel
	<code>-stdout</code>		Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
	<code>-to_clock &lt;names&gt;</code>		Valid destination clocks (string patterns are matched using Tcl string matching)
<b>Description</b>	<div>Reports timing information related to design partitions.</div> <div>The <code>report_partitions</code> command analyzes the worst 1000 failing setup paths in the design by default, but you can optionally set the <code>nworst</code> option to increase or decrease this number. The <code>from_clock</code> and <code>to_clock</code> arguments can be used to control how this function finds the paths to be analyzed.</div> <div>This function reports the number of failing paths within each partition and the worst-case slack of the paths that are entirely contained within a single partition in a Partition Timing Overview table.</div> <div>The function also creates a Partition Timing Details table that lists the number of failing paths and worst-case slack of paths that feed from one partition to another partition. This information provides more details on where the critical paths in the design are with respect to design partitions.</div> <div>The function also creates a Partition Timing Breakdown table. This table bins the worst failing paths by all partitions that the path spans, and reports the number of failing paths and worst case slack for each group of partitions.</div> <div>This report can be directed to the Tcl console ("<code>-stdout</code>", default), a file ("<code>-file</code>"), the Timing Analyzer graphical user interface ("<code>-panel_name</code>"), or any combination of the three.</div>		
<b>Example Usage</b>	<pre>project_open my_project create_timing_netlist read_sdc update_timing_netlist  # Report a maximum of 500 failing paths between partitions to the # Timing Analyzer graphical interface and to the Tcl console. report_partitions -panel_name "Partition Timing Report" -nworst 500 -stdout</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Design partitions are not supported in this project.

### 3.1.36.65. report\_path (::quartus::sta)

The following table displays information for the report\_path Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601
<b>Syntax</b>	<pre>report_path [-h   -help] [-long_help] [-append] [-fall_from &lt;names&gt; ] [-fall_through &lt;names&gt; ] [-fall_to &lt;names&gt; ] [-file &lt;name&gt; ] [-from &lt;names&gt; ] [-list_clocks] [-logic_depth] [-min_path] [-npaths &lt;number&gt; ] [-nworst &lt;number&gt; ] [-pairs_only] [-panel_name &lt;name&gt; ] [-rise_from &lt;names&gt; ] [-rise_through &lt;names&gt; ] [-rise_to &lt;names&gt; ] [-show_routing] [-split_by_corner] [-stdout] [-summary] [-through &lt;names&gt; ] [-to &lt;names&gt; ]</pre>
continued...	

<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-fall_from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-fall_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	-fall_to <names>	Valid destinations (string patterns are matched using Tcl string matching)
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-list_clocks	Includes the driving clocks associated with the from and to nodes of each path in the Path Summary table
	-logic_depth	Option to display the logic depth instead of path delay
	-min_path	Find the minimum delay path(s)
	-npaths <number>	Specifies the number of paths to report (default=1, or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported but be wary that this may be slow)
	-nworst <number>	Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same as nworst
	-pairs_only	When set, paths with the same start and end points are considered to be equivalent. Only the longest delay path for each unique combination is displayed.
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
	-rise_from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-rise_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
	-rise_to <names>	Valid destinations (string patterns are matched using Tcl string matching)
	-show_routing	Option to display detailed routing in the path
	-split_by_corner	When set, running this command with the -panel option creates a folder containing versions of this report for selected multiple operating conditions. This option has no effect when used with the -stdout or -file options.
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
	-summary	Create a single table with a summary of each path found
	-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
<b>continued...</b>		

	-to <names>		Valid destinations (string patterns are matched using Tcl string matching)
Description	<p>Reports the longest delay paths and the corresponding delay value.</p> <p>The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.</p> <p>You can limit the analysis performed by this command to specific start and end points, using the "-from" and "-to" options. Any node or cell in the design is considered a valid endpoint. Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Paths that are reported can not start before or go beyond a keeper node (register or port); this restriction considers register pins as combinational nodes in the design.</p> <p>Use "-npaths" to limit the number of paths to report. If this option is not specified, only the single longest delay path is provided.</p> <p>Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. If this option is used, but "-npaths" is not specified, then "-npaths" defaults to the same value specified for "-nworst".</p> <p>Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.</p> <p>Use the "-summary" option to generate a single table listing only the highlights of each path.</p> <p>The "-min_path" option finds the minimum delay path(s) rather than the maximum delay paths which is the default behavior.</p> <p>The "-show_routing" option displays detailed routing information in the path. Lines that were marked as "IC" without the option are still shown, but only as a placeholder. The routing elements for that line are broken out individually and listed before the line.</p> <p>The return value of this command is a two-element list. The first number is the number of paths found in the analysis. The second is the longest delay, in terms of the current default time unit.</p> <p>The values of the "-from", "-to", "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>		
Example Usage	<pre>project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist  # Report path delay between nodes "foo" and "bar", # reporting the longest delay if a path is found.  set my_list [report_path -from foo -to bar] set num_paths [lindex \$my_list 0] set longest_delay [lindex \$my_list 1] if { \$num_paths &gt; 0 } {     puts "Longest delay -from foo -to bar is \$longest_delay" }  # The following command is optional delete_timing_netlist  project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
continued...			

TCL_ERROR	1	ERROR: Option <string> has illegal value: <string>. Specify a legal option value.
TCL_ERROR	1	ERROR: Collection type '<string>' is not a valid type for a through collection. Valid collection types are 'pin' and 'net'
TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.66. report\_pipelining\_info (::quartus::sta)

The following table displays information for the `report_pipelining_info` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sta</code> on page 601		
<b>Syntax</b>	report_pipelining_info [-h   -help] [-long_help] [-append] [-bus_name <names> ] [-file <name> ] [-max_rows <number> ] [-min_depth <number> ] [-min_width <number> ] [-panel_name <name> ] [-stdout]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-bus_name <names>	When set, pipelining report gives detailed information on the specific bus	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-max_rows <number>	Specifies the maximum number of rows to report	
	-min_depth <number>	Specifies the minimum average bus depth	
	-min_width <number>	Specifies the minimum bus width	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
<b>Description</b>	<div>This command reports back-to-back pipelining registers information and collapses pipelining chains based on which bus they are in.</div> <div>Use the "-min_depth" option to specify the minimum average depths of pipelining buses to report. The default value for this field is "3".</div> <div>Use the "-min_width" option to specify the minimum width of pipelining buses to report. The default value for this field is "16".</div> <div>By default, the command reports all of the pipelining buses with average depth and width over the value specified by "-min_depth" and "-min_width" options. To help check one pipelining bus in detail, this command also provides detailed mode. Use the "bus_name" to specify which bus to focus.</div>		
<b>Example Usage</b>	<div>This command currently contains no example usage.</div>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.36.67. report\_register\_spread (::quartus::sta)

The following table displays information for the report\_register\_spread Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	report_register_spread [-h   -help] [-long_help] [-append] [-file <name> ] [-from_clock <names> ] [-min_sinks <number> ] [-num_registers <number> ] [-panel_name <name> ] [-sink_type <endpoint immediate> ] [-spread_type <tension span area angle count> ] [-stdout] [-to_clock <names> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-min_sinks <number>	Specifies the minimum number of sinks per register (must be at least 2)
	-num_registers <number>	Specifies the top N registers with highest spread
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
	-sink_type <endpoint immediate>	Determines which sink type [endpoint immediate] is analyzed
	-spread_type <tension span area angle count>	Determines which spread type is analyzed [tension span area angle count]
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
	-to_clock <names>	Valid sink clocks (string patterns are matched using Tcl string matching)
<b>Description</b>	<p>This report analyzes the final placement of a design and strive to identify registers with sinks that are pulling them in various directions. These registers are then recommended as candidates for duplication. There are two types of sink: "Immediate Fan-Out" and "Timing Path Endpoint". There are two types of pull: "Tension" and "Span"</p> <p>The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.</p> <p>Use "-sink_type" to specify between endpoints and immediate fanouts to report on. If not specified, the default reports on endpoint fanouts.</p> <p>Timing Path Endpoints: the nodes (usually registers) that terminate timing paths from a register</p> <p>Immediate Fanouts: the immediately connected nodes (lookup tables, other registers, RAM or DSP blocks, etc.) of the register.</p> <p>Use "-spread_type" to specify the type of spread to report on, a user can choose between:</p> <p>Tension: the sum over each sink of the distance from it to the centroid of all the sinks.</p> <p>Span: the maximum 1-dimensional delta between the left/bottom-most sink and the right/top-most sink.</p> <p>Area: the area covered by a box drawn around the left/bottom-most sink and the right/top-most sink.</p>	

*continued...*

	<p>Angle: the angular span of the sinks around to the source, defined as 360 minus the largest angle between any two angularly-adjacent sinks that are each a sufficiently large distance from the source.</p> <p>Count: the number of each sink type associated with the source register.</p> <p>The analysis can be limited to clocks using the "-from_clock" and "-to_clock" options.</p> <p>Use "-min_sinks" to filter out any registers with a number of sinks below the threshold. Span, Area, and Angle have a low sensitivity to sink count, which can result in registers with a small sink count having a larger spread score than other registers with more sinks. The minimum number of sinks must be at least 2 for the spread calculations to work properly.</p> <p>Use "-num_registers" to limit the number source registers reported. Registers are reported in decreasing order of the spread type selected so the top n registers are reported. If you do not specify this option, the number of source registers displayed is limited to a maximum of 10.</p>		
<b>Example Usage</b>	<pre>project_open my_project  # Always create the netlist first create_timing_netlist read_sdc my_project.sdc update_timing_netlist  report_register_spread -num_registers 20 -spread_type "tension" -sink_type "endpoint"  project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Invalid value %u for argument <string>. Specify a value of at least %u.

### 3.1.36.68. report\_register\_statistics (::quartus::sta)

The following table displays information for the report\_register\_statistics Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	report_register_statistics [-h   -help] [-long_help] [-append] [-file <name> ] [-panel_name <name> ] [-registers_without_clocks] [-stdout] [-unique_clocks_feeding_registers]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
	-registers_without_clocks	Include a column showing registers with no defined clock on their clock pin
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
continued...		

	- unique_clocks_feeding_registers		Include a column showing the number of unique clocks feeding registers clock pins
<b>Description</b>	This command reports reset statistics.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.36.69. report\_retiming\_restrictions (::quartus::sta)

The following table displays information for the report\_retiming\_restrictions Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601		
<b>Syntax</b>	report_retiming_restrictions [-h   -help] [-long_help] [-append] [-file <name> ] [-panel_name <name> ] [-stdout]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
<b>Description</b>	This command reports retiming restrictions in a hierarchical form. The report helps users identify various types of retiming restrictions in each entity. Consider removing these retiming restrictions to allow retiming optimization to improve performance.		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.36.70. report\_route\_net\_of\_interest (::quartus::sta)

The following table displays information for the report\_route\_net\_of\_interest Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601
<b>Syntax</b>	<pre>report_route_net_of_interest [-h   -help] [-long_help] [-append] [-file &lt;name&gt; ] [-num_nets &lt;number&gt; ] [-panel_name &lt;name&gt; ] [-stdout]</pre>
continued...	

Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-num_nets <number>	Specifies the number of nets of interest to report	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
Description	This command reports nets that router works hardest on.		
Example Usage	This command currently contains no example usage.		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.36.71. report\_rskm (::quartus::sta)

The following table displays information for the `report_rskm` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	report_rskm [-h   -help] [-long_help] [-append] [-file <name> ] [-panel_name <name> ] [-stdout]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
<b>Description</b>	<p>Reports RSKM for dedicated LVDS circuitry.</p> <p>In designs that use dedicated LVDS circuitry, receiver input skew margin (RSKM) is the time margin available before the LVDS receiver megafunction fails to operate. RSKM is defined as the total time margin that remains after subtracting the sampling window (SW) size and the receiver channel-to-channel skew (RCCS) from the time unit interval (TUI), as expressed in the following formula:</p> $RSKM = (TUI - SW - RCCS) / 2$ <p>The time unit interval is the LVDS clock period (1/fmax). The sampling</p>	
continued...		

*continued...*

	<p>window is the period of time that the input data must be stable to ensure that the data is successfully sampled by the LVDS receiver megafunction. The sampling window size varies by device speed grade. RCCS is the difference between the fastest and slowest data output transitions, including the tco variation and clock skew. To obtain an accurate analysis of an LVDS circuit, you should assign an appropriate input delay to the LVDS receiver megafunction. RCCS is equal to the difference between maximum input delay and minimum input delay. If no input delay is set, RCCS defaults to zero.</p>		
<b>Example Usage</b>	<pre>project_open top create_timing_netlist read_sdc update_timing_netlist  # Ensure a tccs of 1ns set_input_delay -max -clock lvds_clk 2ns [get_ports lvds_input] set_input_delay -min -clock lvds_clk 1ns [get_ports lvds_input]  # Show lvds information report_rskm</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.72. report\_sdc (::quartus::sta)

The following table displays information for the report\_sdc Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	report_sdc [-h   -help] [-long_help] [-append] [-file <name> ] [-ignored] [-panel_name <name> ] [-stdout]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-ignored	Reports full history of assignments to locate ignored ones
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.
<b>Description</b>	Reports all SDC constraints used in the design. Use the -ignored option to report SDC constraints that were ignored and the reason they were ignored.	
<b>Example Usage</b>	<pre>project_new test create_timing_netlist create_clock -period 10 -name clk10 clk set_multicycle_path -from [get_cells a] -to [get_cells b] update_timing_netlist</pre>	
continued...		

	<pre>report_sdc -panel_name sdc_report_panel report_timing delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.73. report\_skew (::quartus::sta)

The following table displays information for the `report_skew` Tcl command:

Tcl Package and Version	Belongs to ::quartus::sta on page 601	
Syntax	<pre>report_skew [-h   -help] [-long_help] [-append] [-asynch_clock] [-detail &lt;summary path_only path_and_clock full_path&gt; ] [-fall_from_clock &lt;names&gt; ] [- fall_to_clock &lt;names&gt; ] [-file &lt;name&gt; ] [-from &lt;names&gt; ] [-from_clock &lt;names&gt; ] [-greater_than_skew &lt;slack limit&gt; ] [-inter_clock] [-intra_clock] [- npaths &lt;number&gt; ] [-panel_name &lt;name&gt; ] [-rise_from_clock &lt;names&gt; ] [- rise_to_clock &lt;names&gt; ] [-show_routing] [-stdout] [-through &lt;names&gt; ] [-to &lt;names&gt; ] [-to_clock &lt;names&gt; ]</pre>	
Arguments	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-asynch_clock	Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups
	-detail <summary path_only path_and_clock full_path>	Option to determine how much detail should be shown in the path report
	-fall_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-fall_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
	-from <names>	Valid sources (string patterns are matched using Tcl string matching)
	-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
	-greater_than_skew <slack limit>	Limit the paths reported to those with skew values greater than the specified limit.
	-inter_clock	Only report paths whose launch and latch clock are different
	-intra_clock	Only report paths whose launch and latch clock are the same
continued...

<b>Description</b>	<p>This report performs skew analysis on selected paths. As opposed to report generated by <code>report_max_skew</code> command, this command does not depend on the existence of <code>set_max_skew</code> assignments. This report computes skew with respect to the latest and the earliest arrival of each selected path.</p> <p>By default, "Skew for the Latest Arrival" is computed by comparing the latest arrival of each path with the earliest arrival of the path that has the smallest value for early arrival of all other paths included in the constraint. Similarly, "Skew for the Earliest Arrival" is computed by comparing the earliest arrival of each path with the latest arrival of the path that has the largest value for late arrival of all other paths included in the constraint. No path is compared with itself.</p> <p>Use the <code>-stdout</code> option to direct the report to the Tcl console (default), the <code>-file</code> option to write the report to a file or the <code>-panel_name</code> option to direct the report to the Timing Analyzer graphical user interface. You can use these options in any combination.</p> <p>Report skew includes data arrival times, clock arrival times, register micro parameters, clock uncertainty, on-die variation and ccpp removal.</p> <p>Use the <code>-npaths</code> option to limit the number of path result pairs reported for each <code>set_max_skew</code> constraint. If you do not specify this option, <code>report_skew</code> only reports the result pair for the single worst-case path. Use the <code>-less_than_slack</code> option to limit output to all paths with skew greater than the specified value, up to the number specified with <code>-npaths</code>.</p> <p>Use the <code>-detail</code> option to specify the desired level of report detail. "<code>-detail path_only</code>" (default) reports the path from the source to the destination without any detail about the clock path. Instead, the clock network delay is shown as a single number. "<code>-detail path_and_clock</code>" extends the arrival and required paths back to the launch and latch clocks. "<code>-detail full_path</code>" continues tracing back through generated clocks to the underlying base clock. The "<code>-detail summary</code>" option is deprecated.</p> <p>The <code>-show_routing</code> option displays detailed routing information in the path. Lines marked "IC" without the option are shown, but only as a placeholder. The routing elements for that line are broken out individually and listed before the line.</p> <p style="text-align: right;"><i>continued...</i></p>

	<p>The return value of this command is a two-element list. The first number is the number of paths found in the analysis. The second is the worst-case skew, in terms of the current default time unit.</p> <p>The "RF" column in the report output uses a two-letter symbol to indicate the rise/fall transition that occurs at that point in the path.</p> <p>Possible "RF" values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>(empty)</td><td>Unknown transition</td></tr><tr><td>R</td><td>Rising output</td></tr><tr><td>F</td><td>Falling output</td></tr><tr><td>RR</td><td>Rising input, rising output</td></tr><tr><td>RF</td><td>Rising input, falling output</td></tr><tr><td>FR</td><td>Falling input, rising output</td></tr><tr><td>FF</td><td>Falling input, falling output</td></tr></table> <p>The "Type" column in the report uses a symbol to indicate what type of delay occurs at that point in the path.</p> <p>Possible "Type" values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>CELL</td><td>Cell delay</td></tr><tr><td>COMP</td><td>PLL clock network compensation delay</td></tr><tr><td>IC</td><td>Interconnect delay</td></tr><tr><td>iExt</td><td>External input delay</td></tr><tr><td>LOOP</td><td>Lumped combinational loop delay</td></tr><tr><td>oExt</td><td>External output delay</td></tr><tr><td>RE</td><td>Routing element (only for paths generated with the -show_routing option)</td></tr><tr><td>uTco</td><td>Register micro-Tco time</td></tr><tr><td>uTsu</td><td>Register micro-Tsu time</td></tr><tr><td>uTh</td><td>Register micro-Th time</td></tr></table>			Value	Description	(empty)	Unknown transition	R	Rising output	F	Falling output	RR	Rising input, rising output	RF	Rising input, falling output	FR	Falling input, rising output	FF	Falling input, falling output	Value	Description	CELL	Cell delay	COMP	PLL clock network compensation delay	IC	Interconnect delay	iExt	External input delay	LOOP	Lumped combinational loop delay	oExt	External output delay	RE	Routing element (only for paths generated with the -show_routing option)	uTco	Register micro-Tco time	uTsu	Register micro-Tsu time	uTh	Register micro-Th time

### 3.1.36.74. report\_tccs (::quartus::sta)

The following table displays information for the report\_tccs Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	report_tccs [-h   -help] [-long_help] [-append] [-file <name> ] [-panel_name <name> ] [-stdout]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
continued...		

	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
Description	Reports TCCS for dedicated LVDS transmitters.  In designs that implement the LVDS I/O standard, transmitter channel-to-channel skew (TCCS) is the timing difference between the fastest and slowest output transitions, including tco variations and clock skew.		
Example Usage	<pre>project_open top create_timing_netlist read_sdc update_timing_netlist  # Show lvds information report_tccs</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Report database is not open

### 3.1.36.75. report\_timing (::quartus::sta)

The following table displays information for the report\_timing Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	<pre>report_timing [-h   -help] [-long_help] [-append] [-asynch_clock] [-data_delay] [-detail &lt;summary path_only path_and_clock full_path&gt; ] [-extra_info &lt;basic all none&gt; ] [-fall_from &lt;names&gt; ] [-fall_from_clock &lt;names&gt; ] [-fall_through &lt;names&gt; ] [-fall_to &lt;names&gt; ] [-fall_to_clock &lt;names&gt; ] [-false_path] [-file &lt;name&gt; ] [-from &lt;names&gt; ] [-from_clock &lt;names&gt; ] [-hold] [-inter_clock] [-intra_clock] [-less_than_slack &lt;slack limit&gt; ] [-npaths &lt;number&gt; ] [-nworst &lt;number&gt; ] [-pairs_only] [-panel_name &lt;name&gt; ] [-recovery] [-removal] [-rise_from &lt;names&gt; ] [-rise_from_clock &lt;names&gt; ] [-rise_through &lt;names&gt; ] [-rise_to &lt;names&gt; ] [-rise_to_clock &lt;names&gt; ] [-setup] [-show_routing] [-split_by_corner] [-stdout] [-through &lt;names&gt; ] [-to &lt;names&gt; ] [-to_clock &lt;names&gt; ]</pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.
	-asynch_clock	Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups
continued...		

-data_delay	Report only paths that are covered by a data delay assignment
-detail <summary path_only path_and_clock full_path>	Option to determine how much detail should be shown in the path report
-extra_info <basic all none>	Option to determine how much detail should be shown in the Extra Info report
-fall_from <names>	Valid sources (string patterns are matched using Tcl string matching)
-fall_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-fall_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
-fall_to <names>	Valid destinations (string patterns are matched using Tcl string matching)
-fall_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
-false_path	Report only paths that are cut by a false path assignment
-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension
-from <names>	Valid sources (string patterns are matched using Tcl string matching)
-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-hold	Option to report clock hold paths
-inter_clock	Only report paths whose launch and latch clock are different
-intra_clock	Only report paths whose launch and latch clock are the same
-less_than_slack <slack limit>	Limit the paths reported to those with slack values less than the specified limit.
-npaths <number>	Specifies the number of paths to report (default=1, or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported but be wary that this may be slow)
-nworst <number>	Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst
-pairs_only	When set, paths with the same start and end points are considered equivalent. Only the worst case path for each unique combination is displayed.
-panel_name <name>	Sends the results to the panel and specifies the name of the new panel
-recovery	Option to report recovery paths
-removal	Option to report removal paths
-rise_from <names>	Valid sources (string patterns are matched using Tcl string matching)
-rise_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)

*continued...*

	<table> <tr> <td>-rise_through &lt;names&gt;</td><td>Valid through nodes (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-rise_to &lt;names&gt;</td><td>Valid destinations (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-rise_to_clock &lt;names&gt;</td><td>Valid destination clocks (string patterns are matched using Tcl string matching)</td></tr> <tr> <td>-setup</td><td>Option to report clock setup paths</td></tr> <tr> <td>-show_routing</td><td>Option to display detailed routing in the path</td></tr> <tr> <td>-split_by_corner</td><td>When set, running this command with the -panel option creates a folder containing versions of this report for selected multiple operating conditions. -rise_to <names>	Valid destinations (string patterns are matched using Tcl string matching)																				
-rise_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)																				
-setup	Option to report clock setup paths																				
-show_routing	Option to display detailed routing in the path																				
-split_by_corner	When set, running this command with the -panel option creates a folder containing versions of this report for selected multiple operating conditions. This option has no effect when used with the -stdout or -file options.																				
-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.																				
-through <names>	Valid through nodes (string patterns are matched using Tcl string matching)																				
-to <names>	Valid destinations (string patterns are matched using Tcl string matching)																				
-to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)																				
<b>Description</b>	<p>Reports the worst-case paths and associated slack.</p> <p>Use the "-setup", "-hold", "-recovery", or "-removal" options to specify which kind of analysis should be performed.</p> <p>The report can be directed to the Tcl console ("-stdout", default), a file ("-file"), the Timing Analyzer graphical user interface ("-panel_name"), or any combination of the three.</p> <p>You can limit the analysis performed by this command to specific start and end points, using the "-from" and "-to" options. Use the "-rise_from" and "-fall_from" options to limit the analysis to endpoints with established high or low starting states. Use the "-rise_to" and "-fall_to" options to limit the analysis to destination points with high or low ending states.</p> <p>The analysis can be further limited to clocks using the "-from_clock" and "-to_clock" options, or to specific edges of the clock using the "-rise_from_clock", "-fall_from_clock", "-rise_to_clock", and "-fall_to_clock" options.</p> <p>Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Use the "-rise_through" and "-fall_through" options to limit the analysis to intermediate points with high or low ending states.</p> <p>Use "-npaths" to limit the number of paths to report. If you do not specify this option, only the single worst-case path is provided. Use the "-less_than_slack" option to limit output to all paths with slack less than the specified value, up to the number specified by "-npaths".</p> <p>Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. If this option is used, but "-npaths" is not specified, then "-npaths" defaults to the same value specified for "-nworst".</p> <p>Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.</p> <p>Use the "-detail" option to specify the desired level of report detail. "-summary" generates a single table listing only the highlights of each path (and is the same as "-summary" option, which this replaces). "-path_only" reports the path from the source to the destination without any detail about the clock path. Instead, the clock network delay is shown as a single number. This is the default behavior. "-path_and_clock" extends the arrival and required paths back to the launch and latch clocks. "-full_path" continues tracing</p>																				

*continued...*

	<p>back through generated clocks to the underlying base clock.</p> <p>The "-show_routing" option displays detailed routing information in the path. Lines that were marked as "IC" without the option are still shown, but only as a placeholder. The routing elements for that line are broken out individually and listed before the line.</p> <p>The "-false_path" option reports only those paths that are normally hidden by false_path assignments or clock to clock cuts. Like the default report, this option only reports constrained paths.</p> <p>The "-data_delay" option reports only those paths that are constrained by set_data_delay. Without this option, such paths are excluded from the report.</p> <p>The return value of this command is a two-element list. The first number is the number of paths found in the analysis. The second is the worst-case slack, in terms of the current default time unit.</p> <p>The "RF" column in the report output uses a two-letter symbol to indicate the rise/fall transition that occurs at that point in the path.</p> <p>Possible "RF" values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>-----</td><td>-----</td></tr><tr><td>(empty)</td><td>Unknown transition</td></tr><tr><td>R</td><td>Rising output</td></tr><tr><td>F</td><td>Falling output</td></tr><tr><td>RR</td><td>Rising input, rising output</td></tr><tr><td>RF</td><td>Rising input, falling output</td></tr><tr><td>FR</td><td>Falling input, rising output</td></tr><tr><td>FF</td><td>Falling input, falling output</td></tr></table> <p>The "Type" column in the report uses a symbol to indicate what type of delay occurs at that point in the path.</p> <p>Possible "Type" values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>-----</td><td>-----</td></tr><tr><td>CELL</td><td>Cell delay</td></tr><tr><td>COMP</td><td>PLL clock network compensation delay</td></tr><tr><td>IC</td><td>Interconnect delay</td></tr><tr><td>iExt</td><td>External input delay</td></tr><tr><td>LOOP</td><td>Lumped combinational loop delay</td></tr><tr><td>oExt</td><td>External output delay</td></tr><tr><td>RE</td><td>Routing element (only for paths generated with the -show_routing option)</td></tr><tr><td>uTco</td><td>Register micro-Tco time</td></tr><tr><td>uTsu</td><td>Register micro-Tsu time</td></tr><tr><td>uTh</td><td>Register micro-Th time</td></tr></table> <p>The values of the "-from", "-to", and "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>			Value	Description	-----	-----	(empty)	Unknown transition	R	Rising output	F	Falling output	RR	Rising input, rising output	RF	Rising input, falling output	FR	Falling input, rising output	FF	Falling input, falling output	Value	Description	-----	-----	CELL	Cell delay	COMP	PLL clock network compensation delay	IC	Interconnect delay	iExt	External input delay	LOOP	Lumped combinational loop delay	oExt	External output delay	RE	Routing element (only for paths generated with the -show_routing option)	uTco	Register micro-Tco time	uTsu	Register micro-Tsu time	uTh	Register micro-Th time

	<p>"-rise_to" and "-fall_to" options to limit the analysis to destination points with high or low ending states.</p> <p>The analysis can be further limited to clocks using the "-from_clock" and "-to_clock" options, or to specific edges of the clock using the "-rise_from_clock", "-fall_from_clock", "-rise_to_clock", and "-fall_to_clock" options.</p> <p>Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Use the "-rise_through" and "-fall_through" options to limit the analysis to intermediate points with high or low ending states.</p> <p>Use "-npaths" to limit the number of paths to report. If you do not specify this option, 1000 worst-case paths are provided. Use the "-less_than_slack" option to limit output to all paths with slack less than the specified value, up to the number specified by "-npaths".</p> <p>Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. If this option is used, but "-npaths" is not specified, then "-npaths" defaults to the same value specified for "-nworst".</p> <p>Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.</p> <p>The "-false_path" option reports only those paths that are normally hidden by false_path assignments or clock to clock cuts. Like the default report, this option only reports constrained paths.</p> <p>The values of the "-from", "-to", and "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p> <p>The return value of this command is a three-element list. The first number is the number of paths found in the analysis. The second is the worst-case slack, in terms of the current default time unit. The third is the total negative slack across all paths found in the analysis.</p>		
<b>Example Usage</b>	<pre>set my_list [report_timing_by_source_files -setup -npaths 1000 -panel_name {Report Timing by Source Files}] set num_paths [lindex \$my_list 0] set wc_slack [lindex \$my_list 1] set tns [lindex \$my_list 2] if { \$num_paths &gt; 0 } {     puts "Analyzed \$num_paths paths against their source file(s)."     puts "Worst-case slack found is \$wc_slack."     puts "Total Negative Slack found is \$tns." }</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.36.77. report\_timing\_tree (::quartus::sta)

The following table displays information for the report\_timing\_tree Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	report_timing_tree [-h   -help] [-long_help] [-asynch_clock] [-fall_from <names>] [-fall_from_clock <names>] [-fall_through <names>] [-fall_to <names>] [-fall_to_clock <names>] [-from <names>] [-from_clock <names>] [-hold] [-inter_clock] [-intra_clock] [-less_than_slack <slack limit>] [-npaths <number>] [-nworst <number>] [-pairs_only] -panel_name <name> [-recovery] [-removal] [-rise_from <names>] [-rise_from_clock <names>] [-rise_through <names>] [-rise_to <names>] [-rise_to_clock <names>] [-setup] [-through <names>] [-to <names>] [-to_clock <names>]	
<b>Arguments</b>	-h   -help	Short help
<i>continued...</i>		

-long_help	Long help with examples and possible return values
-asynch_clock	Only report paths whose launch and latch clock do not share a common ancestor clock, or were explicitly marked as asynchronous via clock groups
-fall_from <names>	Valid sources (string patterns are matched using Tcl string matching)
-fall_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-fall_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
-fall_to <names>	Valid destinations (string patterns are matched using Tcl string matching)
-fall_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)
-from <names>	Valid sources (string patterns are matched using Tcl string matching)
-from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-hold	Option to report clock hold paths
-inter_clock	Only report paths whose launch and latch clock are different
-intra_clock	Only report paths whose launch and latch clock are the same
-less_than_slack <slack limit>	Limit the paths reported to those with slack values less than the specified limit.
-npaths <number>	Specifies the number of paths to report (default=1, or the same value as nworst, if nworst is specified. Value of 0 causes all paths to be reported but be wary that this may be slow)
-nworst <number>	Specifies the maximum number of paths to report for each endpoint. If unspecified, there is no limit. If nworst is specified, but npaths is not, npaths defaults to the same value as nworst
-pairs_only	When set, paths with the same start and end points are considered equivalent. Only the worst case path for each unique combination is displayed.
-panel_name <name>	Report panel_name
-recovery	Option to report recovery paths
-removal	Option to report removal paths
-rise_from <names>	Valid sources (string patterns are matched using Tcl string matching)
-rise_from_clock <names>	Valid source clocks (string patterns are matched using Tcl string matching)
-rise_through <names>	Valid through nodes (string patterns are matched using Tcl string matching)
-rise_to <names>	Valid destinations (string patterns are matched using Tcl string matching)
-rise_to_clock <names>	Valid destination clocks (string patterns are matched using Tcl string matching)

*continued...*

	-setup		Option to report clock setup paths
	-through <names>		Valid through nodes (string patterns are matched using Tcl string matching)
	-to <names>		Valid destinations (string patterns are matched using Tcl string matching)
	-to_clock <names>		Valid destination clocks (string patterns are matched using Tcl string matching)
<b>Description</b>			
<p>Reports the worst-case paths and associated slack grouped by design entity. Each entity level indicates the worst-case slack and number of paths at that level.</p> <p>Use the "-setup", "-hold", "-recovery", or "-removal" options to specify which kind of analysis should be performed.</p> <p>Use the "-panel_name" option to direct the report to the Timing Analyzer graphical user interface.</p> <p>You can limit the analysis performed by this command to specific start and end points, using the "-from" and "-to" options. Use the "-rise_from" and "-fall_from" options to limit the analysis to endpoints with established high or low starting states. Use the "rise_to" and "fall_to" options to limit the analysis to destination points with high or low ending states.</p> <p>The analysis can be further limited to clocks using the "-from_clock" and "-to_clock" options, or to specific edges of the clock using the "-rise_from_clock", "-fall_from_clock", "-rise_to_clock", and "-fall_to_clock" options.</p> <p>Additionally, the "-through" option can be used to restrict analysis to paths which go through specified pins or nets. Use the "rise_through" and "fall_through" options to limit the analysis to intermediate points with high or low ending states.</p> <p>Use "-npaths" to limit the number of paths to report. If you do not specify this option, only the single worst-case path is provided. Use the "-less_than_slack" option to limit output to all paths with slack less than the specified value, up to the number specified by "-npaths".</p> <p>Use "-nworst" to limit the number of paths reported for each unique endpoint. If you do not specify this option, the number of paths reported for each destination node is bounded only by the "-npaths" option. If this option is used, but "-npaths" is not specified, then "-npaths" defaults to the same value specified for "-nworst".</p> <p>Use the "-pairs_only" option to filter the output further, restricting the results to only unique combinations of start and end points.</p> <p>The values of the "-from", "-to", and "-through" options are either collections or a Tcl list of wildcards used to create collections of appropriate types. The values used must follow standard Tcl or Timing Analyzer-extension substitution rules. See the help for use_timing_analyzer_style_escaping for details.</p>			
<b>Example Usage</b>			
This command currently contains no example usage.			
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful

### 3.1.36.78. report\_ucp (::quartus::sta)

The following table displays information for the report\_ucp Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	report_ucp [-h   -help] [-long_help] [-append] [-file <name> ] [-panel_name <name> ] [-stdout] [-summary]	
<b>Arguments</b>	-h   -help	Short help
continued...		

	-long_help	Long help with examples and possible return values	
	-append	If output is sent to a file, this option appends the result to that file. Otherwise, the file is overwritten. This option is not supported for HTML files.	
	-file <name>	Sends the results to an ASCII or HTML file. Depending on the extension	
	-panel_name <name>	Sends the results to the panel and specifies the name of the new panel	
	-stdout	Send output to stdout, via messages. You only need to use this option if you have selected another output format, such as a file, and would also like to receive messages.	
	-summary	Generate everything except for the detailed paths panels.	
Description	Reports unconstrained paths.		
Example Usage	<pre>project_open chiptrip create_timing_netlist read_sdc update_timing_netlist report_ucp delete_timing_netlist project_close</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.36.79. set\_operating\_conditions (::quartus::sta)

The following table displays information for the set\_operating\_conditions Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::sta on page 601	
<b>Syntax</b>	set_operating_conditions [-h   -help] [-long_help] [-force_dat] [-grade <c i m e a> ] [-model <fast slow> ] [-speed <speed> ] [-temperature <value_in_C> ] [-voltage <value_in_mV> ] [ <list_of_operating_conditions> ]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-force_dat	Option to force delay annotation (only done when selecting an unanalyzed corner)
	-grade <c i m e a>	Option to specify temperature grade
	-model <fast slow>	Option to specify timing model
	-speed <speed>	Speed grade
	-temperature <value_in_C>	Operating temperature
	-voltage <value_in_mV>	Operating voltage
	<list_of_operating_conditions>	list or collection of Operating conditions Tcl objects or names
<b>Description</b>	Use this command to specify operating conditions different from the initial conditions used to create the timing netlist. When a timing model is not specified, the slow model is used.	
continued...		

continued...

	<p>Voltage and temperature options must be used together. These two options are not available for all devices. The <code>get_available_operating_conditions</code> command returns the list of available operating conditions for your device.</p> <p>Use the <code>-speed</code> option to analyze the design at a different speed grade of the selected device.</p> <p>Use the <code>-grade</code> option to analyze the design at a different temperature grade. This option is provided to support what-if analysis and is not recommended for final sign-off analysis.</p> <p>By default, delay annotation is skipped if previously performed. Use <code>-force_dat</code> to rerun delay annotation.</p>		
<b>Example Usage</b>	<pre>#do report timing for different operating conditions one by one foreach_in_collection op [get_available_operating_conditions] {     set_operating_conditions \$op     update_timing_netlist     report_timing }  #set aggregated report timing for all operating conditions when corner aggregation is enabled set_operating_conditions [get_available_operating_conditions] report_timing  #manually set operating conditions set_operating_conditions -model fast -temperature 85 -voltage 1200 update_timing_netlist  #change device speed grade and set operating conditions set_operating_conditions -speed 3 -model slow -temperature 0 -voltage 1100 update_timing_netlist</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Cannot set operating conditions for timing netlist created from XML file. Run <code>create_timing_netlist</code> .
	TCL_ERROR	1	ERROR: Both the <code>-temperature</code> and <code>-voltage</code> options and their values are required.
	TCL_ERROR	1	ERROR: The ability to select multiple operating conditions at once has been disabled.
	TCL_ERROR	1	ERROR: Values entered did not match any valid operating conditions. Available operating conditions are: <code>&lt;string&gt;</code>
	TCL_ERROR	1	ERROR: The <code>&lt;string&gt;</code> device family does not support <code>set_operating_conditions</code> command.
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use <code>create_timing_netlist</code> to create a timing netlist.
	TCL_ERROR	1	ERROR: Illegal value: <code>&lt;string&gt;</code> . Specify an integer ranging from -999999999 to 999999999 for the option <code>-voltage</code>
	TCL_ERROR	1	ERROR: Unsupported option: <code>&lt;string&gt;</code> .

### 3.1.36.80. timing\_netlist\_exist (::quartus::sta)

The following table displays information for the `timing_netlist_exist` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	<code>timing_netlist_exist [-h   -help] [-long_help]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
<i>continued...</i>		

	-long_help		Long help with examples and possible return values
Description	Checks if the timing netlist exists.  Returns 1, if the timing netlist exists. Returns 0, otherwise.		
Example Usage	<pre>if {[!timing_netlist_exist]} {     create_timing_netlist }</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful

### 3.1.36.81. update\_timing\_netlist (::quartus::sta)

The following table displays information for the update\_timing\_netlist Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sta</code> on page 601	
<b>Syntax</b>	update_timing_netlist [-h   -help] [-long_help] [-dynamic_borrow] [-full] [-loop_aware_dynamic_borrow] [-no_borrow] [-recompute_borrow]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-dynamic_borrow	Use time borrowing values that are correct for the current clock constraints
	-full	Forces creation of an updated timing netlist to ensure correctness
	-loop_aware_dynamic_borrow	Determine time borrowing values as with the -dynamic_borrow option with an addition loop-detection layer to prevent excessive time borrowing in sequential latch loops
	-no_borrow	Turn off all time borrowing
	-recompute_borrow	Recompute optimal time borrowing values
<b>Description</b>	<p>Updates and applies SDC commands to the timing netlist. The update_timing_netlist command expands and validates generated clocks, warns about sources in the design that require clock settings, identifies and removes combinational loops, and warns about undefined input/output delays.</p> <p>Most Tcl commands (e.g., report_timing) automatically update the timing netlist when necessary. You can use the update_timing_netlist command explicitly to control when updating occurs, or to force a full update using the -full option.</p> <p>The update_timing_netlist command can also be used to control time borrowing behavior. Time borrowing is a technique whereby certain flip-flops in certain device families are allowed to have signals that arrive late (thus improving upstream slack), at the expense of downstream slack. The amount of time borrowing allowed at each flip-flop is hardware-dependent.</p> <p>By default, optimal time borrowing values are computed at the end of the Fitter (Finalize) stage (if enabled by your compilation settings), and these are the values you will see in the timing reports. To turn off time borrowing support, use the -no_borrow option. This is not recommended, as it may result in significantly pessimistic timing results.</p> <p>If you have changed clock constraints after compiling your design, pre-computed optimal time borrowing values may no longer be valid. Time borrowing is turned off for the changed clocks, resulting in pessimistic timing. To get optimal results once again, run update_timing_netlist with the -recompute_borrow option. This may take significant time on large designs, but the results are saved and</p>	
continued...		

	<p>available the next time you run <code>update_timing_netlist</code> without any time borrowing options.</p> <p>The time borrowing optimization algorithm has a few limitation - for example, it never borrows any time on sources of cross-clock transfers, sources of paths with <code>set_max_delay</code> or <code>set_max_skew</code> constraints, or in any clock domain containing at least one level-sensitive latch. If your design is correctly constrained, you may overcome these limitations and get better timing results with the <code>-dynamic_borrow</code> option, which calculates time borrowing amounts based on your actual clock constraints (rather than optimizing for highest FMax within each clock domain). Note that <code>-dynamic_borrowing</code> is not recommended for overconstrained designs.</p> <p>Using the <code>-dynamic_borrow</code> option may result in excessive time borrowing in sequential loops of level-sensitive latches, potentially leading to worse downstream slack. If your design contains such loops and you encounter this behavior, use the <code>-loop_aware_dynamic_borrow</code> option to detect sequential latch loops when evaluating their borrow amounts. Note that enabling this loop-detection feature may result in increased memory consumption and significantly increased runtime for large designs.</p>		
<b>Example Usage</b>	<pre>project_open top create_timing_netlist read_sdc update_timing_netlist  report_timing -to_clock clk1 report_timing -to_clock clk2  delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use <code>create_timing_netlist</code> to create a timing netlist.

### 3.1.36.82. use\_timing\_analyzer\_style\_escaping (::quartus::sta)

The following table displays information for the `use_timing_analyzer_style_escaping` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::sta</code> on page 601	
<b>Syntax</b>	<code>use_timing_analyzer_style_escaping [-h   -help] [-long_help] [-off] [-on]</code>	
<b>Arguments</b>	<code>-h   -help</code>	Short help
	<code>-long_help</code>	Long help with examples and possible return values
	<code>-off</code>	Disable this setting.
	<code>-on</code>	Enable this setting.
<b>Description</b>	<p>Use Timing Analyzer-style escaping. (Timing Analyzer-style escaping is enabled by default.</p> <p>The values used to create a collection, whether explicitly using a collection command or implicitly as a value specified as a <code>"-from"</code>, <code>"-to"</code>, or similar option to various SDC and report commands, are a Tcl list of wildcards. This includes a single name with an exact match. The value must follow standard Tcl substitution rules for Tcl lists and <code>"string match"</code> as described below, unless using Timing Analyzer-style escaping (default).</p> <p>For special characters such as <code>'\$'</code>, the character must be escaped using a single <code>'\'</code> character to prevent Tcl from interpreting the word after <code>'\$'</code> as a Tcl variable, such as: <code>Clk\\${Signal}</code>.</p> <p>A <code>'\'</code> character itself must be escaped with another <code>'\'</code> as in the <code>'\$'</code> case, must be escaped again for the Tcl list, and must be escaped yet again for Tcl <code>"string match."</code> The final result is eight <code>'\'</code></p>	

*continued...*

	<p>characters, such as: Clk\\\\\\\\\\\\Signal.</p> <p>Using Tcl "list" eliminates one level of escaping, since it escapes any '\\' characters automatically for the Tcl list, such as: [list Clk\\\\Signal]</p> <p>Using '{' and '}' characters also eliminates the need for one or two levels of escaping, since '{' and '}' prevent string substitution in the contents, such as: [list {Clk\\Signal}] {Clk\\Signal}</p> <p>The use_timing_analyzer_style_escaping option, which is on by default, allows the user to specify a name containing '\\' characters with only two '\\' characters in all cases, such as: Clk\\Signal. The extra '\\' characters required for Tcl list string substitution and "string match" are added automatically by the Timing Analyzer.</p> <p>To disable Timing Analyzer style string escaping, call "use_timing_analyzer_style_escaping -off" before adding any timing constraints or exceptions.</p>		
<b>Example Usage</b>	<pre>project_open top use_timing_analyzer_style_escaping -on create_timing_netlist set res [get_cells my_test special\\reg] query_collection \$res -all  delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.

### 3.1.36.83. write\_sdc (::quartus::sta)

The following table displays information for the write\_sdc Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::sta</a> on page 601	
<b>Syntax</b>	write_sdc [-h   -help] [-long_help] [-expand] [-history] [-valid_exceptions] <file_name>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-expand	Generate SDC file by expanding the macros
	-history	Reports full history of assignments
	-valid_exceptions	Generate SDC file containing only valid timing exceptions for debugging purposes
	<file_name>	Name of output file
<b>Description</b>	<p>Generates an SDC file with all current constraints and exceptions. When you use the -expand option, derive_clocks, derive_pll_clocks, derive_lvds_clocks and derive_clock_uncertainty macros are be expanded to corresponding sdc assignments before they are written to a file. If you do not use the -expand option, these macros are preserved.</p> <p>Use the -valid_exceptions option to generate an SDC file that contains only valid timing exceptions. Run the report_exceptions command with the -valid option to see all the valid timing exceptions in your design.</p>	
continued...		

<b>Example Usage</b>	<pre>project_new test create_timing_netlist create_clock -period 10 -name clk10 clk set_multicycle_path -from [get_cells a] -to [get_cells b] update_timing_netlist  report_timing  write_sdc my_sdc_file.sdc  delete_timing_netlist project_close</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: Clock manager is not up-to-date. Run update_timing_netlist to generate the latest clock manager.
	TCL_ERROR	1	ERROR: Timing netlist does not exist. Use create_timing_netlist to create a timing netlist.
	TCL_ERROR	1	ERROR: Open failed: <string>

### 3.1.37. ::quartus::stp

The following table displays information for the **::quartus::stp** Tcl package:

<b>Tcl Package and Version</b>	::quartus::stp 1.0
<b>Description</b>	This package contains the set of Tcl functions for acquiring Signal Tap data from the Intel device.
<b>Availability</b>	This package is loaded by default in the following executables:  quartus_stp quartus_stp_tcl
<b>Tcl Commands</b>	<a href="#">close_session (::quartus::stp)</a> on page 712 <a href="#">export_data_log (::quartus::stp)</a> on page 713 <a href="#">open_session (::quartus::stp)</a> on page 714 <a href="#">run (::quartus::stp)</a> on page 715 <a href="#">run_multiple_end (::quartus::stp)</a> on page 716 <a href="#">run_multiple_start (::quartus::stp)</a> on page 717 <a href="#">stop (::quartus::stp)</a> on page 717

#### 3.1.37.1. close\_session (::quartus::stp)

The following table displays information for the `close_session` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::stp</a> on page 712	
<b>Syntax</b>	close_session [-h   -help] [-long_help]	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
<b>Description</b>	Saves the current session to the existing Signal Tap File (.stp).	
<b>Example Usage</b>	#opens signaltap session open_session -name stp1.stp  #capture data to log named log1, timeout after 5 seconds if no trigger occurs	
continued...		

	<pre> if { [catch {run -instance auto_signaltap_0 -signal_set signal_set_1 -trigger trigger_1 - data_log log_1 -timeout 5} err_msg] } {     # Timeout event is thrown as TCL exception     puts "ERROR: \$err_msg" }  #close signaltap session close_session </pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Session has been saved in Signal Tap File and closed
	TCL_ERROR	1	ERROR: Can't open Signal Tap File for writing. Make sure Signal Tap File exists, has write permission, and is not currently being used by another program.
	TCL_ERROR	1	ERROR: Session has not been opened. Make sure a session is open before attempting to close it.

### 3.1.37.2. export\_data\_log (::quartus::stp)

The following table displays information for the export\_data\_log Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::stp on page 712	
<b>Syntax</b>	<pre> export_data_log [-h   -help] [-long_help] [-clock_period &lt;clock period&gt; ] [- data_log &lt;data log&gt; ] -filename &lt;export file name&gt; [-format &lt;export format&gt; ] [- instance &lt;instance&gt; ] [-signal_set &lt;signal set&gt; ] [-trigger &lt;trigger&gt; ] </pre>	
<b>Arguments</b>	-h   -help	Short help
	-long_help	Long help with examples and possible return values
	-clock_period <clock period>	The file name of the exported file
	-data_log <data log>	Name of data log to be exported
	-filename <export file name>	The file name of the exported file
	-format <export format>	File format of the exported file
	-instance <instance>	Name of instance that defines data log
	-signal_set <signal set>	Name of signal set that defines data log
	-trigger <trigger>	Name of trigger that defines data log
<b>Description</b>	<p>Exports the specified data log from the current open session into another file in different format.</p> <p>If a data log is not explicitly specified, the last active one is used.</p> <p>The supported file formats are Comma Separated Value file (.csv), Value Change Dump file (.vcd), and Table file (.tbl).</p>	
<b>Example Usage</b>	<pre> #opens signaltap session open_session -name stpl.stp  #capture data to log named log1, timeout after 5 seconds if no trigger occurs if { [catch {run -instance auto_signaltap_0 -signal_set signal_set_1 -trigger trigger_1 - data_log log_1 -timeout 5} err_msg] } {     # Timeout event is thrown as TCL exception     puts "ERROR: \$err_msg" }  #export data into a VCD file </pre>	

*continued...*

	<pre>export_data_log -instance auto_signaltap_0 -signal_set signal_set_1 -trigger trigger_1 - data_log log_1 -filename log_1.vcd -format vcd  #close signaltap session close_session</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Data has been acquired successfully
	TCL_ERROR	1	ERROR: Error ocured when the specified data log was exported to a file.
	TCL_ERROR	1	ERROR: Instance, signal set, or trigger does not exist. Make sure the instance, signal set, and trigger exist in the Signal Tap File.
	TCL_ERROR	1	ERROR: Session has not been opened. Make sure a session is open before attempting to close it.

### 3.1.37.3. open\_session (::quartus::stp)

The following table displays information for the open\_session Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::stp</a> on page 712		
<b>Syntax</b>	open_session [-h   -help] [-long_help] -name <.stp file name>		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-name <.stp file name>	Signal Tap File (.stp) name	
<b>Description</b>	Opens a session from the specified Signal Tap File (.stp).		
<b>Example Usage</b>	<pre>#opens signaltap session open_session -name stp1.stp  #capture data to log named log1, timeout after 5 seconds if no trigger occurs if { [catch {run -instance auto_signaltap_0 -signal_set signal_set_1 -trigger trigger_1 - data_log log_1 -timeout 5} err_msg] } {     # Timeout event is thrown as TCL exception     puts "ERROR: \$err_msg" }  #close signaltap session close_session</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Session has been opened from Signal Tap File
	TCL_ERROR	1	ERROR: Can't open Signal Tap File for reading. Make sure the Signal Tap File exists and has read permission.
	TCL_ERROR	1	ERROR: Session already open. Close session before attempting to open it again.
	TCL_ERROR	1	ERROR: Signal Tap File contains syntax error. Make sure the Signal Tap File is formatted correctly before opening. Intel recommends that you do not manually edit Signal Tap Files, but use the Signal Tap dialog boxes in the Quartus Prime GUI.

## 3.1.37.4. run (::quartus::stp)

The following table displays information for the run Tcl command:

Tcl Package and Version	Belongs to ::quartus::stp on page 712		
Syntax	run [-h   -help] [-long_help] [-bridge <bridge> ] [-data_log <data log> ] [-device_name <device name> ] [-hardware_name <hardware name> ] [-instance <instance> ] [-signal_set <signal set> ] [-timeout <timeout> ] [-trigger <trigger> ]		
Arguments	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
	-bridge <bridge>	Bridge to use instead of the one specified in the stp file	
	-data_log <data log>	Name of data log to be recorded	
	-device_name <device name>	Device to use instead of the one specified in the stp file. Tcl command, get_device_names, can be used to obtain the valid hardware names	
	-hardware_name <hardware name>	JTAG programming hardware to use instead of the one specified in the stp file. Tcl command, get_hardware_names, can be used to obtain the valid hardware name	
	-instance <instance>	Name of instance that defines data acquisition	
	-signal_set <signal set>	Name of signal set that defines data acquisition	
	-timeout <timeout>	Timeout period for data acquisition in seconds	
	-trigger <trigger>	Name of trigger that defines data acquisition	
Description	Starts data acquisition with the specified conditions in the session and saves data into the specified data log within the timeout period.		
Example Usage	<pre>#opens signaltap session open_session -name stp1.stp  #capture data to log named log1, timeout after 5 seconds if no trigger occurs if { [catch {run -instance auto_signaltap_0 -signal_set signal_set_1 -trigger trigger_1 -data_log log_1 -timeout 5} err_msg] } {     # Timeout event is thrown as TCL exception     puts "ERROR: \$err_msg" }  #close signaltap session close_session</pre>		
Return Value	Code Name	Code	String Return
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Data has been acquired successfully
	TCL_ERROR	1	ERROR: JTAG chain in use. Wait for JTAG communication to finish and run again.
	TCL_ERROR	1	ERROR: Data acquisition stopped unexpectedly. Make sure device is stable and run again.
	TCL_ERROR	1	ERROR: Trigger not compatible with device. Download a design with the current SRAM Object File after recompiling.

continued..

continued...

	TCL_ERROR	1	ERROR: Instance, signal set, or trigger does not exist. Make sure the instance, signal set, and trigger exist in the Signal Tap File.
	TCL_ERROR	1	ERROR: Session has not been opened. Make sure a session is open before attempting to close it.
	TCL_ERROR	1	ERROR: Trigger did not occur in timeout period. Make sure trigger conditions are valid and/or increase timeout period.

### 3.1.37.5. run\_multiple\_end (::quartus::stp)

The following table displays information for the run\_multiple\_end Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::stp on page 712		
<b>Syntax</b>	run_multiple_end [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	<p>Defines the end of a set of "run" commands. This command is used when multiple instances of data acquisition are started simultaneously. Add "run_multiple_start" before the set of "run" commands that specify data acquisition. Add this command after the set of commands.</p> <p>If "run_multiple_end" is not included, the "run" commands do not execute.</p>		
<b>Example Usage</b>	<pre>#opens signaltap session open_session -name stp1.stp  #start acquisition of instance auto_signaltap_0 and auto_signaltap_1 at the same time #calling run_multiple_end will start all instances run after run_multiple_start call run_multiple_start run -instance auto_signaltap_0 -signal_set signal_set_1 -trigger trigger_1 -data_log log_1 - timeout 5 run -instance auto_signaltap_1 -signal_set signal_set_1 -trigger trigger_1 -data_log log_1 - timeout 5 if { [catch {run_multiple_end} err_msg] } {     # Timeout event is thrown as TCL exception     puts "ERROR: \$err_msg" }  #close signaltap session close_session</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Multiple instances of data acquisition ended successfully
	TCL_ERROR	1	ERROR: Data acquisition stopped unexpectedly. Make sure device is stable and run again.
	TCL_ERROR	1	ERROR: Run multiple instances has not been started. Use run_multiple_start before using run_multiple_end.
	TCL_ERROR	1	ERROR: Session has not been opened. Make sure a session is open before attempting to close it.

### 3.1.37.6. run\_multiple\_start (::quartus::stp)

The following table displays information for the run\_multiple\_start Tcl command:

<b>Tcl Package and Version</b>	Belongs to ::quartus::stp on page 712		
<b>Syntax</b>	run_multiple_start [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	<p>Defines the start of a set of "run" commands. This command is used when multiple instances of data acquisition are started simultaneously. Add this command before the set of "run" commands that specify data acquisition. Add "run_multiple_end" after the set of commands.</p> <p>If "run_multiple_end" is not included, the "run" commands do not execute.</p>		
<b>Example Usage</b>	<pre>#opens signaltap session open_session -name stp1.stp  #start acquisition of instance auto_signaltap_0 and auto_signaltap_1 at the same time #calling run_multiple_end will start all instances run after run_multiple_start call run_multiple_start run -instance auto_signaltap_0 -signal_set signal_set_1 -trigger trigger_1 -data_log log_1 - timeout 5 run -instance auto_signaltap_1 -signal_set signal_set_1 -trigger trigger_1 -data_log log_1 - timeout 5 if { [catch {run_multiple_end} err_msg] } {     # Timeout event is thrown as TCL exception     puts "ERROR: \$err_msg" }  #close signaltap session close_session</pre>		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Multiple instances of data acquisition started
	TCL_ERROR	1	ERROR: Run multiple instances has not ended. Use run_multiple_end to complete an active call to run_multiple_start before using run_multiple_start again.
	TCL_ERROR	1	ERROR: Session has not been opened. Make sure a session is open before attempting to close it.

### 3.1.37.7. stop (::quartus::stp)

The following table displays information for the stop Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::stp</a> on page 712		
<b>Syntax</b>	stop [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Stops all data acquisition.		
continued...			

<b>Example Usage</b>	stop		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_OK	0	INFO: Data acquisition has stopped
	TCL_ERROR	1	ERROR: No data acquisition was started. Data acquisition must be in progress before stopping.

### 3.1.38. ::quartus::tdc

The following table displays information for the **::quartus::tdc** Tcl package:

<b>Tcl Package and Version</b>	::quartus::tdc 1.0
<b>Description</b>	This package contains the set of Tcl functions for obtaining information from the Timing Analyzer.
<b>Availability</b>	This package is loaded by default in the following executables:  qpro quartus quartus_fit quartus_map quartus_pow quartus_sta quartus_syn
<b>Tcl Commands</b>	is_place (::quartus::tdc) on page 718 is_plan (::quartus::tdc) on page 719 is_post_route (::quartus::tdc) on page 719

#### 3.1.38.1. is\_place (::quartus::tdc)

The following table displays information for the **is\_place** Tcl command:

<b>Tcl Package and Version</b>	Belongs to <a href="#">::quartus::tdc</a> on page 718		
<b>Syntax</b>	is_place [-h   -help] [-long_help]		
<b>Arguments</b>	-h   -help	Short help	
	-long_help	Long help with examples and possible return values	
<b>Description</b>	Returns true when called from Fitter during the placer. (Only supported in Quartus Prime Pro Edition)		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: This command is not supported in the current software edition.

### 3.1.38.2. is\_plan (::quartus::tdc)

The following table displays information for the `is_plan` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::tdc</code> on page 718		
<b>Syntax</b>	<code>is_plan [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Returns true when called from Fitter during the plan. (Only supported in Quartus Prime Pro Edition)		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: This command is not supported in the current software edition.

### 3.1.38.3. is\_post\_route (::quartus::tdc)

The following table displays information for the `is_post_route` Tcl command:

<b>Tcl Package and Version</b>	Belongs to <code>::quartus::tdc</code> on page 718		
<b>Syntax</b>	<code>is_post_route [-h   -help] [-long_help]</code>		
<b>Arguments</b>	<code>-h   -help</code>	Short help	
	<code>-long_help</code>	Long help with examples and possible return values	
<b>Description</b>	Returns true when called from Fitter after router has completed or when post-fitting delays are annotated. (Only supported in Quartus Prime Pro Edition)		
<b>Example Usage</b>	This command currently contains no example usage.		
<b>Return Value</b>	<b>Code Name</b>	<b>Code</b>	<b>String Return</b>
	TCL_OK	0	INFO: Operation successful
	TCL_ERROR	1	ERROR: No project is currently open. Open an existing project or create a new project.
	TCL_ERROR	1	ERROR: This command is not supported in the current software edition.

## 3.2. Tcl Commands and Packages Revision History

The following revision history applies to this chapter:

**Table 13. Document Revision History**

Document Version	Quartus Prime Version	Changes
2024.07.08	24.2	<ul style="list-style-type: none"> <li>Updated for latest Tcl commands and packages support.</li> </ul>
2024.04.01	24.1	<ul style="list-style-type: none"> <li>Applied phase I Altera rebranding throughout.</li> <li>Updated for latest Tcl commands and packages support.</li> </ul>
2023.12.04	23.4	<ul style="list-style-type: none"> <li>Updated for latest Tcl commands and packages support.</li> </ul>
2023.10.02	23.3	<ul style="list-style-type: none"> <li>Updated for latest Tcl commands and packages support.</li> </ul>

2020.12.14	20.4	Initial release of <i>Tcl Commands and Packages</i> reference chapter.

## 4. Quartus Prime Pro Edition User Guide Scripting Archives

---

For the latest and previous versions of this user guide, refer to [Quartus Prime Pro Edition User Guide: Scripting](#). If a software version is not listed, the guide for the previous software version applies.

## A. Quartus Prime Pro Edition User Guides

---

Refer to the following user guides for comprehensive information on all phases of the Quartus Prime Pro Edition FPGA design flow.

### Related Information

- [Quartus Prime Pro Edition User Guide: Getting Started](#)  
Introduces the basic features, files, and design flow of the Quartus Prime Pro Edition software, including managing Quartus Prime Pro Edition projects and IP, initial design planning considerations, and project migration from previous software versions.
- [Quartus Prime Pro Edition User Guide: Platform Designer](#)  
Describes creating and optimizing systems using Platform Designer, a system integration tool that simplifies integrating customized IP cores in your project. Platform Designer automatically generates interconnect logic to connect intellectual property (IP) functions and subsystems.
- [Quartus Prime Pro Edition User Guide: Design Recommendations](#)  
Describes best design practices for designing FPGAs with the Quartus Prime Pro Edition software. HDL coding styles and synchronous design practices can significantly impact design performance. Following recommended HDL coding styles ensures that Quartus Prime Pro Edition synthesis optimally implements your design in hardware.
- [Quartus Prime Pro Edition User Guide: Design Compilation](#)  
Describes set up, running, and optimization for all stages of the Quartus Prime Pro Edition Compiler. The Compiler synthesizes, places, and routes your design before generating a device programming file.
- [Quartus Prime Pro Edition User Guide: Design Optimization](#)  
Describes Quartus Prime Pro Edition settings, tools, and techniques that you can use to achieve the highest design performance in Intel® FPGAs. Techniques include optimizing the design netlist, addressing critical chains that limit retiming and timing closure, optimizing device resource usage, device floorplanning, and implementing engineering change orders (ECOs).
- [Quartus Prime Pro Edition User Guide: Programmer](#)  
Describes operation of the Quartus Prime Pro Edition Programmer, which allows you to configure Intel® FPGA devices, and program CPLD and configuration devices, via connection with an Intel® FPGA download cable.
- [Quartus Prime Pro Edition User Guide: Block-Based Design](#)  
Describes block-based design flows, also known as modular or hierarchical design flows. These advanced flows enable preservation of design blocks (or logic that comprises a hierarchical design instance) within a project, and reuse of design blocks in other projects.

- [Quartus Prime Pro Edition User Guide: Partial Reconfiguration](#)  
Describes Partial Reconfiguration, an advanced design flow that allows you to reconfigure a portion of the FPGA dynamically, while the remaining FPGA design continues to function. Define multiple personas for a particular design region, without impacting operation in other areas.
- [Quartus Prime Pro Edition User Guide: Third-party Simulation](#)  
Describes RTL- and gate-level design simulation support for third-party simulation tools by Aldec\*, Cadence\*, Siemens EDA, and Synopsys that allow you to verify design behavior before device programming. Includes simulator support, simulation flows, and simulating Intel® FPGA IP.
- [Quartus Prime Pro Edition User Guide: Third-party Synthesis](#)  
Describes support for optional synthesis of your design in third-party synthesis tools by Siemens EDA, and Synopsys. Includes design flow steps, generated file descriptions, and synthesis guidelines.
- [Quartus Prime Pro Edition User Guide: Third-party Logic Equivalence Checking Tools](#)  
Describes support for optional logic equivalence checking (LEC) of your design in third-party LEC tools by OneSpin\*.
- [Quartus Prime Pro Edition User Guide: Debug Tools](#)  
Describes a portfolio of Quartus Prime Pro Edition in-system design debugging tools for real-time verification of your design. These tools provide visibility by routing (or “tapping”) signals in your design to debugging logic. These tools include System Console, Signal Tap logic analyzer, system debugging toolkits, In-System Memory Content Editor, and In-System Sources and Probes Editor.
- [Quartus Prime Pro Edition User Guide: Timing Analyzer](#)  
Explains basic static timing analysis principals and use of the Quartus Prime Pro Edition Timing Analyzer, a powerful ASIC-style timing analysis tool that validates the timing performance of all logic in your design using an industry-standard constraint, analysis, and reporting methodology.
- [Quartus Prime Pro Edition User Guide: Power Analysis and Optimization](#)  
Describes the Quartus Prime Pro Edition Power Analysis tools that allow accurate estimation of device power consumption. Estimate the power consumption of a device to develop power budgets and design power supplies, voltage regulators, heat sink, and cooling systems.
- [Quartus Prime Pro Edition User Guide: Design Constraints](#)  
Describes timing and logic constraints that influence how the Compiler implements your design, such as pin assignments, device options, logic options, and timing constraints. Use the Interface Planner to prototype interface implementations, plan clocks, and quickly define a legal device floorplan. Use the Pin Planner to visualize, modify, and validate all I/O assignments in a graphical representation of the target device.
- [Quartus Prime Pro Edition User Guide: PCB Design Tools](#)  
Describes support for optional third-party PCB design tools by Siemens EDA and Cadence\*. Also includes information about signal integrity analysis and simulations with HSPICE and IBIS Models.
- [Quartus Prime Pro Edition User Guide: Scripting](#)  
Describes use of Tcl and command line scripts to control the Quartus Prime Pro Edition software and to perform a wide range of functions, such as managing projects, specifying constraints, running compilation or timing analysis, or generating reports.
